Publication Ethics and Malpractice Statement

The Future of Education Proceedings, edited by Pixel and published by Filodiritto Editore, is a collection of international peer-reviewed Conference Proceedings committed to upholding the highest standards of publication ethics. In order to provide readers with Proceedings of the highest quality, we state the following principles of Publication Ethics and Malpractice Statement.

1) Editorial Board
Pixel, the Chief Editor, coordinates the Editorial Board whose members are recognized experts in the field of innovation in education. The Editorial Board members are the experts involved in the Future of Education Conference Scientific Committee. The full names and affiliations of the members of the Editorial Board/Scientific Committee are provided in the related section of the Conference Web Site. The Editorial Office is based at Pixel, Via Luigi Lanzi 12, I-50134 Firenze, Italy. E-mail: foe@pixel-online.net.

2) Authors and Authors responsibilities
Authors are obliged to participate in the papers' peer review process, responding to the reviewers' feedback and making the requested corrections, retractions, modifications and/or integrations.
All authors must have significantly contributed to the research work for the paper's production providing real and authentic data.
Authors must have written original papers and are aware that it is forbidden to republish the same paper.
Authors must provide the list of references and disclose all sources of financial support.
Fees required for manuscript processing and publishing are stated on the Conference Registration page.

3) Peer-review process
Pixel, as the Chief Editor, ensures a fair double peer-review of the submitted papers for publication.
Peer-review is defined as obtaining advice on individual papers from reviewers' expert in the field.
Papers submitted to the Future of Education Proceedings go through, first of all, an internal review and if they meet the basic requirements, they are sent out for review by experts in the field, who are members of the Future of Education Conference Scientific Committee. The Peer reviewers evaluate and give advice on the papers.
The paper review process is clearly described below.
The reviewers evaluate the submitted papers objectively and present their opinions on the works in the Review Form. Reviewers evaluate papers based on content without regard to ethnic origin, gender, sexual orientation, citizenship, religious belief or political philosophy of the authors. A reviewer who feels unqualified to review the research reported in a manuscript notify the Editor and excuses himself from the review process.
The Chief Editor strives to prevent any potential conflict of interests between the author and the reviewers.
Reviewers should identify relevant published work that has not been cited by the authors. If a reviewer finds any substantial similarity or overlap between the submitted manuscript and any other published works, he/she should inform the Chief Editor.
Private information or ideas obtained through reviewing the paper must be kept confidential by the reviewers and not used for personal advantage. Papers received for review must be treated as confidential documents. Without any authorization by the Chief Editor, the information of the submitted paper must not be shown to, or discussed with, others.

4) Publication ethics
The Reviewers must report to the Chief Editor any identified plagiarism, research fabrication, falsification and improper use of humans or animals in research. The Chief Editor strives not to allow any misconduct.

In the event that there is documented misconduct the following sanctions will be applied:

- Immediate rejection of the infringing paper.
- Immediate rejection of every other paper submitted to The Future of Education Proceedings by any of the authors of the infringing paper.
- Prohibition against all of the authors for any new submissions to The Future of Education Proceedings, either individually or in combination with other authors of the infringing manuscript,

as well as in combination with any other authors. This prohibition will be imposed for a minimum of three years.
- Prohibition against all of the authors from serving on the Editorial Board (Scientific Committee) of the Future of Education Proceedings.

In cases where the violations of the above policies are found to be particularly outrageous, the Chief Editor reserves the right to impose additional sanctions beyond those described above.

Guidelines for retracting articles are the following:

- Retracting article will be considered if there is clear evidence that the findings are unreliable, either as a result of misconduct, honest error, plagiarism, or if the paper reports unethical research.
- The main purpose of retractions is to correct the literature and ensure its integrity.
- Notices of retraction will be promptly published on the online version of the Proceedings available on the Future of Education Conference website and linked to the retracted article, accurately stating the information of the retracted article and the reason(s) for retraction.
- Articles may be retracted by their author(s) or by the Chief Editor (Pixel). The Chief Editor has the final decision about retracting articles. The Chief Editor will retract publications even if all or some of the authors refuse to retract the publication themselves in case of unethical behavior.

Authors who wish to enquire about publication of a correction for their article, or who have serious concern that they believe may warrant retraction, should contact the Chief Editor.

5) Copyright and Access
Copyright and licensing information is clearly described in the Future of Education Conference website at Release for Publication.
The electronic version of the Conference Proceedings will be shared to all the registered participants who paid the registration fee.

6) Archiving
The Future of Education Proceedings books are digitally archived on **Google Scholar** and **Academia.edu**.

7) Ownership and management
The Future of Education Proceedings are managed and edited by Pixel and published by Filodiritto Editore.

8) Web site
The Future of Education Conference website demonstrates that care has been taken to ensure high ethical and professional standards. It does not contain any misleading information, including any attempt to mimic another journal/publisher's site.

9) Publishing schedule
The Future of Education Conference Proceedings are published yearly.

10) Name of journal
The proceedings' name The Future of Education is unique and cannot be easily confused with another journal. These Proceedings have ISSN code from CNR.

11) Ethical Use of AI Tools
Authors are permitted to use AI-based tools for language assistance, formatting suggestions, or other non-substantive editorial support. However, the uncredited generation of substantive scholarly content—such as original analysis, interpretation of results, literature review, or conclusions—is strictly prohibited. All contributions must be the authors' own work, and any AI-assisted content must be transparently acknowledged. Misuse of AI tools to produce or modify core research content will be treated as a breach of publication ethics, subject to the sanctions outlined in Section 4. This policy aims to maintain the integrity, originality, and reputation of The Future of Education Proceedings while supporting authors in improving clarity and readability.

Adult Education

Toward Ubiquitous Learning for Adults: Opportunities Enabled by Artificial Intelligence

Laura Vettraino[1*]

[1]Italian Ministry of Education and Merit, Italy

Abstract

Adult learning and continuous upskilling throughout the life course are essential conditions for active citizenship and workforce adaptability. Within the European Education strategic framework, a target has been set for at least 60% of adults aged 25–64 to have participated in learning activities during the previous 12 months by 2030. However, according to the European Commission's Education and Training Monitor 2025, adult participation in learning stood at only 39.5% in 2022. Against this backdrop, this paper explores how digital technologies in general and artificial intelligence in particular, may prefigure a ubiquitous and engaging learning experience for adult learners, provided that effective strategies for orientation and personalization are implemented and that a multidimensional interpretative pedagogical paradigm is adopted.

Keywords: *personalization, IA, ubiquitous learning, complex learning, adult learning*

Introduction

The European Pillar of Social Rights Action Plan increased its ambition by setting a target of 60% of adults aged 25–64 participating in learning within the previous 12 months by 2030, up from 47%. However, the *Education and Training Monitor 2025* [14] reports that participation reached only 39.5% in 2022. Similarly, the *Survey of Adult Skills (PIAAC) 2023* [40] shows an average rate of 40.8% across 20 EU Member States, broadly consistent with 2022.
The OECD report *Trends in Adult Learning 2025* [39] identifies key barriers to participation. The main obstacle is lack of time due to work and family responsibilities (48%), followed by limited suitable training (14%) and financial costs (13%). These constraints reduce motivation and willingness to engage. Negative experiences in formal education also discourage many adults.
A recent literature review [44], based on data from 2000–2025 across multiple Countries, groups barriers into three categories: situational, institutional and personal. Situational barriers include work–study conflicts, life–work balance issues, time limits, and financial constraints. Institutional barriers involve organisational inflexibility, limited interaction or social isolation, and technological or access difficulties. Personal barriers mainly concern low self-confidence and fear of failure.
Additionally, adults often experience confusion when navigating training opportunities. Many have established careers and routines shaped by specific life trajectories, habits and learning strategies, which can limit access to standardised or rigid pathways.
Against this backdrop, this paper explores how digital technologies, particularly artificial intelligence, can support more ubiquitous, flexible and engaging learning for adults. This potential depends on effective orientation and personalisation strategies, as well as a multidimensional pedagogical paradigm capable of addressing the complexity of adult learning trajectories.

1. Adult Learning Personalization Requirements

To increase adult participation in formal and non-formal learning, a shift in prevailing educational paradigms is needed. One response is adopting a framework that promotes ubiquitous, flexible, and engaging learning experiences. Such a framework should rely on personalization strategies and a multidimensional pedagogical approach capable of addressing the complexity of adult learning trajectories. This perspective can better align provision with learners' needs while supporting target achievement.
Personalizing learning is challenging, as it requires adapting pathways to learners' characteristics, needs, and dispositions. Drawing on the andragogic framework [28], this implies a learner-centred approach based on adult learners' key traits:

- need to understand why they must learn something;
- see themselves as self-directed and responsible for their choices;
- use prior experience as a resource;
- become ready to learn when facing real-life demands;
- face task-oriented and problem-centred assignments;
- are are primarily motivated by internal factors such as self-esteem, professional fulfilment and quality of life.

Accordingly, learning environments should help adults recognize and valorize prior experiences and actively co-design their pathways. Practical relevance and applicability should guide training, connecting it to everyday contexts, integrating informal learning and reducing disengagement [41].
Despite its complexity, a personalized approach produces positive outcomes, especially for learners with interrupted or negative educational experiences, enhancing accessibility and inclusion. However, it is time-consuming, requiring data collection, assessments and skilled trainers able to design learner profiles and tailored pathways, an even greater challenge in group settings.
Today, AI-driven solutions significantly ease this process [46] [63]. AI tutoring applications combine flexibility, adaptability and learner agency through dialogic interaction, aligning with personalized learning principles. Algorithms enable customization based on individual needs, preferences, and pace [1] [34]. Unlike general chatbots, AI tutoring systems dynamically generate and adapt study plans, functioning as learning contracts within a dialogic framework [45]. They adjust task difficulty to learner performance, guiding practice through reinforcement while identifying errors formatively [3].
Rather than replacing human guidance, AI-based personalization amplifies the Zone of Proximal Development theorized by Vygotsky [61], traditionally supported by tutors or peers. Unlike human instructors, it operates without fatigue. These solutions, often freely available, range from simple tools to advanced systems, making learning more inclusive, accessible and effective while enabling learners to fully develop their potential.

2. Learning in the Ecosystem

The extraordinary potential of AI-based technologies in enhancing personalized learning nonetheless faces a structural limitation: it remains confined within the interactional boundaries of the device through which it operates. AI-driven learning applications often become self-contained systems, reproducing, albeit in new forms, the traditional boundaries of the classroom. This limits their ability to support truly lifelong learning grounded in adult needs, fostering self-direction, integrating informal and non-formal dimensions, and aligning with learners' biographies and daily lives. Even with advanced AI, the "rear-view mirror syndrome" described by McLuhan [36] reappears, without breaking the "fourth wall" theorized by Pirandello: a necessary condition for making learning genuinely interactive. This requires overcoming fixed roles and structures, to reflect the fluid nature of adult learning.
The concept of a learning ecosystem, as framed by Bronfenbrenner [10], is crucial to reach this aim: technology is only one component of a broader system shaped by interactions among institutions, contexts (formal, non-formal, informal) and the relationships between subjects, objects, times, and places of learning [30]. Within this system, AI tutoring applications act as active agents alongside human participants.
Transforming learning into a personalized, adaptive lifelong process within a ubiquitous ecosystem requires rethinking these categories and their relationships. The goal is to map and connect learning environments, physical and virtual, to design personalized pathways. Urban spaces frequented by adults become not just contexts but "learning activation devices," serving as nodes in continuous educational networks.
One could envision a distributed network of "learning dashboards," connecting diverse environments such as fast-food venues, shopping centres, archaeological sites, natural areas, libraries, schools, businesses, travel agencies, sports centres or bookstores. While once utopian, early initiatives like the ARIADNE project [15] in the 1990s explored interoperable platforms for adaptive learning, laying the groundwork for flexible, modular environments during the growth of the web.
Today, AI strengthens these connections, enabling not only interconnected resources, but integrated ecosystems and personalized pathways. Interoperability expands beyond technology to include experiential and contextual dimensions, forming dynamic systems that adapt to individual needs.
The sense of disruption that this vision can create reflects the scale of the paradigm shift driven by AI. Overcoming the "rear-view mirror syndrome" means moving from accumulation-based models to those based on distribution and flow. In this sense, Serres, in *C'était mieux avant!* [49], captures this transformation: what was once concentrated is now diffused and circulating.

Within this framework, learning may begin in informal or non-formal contexts and later be formalized within institutions, creating a virtuous circular relationship among diverse learning environments.

2.1 Breaking the "Fourth Wall": A Possible Application

Widespread museum initiatives embody the concept of a ubiquitous learning ecosystem, connecting diverse cultural environments, physical and virtual, and fostering synergies among formal, non-formal, and informal actors in urban and rural contexts, integrating learning into spaces frequented by adults [16] [32].
Consider a daily commute. In a city like Rome, even a short journey reveals rich historical stratification: passing the Pyramid of Cestius, skirting Porta San Paolo, once part of the city walls (275 AD) and later a site of resistance, and walking alongside the Non-Catholic Cemetery, resting place of poets and intellectuals. One might also encounter an early "Casa dei Bambini" founded by Maria Montessori. This brief route encapsulates multiple eras, showing how urban space can act as a pervasive cultural environment and learning device. Similar dynamics exist also in rural contexts, offering rich links between space, memory and education.
The widespread museum provides diverse stimuli within an ecosystem enabling informal and non-formal learning across cultural, naturalistic and recreational domains. However, the relevance of each stimulus depends on the learner's biography, experiences and dispositions. For this reason, connections among environments and stimuli should extend across broader urban spaces.
Learning pathways may activate in everyday contexts such as supermarkets, theatres, libraries, bookstores and fast-food venues, as well as sport and leisure spaces. These familiar environments offer opportunities to leverage informal learning. Digital displays at bus stops or kiosks and interactive interfaces could embed access to a learning tour.
These spaces can be interconnected nodes in a hybrid, dynamic, reconfigurable network. Ecosystems inspired by the diffused museum paradigm, enhanced by digital technologies, then reflect real-world complexity. Learners play an active role in perception, interpretation, and knowledge construction, processes that unfold through cyclical and interconnected dynamics rather than linear sequences.
Such environments align with andragogic principles: experiential, meaningful, interest-driven, self-directed and oriented toward mastery [11]. However, learning in natural contexts emerges from dynamic, sometimes serendipitous interactions between learner and environment [47] and is not fully predictable. This requires moving beyond linear models; accept the unexpected, toward deeper engagement and meaning, enabling flexible, personalized trajectories.
AI-based learning systems make these transformations increasingly feasible. They support adaptive, dialogical experiences calibrated to learners' knowledge and pace, extending learning beyond classrooms and reinforcing the concept of the Personal Learning Environment [51] [62].
At the same time, such ecosystems are more complex than traditional classrooms, increasing cognitive load and requiring strong metacognitive skills. Moreover, effective learning does not arise spontaneously: a solid pedagogical framework and structured plans oriented toward clear outcomes are necessary to ground educational stimuli.
Given this complexity, learning plans should span progressively structured levels, from individual experiences to pathways and full curricula, addressing diverse needs. While AI enables personalization at the micro-level, it remains insufficient to address the systemic and contextual dimensions of adult learning, which require an ecosystemic approach and human mediation. Within this framework, the role of the Learning Personalization Trainer remains essential, alongside a coherent pedagogical paradigm.

3. The Human Agency. The Learning Personalization Trainer in the AI Age

Anyone who has used an AI-based learning tutor is likely to trust this powerful ally: a system that does not tire, judge or lose patience with mistakes.
However, for personalization and guidance to be truly effective, a human agent, a Learning Personalization Trainer (LPT), with a clear pedagogical vision remains essential [52]. This agent selects appropriate solutions, designs meaningful pathways, avoids generic responses, and identifies strategies suited to diverse needs, while also experimenting with new approaches and contributing to educational innovation.
Personalization indeed, even when AI-mediated, remains a means for individual development and identity construction. It enables learners to shape their trajectories, becoming co-authors of their growth while developing metacognitive skills for autonomous learning [27] [48]. These learning trajectories, in ubiquitous learning environments, emerges through continuous negotiation with context and others,

reshaping what adults build across formal, non-formal, and informal experiences. This process relies on complex cognitive connections, moving beyond linear models and producing highly individualized pathways. The LPT is crucial in guiding self-assessment and, the skills assessment [13] [59] [60] in reskilling contexts. Through interaction with the LPT, assessment becomes a reflective process involving professional paths, learning strategies, and emotional dimensions. The human interaction with the LPT guiding self-assessment become central to support the learner autonomy.

AI enhances these dynamics: Intelligent Tutoring Systems provide adaptive guidance, adjusting pace, offering feedback, and refining strategies. They help learners monitor progress, identify next steps, and explore solutions, gradually increasing difficulty. This reduces frustration, prevents emotional blocks, and indirectly supports trainers. At the same time, managing frustration has pedagogical value. While reducing it benefits adults, especially those with negative past experiences, it can foster resilience in adolescents. In both cases, the LPT plays a key role in balancing this dynamic.

Although AI can manage personalization, informal learning risks remaining ineffective without a meaningful framework. Here, the LPT helps position outcomes within formal structures and pathways. This framework remains provisional and evolving, with the LPT supporting interpretation, integration, and planning of future learning stages aligned with ubiquitous and personalized principles.

Another key dimension is the social nature of learning. The LPT ensures learning remains connected to broader interactions and communities. Overall, the LPT adopts a learner-centred, co-constructive approach, focusing on challenges rather than predefined goals and supporting adaptive, non-standardized pathways. The process involves collaboration in defining challenges, designing pathways, and evaluating progress, with personalization tailored to learner profiles, contexts and resources.

The LPT intervention unfolds through phases such as welcoming, interviewing, needs analysis, agreement, design, support, and evaluation. Diagnostic activities integrate interviews, self-assessment tools, and AI-supported analysis. Over time, learners take ownership of their learning, developing metacognitive and transversal skills like reflection, autonomy, collaboration, and problem solving.

The LPT can also mitigates risks related to data use, algorithmic bias, and accessibility in AI systems. Since AI may reflect human biases, human-machine interaction becomes a balancing mechanism, fostering critical awareness in learners too.

Thus, the LPT plays a pivotal role in advancing personalized adult education by integrating adaptive design, learner empowerment and continuous evaluation; promotes personalization not as a purely AI-driven adaptation, but as an intentional process aimed at strengthening adult learners' capabilities. This supports both immediate outcomes and long-term competences, while AI technologies help manage the complexity of the role in terms of data, strategies, and time.

4. A Theoretical Framework for Ubiquitous and AI Augmented Learning for Adults: Complex Learning

Understanding and governing a learning process shaped by non-linear, emergent and constantly evolving dynamics requires a multidimensional pedagogical paradigm capable of interpreting the complexity of knowledge construction. Such a paradigm must fit increasingly dynamic, holistic, serendipitous, ubiquitous and highly personalized learning pathways unfolding in open, interactive contexts marked by unpredictability and fluidity, typical of "liquid modernity" [6]. A paradigm addressing these features must integrate multiple educational dimensions. It implies the hybridization of physical and virtual learning spaces, where traditional classroom boundaries are transcended in favour of open, interconnected environments fostering multi-channel and multi-actor interaction. In this perspective, relationships among media are reconfigured according to remediation logic [9], highlighting new hierarchies among communication tools and languages.

Another element concerns the transformation of participants' roles. In complex, collaborative environments, adult learners move beyond passive reception, exercising situated and variable leadership, acting as experts de facto in their domains and actively contributing to shared knowledge construction. From this viewpoint, knowledge develops through authentic, situated experiences grounded in dialogue and collaboration [29]. Learning assumes a cyclical, recursive structure it unfolds through phases of reflection and reinterpretation that lead to new knowledge and deeper awareness [24]. Within this framework, importance is given to representative biographies [23] and competences developed across formal, non-formal, and informal contexts [54]. Learning is thus seen holistically, as a dynamic continuum rather than a sum of discrete modules. Metacognitive competences become essential, enabling learners to plan, monitor, and regulate their learning while engaging in self-assessment and continuous reorientation. Learning pathways rely on personalization, participation and

hybridization of environments, tools and communicative codes. Learners become active users and co-producers of resources within an integrated framework.
These elements converge in the Complex Learning paradigm, which interprets dialogic, networked, multi-channel learning within digital ecosystems [47] [56]. Its emergence is linked to social media, online learning communities and the growing relevance of collective knowledge systems. Through participatory and dialogic processes [5] [35], learners achieve personalized outcomes tied to their biographies and development. Learning becomes continuous reorganization and reinterpretation of knowledge across contexts, with competences progressively recognized within formal frameworks. Early conceptualizations trace back to Linda Harasim [27], who identified Complex Learning as distinct from traditional educational models. Morin's complexity paradigm [38], emphasizing interactions between order and disorder; the transactional perspective of Garrison and Anderson [18]; and connectivism [50], which views knowledge as distributed across networks of people, technologies, and information sources well display this educational frame. Later interpretations adopted in this paper [12] [20] [21] [22] [26] [58], have framed Complex Learning as an emerging pedagogical paradigm, capable of supporting genuinely learner-centred educational processes.
Consistent with ubiquitous, personalized, and learner centred approaches, Complex Learning interprets outcomes as temporary stages in an ongoing evolutionary trajectory, where new knowledge continually becomes the basis for further development. These dynamics, initially enabled by multiple media interactions, are now amplified by AI technologies.

5. Future Perspectives

From an operational standpoint, the National Lifelong Learning System represents a relevant application scenario for a distributed, adaptive AI-based learning ecosystem. In Italy, the ITS Academy system [33], a higher vocational pathway parallel to higher education, offers a suitable context. An Edutech District within ITS Academies could exemplify such an ecosystem, where educational environments act as interconnected nodes linking schools, start-ups, enterprises, and regional innovation hubs. A formal cooperation among educational stakeholders, in synergy with local industries and communities, extended into urban spaces via AI-enhanced digital displays in everyday settings, could implement this educational network.
An initial step would involve designing and validating a prototype of a dynamic, holistic, serendipitous, and ubiquitous learning ecosystem, highly personalized and applied to the ITS Academy system. An AI-augmented map could embed this model in urban environments, accessible through interactive infrastructures. Many underlying components of the complex learning ecosystem have already been tested in European projects and educational initiatives (e.g., PEAPEDA FSE/OB3/C4, EQUAL Project ComuNet IT-S2-MDL-374, LLP-LDV- TOI/2009/IT/0447 DEEPER, LEADLAB - Leading Elderly and Adult Development – LAB Reference: 502057-LLP-1-2009-1-IT-GRUNDTVIG-GMP 2011 [23][25][43][20]). A new pilot phase would enable empirical validation of the framework and refinement of its methodological and technological architecture, integrating AI technologies.
To ensure feasibility and sustainability of the proposed model, human mediation remains essential. The LPT plays a key role in supporting personalized adult education, also through AI technologies. Formal recognition and institutionalization of the LPT within the professional domain of educators is needed, ensuring standardized competencies, clear roles and effective integration into existing education and training systems. In Italy, this perspective aligns with recent policy developments, such as Ministry Decree No. 328 (December 22, 2022) [37], which introduces roles like the learning personalization tutor and guidance tutor. Building on this framework, the proposed approach is well suited for scalability, adaptation, and extension to other sectors and target groups, including learners with diverse needs such as NEETs or early school leavers.
Finally, mapping environments and generating curricula within a distributed learning ecosystem can support orientation functions, integrating professional outcomes into educational design and aligning with labour market demands. The resulting model, as an adaptive educational infrastructure, could interact with social and economic systems, strengthening the link between education, employability and territorial development.

6. Conclusions

Despite the policy ambition of the European Pillar of Social Rights Action Plan, adult participation in learning remains well below the 60% target for 2030. As highlighted by OECD and European Commission reports, adults still face multiple barriers, including time constraints, limited access to

training, financial costs and dispositional factors such as low self-confidence or negative past educational experiences. These challenges are often compounded by difficulties in navigating complex training systems, especially for adults with already established careers and life routines.
In this context, lifelong learning can no longer be seen as a phase preceding professional life but as a continuous process spanning the entire life course [55]. Educational provision must therefore align with key OECD principles [42]: a systemic vision integrating formal, non-formal, and informal learning; learner centrality; development of learning-to-learn competences and a multi-objective conception of education evolving over time.
From this perspective, a multidimensional pedagogical approach becomes essential. The Complex Learning paradigm offers a coherent framework to interpret dialogical, adaptive, and interconnected learning processes distributed across diverse environments typical of digital ecosystems.
Overall, the framework proposed contributes to the debate on AI-supported lifelong learning ecosystems by integrating ubiquitous environments, personalized strategies and human mediation through the Learning Personalization Trainer. This approach can support more inclusive and adaptive learning infrastructures, addressing structural barriers that still limit adult participation. At the same time, it emphasizes that the primary "technology" to enhance is the human mind itself, in line with the educational vision of John Dewey and, earlier, Aristide Gabelli [17], who promoted the "*strumento testa*" as the foundation of education. Since the early reforms of the Italian school system, this perspective has aimed to foster conscious, responsible citizens capable of autonomous decisions, an objective that remains highly relevant today.

Continuing Vocational Training of Human Resources: Results of a Longitudinal Survey

Mariya Neycheva

Burgas Free University, Bulgaria

Abstract

The paper focuses on company-provided management training and its determinants utilizing a longitudinal survey of Bulgarian firms conducted between 2020 and 2024. Data has been collected through a standardized interview with firm owners or managers. In addition to training participation, the questionnaire includes a wide range of aspects such as company characteristics, innovation activity, learning culture. Framed with the institutional paradigm, the study estimates the relationship between business investments in management training and three company attributes: size, measured by the number of employees, innovation activity and commitment to learning. To ensure robustness of empirical outputs and conclusions, two alternative estimation methods have been applied – binary logistic regressions as well as non-parametric tests. Stability of the relationships over time has also been assessed by a year term in the models. Empirical analyses indicate that learning orientation is the strongest and most significant predictor of management continuing training. Second, genuine innovations, rather than imitative changes, are correlated with continuing training. A stable positive association exists between industry-wide innovations and management training regardless of firm size while introducing products and services which are new or significantly improved for the company but not for its rivals, does not exhibit a statistically significant effect.

Keywords: *continuing vocational training, management training, firm provided training, innovation, learning culture*

1. Introduction

In today's dynamic world of technological changes and, in turn, new business models, continuing education and training is expected to play a key role for worker labor market competitiveness, company market success as well as national growth prospects. Although the benefits of training have been widely recognised, some countries still lag behind. According to Eurostat, the average percentage of employed people who have participated in continuing education and training across the EU is 43% on average but this number hides the wide differences between the member states ranging from 18.5% in Greece to 83.7% in the Czech Republic. Given these big differentials, it is important to explore to a greater extent the training patterns through country-by-country analyses. Therefore, the current study focuses on firm-provided vocational management training across Bulgarian companies. The research topic is chosen for two reasons. First, Bulgaria is one of the EU countries with lowest involvement of companies in lifelong learning. For example, in 2020, the share of enterprises providing continuing training was only 41.1% compared to 67.4% for the EU-28. Additionally, Bulgarian management is considered less professionally prepared than that in other European countries [1]. According to a study of Ruseva [2] only 53% of Bulgarian managers are aware of the problems and needs faced by their organisations. The present paper extends the scientific research in two directions. It examines a country with low participations in adult learning which might have important policy implications and focuses on determinants of management training particularly – an issue not well developed in the relevant literature. The study utilizes the results of a longitudinal survey comprising three waves – in 2020, 2022, and 2024 respectively. The structure is as follows. Section 2 makes an overview of the theory regarding firm investments in continuing education and training and, on this basis, formulates research questions and hypothesis. Section 3 describes the survey and makes a comparative descriptive analysis across the three rounds. Section 4 presents the empirical models and outputs. Concluding remarks are given in the last section.

2. Determinants of Firm-Provided Training: Theoretical Background in Brief

Firm investment in vocational education and training could be explained in the light of two main views – human capital theory and institutionalism. Training activities are widely regarded as investments in

human capital that enhance productivity, efficiency, and competitiveness. From a rational perspective, firms invest in training only when the expected benefits—such as productivity gains—exceed the associated costs. In a perfectly competitive labor market, employees who receive training would earn higher wages reflecting their increased marginal productivity [3]. Employers are generally reluctant to finance general training, since the acquired skills are transferable and may benefit firm rivals if the employee decides to change his or her job after training. Therefore, companies are willing to invest in firm-specific training, particularly, since the benefits would be retained within the company [4]. Nevertheless, when worker abilities differ and information about training outcomes is imperfect, employers may still finance general training. Firms may offer higher wages to retain high-ability people while encouraging the turnover of the less productive ones [5].

A significant body of research on work-based training is rooted in institutional theory [6]. From this perspective, continuing training is shaped by the inside and outside environment in which the company operate. It can be viewed as a response to formal regulations, industry norms, shared beliefs, and societal values at national, sectoral, or organizational levels. Factors such as trade union presence, organizational culture and ethics, market structures, and processes of institutional change influence firm training decisions [7,8]. Thus, training investments are not determined solely by economic rationality but are embedded in a broader institutional environment. The studies also underline the key importance of organizational factors such as involvement in R&D and innovations; existence of human resource development strategy and practices as well as focus on learning [9,10,11,12]. Sharing of work experiences, learning-oriented culture, appointment of staff responsible for training, private ownership, transparency and fairness in selection of trainees are conducive to lifelong learning in enterprises [13, 14, 15].

Regarding all said above, the current study explores the role of intra-company determinants of firm-provided management training by raising two research questions:

1. Are company attributes such as company size, innovation activity as well as focus on learning related to management training?
2. Are those relationships, if any, stable over time, particularly before and after CoVid-19 pandemics?

The research hypothesis is that firm size, propensity to innovate as well as learning orientation are positively associated with participation in management training.

3. Data and Estimation Method

To test the abovementioned hypothesis, the study uses data from a longitudinal survey of companies operating in the southeastern region of Bulgaria, conducted in three waves: 2020, 2022, and 2024. All samples are representative in terms of firm demographics thus enabling meaningful comparisons across the three rounds to be made. This, in turn, enhances the robustness and reliability of the research findings and strengthens the validity of the conclusions. The data was collected by direct standardized interviews with company manager or owner. The questionnaire comprised a wide range of questions on firm characteristics, policies and practices, including continuing training of managers. The survey was prepared and conducted by a specialized agency which assures its consistency and quality realization.

Table 1. Characteristics of the samples

Survey round	2020	2022	2024
Company's size (number of employees)			
Micro (0-9 employees)	34.7%	38.9%	38.9%
Small (10-49 employees)	33.3%	31.0%	31.0%
Medium and large (50+ employees)	32.0%	30.1%	30.1%
Sector of activity*			
Construction	24,0%	3,5%	4,7%
Trade, repair of motor vehicles and motorcycles	17,3%	14,2%	11,2%
Processing industry	14,7%	23,0%	19,6%
Hospitality industry	4%	20.4%	20.6%
Agriculture, forestry and fishing	13,3%	18,6%	15,0%
Firm-provided continuing training for managers**			
Never	60.0%	51.3%	25.2%
Yes, once	13.3%	18.6%	27.1%
Yes, several times	22.7%	26.5%	37.4%
Yes, by a long-term contract	4.0%	3.5%	10.3%

Training provider			
Individual training specialist	32.0%	18.6%	47.7%
A small company	21.3%	25.7%	19.6%
University/specialised training organisation	6.7%	16.8%	19.6%
NGO	8.0%	8.8%	6.5%
Government organisation	4.0%	7.1%	1.9%

*Only the first three are reported.
**The percentage of respondents answered by "I cannot say" has not been presented here.

Table 1 presents the sample characteristics. More than two-thirds of respondents were micro- or small enterprises with less than 50 employees. The sectoral distribution differs across the three rounds – whereas in 2020 the respondents predominantly operated in the field of Construction (23.8%), Trade, repair of motor vehicles and motorcycles (18.5%), and Processing Industry (16.6%), in 2022 and 2024 the biggest percentage came from Hospitality Industry - 20.4 % and 20.6%, respectively, followed by Processing Industry - 23% in 2022 and 19.6% in 2024, and Agriculture, forestry and fishing – 18.6% in 2022 and 15% in 2024. These differences reflect the change in the sectoral landscape of the Bulgarian economy over the investigated period, and, in turn, ensures representativeness. The number of companies being interviewed is 75, 113, and 107, respectively which accounts for approximately 0.2% of the total number of enterprises in the region per round.
The data shows a clearly expressed upward trend regarding investments in management training. In the first as well as the second round at least 70% of respondents admitted that they had not at all or have only once provided continuing training of managers. For the third round that percentage significantly fell to less than 53%. The percentage of respondents with no training was more than two times lower. Respectively, the share of companies providing management training on long-term contractual basis more than doubled from 4% to 10.3% between 2020 and 2024. The list of the most often used providers includes a training specialist, a small company specializing in training or a university/training organization. The role of the latter in providing management training has been continuously rising over the years from 6.7% during the first wave to nearly 20% in the last survey. Government organisations are rarely selected as trainers.
The main estimation method to test the hypothesis includes binary logistic regressions taking a general form as follows (eq .1):

$$L_i = \ln\left(\frac{P_i}{1-P_i}\right) = B_0 + \sum_{i=1}^{n} B_i\, x_i + \varepsilon_i \qquad (1)$$

The models are estimated on the basis of the results from the first (2020) and the third (2024) round, only. The data for the former was gathered in January 2020, just before the beginning of CoVid-19 crisis. Considering that the two time periods under investigation cover pre- and post-CoVid19 years, the study could, at least indirectly, give some insights into the role of pandemics for training. In all regressions, the dependent variable is a binary variable measuring the existence of firm-provided continuing management training. The variable takes the value of 1 if the company has not provided any management training at all or has participated in training only once. In case of more than one case of management training, the variable equals 2. The regression coefficients (*Bi*) show how the log of the odds ratio changes in case of a unit increase in the factor variable x_i [16]. Alternatively, *Exp(B)* indicates the increase of the odds ratio.
In addition to binary logistic regressions, nonparametric tests are used for assuring the robustness of the results and conclusions – Chi-square test and Mann-Whitney U test. The next section highlights the empirical outcomes.

4. Research Outputs and Analyses

A separate regression was run for each factor of training being tested. The models are of the form (eq. 2):

$$\text{Logit(CTM)}=\beta 0+\beta 1*\text{Xi}+\beta 2*(\text{Xi}*\text{Year})+\beta 3*(\text{Year}) \qquad (2)$$

CTM is the binary dependent variable for continuing management training presented above. Constructed in this way, the specification allows for the stability of the impact of a given factor on training over time to be estimated. The variable *year* takes 0 for the first survey wave (2020), and 1 for the third

one (2024). The size of the enterprise denoted by *firm size* (see, table 1) is measured by a categorical variable which equals 1 for the micro-companies (up to 9 employees), 2 in case of a small or a medium-size company (between 10 and 49 people), and 3 for larger players (50+ employees).
The second training determinant – innovation activity - is defined as an introduction of a product, service, method or process which is new or significantly improved either for the industry or the company. The paper differentiates between its quantity and quality by using two proxies. The binary categorical variable denoted *innovation* (see, table 1) reflects the answers to the question "Did your organization introduced an innovation in the year…" referring to the year preceding the survey. The variable takes 1 in case of a confirmatory answer or 2, otherwise. Alternatively, *innovation scope* is used as a measure of innovation quality. It is a binary categorical variable equal to 1 if the respondent claims that over the two years prior to the survey an industry-level innovation not only for the firm but also for its competitors has happened in products or services being supplied. The variable is coded by 2 if the product/service being introduced was new for the company but not for the market and customers. In case of no innovations, the variable equals 3.
The third training determinant is *learning commitment*. It is a scale variable calculated as an average of three items, each one representing one of the following statements:

1. The ability of employees to learn is a key competitive advantage.
2. Employee training is considered an investment rather than cost.
3. Employee training is a main priority.

Each of the above is measured by a 5-point Likert scale varying from 1 for "Definitely, no" to 5 for "Definitely, yes".

Table 2. Binary logistic regression output

Independent variables	Estimate	St. error	Wald	Sig.	Exp(B)	Goodness of Fit	
						Nagelkerke R^2 p-value	Hosmer–Lemeshow Test p-value
Model 1						0.153	0.911

learning commitment * year	0.147	0.333	0.195	0.659	1.158		
year	0.319	1.321	0.058	0.809	1.376		

***,**,* Statistical significance at 0.01, 0.05 and 0.10 level, respectively

The model goodness of fit is estimated by Hosmer-Lemeshow (HL) test [17] which is widely applied as a standard tool in logistic regressions. A p-value higher than 0.5 implies a failure to reject the null that the model is appropriate in the context of the empirical data. Nagelkerke estimate [18] is a pseudo R-square for generalized linear models ranging from 0 to 1. A value above 0.2 implies a moderate relationship and is considered good fit in the field of social sciences [19].
The regression outputs are presented in table 2. According to the first model, company size is a significant predictor of training, in general (p-value = 0.039). Not unexpected, the negative regression coefficients imply that both micro- and small firms are less likely to provide management training than larger firms. The odds are much lower and statistically significant at 5% level (p-value = 0.018) for micro-firms, particularly. For small companies, the association is weaker and not significant (p-value = 0.341). The positive association is stable over time since the coefficients for *year* as well as the interaction term are not significant. The Hosmer–Lemeshow test has a very high p-value (0.911) indicating that the model performs well. However, Nagelkerke R^2 of 0.153 shows that, although statistically significant, firm size exerts only a weak effect on participation in management training and the model explains hardly 15% of the variance.
Model 2 evaluates the effect of innovation culture on training. It demonstrates a good fit to the data (HL = 1) but its explanatory power is very limited, as indicated by the low value of Nagelkerke R^2 (< 0.10). The regression coefficient for *innovation* is above zero (1.030). This means that companies with innovation in their products, services, methods or processes have higher odds of providing management training in comparison with the competitors which have not recorded any innovation activity. Nonetheless, the higher than 0.05 p-value (0.065) implies marginal statistical significance which suggests a lack of conclusive evidence on the link between innovation quantity and firm investments in management training. Covid-19 crisis has not changed the relationship.

Table 3. Test outputs

[1]Group 1 includes enterprises which have never participated in management education and training or those participating only once while group 2 the firms with more management training activity.
[2]Pearson's Chi-square p-value
***,**,*Statistical significance at 0.01, 0.05 or 0.10 level, respectively.

The introduction of a separate variable measuring innovation quality changes the outcome. Wald statistics for model 3 shows that not innovation per se but its scope is a statistically significant determinant of management training (p-value = 0.032). In table 2, the coefficient for the variable titled *product/service new for the industry* is above zero. Moreover, according to *Exp (B),* companies with market-wide innovations have 3.3 times higher odds of training involvement compared to non-innovators. The statistical significance is high given the slightly above the accepted 5% margin p-value (0.051). On the other hand, the impact of firm-level innovations denoted by *product/service new for the company only* is negative and statistically non-significant. The coefficient for *year* is marginally significant at 0.10 but the high p-value (0.403) for the interaction term *innovation scope*year* indicates a lack of evidence that the association has changed during the post-CoVid-19 years. In general, the output reveals that innovations rather than imitations matter for management training. The model exhibits good fit to data with HL near 1 and shows a moderate association between the scope of firm innovations and training incidences.

Since there is a likelihood that due to lower financial and non-financial constraints, higher R&D spending, scale economies as well as market power, larger firms have higher innovative outputs [20], we check if the outcomes of model 2 and 3 result from the positive link between company size and continuing training as model 1 implies. According to the correlation analysis between training participation and each of the two innovation proxies included in model 2 or model 3, both the zero order correlations and partial correlation coefficients with company size used as control are statistically significant. Moreover, the lack of significant correlation between size and innovation indicators used here is in compliance with the non-linear relationship found by some studies. For example, there is evidence that smaller firms have significant potential in product innovations, and in cases of rapid innovation changes [21,22]. So, in this study, the results for the role of innovation performance cannot be explained by firm size.

The third factor – *learning commitment* – is positively linked to firm-provided training (model 4). This is the only coefficient with p-value less than 0.01. Additionally, *year* and the interaction term are not significant (p-value > 0.10) which denotes a stable effect of learning culture on training. Model 4 has moderate explanatory power (p-value = 0.206) and demonstrates a good fit to the data as shown by HL test statistics (p-value = 0.426).

For checking the robustness of the regression outputs discussed above, non-parametric testing has been performed additionally. The results are described in table 3. Chi-square test is employed to the cases of a categorical type factor variable such as firm size, innovation activity or innovation scope. The test results confirm the positive association between larger size and training. However, some slight differences over time have been observed due to the marginal significance for the second round since p-value is slightly above 0.05. Cramer's V statistics is higher than 0.2 denoting a moderate correlation which is a bit lower for the second round.

Regarding the role of innovations, the same as logistic model, the test has not found an overall statistically significant correlation at the 5% level. Chi-square p-value is 0.103. However, during pre-CoVid-19 period, there were some indications for a positive relationship since the p-value is (0.06) is significant at 10% level. A stratified analysis controlling for year was conducted using the Mantel–Haenszel (MH) procedure. The Breslow–Day test indicates that the odds ratios did not significantly differ across years (p = 0.30). The MH shows no significant association between innovation and training after adjusting for year (p-value > 0.10). Overall, no conclusive evidence has been found that the companies declaring some innovation activity are active also in training which is in compliance with the regression outcome above. Contrary to the latter, the statistical analysis once again proves the existence of a robust

stable correlation between the scope of innovations and training involvement. The Fisher–Freeman–Halton exact test is more appropriate in this case because of the small cell counts for the first wave (2020). The total effect is significant at the 0.01 threshold (p-value = 0.033). Cramer's V demonstrates a moderate link between innovation quality and training for the first round (0.312) and moderate to strong effect for the second round (0.378).
To explore the effect of learning culture, Mann-Whitney U test is employed due to the non-normal distribution of *learning commitment* variable and the dichotomous grouping structure. It enforces the outcome of the logistic regression (table 2) by confirming that the organizational focus on human resource development differs significantly between firms with no or very weak management training involvement and those with more intensive participation. The relationship is robust over time as p-value is less than 0.01 for both rounds. The effect size is 0.32 denoting a clearly expressed medium effect. Comparing the four determinants of training being tested, the analysis shows the underlining role of human resource management and the emphasis placed on learning.

5. Concluding Remarks

The aim of this study is to explore the link between selected firm-level attributes and management training. In line with the institutional paradigm, several factors have been included in the econometric specifications: firm size, existence of innovations, innovation scope, and focus on learning. The data comes from two rounds of a field survey conducted with Bulgarian companies. This allows for estimating the stability of the training determinants over time, specifically before and after CoVid-19 pandemics. The outputs suggest a positive significant association between company size and training incidences. Micro-companies are much less likely to provide training to their managers than the large players. Bulgarian firms employing up to 9 people account for nearly 94% of the total number of non-financial enterprises which is a plausible explanation of the low country involvement in firm-sponsored adult learning.
Regarding the second training determinant, the results differ according to the innovation indicator being applied. Introduction of an innovation, though positively related to training, lacks statistical significance at the 0.05 level. While not entirely foreseen, this outcome is explainable considering the broad definition of innovation used here. The latter encompasses any introduction of new or significantly improved products, services, methods, or processes in an organization. Once the quality of innovation is estimated, the effect becomes statistically significant. A stable positive link emerges between the scope of innovations and management training with innovation leadership acting as a catalyst of business investments in training. This outcome is consistent with the resource-based view [23] which sees learning as a key strategic organizational asset. On the other hand, there is no conclusive evidence regarding the effect of firm-only innovations. The study suggests that regular management training is offered by companies with genuine innovations, rather than imitative ones, regardless of firm size. The final factor being tested is learning orientation. Here, it is approximated by respondent perception of learning as a main source of competitive advantage and a key priority for the company. Both the binary logistic regression and the non-parametric test provide evidence of the essential role of learning commitment.
Overall, the current study fully confirms the hypothesized relations regarding firm size as well as learning orientation, while partially justifying the role of innovation performance. Moreover, it underlines the primary importance of learning culture and market-wide innovations of product or services produced by the firm. Thus, the research findings are in line with resource-based view and institutional theory.
The paper has some practical implications for public policy in adult learning. The government should direct its efforts to create incentives for micro-firms to invest in staff training given the financial constraints which such organisations likely face. According to a field study on continuing vocational education and training across Bulgarian companies conducted in 2024 [24], the three most effective measures of government support include direct subsidies from government budget covering all the associated expenses for 34% of respondents, national or European projects (23%), direct subsidies covering part of training spending (15%). Such measures might lead not only to human capital accumulation but also to higher firm potential to innovate. The reverse effect of training on innovation capacity needs to be further examined.

This study is developed under ABECVET project funded by Bulgarian National Scientific Fund, contract № КП-06-Н65/12, 12.12.2022.

Acting Together in Prehospital Care: Qualitative Insights into an Interprofessional Trauma Training Program

Marcel Köhler[1], Adina Friedrich[2]

[1]Faculty of Nursing and Health Sciences, Nord University, Norway
[2]Nordland Hospital Vesterålen, Norway

Abstract

Effective trauma care necessitates a high level of interdisciplinary coordination between paramedics and physicians. In response to this requirement, an eight-hours interprofessional training program was implemented in 2025 at a German educational institution to enhance collaborative competencies in prehospital trauma management. The educational concept was grounded in experiential learning theory and integrated simulation-based scenarios with structured reflection phases. The aim of this study was to explore participants' experiences with the didactic concept and their perceptions of its realization. A qualitative, exploratory research design was applied. Following the training, eight semi-structured interviews were conducted with participating paramedics (n=5) and physicians (n=3). Data was analyzed using qualitative content analysis according to Mayring [1]. Analytical emphasis was placed on identifying key experiential dimensions related to instructional design, team interaction, interprofessional collaboration, and the training's perceived relevance for clinical practice. Participants described the training as highly relevant, motivating, and conducive to effective learning. Authentic case simulations were perceived as particularly valuable in illustrating the necessity of interprofessional coordination during emergency response. Structured reflection phases were highlighted as essential for consolidating knowledge and facilitating metacognitive awareness. Tensions related to professional hierarchies and distinct role perceptions emerged but were constructively addressed through the reflective and interactive design of the training. Findings indicate that intentionally designed, simulation-based learning environments can significantly foster interprofessional collaboration and action competence in prehospital trauma care. The study underscores the importance of reflective, practice-oriented didactic models in strengthening interprofessional teamwork and decision-making under emergency conditions.

Keywords: *Interprofessional training, Prehospital trauma care, Simulation-based learning, Experiential learning, Qualitative research*

1. Introduction

Prehospital trauma care places the highest demands on the competence and capacity for action of the health professions involved. Severe trauma ranks among the leading causes of death worldwide, particularly among younger populations [2], and requires coordinated, time-critical care by interprofessional teams immediately following the event. In the German emergency medical services system, emergency physicians and paramedics work closely together within a physician-led framework. The competencies and scope of practice of both professional groups are defined by the legal framework set out in the emergency services legislation of the respective federal states [e.g. 3] and by the Emergency Paramedic Act (Notfallsanitätergesetz) [4]. Despite this structural connection, interprofessional training formats that address both professional groups jointly and on equal terms remain underrepresented in the practice of initial and continuing education [5]. The quality of interprofessional collaboration in emergency situations has, however, been demonstrably shown to have a direct influence on patient outcomes: unclear role distribution, deficient communication, and hierarchy-related interaction problems are considered key risk factors for errors and gaps in care in prehospital acute care settings [6, 7, 8].
Simulation-based interprofessional training formats offer a promising pedagogical approach to addressing these challenges, as they enable realistic learning experiences under controlled conditions and specifically promote the development of shared clinical competence [7, 9, 10]. Against this background, an eight-hour interprofessional training program for prehospital trauma care was developed in 2025 and piloted during a continuing education event in Pirna, Germany. The program combines simulation-based scenarios with structured reflection phases. The aim of the present study is to qualitatively capture participants' experiences with the didactic concept of the program and to examine

their perceptions of its implementation. The findings are intended to contribute to establishing evidence-based foundations for the further development of interprofessional training concepts in emergency medical services.

2. Background

The didactic concept of the training program under investigation is grounded in two complementary theoretical pillars: Kolb's Experiential Learning Theory [11] and the principles of interprofessional education (IPE) [9, 12, 13]. Both approaches are mutually reinforcing in their pedagogical orientation and together provide a coherent framework for the design and analysis of simulation-based interprofessional learning formats in healthcare.

2.1 Theoretical Approaches

Experiential Learning and Simulation-based learning
Kolb describes learning as a cyclical process comprising four successive phases: concrete experience, reflective observation, abstract conceptualization, and active experimentation [11]. Learning takes place not through passive absorption of knowledge, but through the active transformation of experience into action-relevant cognitive structures. The reflective phase occupies a key role: it fosters metacognitive competencies and enables the transfer of situated experiential learning into generalized knowledge. This is a capability of particularly high practical relevance in dynamic emergency settings [14, 15].
Simulation-based learning (SBL) is well-supported by empirical evidence in health professions education as a tool for fostering clinical and team-based competence [6, 7, 10]. It creates authentic learning experiences under controlled, psychologically safe conditions, making it particularly suitable for complex, time-critical care contexts such as emergency medicine. Within the framework of the Kolb cycle, simulation fulfills the function of concrete experience: it generates emotional and cognitive engagement and activates procedural knowledge. Decisive for learning effectiveness, alongside scenario fidelity, are above all structured debriefing and reflection phases, which have been demonstrably shown to contribute to the consolidation of learning outcomes and the development of collective reflexivity. In this context, debriefing is understood not merely as a post-activity review, but as an independent pedagogical intervention that bridges the gap between concrete experience and abstract conceptualization [6].

Interprofessional Education (IPE)
According to the definition of the World Health Organization (WHO), interprofessional education refers to that form of learning which occurs when members of two or more health professions learn from, with, and about each other [16], with the aim of enabling improved collaboration and patient care. IPE is therefore not merely an organizational format, but a pedagogical program aimed at overcoming profession-specific tunnel vision, fostering mutual appreciation, and developing shared action orientations. The scientific evidence demonstrates that well-designed IPE formats not only positively influence attitudes toward other professional groups, but also measurably promote practical collaborative competencies, such as shared decision-making, structured communication, and a shared awareness of professional roles [5-9]. In emergency medicine, where effective teamwork is directly linked to patient safety, efforts are underway to establish IPE as a component of evidence-based continuing professional development [17, 18].

2.2 Simulation-based Interprofessional Training for Prehospital Trauma Care

The theoretical foundations outlined above constitute the conceptual frame of reference both for the design of the present training program and for the analytical perspective of this study. Their application to the context of prehospital trauma care requires a context-sensitive adaptation that takes into account the structural specificities of the German emergency medical services system.
The simulated trauma scenarios of the program served as the primary experiential anchor in the sense of the first phase of the Kolb cycle. Their authenticity was designed to generate emotional and cognitive engagement, thereby creating preconditions for deeper reflection. The immediately subsequent structured reflection phases assumed the function of the second and third cycle phases: they supported participants to observe what they had experienced, identify patterns, and draw conceptual conclusions. The sequential arrangement of multiple scenarios additionally operationalized the fourth phase (active experimentation) by enabling participants to trial new action strategies immediately [11].

A particular area of tension concerns the structurally embedded hierarchies between emergency physicians on the one hand and paramedic personnel on the other. The German emergency medical services system is traditionally physician-led, and despite the expanded scope of practice introduced by the Emergency Paramedic Act (Notfallsanitätergesetz) [4], the scope of action of both professional groups remains clearly defined by law. Such structural asymmetries are frequently reflected in interaction patterns and communication styles and can substantially affect the quality of interprofessional collaboration. The program therefore pursued the explicit goal of creating a learning space in which both professional groups could engage as equals and jointly reflect on their respective understandings of their professional roles. The combination of IPE principles with Kolb's reflection-oriented didactic approach made it possible not to suppress these hierarchical tensions, but to engage with them constructively as productive learning material [11, 19, 20].
The present qualitative study focuses on this process of translation into practice. The analytical categories of (a) didactic concept, (b) team interaction, (c) interprofessional collaboration, and (d) perceived practical relevance reflect the theoretical target dimensions of experiential learning and IPE, and form the basis for the qualitative data analysis.

3. Data Collection and Analysis

A total of N=23 individuals participated in the training program (paramedics: n=15; emergency physicians: n=8). Data collection was conducted in September 2025 with eight participants of the interprofessional training program, including five paramedics (n=5) and three emergency physicians (n=3). Participants were selected according to the principle of purposive sampling in order to ensure the inclusion of both professional groups. Semi-structured short interviews were conducted immediately following the training. The interview guide was oriented toward the central analytical categories of the study: the didactic concept and its implementation, team interaction within the scenarios, the experienced interprofessional collaboration, and the perceived practical relevance of the training. Participation in the study was voluntary. With participants' informed consent, the interviews were digitally recorded, subsequently transcribed verbatim, and pseudonymized for analysis purposes (paramedics: P1 - P5; emergency physicians: P6 - P8).
Data analysis was conducted using qualitative content analysis following Mayring [1] and pursues an exploratory approach. The procedure was designed as a deductive-inductive process: the superordinate analytical categories were developed in advance on a deductive basis, grounded in the theoretical framework, while the subcategories were formed inductively from the data material. Transparency of the analytical process was ensured through comprehensible documentation of the category formation procedure. Intercoder reliability was secured through independent coding runs and consensual validation.

4. Results

The qualitative content analysis of the interview material yielded four superordinate categories, which were developed deductively on the basis of the theoretical framework and further differentiated through inductively formed subcategories. Table 1 below provides an overview of the category system:

Table 1. Overview of the Category System of the Qualitative Content Analysis.

Category	Subcategories
A – Didactic Concept and Implementation	• Structuring of the workflow • Perceived facilitation of learning
B – Team Interaction	• Communication behavior • Task distribution within the scenario • Dynamics under time pressure
C – Interprofessional Collaboration	• Role understanding • Hierarchical tensions • Mutual professional appreciation
D – Practical Relevance	• Transfer to professional practice • Confidence in clinical action

4.1 Category A: Didactic Concept and Implementation

The didactic concept of the training program was consistently rated positively by the participants. Particular emphasis was placed on the high degree of realism of the simulated scenarios and the clear structure of the eight-hour program. The authenticity of the case design proved to be a central factor in the perceived learning effectiveness: participants reported that the setting generated emotional involvement and made the seriousness of the situation tangible. Structured reflection phases following the scenarios were described as didactically indispensable, as they provided the opportunity to analyze clinical workflows and collectively identify areas for improvement.

- *"The cases were designed in such a way that you really had the feeling that this could happen exactly the same way tomorrow. That helped me to engage fully." (P3, paramedic)*

- *"The reflection round afterwards was the most valuable part for me. It was only then that I became aware of what I had actually been thinking in that situation and why." (P7, emergency physician)*

The combination of simulation and structured reflection corresponded to the experience of a complete learning cycle: participants described how the sequence of scenarios enabled them to progressively develop new action strategies and immediately apply them in the subsequent scenario.

4.2 Category B: Team Interaction

The analysis of the interview statements on team interaction revealed that collaborative action under time pressure was perceived as particularly instructive. Participants addressed both successful coordination processes and moments in which communication gaps or unclear task distribution temporarily impaired the team's ability to act. These critical moments, however, were not experienced as failure but rather as productive learning opportunities, particularly when they were explicitly addressed during debriefing.

- *"In the first scenario, we were talking past each other. Nobody knew exactly who was supposed to do what. But that is precisely what we unpacked in the debriefing, and the second time around it went noticeably better." (P1, paramedic)*

- *"I realized how important it is to clearly communicate what I need next. That sounds trivial, but under pressure you forget it quickly." (P6, emergency physician)*

The analysis revealed that team interaction in the simulation context was experienced not only as a domain of competence but also as a mirror of everyday behavioral patterns. The training thus created a space in which both well-established and partially problematic interaction behaviors became visible and accessible to reflection.

4.3 Category C: Interprofessional Collaboration

This category proved to be particularly rich and multifaceted. Participants described an initial field of tension between the two professional groups, resulting from differing role understandings, professional socialization processes, and established hierarchical expectations. Both paramedics and emergency physicians reported an initial sense of uncertainty in their interactions with the respective other professional group within the simulation context. Over the course of the training, in particular through the shared reflection phases, this perception shifted. Participants developed a more differentiated understanding of the competencies and perspectives of the other profession.

- *"At the beginning, I thought: the emergency physician will handle it, I'll hold back. But during the debrief it became clear to me that my knowledge is equally in demand and needed." (P2, paramedic)*

- *"I was surprised by how much the paramedic colleagues contribute. That made me realize that in real practice I perhaps listen too little." (P8, emergency physician)*

The hierarchical tensions were not resolved by the reflective-interactive design of the training, but were made constructively workable. Participants described the shared learning space as an experience in which professional equality was not presupposed but actively negotiated.

4.4 Category D: Practical Relevance

The participants described the training as highly relevant to their professional practice. They emphasized that the competencies acquired (e.g., more structured communication, clear role assumption, and shared decision-making under time pressure) were directly transferable to everyday operational practice. Several participants expressed a desire for regular repetition of this kind of training as well as for its extension to additional professional groups within the emergency medical services system.

- *"Training like this should be mandatory. In eight hours, I learned more about actual collaborative work than in four years of operational practice." (P4, paramedic)*

- *"This showed me where I still have gaps in my communication skills with the paramedic team. That is something I am taking away with me." (P5, emergency physician)*

The transferability of the training was closely linked by participants to its practical relevance: the experience of the learned content being directly applicable was described as a key factor in its usefulness in daily work and as a contribution to enhancing confidence in clinical action.

5. Discussion and Conclusion

The findings of the present study indicate that a reflective simulation-based interprofessional training program can effectively promote the collaborative competence of paramedics and emergency physicians in prehospital trauma care. The positive evaluation of the didactic concept corresponds with the evidence in international literature, which identifies the combination of case simulations and structured debriefing phases as particularly effective for learning [7]. The reflection phases served as significant bridging function between concrete experiential action and conceptual understanding.
The identified communication gaps and coordination problems under time pressure correspond to structural findings from interprofessional emergency research, which identifies unclear role distribution and the absence of feedback routines as central sources of error in acute care [21]. It is significant that participants experienced these deficits as amenable to change through the formalized debriefing process. This points to the pedagogical effectiveness of reflective learning spaces in highly complex care contexts.
The hierarchical tensions reported between the two professional groups are structurally embedded in the German emergency medical services system. While the training program was unable to resolve these tensions, it created the conditions necessary to address them constructively and to develop mutual professional understanding. This underscores that interprofessional competence cannot be presupposed but must be actively cultivated through deliberately designed learning formats.
The study has methodological limitations: the small sample size, the absence of a longitudinal perspective, and potential social desirability effects limit the generalizability of the findings. Future studies should incorporate follow-up assessments and quantitative methods in order to validly capture transfer effects into clinical practice.
The findings provide an empirical basis for the further development of interprofessional training formats in emergency medical services and underscore the educational policy imperative to establish such formats as a permanent component of continuing professional development and advanced training.

Investigating Secondary Mathematics Teachers' Confidence Levels after Attending Voluntary Professional Learning

Abstract

The supply of secondary school mathematics teachers (SSMTs) in Australian schools is a problematic issue [1]. To address this issue, one effort conducted at scale involves providing professional learning (PL) for teachers of Years 7-10 mathematics, so that they are competent and qualified to teach mathematics courses to Year 11 and 12 students. PL is viewed as the processes by which teachers acquire new knowledge, skills, affects, and/or develop behaviors [2], which ultimately lead to improved student outcomes [3]. Presented at the conference are the findings of a survey where 73 SSMTs completed immediately before and again, immediately after, they participated in an intensive PL course. The survey interrogated the extent to which SSMTs felt confident to teach mathematical content following their PL course participation. For one survey question with six items, mean confidence scores were calculated, and pre-post PL changes in confidence levels were assessed across mathematics courses and year levels using a linear mixed model [4]. Results indicated SSMTs' confidence levels improved after completion of all PL courses, with teachers in the Year 11 courses having higher confidence levels than those attending the Year 12 courses. No significant difference was detected for Mathematics Methods versus Specialist Mathematics courses.

Keywords: *Secondary mathematics teachers; Professional learning; Confidence*

1. Introduction

Australia has experienced problems with the supply of secondary mathematics teachers for several decades, evidenced in out-of-field (OOF) teacher rates and increasing student enrolments in secondary schools [1]. Efforts to ameliorate this issue have included pre-service mathematics teacher training [5], the provision of professional development (PD) for in-service teachers, and professional learning (PL) for OOF [6]. According to some authors [1], one suggestion is that teachers of Years 7-10 be encouraged to progress to Years 11 and 12, through collaboration across discipline and education professionals. Within this paper, the confidence levels of secondary school mathematics teachers (SSMTs) participating in voluntary PL will be outlined. PL is viewed as the processes by which teachers acquire new knowledge, skills, affects, and/or develop behaviours [2], which ultimately lead to improved student outcomes [3]. The significance of this study is underpinned chiefly by the premise that quality teaching impacts student learning positively [7]. Accordingly, school leaders and systems have focused on implementing quality teaching practices and accessing PL which supports these practices [8].

1.1 Research Question

The main research question addressed in this paper is: To what extent does SSMTs' participation in voluntary PL courses affect their confidence to teach mathematical content?

2. Research Design

2.1 Context

In response to the need for secondary mathematics PL, the Department of Education Western Australian (DoE) offers PL courses in senior secondary mathematics to SSMTs. The lead author has delivered perennially the following intensive, short PL courses to current DoE SSMTs from 2020-2022; Year 11

Mathematics Methods [11MAM], Year 11 Mathematics Specialist, Year 12 Mathematics Methods, and Year 12 Mathematics Specialist [see School Curriculum & Standards Authority (SCSA)], [9]. Over the 3-year period, 73 SSMTs participated in pre-course surveys, post-course surveys, and individual interviews. Reported in this paper are the analysed confidence results from the pre- and post-course surveys (see Instrument).

2.2 Instrument

SSMTs were invited to complete a pre-and post-course survey for every PL course they participated in. The survey items for each PL course were identical except for Question 3. All PL surveys listed six course topics at Question 3 which were developed according to the content for respective courses [9]. Respondents rated their confidence to teach mathematics topics according to a 5-point Likert scale. To illustrate, Question 3 of the pre-course survey for 11MAM is presented below.

Currently, how confident are to you feeling to competently teach the following Year 11 Mathematics Methods course topics (1 = Not Confident at all, 2 = Slightly Confident, 3 = Somewhat Confident, 4 = Fairly Confident, 5 = Completely Confident):					
• Functions and graphs	1	2	3	4	5
• Trigonometric functions	1	2	3	4	5
• Counting and probability	1	2	3	4	5
• Exponential functions	1	2	3	4	5
• Arithmetic and geometric sequences and series	1	2	3	4	5
• Applications to differential calculus	1	2	3	4	5

3. Statistical Analysis

A total confidence score was calculated by summing the six Likert scale items at Question 3 for each PL course. Scores could range from a minimum of six to a maximum of 30. A mean item score was calculated (total score/6). Cohen's d effect sizes were computed for individual items, and magnitude was interpreted as no effect (0.0-0.1), small effect (0.2-0.4), intermediate effect (0.5-0.7), and large effect (≥0.8). A linear mixed model was used to investigate the change in confidence levels (mean item score, dependent variable) across mathematics course (Methods/Specialist), year level (11/12) and course evaluations (pre-/post-PL course), treated as fixed factors, and anonymous identifier treated as a random effect. Tests of fixed effects (F and p-value) are reported. Residuals were assessed and assumptions met with a normal distribution (Shapiro-Wilk=1.0, p=.166). IBM Statistical Package for the Social Sciences Statistics Version 29.0 was used for the data analysis [10].

4. Results

Over a period of 3 years, 167 SSMTs attended one of four PL courses. A total of 133 pre- and post-responses were collected from participants across that period, with a response rate of 39.8%. For each professional learning course, SSMTs' reported confidence levels increased (Fig. 1). Across course topics, all but three course topics reported intermediate or large effect sizes (Fig. 2).

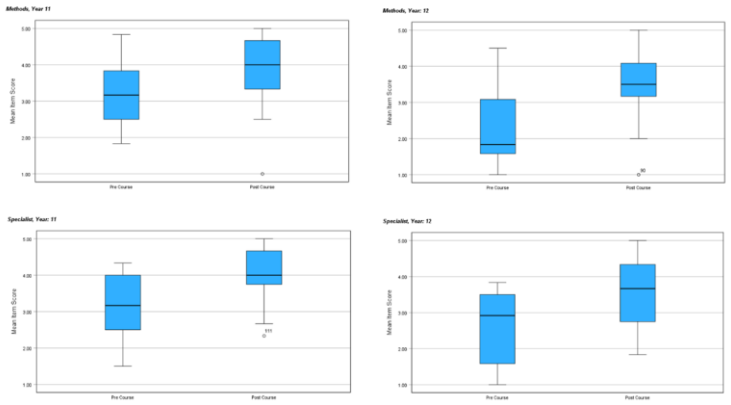

Fig. 1. Confidence levels (mean item score) to competently teach mathematics course topics, separated across course, year level and pre- and post- professional learning course attendance.

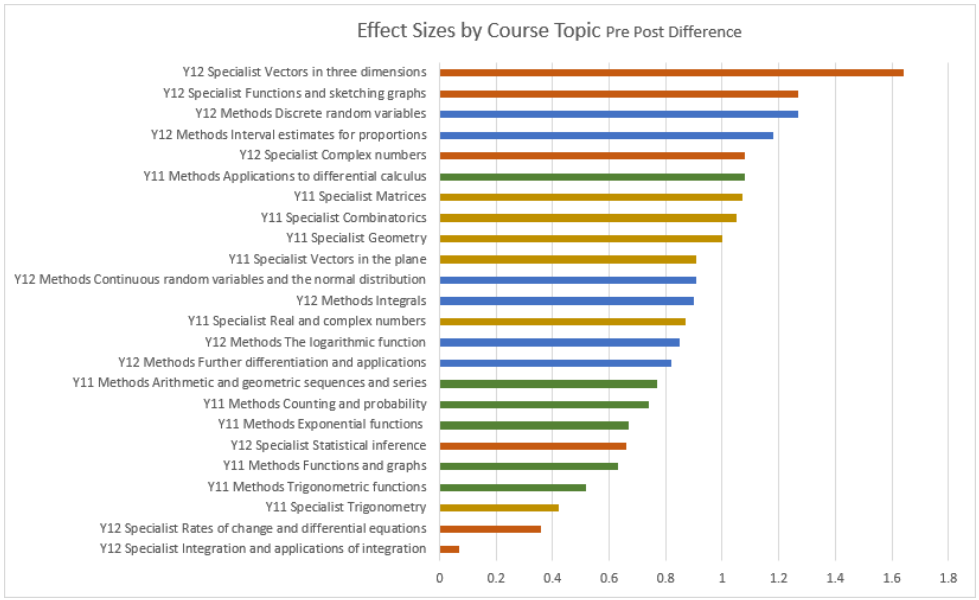

Fig. 2. Pre- and post- effect size differences by professional learning course topic.

Linear mixed modelling [4, 11] found SSMTs' confidence levels improved after completion of the PL program ($F=32.2$, $p<.001$), with teachers in the Year 11 programs having higher confidence levels than those attending the Year 12 courses ($F=10.6$, $p=.001$). No significant difference was detected for Methods versus Specialist courses ($F=0.4$, $p=.553$). Mean differences are summarised in Table 1.

Table 1. Linear mixed model means confidence level differences for pairwise comparisons of mathematics unit, year level and pre and post course.

Calculation	**MD**	**SE**	**p-value**	**95% Confidence Interval for Difference**	
				Lower Bound	Upper Bound
Specialist-Methods	0.1	0.2	.553	-0.3	0.5
Year 12-Year 11	-0.6*	0.2	.001*	-0.9	-0.2
Post-/Pre-Course	1.0*	0.2	<.001*	0.6	1.3

N.B. Based on linear mixed model with the dependent outcome mean item score, degrees of freedom =122.
***bolded** statistical significance at $p<.05^a$ Bonferroni adjustment for multiple comparisons [MD Mean difference, SE standard error].

5. Conclusion

This survey reported a positive effect where SSMTs felt confident to teach mathematical content following their PL course participation. Teachers participating in the Year 11 courses had higher confidence levels than those attending the Year 12 courses, which likely represents the level of mathematical difficulty involved. No significant differences were detected for Methods versus Specialist courses, which probably indicates that the affordances of PL are similar for both mathematics courses. Effect sizes suggest that SSMTs may benefit from PL focused on certain mathematics topics more than others. This study supports the value of PL for improving quality teacher practice which should translate into quality learning outcomes for students.

Abstract

The development of joint and integrated master's programmes within international consortia involves complex academic, institutional, and regulatory challenges. This paper reflects on risk assessment and risk materialisation within the Low Carbon Structures (LowCarb-S) project, an Erasmus Mundus Design Measures action aimed at developing a future joint master's degree in sustainable structural engineering across six European universities. During the proposal phase, a structured risk analysis was conducted to anticipate challenges related to curriculum harmonisation, alignment of learning outcomes, accreditation procedures, institutional engagement, and governance. Although these risks were formally identified and mitigation strategies proposed, the programme development phase revealed notable discrepancies between anticipated and actual risks. Several challenges evolved differently than expected, and additional risks emerged. Key emergent risks included divergent national accreditation cultures, varying interpretations of sustainability and low-carbon competencies, differences in institutional readiness for joint degrees, and difficulties in translating strategic educational objectives into coherent and assessable curricula. Moreover, interdisciplinary integration—central to the programme's ambition—introduced a level of complexity that was underestimated at proposal stage. By contrasting projected and real risks, this paper highlights the limitations of conventional proposal-stage risk assessments and emphasises the need for adaptive and process-oriented risk management throughout joint programme design. The findings provide practical insights for academic leaders and project coordinators involved in Erasmus Mundus initiatives, European University alliances, and the development of innovative, sustainability-oriented engineering programmes.

Keywords: *Joint degree, Erasmus Mundus, curriculum development, risk assessment, low-carbon structures, higher education*

1. Introduction

As the transition toward a greener and more digital society accelerates, the construction sector faces increasing pressure to balance sustainability, competitiveness, and innovation. The European Union has set ambitious targets through initiatives such as the European Green Deal [1] and the Fit for 55 package [2], aiming for climate neutrality by 2050 and significant reductions in CO_2 emissions. Complementary measures, including the Net-Zero Industry Act [3] and the Carbon Border Adjustment Mechanism [4], seek to support industrial transformation while maintaining fair competition. These policies are driving a shift toward low-carbon materials, improved energy efficiency, life cycle-based design approaches in construction, and industry initiatives such as CEMBUREAU's Net Zero Roadmap [5].

At the same time, the EU's digital strategy highlights the need to enhance digital skills and increase the adoption of advanced technologies such as artificial intelligence. Despite their potential, uptake remains limited, with only 54% of adults possessing basic digital skills [6,7] and a relatively low adoption of AI in enterprises, particularly in the construction sector [8]. Alongside the green and digital transitions,

education plays a critical role in supporting innovation and competitiveness. However, disparities persist in participation and attainment levels, with only 47% of European adults engaged in learning activities [9] and 23% attaining tertiary education degrees [10]. EU policy frameworks, including the European Pillar of Social Rights Action Plan [11], aim to address these gaps, although differences across fields remain evident [12].

In response to these interconnected challenges, the Low Carbon Structures Joint Master's Degree (Acronym LowCarb-S) is being developed as an interdisciplinary programme bringing together six European universities. The development of the programme is funded by the European Union through the Erasmus Mundus Design Measures (EMDM) financial scheme. The programme integrates sustainability, digitalization, and AI-driven design within a flexible, modular structure that enhances accessibility while maintaining academic rigor.

The development of joint and double degree programmes has been widely recognised in the literature as a key instrument for advancing internationalisation and institutional cooperation in higher education. However, previous studies consistently highlight that such programmes are inherently complex and often affected by structural, legal, and organisational challenges that extend beyond purely academic design. Evidence shows that difficulties related to accreditation, recognition of qualifications, funding sustainability, and curriculum integration are among the most frequently reported obstacles in transnational programme development [13,14].

Moreover, research conducted at European level indicates that joint programmes operate within highly heterogeneous institutional and regulatory environments, where differences in national systems and institutional practices significantly influence implementation processes and outcomes [15,16]. These findings suggest that the success of joint master's programmes depends not only on academic excellence, but also on the ability to manage institutional diversity and coordination complexity.

This paper examines the gap between anticipated and actual risks in the development of the Low Carbon Structures (LowCarb-S) joint master's programme. Beyond a descriptive comparison, it aims to provide a critical reflection on the limitations of proposal-stage risk assessment in complex, multi-institutional academic projects. The paper argues that risk in such contexts is not primarily technical, but emerges from institutional diversity, governance complexity, and uneven partner engagement. By analysing how initially identified risks evolved and how new risks emerged during implementation, the study contributes to a more process-oriented understanding of risk management in joint programme design. While not aiming for statistical generalisation, the study offers practical and conceptual insights for academic leaders and project coordinators involved in Erasmus Mundus initiatives, European University alliances, and the development of interdisciplinary, sustainability-oriented programmes.

This study adopts a qualitative case-study approach based on the implementation of the LowCarb-S project. The analysis is grounded in the comparison between proposal-stage risk assessment and mid-term implementation dynamics, using internal project documentation, coordination meetings, and progress monitoring activities as primary sources of evidence.

2. Description of the Low Carbon Structures (LowCarb-S) Joint Master's Programme

The Low Carbon Structures (LowCarb-S) Joint Master's Degree is an interdisciplinary initiative developed by a consortium of six European universities: Technical University of Cluj-Napoca (TUCN), Cyprus University of Technology (CUT), Riga Technical University (RTU), University of Cassino and Southern Lazio (UNICAS), Technological University Dublin (TUD), and University of Montenegro (UoM). Each institution contributes complementary expertise in sustainable construction, structural engineering, digitalization, and artificial intelligence, supported by specialized laboratories and research facilities. It is designed to respond to the growing need for engineers capable of addressing climate change challenges through low-carbon design, life cycle optimisation, and the integration of digital tools such as AI-driven modelling.

The project is guided by several core objectives in alignment with Erasmus Mundus Design Measures requirements. Figure 1 details the objectives of the LowCarb-S project:

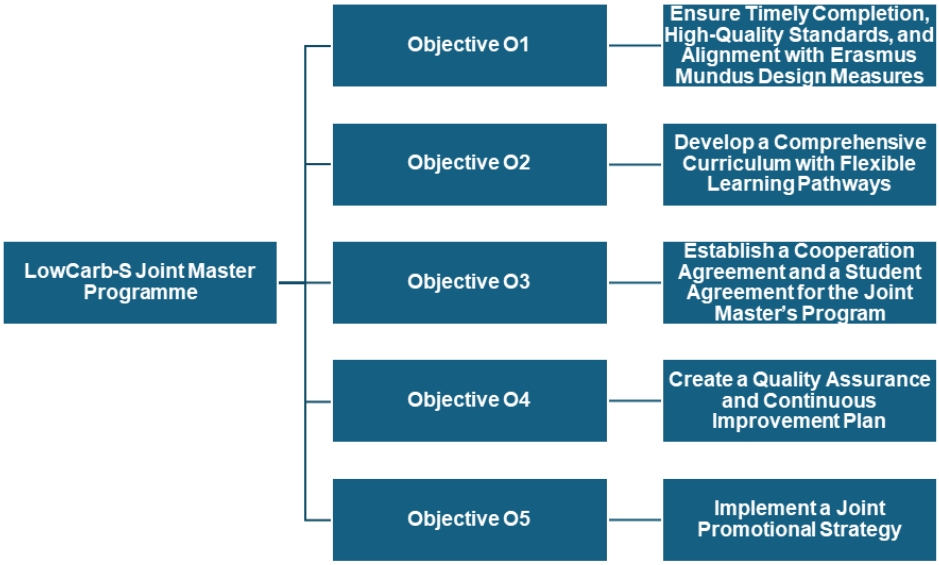

Fig. 1. LowCarb-S Core Objectives

The achievement of these objectives may be affected by a range of risks, including institutional, regulatory, and operational challenges, which can influence both the implementation process and the overall outcomes of the programme.

3. Risks in the Proposal Phase vs. the Development Phase at the Mid-point Implementation Period

During the proposal phase, a structured risk assessment was conducted to identify potential challenges that could affect the achievement of the project objectives and to define appropriate mitigation measures, which is presented in Table 1. The risks were classified as having either high or medium impact on the implementation of the project proposal.

Table 1. Risks in the proposal phase with corrective measures

Risk No	Description	Proposed risk-mitigation measures	Affected Objectives
R1	Differences in academic structures, credit recognition policies, and institutional priorities may hinder the development of a cohesive joint master's programme. Risk: High impact.	1. Establish a structured governance and coordination framework early in the project. 2. Conduct regular consortium meetings to align expectations and resolve conflicts. 3. Ensure adherence to European Higher Education Area (EHEA) qualification frameworks for uniformity across institutions.	O1, O2, O3, O4
R2	Lengthy administrative processes in partner institutions may delay curriculum validation and approval. Risk: Medium impact.	1. Develop a pre-accreditation compliance checklist to anticipate and address approval challenges. 2. Establish clear responsibilities for each partner in securing internal approvals.	O1, O3, O4
R3	Designing an interdisciplinary programme that integrates expertise from multiple universities while ensuring academic coherence can be complex. Risk: High impact.	1. Define common learning outcomes based on partner expertise and industry needs. 2. Ensure flexibility through modular course structures that accommodate different institutional requirements.	O2
R4	A lack of engagement from industry partners and external stakeholders may reduce the programme's practical relevance. Risk: Medium impact.	1. Establish advisory boards with representatives from industry and research institutions. 2. Align curriculum with industry needs through consultations and workshops.	O2, O5

		3. Incorporate practical case studies and industry-driven challenges into course design.	
R5	Without an effective dissemination strategy, the proposed master's programme may struggle to attract strong institutional and student interest. Risk: High impact.	1. Develop a strategic marketing plan that highlights the programme's unique value. 2. Address existing university networks, Erasmus+ platforms, and academic conferences to promote the initiative.	O5
R6	Unforeseen financial limitations or bureaucratic hurdles could impact the project's ability to finalize the programme design. Risk: Medium impact.	1. Establish a detailed and transparent financial management plan with contingency funds.	O1, O3, O5
R7	The joint master's programme may not secure sufficient funding or institutional commitment for future implementation. Risk: High impact.	1. Secure institutional commitments from partners regarding future resource allocation. 2. Search potential funding sources, including Erasmus Mundus Joint Master (EMJM) funding.	O3, O5

At the mid-point of project implementation, the development of the LowCarb-S programme reveals a mixed progress pattern, with discrepancies between planned and actual achievements, thus confirming the relevance of several risks identified during the proposal phase.

On the academic side, ~~i~~several key steps have been completed. The overall programme structure has been agreed (four semesters, 120 ECTS), alongside a decentralized accreditation approach, whereby each partner will pursue national accreditation in line with domestic regulations. Additionally, stakeholder engagement has been initiated through the design of questionnaires targeting employers and employees, focusing on sustainability, green practices in construction, and digitalization needs. Final learning outcomes have also been defined, and the consortium has initiated the process of aligning existing courses within each institution to these outcomes—an essential step given the constraints related to future Erasmus Mundus Joint Master (EMJM) applications.

However, progress has been slower than initially planned in several areas. The curriculum development process, while conceptually advanced, has been affected by institutional differences and varying interpretations of legal and procedural constraints. This situation directly reflects Risk R1 (differences in institutional frameworks) and Risk R3 (complexity of interdisciplinary curriculum design), while also highlighting additional layers of legal sensitivity not fully anticipated at proposal stage.

Furthermore, limited progress has been recorded in the development of joint governance instruments, such as joint policies and agreements, primarily due to time constraints among responsible partners. This aligns with Risk R2 (administrative delays) and Risk R6 (organizational and resource-related constraints), demonstrating how competing institutional priorities can impact coordination efforts.

In contrast, dissemination activities have progressed effectively. The consortium has successfully developed a visual identity, communication templates, social media presence, a dedicated website and promotional materials for the first project onsite event. Furthermore, the project was already presented in an international conference and more scientific disseminations are ongoing, in accordance with the project proposal. These outcomes indicate that mitigation measures associated with Risk R5 (dissemination and visibility) have been successfully implemented.

Regarding partnership formalization, although partner agreements have been drafted to regulate financial distribution—given that the Technical University of Cluj-Napoca (TUCN) acts as the main beneficiary—only partial signature completion has been achieved to date, with the agreement finalized by the University of Montenegro (UoM), Cyprus University of Technology (CUT), and University of Cassino and Southern Lazio (UNICAS). This situation reflects elements of Risk R7 (insufficient institutional commitment) and highlights delays in formal engagement across the consortium.

Overall, the current stage of implementation demonstrates that while strategic academic components are advancing, operational, legal, and institutional factors are generating delays and reshaping the initially anticipated risk landscape. These findings demonstrate the need of adaptive and continuous risk management beyond the proposal phase.

Table 2 presents the risks identified in the project proposal and the updated corrective measures required to bring the project back on track.

Table 2. Risks in the proposal phase encountered in the development phase and updated corrective measures at mid-point project

Risk No	Encountered (Yes/No)	Updated corrective measures adopted at the project mid-point
R1	Yes	Organize targeted bilateral meetings to clarify legal constraints; define a minimum common framework accepted by all partners; use external guidance (EHEA/EMJM examples) to standardize interpretations.
R2	Yes	Set internal deadlines with clear responsibilities per partner; introduce periodic progress monitoring; escalate delays within the consortium management structure.
R3	Yes	Continue structured mapping of existing courses to agreed learning outcomes; organize dedicated curriculum workshops.
R4	Partially	Finalize and distribute questionnaires; actively involve industry representatives through advisory boards and upcoming events (e.g., Midpoint and endpoint project physical meetings); integrate feedback into curriculum design.
R5	No (well managed)	Continue dissemination efforts; maintain active online presence; leverage upcoming physical meetings and networks to increase visibility and attract stakeholders.
R6	Yes	Reallocate tasks or provide support to overloaded partners; prioritize critical deliverables (joint policies); introduce shorter, more frequent coordination meetings focused on specific outputs.
R7	Yes	Follow up individually with partners; clarify financial and legal implications; set firm deadlines for signature; consider interim agreements if needed to ensure continuity.

The analysis of the current risk landscape indicates that most of the risks identified during the proposal phase have materialised, particularly those related to institutional diversity, administrative complexity, and coordination constraints. However, beyond simple validation of initial assumptions, the findings reveal that risks in joint programme development are not static events, but dynamic processes shaped by institutional behaviour and interaction patterns within the consortium.

A clear differentiation emerges between risks that are structural (e.g., differences in legal frameworks and accreditation procedures), operational (e.g., delays in curriculum alignment and governance development), and behavioural (e.g., uneven partner engagement and limited availability of key contributors). Among these, behavioural and governance-related risks (R2, R6, R7) have had the most significant cascading effects, directly impacting the achievement of core programme objectives, particularly O (programme design), O3 (institutional integration and accreditation), and O5 (long-term sustainability).

In contrast, risks associated with more autonomous and less interdependent activities, such as dissemination (R5), have been effectively mitigated, confirming that tasks with lower dependency on multi-actor coordination are more resilient to implementation constraints. This distinction suggests that the main limitation of the proposal-stage risk assessment was not the identification of individual risks, but the underestimation of their interdependency and amplification effects within a complex consortium environment.

These findings highlight the need to move from a static, compliance-oriented risk assessment approach toward a dynamic and adaptive model, in which risks are continuously monitored, reinterpreted, and managed in relation to evolving institutional realities.

4. Lessons Learned

Table 3 proposes a structured framework of implementation-stage risks (revised risks RR) suitable for Erasmus Mundus Design Measures new applications, along with the reasons why the specific risk was underestimated in the proposal phase of the LowCarb-S project.

Table 3. Revised Risks (RR) that should be included in an Erasmus Mundus Design Measures project proposal

Risk No	Description (Emergent Risk)	Proposed mitigation measures	Why it was underestimated in proposal phase of the LowCarb-S
RR1	Divergent legal interpretations and risk-averse institutional cultures (e.g., regarding surveys, data use, or joint procedures) delay decision-making.	Engage legal departments early; develop shared legal guidelines/templates; use previously approved Erasmus Mundus examples to reduce uncertainty.	The proposal assumed alignment under common European frameworks (EHEA, Erasmus+), underestimating institutional legal caution and internal compliance layers.
RR2	Variability in institutional readiness for joint degrees	Conduct an initial “readiness assessment”; provide targeted	It was assumed that all partners have similar

	(administrative capacity, experience, internal support).	support to less experienced partners; define minimum operational standards.	experience with international joint programmes, while in reality readiness levels differ significantly.
RR3	Difficulty in translating high-level learning outcomes into coherent, compatible curricula based on existing courses.	Introduce iterative curriculum design workshops; allow partial course adaptation; consider hybrid solutions (new + existing courses).	The proposal underestimated the rigidity of existing curricula and the complexity of aligning them across institutions.
RR4	Delays caused by uneven partner engagement and limited time availability for key contributors.	Define clearer accountability mechanisms; introduce milestone-based monitoring; redistribute tasks where delays persist.	The proposal assumed consistent engagement across partners, without fully accounting for workload differences and competing priorities.
RR5	Overestimation of the speed of governance framework development (joint policies, agreements).	Prioritize essential agreements first; use simplified or interim versions; build on existing templates from similar projects.	Governance development was treated as a structured process, without accounting for negotiation complexity and institutional constraints.
RR6	Challenges in aligning expectations regarding programme implementation pathways (national accreditation vs. fully joint accreditation).	Clarify early the preferred implementation model; document agreed pathway; ensure transparency and consensus at consortium level.	The proposal did not fully anticipate strategic differences in how partners envision the final programme structure.
RR7	Underestimation of the complexity introduced by interdisciplinary integration (technical + digital + sustainability domains).	Define clear thematic pillars; assign interdisciplinary coordinators; ensure balance between depth and integration.	Interdisciplinarity was considered an added value, but its operational complexity in curriculum design was underestimated.

Table 3 contains a set of structural and emergent risks that are typical for Erasmus Mundus Design Measures projects, but which are often underrepresented or underestimated in the initial proposal phase. A common pattern across all identified risks is the gap between assumed institutional homogeneity and the actual heterogeneity of consortium partners in terms of legal interpretation, administrative capacity, and operational readiness.

First, RR1 and RR2 emphasize that institutional diversity is not only administrative but also cultural and legal. While Erasmus+ frameworks assume a shared European baseline, the implementation reality of the LowCarb-S project shows that internal compliance layers, legal caution, and differing interpretations of regulations can significantly slow down decision-making. Variability in readiness for joint degrees demonstrates that partner institutions operate at different maturity levels, requiring differentiated support strategies rather than uniform assumptions.

The findings of this study are consistent with previous research on joint and transnational degree programmes. Earlier studies have identified similar patterns, including difficulties in curriculum integration, administrative complexity, and the need for sustained institutional commitment [13,14,15]. These aspects are often underestimated at proposal stage, despite being repeatedly highlighted in European-level analyses of joint programme development.

RR3 and RR7 reflect curricular and academic integration challenges in the LowCarb-S project, particularly in interdisciplinary programmes. The transformation of high-level learning outcomes into coherent curricula is constrained by existing national requirements, which are often rigid and not easily adaptable. Interdisciplinary integration further amplifies this complexity, as it requires not only content alignment but also conceptual coherence across domains that traditionally operate separately. These difficulties align with previous studies showing that curriculum integration across institutions is one of the most complex aspects of joint programme design. This complexity is further amplified in interdisciplinary programmes, where alignment must occur not only across institutions but also across distinct academic domains [17].

RR4 and RR5 shift the focus toward governance and consortium dynamics, highlighting that project delays are frequently driven by uneven partner engagement and the optimistic assumptions regarding the speed of institutional alignment. For LowCarb-S, governance frameworks and formal agreements require significantly more time due to negotiation processes, competing institutional priorities, and differing strategic interpretations of the programme structure. These findings are similar to prior research, which underline that successful implementation of joint programmes depends heavily on

sustained institutional commitment and effective coordination among partners. Without clear accountability mechanisms and active participation, delays and misalignments become systemic rather than isolated issues [14,16].
Finally, RR6 illustrates a critical strategic risk related to divergent expectations regarding the final programme architecture, particularly in relation to accreditation pathways. This type of misalignment is not operational but strategic, and it can affect the entire design logic of the programme if not addressed early and explicitly.
Overall, the table highlights that the main underestimated dimension in the proposal phase of the LowCarb-S project was not technical feasibility, but rather organizational complexity and behavioural variability across partners. The proposed mitigation measures consistently point toward earlier alignment, incremental design approaches, and stronger governance enforcement mechanisms, suggesting a shift from assumption-based planning to iterative and evidence-based consortium management. The complexity of international collaboration environments, including intercultural interactions and diverse academic practices, has been recognised as a defining characteristic of Erasmus Mundus programmes. These environments generate both opportunities for learning and additional layers of coordination challenges, particularly in relation to communication, expectations, and collaborative work dynamics [18].

5. Conclusions

In conclusion, the risk analysis and implementation challenges demonstrate that the success of Erasmus Mundus Design Measures projects depends less on the conceptual robustness of the initial proposal and more on the capacity to manage institutional diversity, align expectations, and respond to evolving constraints. The findings on the LowCarb-S project implementation show that the most critical risks are not technical, but organisational—emerging from governance complexity, legal heterogeneity, and uneven partner engagement.
The study further highlights that proposal-stage risk assessments of the LowCarb-S project underestimated not only the likelihood of certain risks, but also their systemic nature and interdependencies. As a result, risks related to coordination, decision-making, and institutional alignment can ultimately affect the achievement of core programme objectives if not actively managed during implementation. not intended for statistical generalisation.
However, future initiatives should move toward more realistic, adaptive, and process-oriented approaches, anticipating uneven participation and embedding governance mechanisms capable of maintaining progress under such conditions. Ultimately, building resilient joint programmes requires a shift from static planning to continuous alignment, active coordination, and iterative risk management.

AI Tools and the Risk to Critical Thinking Skills in Undergraduate Courses

Klodjana Skendaj

New York University of Tirana, Albania

Abstract

This study investigates the potential risks posed by the increasing reliance on AI tools to undergraduate students' critical thinking skills. As the use of automated writing assistance becomes more prevalent, it is vital to understand the implications for students' independent analysis, creativity, and problem-solving abilities. The primary objective of this research is to explore the extent to which students use AI tools in their writing processes and to assess how this reliance may affect their originality and critical thinking skills. Based on preliminary observations, the study hypothesizes that frequent reliance on AI tools may diminish students' critical thinking capabilities. Further, it is anticipated that instructors may view AI as a potential threat to the development of independent reasoning skills in their students, possibly leading to resistance against the integration of such technologies in educational settings. The research methodology comprises a comprehensive survey targeting approximately 60 instructors and 203 undergraduate students. This study is structured into two phases: the first gathers insights from undergraduate students, while the second collects perspectives from instructors. A key aspect of this research is to identify and evaluate each party's awareness of reliance on AI tools in writing. Quantitative analysis will involve statistical assessments to determine the relationship between the frequency of AI tool use and students' critical thinking outcome metrics. In contrast, qualitative analysis will provide deeper insights into personal experiences and perceptions regarding AI assistance. This dual approach aims to paint a holistic picture of the interplay between technological support and intellectual autonomy in academic writing. Overall, the findings from this study are expected to make significant contributions to the ongoing discourse on the role of technology in education, particularly in the development of writing and critical thinking. By identifying the potential risks of relying on AI, the study aims to inform both educational practices and policy-making, ensuring that technological advancements enhance rather than hinder students' intellectual growth.

Keywords: *AI Tools, Critical Thinking, Undergraduate Education, Automated Writing Assistance, Independent Analysis, Technological Integration*

Introduction

The introduction of OpenAI platforms to individuals of all ages and to anyone possessing a smartphone marked the initial step, the implications and consequences of which will become evident over time through experience. The emergence of advanced educational technologies has proven to be a significant asset in the pedagogical landscape, serving as an efficient facilitator and a consistent support system in addressing technical challenges. These innovations have effectively streamlined professional duties, thereby enhancing the adaptability and accessibility of teaching methodologies in educational settings. The integration of such tools fosters a more organized and responsive approach to instruction, ultimately improving the overall learning experience for both educators and students. Emphasizing the crucial factor that all the features that are offered by these platforms are learned in the process of usage, excluding any elements of their ethics, authenticity, and reliability. On the other hand, the rapid integration of artificial intelligence (AI) tools into higher education has transformed how students approach all their courses, especially in those where critical thinking and analytical skills are essential. Applications such as automated grammar checkers, paraphrasing engines, and generative text platforms promise efficiency and support, yet they also raise concerns about the erosion of essential cognitive skills. For example, in composition/academic writing courses, where the development of critical thinking is a central objective, the reliance on AI may inadvertently shift students away from independent reasoning and toward passive dependence on machine-generated outputs. Prior to such an introduction, undergraduate students typically approached an assignment by visiting the library, using online platforms, or searching for information on search engines to support their hypotheses. After gathering their findings, they would read and verify whether the information was relevant to their topic,

then paraphrase or summarize it for use as supporting evidence. Fostering problem-solving skills includes rethinking teaching methods in light of the potential dangers of using ChatGPT and ways to mitigate them [1]. However, over the past two years, this process has changed significantly, as AI tools now enable these practices instantly. This development may have led students to rely entirely on the reliability and relevance of the content provided by these tools. Tasks that AI tools can easily perform can be shifted toward more complex evaluations in educational practice by focusing less on general writing skills [2]. According to Zhai [3], designing learning goals so that policymakers and educators focus more on critical thinking and the effective use of AI tools.

Critical thinking—defined as the ability to analyze, evaluate, and synthesize information—remains a cornerstone of undergraduate education. Composition courses, in particular, are designed to cultivate these skills through tasks that require students to construct arguments, evaluate evidence, and express original ideas. However, when students substitute AI-generated text for their own analysis, they risk diminishing their capacity to engage deeply with content. In a study by T. Demirel, E. [4], students' perceptions and approaches towards AI indicate concern about accuracy, ethical implications, and the potential for overreliance on it. This pattern of reasoning is essential for students to develop a proper sense, not only academically but also in their future endeavors. Such skills are often observed as a single pattern, but they can be more than one, such as problem-solving, open-mindedness, and creativity. Critical thinking is essential for minimizing the acceptance of inaccurate beliefs by enabling individuals to assess, evaluate, and reorganize their thoughts. It encompasses understanding logical inquiry methods and addressing personal biases and misinformation. Students and adults must develop these skills to tackle personal and societal challenges effectively. Critical thinking involves refining ideas, making informed decisions, and improving solutions. While it is emphasized in educational settings, effective critical thinking is not automatically developed through college courses; it requires structured instruction and practice [5].

Literature Review

Contemporary researchers agree that critical thinking is “purposeful, self-regulatory judgment which results in interpretation, analysis, evaluation, and inference, as well as explanation of the evidential, conceptual, methodological, criteriological or contextual considerations upon which judgment is based” [6]. Brookfield [7] and Banning [8] contend that critical thinking involves differentiating, analyzing, and evaluating information, as well as reflecting on how this data will be utilized to assess and inform scientific decisions. Typically, critical thinkers are presumed to possess a goal and curiosity aimed at resolving contradictions; however, when AI applications are used to perform their tasks, the development of such skills is diminished.

Several studies agree that "the influence of AI on the decision-making process may lead to a situation where people engage less in critical thinking, relying instead on algorithmic recommendations" [9]. The primary goal of AI is to develop tools and machines that can understand and adapt to their environment and changing conditions, so that they resemble the human mind [10]. Based on an article on students’ perceptions of feedback, 71.1% found AI tools mostly helpful, with only occasional use for developing skills in analyzing information and forming arguments. Although these tools assist in this area, they are not always flawless [11]. The majority of educational institutions have found themselves unprepared for the patterns of AI tools, particularly in terms of affordability and the time required to implement and properly integrate these tools into the teaching process [12]. The professors and lecturers frequently lack adequate training and instruction in AI technology; as a result, their adaptation may be erratic and problematic [13]. Mollick [14] states that if the use of AI increases, the intellectual effort by individuals will become reluctant to take any responsibility towards activities and tasks, and this is for the simplest reason that AI tools are easier and faster in providing a logical answer, especially when the user is illiterate on the topic.

Society's optimistic outlook on the future focuses on using AI platforms to improve efficiency and convenience across academic, economic, and social domains. Nonetheless, this optimistic view presumes a society that is intellectually prepared to employ such tools optimally; however, the reality diverges significantly. We have access to a free, extremely powerful application, such as ChatGPT, available to every individual regardless of age, gender, origin, intention, or cognitive ability, who can and does use it at their convenience without any repercussions. Whether such a pattern was ever tested and its effects ever been comprehended, this is something that only time will show; adding its responsibility to the role of governments and educational institutions to be the central guarantees of AI’s successes and adaptabilities in the teaching and learning processes that simultaneously boost critical thinking behaviors starting from students to every other party involved [15].

On the one hand, AI tools facilitate access to information by not only making the research process much faster but also encouraging students' curiosity in assessing their own questions and answers [16]. Several scholars claim that AI enhances educational opportunities by generating new learning materials, offering personalized feedback and language support, and automating administrative tasks. Their research also supports encouraging online education within the system, as AI tools can provide students with additional resources that make online learning more interactive and engaging. Applying these insights to the current study, activities like expert seminars, workshops, and field visits can transform learning experiences by combining face-to-face participation with online resources, allowing students to connect directly with the environment and social contexts. Such hybrid approaches, blending traditional and innovative methodologies, can significantly benefit education. Additionally, professors and lecturers could provide tailored tutoring to address specific questions, thereby improving students' understanding [16]. However, both lecturers and students frequently find themselves overwhelmed by data and information. When retrieving information via these platforms, they must exercise caution to verify the accuracy and relevance of the data, ensuring it is not fabricated by AI manipulation. Nonetheless, one may question whether such skills are already ingrained in undergraduate students, given that their knowledge of the subject remains in its infancy. For example, an instructor might ask students to use ChatGPT to compose an essay on a class-related topic. Afterward, students would be asked to critique the essay. Analyzing its strengths and weaknesses can facilitate the exploration process [17]. In an article published in 2019, Jonathan Michael Spector & Shanshan Ma stated that: *"Critical thinking is one of four keys 21st century skills– communication, collaboration, critical thinking, and creativity. Though most people are aware of the value of critical thinking, it lacks emphasis in curricula."* By highlighting, "While much funding and support go to the development of artificial intelligence, this should not happen at the expense of human intelligence." [18]. Spector and Ma (2019a) highlight critical thinking as one of four essential 21st-century skills—alongside communication, collaboration, and creativity—yet they observe that it remains underemphasized in curricula despite widespread recognition of its value. In a related contribution, Spector and Ma (2019b) argue that while substantial funding and support are directed toward artificial intelligence, this progress must not come at the expense of cultivating human intelligence and inquiry skills. Together, these works underscore a pressing concern: although critical thinking is universally acknowledged as vital for preparing learners to navigate complex challenges, educational systems risk neglecting its development in favor of technological advancement, thereby weakening the very human capacities that AI cannot replace [19].

Research Questions

- **RQ1:** To what extent do undergraduates rely on AI tools in their courses?
- **RQ2:** How does AI use affect originality and independent analysis?
- **RQ3:** What are students' and instructors' perceptions of AI's role in writing?

Hypotheses:

- **H1:** Frequent AI use reduces critical thinking skills.
- **H2:** Heavy reliance on AI lowers originality in student writing.
- **H3:** Instructors perceive AI as a threat to independent reasoning.

Methodology

Data were gathered from both primary and secondary sources, including reliable domains such as Springer, Elsevier, and Google Scholar, as well as the most up-to-date articles, given that the topic's relevance is constantly changing and that these rapid changes have had an even greater impact on the audience, especially in academic settings. This study was divided into two phases. The first involved distributing a questionnaire via a Google Forms link to 203 undergraduate students from diverse majors, accessible from October 2024 to February 2025, and focused on AI use and practices in relation to the academic guidelines provided to the students. The second phase targeted university instructors, involving 60 participants who responded to a questionnaire containing multiple-choice, Likert-scale, and open-ended questions aimed at eliciting their personal perceptions of AI tools they use and their students use, as well as their impact on the teaching process, with an emphasis on critical skills.

Statistical Methodology**:** Data analysis was conducted using *SPSS*. Descriptive statistics were first applied to summarize the dataset. Group comparisons were performed using the **Kruskal–Wallis test**, while associations between variables were examined with the **Spearman correlation coefficient**. To assess predictive relationships, **linear regression models** were employed. Reliability of the cognitive skills scale (Q9, Q10, Q13, and Q7) was assessed using Cronbach's Alpha, yielding $\alpha = 0.800$, indicating good internal consistency. Statistical significance was set at $p < 0.05$.

Results and Discussion

To analyze students' perceptions of artificial intelligence in academic writing, non-parametric tests and regression models were applied.
The Kruskal–Wallis test revealed statistically significant differences in perceptions across frequencies of AI use. Differences were observed in idea organization ($H = 24.091$, $p < 0.001$), time saving ($H = 30.004$, $p < 0.001$), grammatical error correction ($H = 13.424$, $p = 0.009$), research skill improvement ($H = 17.151$, $p = 0.002$), and maintaining writing style ($H = 20.264$, $p < 0.001$). Students who used AI more frequently also reported higher confidence in their abilities and greater improvement in writing quality ($H = 20.94$, $p < 0.001$; $H = 19.26$, $p = 0.001$). Correlation analysis revealed a paradox in students' attitudes. More frequent AI use was negatively associated with perceived benefits such as idea organization ($r = –0.322$), time saving ($r = –0.374$), research skill improvement ($r = –0.248$), and writing style preservation ($r = –0.265$). A weaker but significant negative correlation was found for grammatical error correction ($r = –0.147$). These results suggest that frequent users develop more critical views of AI's effectiveness. At the same time, positive correlations among benefits indicate that students who value AI in one dimension tend to value it across others. Regression models confirmed that AI use (Q7) has a positive and statistically significant impact on critical thinking (Q9: $\beta = 0.435$, $p = 0.001$; $R^2 = 0.189$), originality (Q10: $\beta = 0.357$, $p = 0.005$; $R^2 = 0.127$), and independent reasoning (Q13: $\beta = 0.518$, $p < 0.001$; $R^2 = 0.268$). Reliability analysis showed good internal consistency for the cognitive skills scale ($\alpha = 0.800$), with Q9 and Q13 contributing the most ($r = 0.723$ and $r = 0.719$, respectively). Removing Q10 increased α to 0.855, suggesting that originality represents a distinct dimension. The findings indicate that AI use enhances performance in critical thinking, originality, and independent reasoning. However, these improvements may reflect gains in measurable outcomes rather than genuine cognitive development. Thus, H1 (AI decreases critical thinking) is not directly supported, while H2 (AI reduces originality) and H3 (AI undermines independent reasoning) are indirectly supported. Overall, the results highlight a paradox: AI improves academic performance yet raises concerns about dependence, standardization, and the erosion of fundamental intellectual skills.
To better illustrate this relationship, **Figure 1 from the second phase, Instructors' perceptions**, shows the connection between the frequency of AI use and cognitive skills.

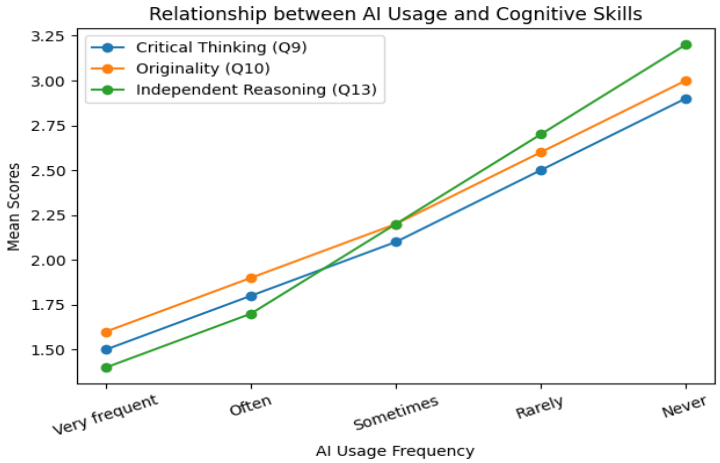

Fig. 1. The relationship between the frequency of AI use and cognitive abilities (critical thinking, originality, and independent reasoning).

Considering the way the variable Q7 is coded (where lower values indicate more frequent use of AI), the results show that an increase in the value of Q7, meaning a decrease in AI use, is associated with an increase in the scores of the cognitive skills variables. Similarly, this suggests that more frequent AI use is associated with lower levels of these dimensions. Overall, the results indicate that AI use is related to significant changes in perceptions and academic outcomes, reflecting a complex relationship between technology use and the development of cognitive skills.
The study results show that the use of artificial intelligence has a statistically significant impact on all analyzed dimensions, reflecting a complex relationship between technology and the development of cognitive skills. Regarding the first hypothesis (H1), which predicts that frequent AI use reduces critical thinking skills, the results support this hypothesis. Considering the coding method, more frequent AI use is associated with lower levels of critical thinking. The second hypothesis (H2), which suggests that

dependence on AI reduces originality in students' writing, is also supported by the findings. The analysis shows that frequent AI use is associated with lower levels of originality, suggesting a tendency toward content standardization. Regarding the third hypothesis (H3), the results demonstrate that AI's impact on independent reasoning is significant, and frequent use is associated with lower levels of this dimension. This supports the view that AI may pose a challenge to the development of independent thinking. Overall, all three hypotheses are empirically supported, showing that while AI can improve aspects of academic performance, its frequent use is associated with limitations in the development of essential cognitive skills.

Regression Analysis. The regression models demonstrated that **AI use (Q7)** had a positive and statistically significant effect on student performance indicators:

- On **Q9 (critical thinking)**: B = 0.394, β = 0.435, *p* = 0.001
- On **Q10 (originality)**: B = 0.330, β = 0.357, *p* = 0.005
- On **Q13 (independent reasoning)**: B = 0.537, β = 0.518, *p* = 0.000

These results indicate that increased reliance on AI is associated with higher scores across all three dimensions. The models' explanatory power ranged from $R^2 = 0.127$ to $R^2 = 0.268$, indicating a moderate level of variance explained.

Reliability Analysis Cronbach's Alpha for the combined scale (Q9, Q10, Q13) was 0.800, confirming strong internal consistency. Item-total correlations showed Q9 and Q13 contributed most strongly (r = 0.723 and r = 0.719), while Q10 had a weaker but acceptable contribution (r = 0.513). Removing Q10 increased Alpha to 0.855, indicating originality is a more differentiated construct within the scale.

Interpretation in Relation to Hypotheses

- **H1 (critical thinking reduction):** Not directly supported; AI use improved performance scores, though this may reflect surface-level gains rather than deeper cognitive engagement.
- **H2 (lower originality):** Indirectly supported; performance improvements may come at the cost of standardized writing, reducing individual voice.
- **H3 (instructors' concerns):** Indirectly supported; while AI enhances outcomes, it may reinforce perceptions of dependency and diminished independent reasoning.

Overall, the findings highlight a paradox: **AI improves measurable performance but raises concerns about originality and the development of critical thinking.**

The results from the first phase, Students' Table 1.

Table 1. Test Statistics

	11. AI tools help me organize my thoughts and ideas better. (1 = Strongly Disagree, 5 = Strongly Agree)	12. Using AI tools saves me time when writing assignments. (1 = Strongly Disagree, 5 = Strongly Agree)	13. I rely on AI tools to catch grammatical errors in my writing. (1 = Strongly Disagree, 5 = Strongly Agree)	14. AI tools have helped me improve my research skills. (1 = Strongly Disagree, 5 = Strongly Agree)	15. AI tools assist me in maintaining a consistent writing style. (1 = Strongly Disagree, 5 = Strongly Agree)
Kruskal-Wallis H	24.091	30.004	13.424	17.151	20.264

a. Kruskal-Wallis Test

b. Grouping Variable: 6. How often do you use AI tools for writing assignments/coursework?

The Kruskal–Wallis H test was conducted to examine whether students' perceptions of AI-assisted writing tools differed by the frequency of their use in coursework. Significant differences were observed across all five items. Specifically, perceptions of AI helping to organize thoughts ($H = 24.091$, $df = 4$, $p < .001$), saving time ($H = 30.004$, $df = 4$, $p < .001$), catching grammatical errors ($H = 13.424$, $df = 4$, $p = .009$), improving research skills ($H = 17.151$, $df = 4$, $p = .002$), and maintaining a consistent writing style ($H = 20.264$, $df = 4$, $p < .001$) varied significantly among groups. These results indicate that students who reported more frequent use of AI tools tended to express stronger agreement with AI's benefits across all dimensions.

Table 2.

			6. How often do you use AI tools for writing assignments /coursework ?	11. AI tools help me to better organize my thoughts and ideas. (1 = Strongly Disagree, 5 = Strongly Agree)	12. Using AI tools saves me time when writing assignments. (1 = Strongly Disagree, 5 = Strongly Agree)	13. I rely on AI tools to catch grammatical errors in my writing. (1 = Strongly Disagree, 5 = Strongly Agree)	14. AI tools have helped me improve my research skills. (1 = Strongly Disagree, 5 = Strongly Agree)	15. AI tools assist me i maintainin a consister writing sty (1 = Stron Disagree, 5 Strongly Agree)
Spearman's rho	6. How often do you use AI tools for writing assignments/coursework?	Correlation Coefficient	1.000	-.322**	-.374**	-.147*	-.248**	-.265**
		Sig. (2-tailed)	.	.000	.000	.037	.000	.000
		N	202	202	202	202	202	202
	11. AI tools help me to better organize my thoughts and ideas. (1 = Strongly Disagree, 5 = Strongly Agree)	Correlation Coefficient	-.322**	1.000	.575**	.254**	.613**	.491**
		Sig. (2-tailed)	.000	.	.000	.000	.000	.000
		N	202	203	203	203	203	203

Table 2 presents Spearman's rho correlation coefficient. Frequent users of AI tools for writing assignments showed **negative correlations** with perceived benefits, suggesting skepticism and unmet expectations. In contrast, occasional users reported **mutually reinforcing positive perceptions**, with strong intercorrelations among benefits like organizing ideas, saving time, and maintaining writing style. Overall, this paradox highlights that **light users view AI as broadly supportive**, while heavy users develop a more critical stance toward its limitations.

Table 3.

Ranks

	6. How often do you use AI tools for writing assignments/coursework ?	N	Mean Rank
9. AI tools have significantly improved the quality of my scientific writing	- A. Always	21	142.95
	- B. Often	65	111.36
	- C. Sometimes	105	89.96
	- D. Never	10	78.90
	Almost Never	1	27.50
	Total	202	
10. I feel more confident in my writing abilities when using AI tools. (1 = Strongly Disagree, 5 = Strongly Agree)	- A. Always	21	137.88
	- B. Often	65	113.97
	- C. Sometimes	105	88.75
	- D. Never	10	84.60
	Almost Never	1	34.50
	Total	202	

The Kruskal–Wallis test indicated significant differences in students' perceptions of AI tools by usage frequency, with frequent users reporting higher confidence in their writing abilities and improved writing quality. Data analysis showed a strong relationship between the frequent use of AI tools and enhanced perceptions of writing competence, supported by reliable statistical methods.

Table 4. The Results from the second phase Instructors' analysis.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.435[a]	.189	.175	.686

a. Predictors: (Constant), Q7_num

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	6.364	1	6.364	13.528	.001[b]
	Residual	27.286	58	.470		
	Total	33.650	59			

a. Dependent Variable: Q9_num

b. Predictors: (Constant), Q7_num

Coefficients[a]

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	1.187	.201		5.906	.000
	Q7_num	.394	.107	.435	3.678	.001

a. Dependent Variable: Q9_num

The results indicate a moderate and statistically significant positive relationship between Q7 and Q9 (p = 0.001), which does not support the first hypothesis regarding critical thinking but does indirectly suggest that students benefit from AI, potentially heightening teachers' concerns about dependency on it.

Table 5.

Model Summary

Model	R	R Square	Adjusted R-Square	Std. Error of the Estimate
1	.357[a]	.127	.112	.725

a. Predictors: (Constant), Q7_num

ANOVA[a]

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	4.458	1	4.458	8.470	.005[b]
	Residual	30.525	58	.526		
	Total	34.983	59			

a. Dependent Variable: Q10_num

b. Predictors: (Constant), Q7_num

Coefficients[a]

Model		Unstandardized Coefficients B	Std. Error	Standardized Coefficients Beta	t	Sig.
1	(Constant)	1.261	.213		5.936	.000
	Q7_num	.330	.113	.357	2.910	.005

a. Dependent Variable: Q10_num

The analysis reveals that increased use of AI (Q7) positively impacts student outcomes (Q9), with a significant effect (B = 0.394, β = 0.435, p = 0.001). However, this does not support the first hypothesis that frequent AI use reduces critical thinking skills, as the improvements in outcomes may reflect dependence on technology rather than genuine development. For the second hypothesis, while AI use can enhance writing quality, it may compromise originality, suggesting a potential standardization of styles. Regarding the third hypothesis, the findings indicate that although AI improves students' performance, it may also diminish their independent reasoning, reinforcing instructors' concerns. Overall, the results highlight a paradox: while AI boosts efficiency and quality, it risks fostering dependence and hindering critical thinking and originality.

Conclusion

This study acknowledges certain limitations, including the reliance on self-reported data, the restricted diversity of the sample, and the rapidly evolving nature of AI technologies, which may render the findings time-sensitive. These constraints highlight the need for ongoing research across disciplines and institutions to capture the shifting role of AI in education. Based on the results, the use of AI in education must be balanced and conscious. Students should be encouraged to use AI as a helpful tool, not as a replacement for their own thinking. Educators can focus more on methods that develop critical thinking

and independent reasoning, such as discussions, analyses, and reflective assignments. Additionally, it is helpful to establish clear guidelines for AI use and provide training to help students and educators use it effectively and ethically. To mitigate risks, educators should integrate training on ethical and effective AI use, design assignments that foster deeper cognitive engagement, and adopt policies that balance technological support with traditional learning methods. While AI tools offer efficiency and accessibility, their growing presence raises critical questions about their influence on students' reasoning. By promoting independent analysis and creativity, institutions can ensure that technological advancements enhance intellectual growth without compromising the integrity of critical thinking.

When Law Meets Practice: How Leaders Handle Legal and Relational Challenges in Schools and Early Childhood Education and Care

Morten E. Edvardsen[1], Atle Kristensen[2]

[1,2]Nord university, Norway

Abstract

Leadership in schools and early childhood education and care settings is becoming more legally complex. Legal risk arises when leaders must balance employer responsibility with professional judgement. At the same time, they must uphold the rights of staff, children, pupils, and parents. This is closely linked to values-based leadership and organisational culture [4] [16] [31]. This study examines how school and ECEC leaders describe their handling of legal risk in everyday practice. The study is based on 92 written assignments from leaders taking continuing education in law for the education sector. The assignments were analysed using a qualitative thematic approach. The findings suggest that employment-law issues are the most common. These include sick leave, accommodation, dismissal, organisational change, and the limits of managerial prerogative. Issues related to the school environment, the duty to act, and the best interests of the child also appear as important [11] [13]. The study further indicate that legal risk is not only about rules. It also grows out of time pressure, documentation demands, relational tensions, and responsibility for both staff and pupils [8] [28]. The findings point to a need for stronger legal competence in leadership development. Employment law, education law, and professional judgement need to be understood together[26].

Keywords: *Educational leadership; legal risk; employment law; education law; professional judgement.*

Introduction

Leadership in schools and ECEC takes place within strong legal frameworks, high quality expectations, and growing complexity. Although the school or ECEC provider holds overall responsibility for compliance with legislation and regulations, day-to-day responsibility rests with local leaders. It rests with the individual leader, who is expected to provide sound pedagogical and administrative leadership. This means that legal, organisational, and pedagogical considerations must be handled at the same time. It often takes place under conditions in which responsibility is decentralised, and support structures are experienced as weaker than before [5] [7] [22] [23] [25] [30].

In this context, legal competence appears to be a necessary part of the leadership role. Leadership in schools and early childhood settings requires the ability to interpret and apply legislation in practice. At the same time, professional, ethical, and organisational judgement must be understood in relation to one another [17] [24]. The legislation regulates not only employer responsibility, but also the rights of children, pupils, and parents. Leaders must therefore often deal with cases in which several legal positions operate at the same time. These interests do not necessarily align easily. This may be understood as a three-way relationship in which legal and relational considerations are closely connected. Perspectives on values-based leadership and organisational culture make it clear that such cases are not only about the application of rules. They are also about balancing norms, relationships, and formal requirements [4] [16] [31]. Against this background, legal risk is used here as an analytical concept for examining how challenging cases arise and are handled in practice. In the leader's assignments, risk does not primarily appear as a lack of legal knowledge. Rather, it emerges when several legitimate considerations collide, and when relationships between the parties make the leader's room for manoeuvre more difficult to use. The study is guided by the following research question:

How is the handling of legal risk described by school and early childhood leaders in cases where employment-related, pedagogical, and relational considerations must be balanced?

To explore this research question, the article draws on a theoretical framework that links legal risk to organisation, practice, and leadership through three main perspectives. First, legal risk is understood as a practice-near phenomenon that arises when legislation is interpreted and applied in complex everyday situations. Second, employment law is understood as an integrated part of pedagogical practice in schools and early childhood settings. Third, relational and trust-based leadership is seen as central to legitimate and professionally responsible handling of legally challenging cases.

Legal Risk as a Practice-Near Phenomenon in Complex Organisations

Legal risk in schools and early childhood education and care settings, can hardly be understood as a matter of rules alone. Risk arises in the application of legislation in situations where several considerations operate at the same time. From a structural perspective, organisations may be understood as frameworks of rules, procedures, and formal lines of responsibility. These are intended to ensure predictability and legal protection [8]. At the same time, such structures are incomplete. Rules are not self-executing. In complex organisations, rules will often be open to interpretation or exist in tension with one another. Legal risk is therefore linked not only to whether rules are followed, but also to how they are prioritised and applied in specific situations. Evans and Harris (2004) show that increased rule governance does not necessarily reduce the space for discretion. It may also create new spaces for interpretation. Hupe and Hill (2007) likewise emphasise that rules must always be interpreted in light of the situation in which they operate.
Interpretations become particularly clear in welfare organisations, where several legal positions and expectations operate simultaneously. Interpretive judgement does not stand outside rule-based governance. It is necessary to make the legal framework work in practice. This is consistent with analyses of street-level bureaucracy, in which frontline actors work under time pressure, resource constraints, and unclear goals. Leaders must make decisions even when the legal framework does not provide unambiguous answers [15] [20]. The exercise of discretion varies in both degree and form. Interpretive judgement is a recurring feature of frontline work. Frontline actors must interpret the lack of clarity and gaps within the legal framework in order to make their work function [9] [12] [29]. In this context, leadership practice becomes a key point at which law, policy, and relationships meet. In practice, it is leaders' decisions and patterns of action that realise policy [20]. Bolman and Deal's (2024) political and human resource perspectives add further depth to this point. They portray organisations as arenas shaped both by formal structures and by human interaction, interests, and negotiation [8]. Legal risk must therefore be understood as closely connected to the organisation's practical and relational working conditions.

Employment Law as an Integrated Part of Pedagogical Practice

The understanding of leadership practice is particularly relevant in employment-law matters in schools and early childhood education and care settings. Legal risk-cases rarely arise as clearly delimited personnel matters. Instead, they emerge in situations where the follow-up of staff, consideration for children and pupils, and expectations from parents operate at the same time. Employment law therefore does not appear as separate from pedagogical activity. Instead, it forms an integrated part of the leader's responsibility for sound operation, quality of provision, and a safe and development-oriented environment. Research on ECEC leadership shows that legal competence is not only about compliance. It is also about leading the core activity through a combination of legal understanding, professional judgement, and organisational development [18] [19]. In such cases, assessments of sick leave, workplace accommodation, conflict, redeployment, or dismissal are closely bound up with pedagogical and relational considerations. Legal risk therefore extends beyond the employer's duties towards staff. It also has implications for children's and pupils' right to a high-quality educational provision, as well as for parents' expectations of stability, quality, and safety. Employment law should therefore be understood as part of pedagogical practice rather than as a separate administrative field. This is supported by research on school leadership, which shows that the administrative, relational, and pedagogical dimensions of leadership are closely interconnected [21].
From a structural perspective, employment-law matters involve rules, procedures, and lines of responsibility that are meant to ensure predictability and legal protection [8]. From a human resource perspective, these matters also involve relationships, needs for support, and perceptions of fairness. Personnel matters cannot therefore be reduced to technical questions of regulation. They affect trust, collaboration, and professional confidence within the organisation. Findings from ECEC leadership point precisely to the fact that legal competence may contribute to clearer communication, greater legitimacy,

and fairer processes. In this way, it may strengthen both leadership practice and the organisation's learning capacity [18] [19]. Employment law may also be understood as part of a broader space of accountability. Frontline actors are accountable not only upwards in the hierarchy. They are also accountable sideways in relation to colleagues, professional communities, parents, and other partners [15]. In schools and early childhood settings, this means that leaders must balance legal requirements against pedagogical considerations, relational obligations, and organisational conditions. Increased rule governance does not necessarily reduce the space for discretion. This is particularly clear in employment-law cases, where standardised answers are rarely sufficient [12].

Relational and Trust-Based Leadership

Legally challenging cases in schools and early childhood education and care settings can rarely be handled through procedures alone. Leaders must balance different considerations, expectations, and needs. This often takes place under conditions of uncertainty, time pressure, and conflicting demands. The exercise of judgement required in such situations appears more legitimate when it is grounded in relationships characterised by trust. When staff experience that a leader acts with openness, professional grounding, and ethical awareness, the possibility of handling disagreement, change, and difficult cases is strengthened. This can happen without weakening the professional community. This understanding is supported by research on pedagogical leadership, professional learning communities, ethical leadership, and transformative forms of leadership [1] [3] [6] [32]. Pedagogical leadership is not only about internal organisation. It is also about interpreting and translating expectations between different levels and actors in the organisation [32]. At the same time, the development of professional learning communities depends on inclusive values, close pedagogical collaboration, and forms of leadership that facilitate participation and democratic processes [3]. The relational context also has a clear ethical dimension. Leadership is linked to justice, empathy, openness, integrity, and trust [6]. In this way, trust is connected to how leadership is experienced both morally and relationally.
Research suggests that strong relation between leader and staff member may increase employees' willingness to express ideas and participate actively [2]. Trust develops through the way leaders communicate, listen, justify decisions, and act in everyday practice. Dialogue is described as a central resource in this work. It is also understood as an arena in which meaning is developed through conversation, reflection, and learning [1] . This is particularly relevant in cases where legal requirements must be translated into practice through collaboration, clarification, and difficult prioritisation. Transferred to schools and early childhood settings, this means that trust-based relationships do not only have value in themselves. They also shape the organisation's capacity to handle legal risk. Relational approaches may strengthen learning and development by linking personal, social, and institutional dimensions [34]. Relationships, dialogue, ethical awareness, and trust therefore appear to be important for turning legal requirements into legitimate and professionally responsible decisions in practice.

Method

This study draws on qualitative material from school and early childhood education and care leaders undertaking continuing education. The data consist of written evaluations from school and ECEC leaders (n = 92), providing experience-near descriptions of challenges in everyday leadership practice. The study was conducted as a qualitative interpretive thematic analysis with a hermeneutic and abductive orientation. The analysis began with open coding and thematic sorting, and themes were developed through repeated movement between individual statements and the whole [27]. The abductive approach involved moving back and forth between empirical material and theory in order to develop the most plausible interpretation.
Theory was used as an expanding and corrective lens, not as a fixed answer. A strength of the study is the extensive material of open written evaluations produced close to participants lived experiences. At the same time, the analysis is based on self-reported data. The findings therefore primarily reflect participants' experiences and interpretations rather than actual interaction in practice [14]. The analysis also requires reflexive awareness of the researcher's pre-understanding [10] [33]. The following analysis examines how legal risk appears in the leaders' descriptions. It first focuses on the three-way relationship between staff, children or pupils, and parents. It then turns to the child rights, parental perspectives, employment-law frameworks, and the cross-cutting themes of documentation, time pressure, and relational vulnerability.

Legal Risk in the Three-Way Relationship Between Staff, Children or Pupils, and Parents

The findings indicate that legal risk in schools and early childhood education and care settings is not only something leaders address through follow-up, clarification, and measures. Employment-law issues form the clearest area of emphasis. In particular, this applies to cases involving sick leave, workplace accommodation, follow-up of staff, dismissal, organisational change, downsizing, and the limits of managerial prerogative. At the same time, these cases rarely appear as clearly delimited personnel matters. They develop at the intersection of staff rights, the needs of children and pupils, parents' expectations, and the organisation's responsibility to provide sound services. Legal risk therefore concerns not only which rules apply, but also how leaders create a defensible course of action when several legitimate considerations operate at the same time. This supports an understanding of legal risk as something that arises in the application of legal rules within complex organisations. Here, rules and procedures are not self-executing but must be interpreted and applied under competing demands and practical constraints [8] [12] [15].
The findings point to handling as work in which legal requirements are translated into practical processes. Cases must be examined, information gathered, documentation built up, measures considered and followed through, and relationships maintained as the case moves forward. Legal risk is therefore not only about whether the law is followed. It is also about how different considerations are balanced in the same case. Documentation, time pressure, professional judgement, and relationships interact in ways that make assessments demanding. Handling does not appear as a linear procedure, but as an ongoing form of leadership work in which assessments and actions are adjusted along the way. The descriptions indicate that leaders often work to move cases from uncertainty into a form that can be handled within the framework of law and organisation. This can be understood in light of decision-making in welfare organisations under conditions of uncertainty, unclear goals, and limited resources [20]. Such work often takes place in gaps within the legal framework, where actors must interpret and fill in what is not clearly regulated [29]. The three-way relationship emerges as a particularly exposed arena for both legal risk and legal handling. It is here that employment-law assessments, pedagogical considerations, and relational pressure are most often woven together. In many of the texts, the leader is positioned as the person who must hold the case together when different legal positions and expectations pull in different directions. This makes clear that leadership takes place in a field where legal questions cannot be understood in isolation but must be handled in relation to organisational conditions and relational dynamics. In light of Bolman and Deal's (2024) perspectives, legal risk-cases appear to be shaped both by formal structures and by human interaction, interests, and negotiation. This applies in cases where staff need accommodation. It also applies in cases concerning the school or ECEC environment, and in cases where parents challenge the assessments made by the school or the ECEC setting. The findings indicate that handling in many cases often consists of creating progress and direction in difficult situations. Situations can easily become stuck in conflicting perceptions, emotional pressure, or a lack of shared understanding. Leaders must therefore do more than relate to the legal framework. They must also work to ensure that the case takes a form that is experienced as legitimate, understandable, and open to review.

The Child's Rights as an Intensifying Dimension

A related form of legal handling appears in cases concerning the rights of the child. Leaders describe why the duty to act, documentation requirements, or school absence can be difficult to deal with. They also clarify how such cases must be followed up through investigation, reporting, documentation, and measures. One school leader links the challenge to "*the school's duty to act, documentation requirements, how to investigate the case thoroughly enough and analyse the findings, the pupil's subjective experience and the interpretation of this, cooperation with parents, time pressure, and complaint handling*." This shows that legal risk does not stem from one single factor. Several demands arise and must be handled at the same time. Increased rule governance does not remove discretion but may create new spaces for interpretation and new forms of responsibility in practice [12] [15].
Cases concerning the school environment are demanding because they require more than correct rule application. They also require judgement in assessing the pupil's subjective experience, the speed of follow-up, the quality of the investigation, and the ability to maintain cooperation with parents. Handling is therefore not only about knowing the legal framework. It is also about creating a process that makes it possible to act quickly enough, investigate thoroughly enough, and ensure that the child's or pupil's experience is taken seriously. Handling must be translated into action under conditions where the legal framework does not provide clear answers [20]. Differences in interpretation among staff appear to be

an important part of this risk. When harassment, exclusion, or bullying are understood differently, action may be delayed. Leadership handling then becomes work aimed at creating a shared understanding and embedding measures in a clear and documentable practice. Legal risk does not arise only from the incident itself. It also depends on whether the organisation is able to build a shared understanding of the case and agree on what needs to be done. From this perspective, structure alone is not enough. Rules and procedures provide a framework, but they must be interpreted and put into practice through interaction and judgement.

The same pattern appears in cases concerning school absence. One school-leader writes: "*In many cases, it is the parents' voice that is heard, and the child's experience is communicated through them. It also happens that the school is not allowed by the parents to speak with the child*." This points to situations in which the pupil's right to participation and follow-up depends on the relationship with parents. The risk is therefore not only about the legal framework, but also about access to information and the possibility of establishing a sufficient basis for further assessment and action. In this way, the rights of the child or pupil are closely tied to the relational conditions in which they are to be realised. Handling then appears as work aimed at moving the case forward in a way that is professionally sound, legitimate, and open to review.

Parents' Perspectives as Part of the Risk Landscape

Cooperation with parents is described as more than a pedagogical form of collaboration. It also forms part of legal handling, especially in cases where parents' expectations, the child's best interests, and the institution's professional assessments do not fully align. In such situations, leaders describe their role as clarifying boundaries, explaining professional assessments, balancing participation against confidentiality, and at the same time preserving trust. One ECEC leader emphasises that the setting must both uphold the child's best interests and ensure that parents "*experience themselves as genuine partners in cooperation*." This shows that relational work and legal handling are closely connected.

Handling has a clear communicative dimension. When one ECEC leader writes that "*parents' right to participation must be balanced against the duty of confidentiality*," it becomes clear that legal risk is also about form, timing, and language in communication. Berges-Puyó (2022) links ethical leadership to justice, empathy, openness, and trust. Adams et al. (2023) and Skjæveland et al. (2017) likewise highlight dialogue and relational grounding as central conditions for legitimate leadership. Balancing participation and confidentiality are not only a matter of legal correctness. It is also a question of what appears fair, respectful, and responsible in encounters with children, parents, and staff. This supports perspectives on values-based leadership and organisational culture. Norms, relationships, and formal requirements work together in leadership practice [4] [16] [31]. The findings therefore indicate that legal risk in many cases can hardly be separated from the way relationships are maintained or challenged through the handling itself.

In some cases, parents' perspectives also become part of the personnel side of leadership work. This is particularly clear in situations where parental concerns about a teacher's language, relational competence, or teaching practice overlap with internal tensions or collaboration problems among staff. In such cases, the matter is no longer only about pedagogical quality or parent-school relations. It also becomes a personnel issue that may involve follow-up of an individual staff member, concerns about the working environment, and questions about how the case should be handled in a legally proper way. At the same time, the leader must take account of the pupil's right to a safe and high-quality provision and the parents' concerns. This supports an understanding of employment law as an integrated part of pedagogical practice rather than a side field detached from the core activity [18] [19] [21]. In this way, parents' perspectives appear as an active part of how legal risk develops and how such personnel-related conflicts must be handled in practice.

Staff Professional Practice and Employment-Law Frameworks as Legal Risk and Legal Handling

Employment-law issues appear as the largest area of risk in the material. Sick leave and workplace accommodation emerge as legally demanding aspects of leadership practice. The same applies to poor work performance, redeployment, and dismissal. Downsizing and the limits of managerial prerogative also stand out as legally difficult areas. Such matters affect the organisation's operation and may also have implications for quality. At the same time, they often shape relationships within the workplace and between the institution and its wider stakeholders. Such descriptions reinforce the view that employment law is an integrated part of the leader's everyday responsibility for sound operation and pedagogical quality, rather than a specialist field separate from the core activity [18] [19]. Cases concerning sick

leave and accommodation make this especially clear. Leaders describe an ongoing tension between taking care of staff and at the same time ensuring stability and quality for children and pupils.
This tension also becomes visible in how such matters are handled in practice. Handling is not just about meeting legal requirements. It involves ongoing practical work: preparing follow-up plans, assessing work capacity, discussing possible measures, and securing substitute staff when needed. These tasks require leaders to balance the needs of individual employees against the pressure to maintain stable daily operation. As one leader notes, much time is spent on "*staff scheduling, recruitment of substitutes, and follow-up of employees on sick leave,*" leaving less time for professional leadership and quality development. In this way, legal handling becomes a form of leadership work that must hold together documentation, procedural follow-up, and everyday operations at the same time.
Accommodation also appears as more than an individual matter. Consideration for the employee must be balanced against the needs of children and pupils, the workload of colleagues, and the overall running of the organisation. Employment-law assessments therefore also become organisational and pedagogical assessments. What becomes visible here is that accountability extends beyond formal lines of authority, as leaders must respond both to expectations from higher levels of the system and to those arising from colleagues, parents, and professional communities (Hupe & Hill, 2007). From a Bolman and Deal (2024) perspective, these cases are shaped both by structural demands and by human resource concerns. These problems often emerge gradually. Firstly, these issues rarely present themselves as clearly defined cases. Rather, they tend to develop through absence, reduced work capacity, collaboration difficulties, and poor work performance. When staff "often engage in hidden accommodation" for colleagues with health-related challenges, loyalty and relationships may both reduce and increase risk. Practices of this kind can delay leadership oversight and make it harder to assess the need for formal measures. The pattern is consistent with an understanding of organisations as both structural and relational systems, in which informal practices influence how formal rules actually work [8].
Cases involving reorganisation, allocation of work tasks, redeployment, and downsizing appear especially uncertain and serious. They affect relationships, loyalty, and trust. They also influence the working environment beyond the individual case. The descriptions therefore suggest that employment-law risk is linked not only to individual decisions, but also to organisation, lines of responsibility, and the sustainability of the overall operation. Increased rule governance does not necessarily reduce the space for discretion, especially in cases where standardised solutions are not enough [12].

Legal Risk and Legal Handling at the Intersection of Documentation, Time Pressure, and Relational Vulnerability

The analysis indicates that legal risk in schools and early childhood education and care settings is not only about the possibility of making decisions that may later be challenged. It is also about leaders' ongoing work to find ways forward that can be defended both legally and professionally. Across the different areas, documentation, time pressure, and relational conditions repeatedly shape the situations leaders face. In turn, these factors influence both how legal risk arises and how it can be handled. Documentation becomes crucial for legal protection and accountability. At the same time, it often has to be built up during cases marked by incomplete information. Time pressure intensifies the complexity further because assessments and priorities must be made under uncertainty. This is closely aligned with descriptions of decision-making in welfare organisations under conditions marked by ambiguity and limited resources [15] [20]. At the same time, relational vulnerability ties the other dimensions together. Conflict, trust, and the sharing of information affect both the basis for assessment and the possibilities for action. This is consistent with research that highlights dialogue, ethical orientation, and relational grounding as central conditions for leadership in complex professional organisations [1] [3] [34]. Taken together, the findings indicate that legal risk arises at the intersection of law, organisation, and relationships. The handling of such cases therefore appears as an integrated part of everyday leadership practice.

The Impact of Artificial Intelligence on Writing and Speaking Practices among EMI and ESL Students: Sociolinguistic and Pragmatic Perspectives

Elina Stepanyan

University of Padova, Italy

Abstract

The rapid integration of language tools powered by artificial intelligence (AI) into higher education has introduced significant cognitive, pedagogical and sociolinguistic implications, particularly for non-native English-speaking university students. This study investigates the evolving impact of AI-assisted writing and speaking tools on second language (L2) development within the academic context. The article is grounded in applied linguistics and second language acquisition theory and examines how sustained reliance on AI-generated language support may influence the learners' linguistic competence, conceptual understanding, cognitive processing, critical thinking and academic voice. Moreover, it analyzes the potential alterations in lexical precision, grammatical accuracy and pragmatic awareness in AI-mediated academic text and speech generation. Using a mixed-methods design, the study will combine quantitative and qualitative analyses. The findings aim to clarify whether AI primarily performs the role of a scaffold that promotes language development (Vygotsky, 1978) or that of a compensatory mechanism that may inhibit deeper cognitive and linguistic processing (Swain, 1985). By placing AI within existing frameworks of second language acquisition, academic discourse development and language pedagogy, the research contributes empirical evidence to ongoing debates that regard AI integration in higher education. Additionally, the study offers pedagogical recommendations for educators and policymakers seeking to optimize AI-assisted learning while reducing the potential negative impacts on language acquisition, conceptual understanding, cognitive processing and critical thinking.

Keywords: *AI-assisted language learning, digital communication, cognitive processing and critical thinking, writing and speaking techniques*

Introduction

In today's digital era, artificial intelligence has become an indispensable agent in digital communication, fundamentally altering the linguistic and the sociolinguistic conditions in which language is produced and identity is conveyed. Systems such as large language models, predictive text engines and smart-reply tools no longer serve as mere supplementary mechanisms for human expression; they function as co-producers of discourse, tangibly influencing and oftentimes directly shaping the speaker's lexical choice, syntactic structure, emotional tone and the social meanings embedded in language (Hohenstein et al., 2023; Hancock, Naaman, & Levy, 2020).

This article examines the emerging processes and subsequent transformations from the perspectives of sociolinguistics, applied linguistics and second language acquisition, paying particular attention to the implications of AI integration for language: the lexical choices speakers and writers make, the syntactic structures they construct and the discursive voice they are able to maintain.

The paper consists of four sections. The first section examines how AI reallocates communicative power and reshapes processes of self-representation in everyday written language. The second section explores the measurable effects of AI-assisted writing on sentence structure and lexical efficiency. In the third section the paper investigates the issue of cognitive offloading and the eventual implications of delegating linguistic decision-making to machine systems. Ultimately, the fourth part of the study focuses on learners in English-medium instruction (EMI) and English as a second language (ESL) contexts, students for whom AI may simultaneously function as a cognitive scaffold and as a potential substitute for the development of linguistic competence.

All four perspectives pointed out above address one central question: whether AI supports the developmental processes through which language is acquired and individual voice is formed, or whether AI progressively replaces them.

Artificial Intelligence and the Reshaping of Communicative Power and Practices

When discussing AI and human communication in terms of linguistic interface, the concept of asymmetrical accommodation, an extension of Giles' (1973) *Communication Accommodation Theory*, is central in providing the most productive analytical insight for understanding human-AI linguistic interaction. In human interaction, the adjustment is normally bidirectional, meaning that interlocutors mutually adjust their language in response to social signals such as the tone, gestures, word choice, conversational context and so on. However, human-machine interaction may partially or sometimes completely disrupt this symmetry. Users routinely simplify their syntax, over-articulate their pronunciation and limit their lexical range in order to accommodate the perceived limitations of the system; the system, however, accommodates only within the parameters set by its training data and operational design. Consequently, one party continually adapts while the other sets the terms of intelligibility (Mieczkowski et al., 2021). This kind of continuous imbalance may substantially alter the existing communicative norms, gradually restricting the range of expression that people feel comfortable or willing to use.

Analyzing real-life scenarios, smart-reply systems such as Gmail's AI-generated response suggestions represent one of the most invasive, prevalent and empirically well-documented sources of AI influence on everyday written language. Hohenstein et al. (2023) demonstrated, in a large-scale study, that the use of such suggestions can indeed systematically increase the positivity of message content, however, it imposes the risk of simultaneously reducing the variation in word choice among users. Algouzi and Alzubi (2023) extend this finding to cross-cultural contexts, documenting the loss of culturally specific linguistic markers as users rely on AI-provided templates. From the sociolinguistic perspective, the implications are tangible: every individual choice to accept a suggested reply represents a small contribution to the homogenization of written English (Jean, 2023). Eventually, this mechanism leads to a subtle and a gradual form of standardization.

The present discussion incorporates the affective dimension of AI-mediated text, which is an important component of this study. Research conducted at the Max Planck Institute confirms that AI-mediated communication tends to be more polite, more concise and more positive than that of natural spontaneous communication. Hohenstein et al. (2023) confirm this pattern across various communicative settings, showing that the positivity preference introduced by suggested language persists even when users believe they are writing independently. This reveals a central paradox; the same features that make AI-generated language tempting — fluency, a controlled tone and reduced communicative friction, may also weaken the authenticity of the messages it produces. As written communication becomes noticeably smooth and polite, the distinctive elements of individual voice, such as rhythm, idiomatic usage and lexical preference, tend to decrease.

One of the most significant dimensions of AI's sociolinguistic influence is the unpredictable rearrangement of communicative power, which happens when AI systems provide generated templates through which institutional communication is conducted. This can lead to a significant extension and alteration of dominant normative forms (Massaad, 2025). In professional and legal settings, where AI may assume responsibility for approximately 70 to 80 per cent of routine document drafting, such systems pose a high risk of becoming central mechanisms for the production and reproduction of institutional knowledge, potentially reallocating traditional authority while simultaneously concentrating linguistic power in the hands of those who design and deploy them (Lardy, 2024).

Ultimately, these findings describe a substantial sociolinguistic transformation. Artificial intelligence has become a fundamental participant in the production of contemporary discourse, reorganizing lexical choice, syntactic form and emotional tone. Its presence alters the dynamics through which identity is shaped in writing, and redesigns the conditions in which linguistic diversity is maintained.

Sentence Length and Lexical Conciseness Affected by AI

Having increasingly influenced the English language, the recent technological advancements in the context of digital communication have had their impact not only on sociolinguistic capacity and communicative self-representation but also on sentence complexity and lexical conciseness. The emergence of Artificial Intelligence (AI), particularly generative AI systems such as OpenAI's ChatGPT, publicly released in November 2022 (OpenAI, 2022), has introduced an unprecedented dimension to linguistic transformation. Since its release, AI has remarkably affected the ways individuals produce and consume language in online environments. Its influence can already be observed in vocabulary expansion, increased linguistic conciseness, automated grammar correction, stylistic standardization and the growing use of AI-assisted communication in academic, professional and everyday contexts.

Recent research has emphasized that AI-powered language models are reshaping digital discourse and altering human interaction with written language (Brown et al., 2020).
In this section, the paper addresses the impact of Artificial Intelligence on the English language, with particular attention to changes in vocabulary, grammar, conciseness and digital communication practices in our days. As outlined above, a central focus of this research is the impact of artificial intelligence on syntactic organization and lexical efficiency in written English. According to findings presented by Karolina Rudnicka (2025), AI-supported writing systems such as ChatGPT and Grammarly consistently generate outputs that are more compact with shorter sentence length and lower levels of lexical repetition. An important element here is that these patterns are also evident in texts that are produced by native speakers and sourced from contemporary corpora, indicating that the observed changes are not restricted to new language learners but encompass broader processes of text adjustment and language optimization.
The empirical basis of the study consists of a case analysis involving one hundred randomly selected sentences drawn from the Corpus of Contemporary American English, a comprehensive corpus of modern American English spanning the period 1990–2019 and consisting of multiple registers, including academic prose, fiction, journalism, blogs, spoken discourse and digital communication. Through systematic comparison of original and AI-modified sentence versions, the research identified a consistent shift toward simpler sentence structure, shorter, more direct wording, and enhanced readability.
Overall, the results indicate that AI-based writing technologies tend to reshape linguistic production by encouraging more simplified, standardized and reasonably structured forms of expression in both academic and digital contexts.
The findings further demonstrate that, despite their differing functional roles, both Grammarly and ChatGPT produce broadly homogenized and aligned linguistic effects. As Rudnicka observes, both systems regularly promote concision by eliminating redundancy and frequently omitting formal constructions such as "in order to," irrespective of sentence complexity or register variation. This indicates a systematic bias toward conciseness over stylistic diversity or rhetorical tone. In fact, the findings additionally reveal a reduction in mean sentence length, however, this change does not necessarily correspond with improved readability outcomes. Rather, the evidence suggests that these tools primarily prioritize textual compression and structural simplification rather than communicative optimization.

When Machines Write: AI, Cognitive Offloading and English as an Intellectual Tool

"We have become intellectual tourists in our own work. We visit ideas. We don't inhabit them" (Sarkar, 2025, p. 2).
This is the central concern of Sarkar's (2025) talk at TEDAI Vienna, published as an annotated transcript under the title *Artificial Intelligence as a Tool for Thought.* Sarkar, a researcher at Microsoft Research Cambridge, opens with a scene that will feel familiar to anyone who has spent time in a modern office: emails, summaries, reports drafted, data analyses, desks assembled, all with AI assistance, all within the span of a single morning. This image of intellectual tourism is more than a rhetorical expression. It captures something truthful about the relationship between the knowledge worker or the student, and the language they produce when AI mediates between thought and text.
In terms of cognitive offloading and English language as a cognitive tool, the evidence gathered by Sarkar carries an important weight, since it since it conveys a profound analysis of how language functions cognitively. When analyzing creativity from the perspective of this AI-mediated communication and English language, Sarkar points to his own earlier research to describe what he calls "mechanized convergence", the documented tendency of groups working with AI assistance to produce a narrower range of ideas than groups working without it (Sarkar, 2023). This finding has an obvious linguistic dimension; language diversity, the range of lexical choices, syntactic structures and rhetorical strategies that writers bring to a task, are not merely aesthetic features of good prose. They reflect the diversity of thought itself. When AI narrows the range of ideas, it also, quietly and gradually, narrows the range of linguistic resources available to express them.
In terms of critical thinking, it is important to point out a survey by Lee et al. (2025), in which knowledge workers reported putting evidently less effort into critical reasoning when working with AI. And what is even more prominent, this reduction was greatest among those who trusted AI most and doubted themselves most, a pattern that should give language educators particular thought. The learner who is least confident in their own English is precisely the learner most likely to rely on AI-generated text, and most likely to miss the language-learning opportunity that is provided by productive "struggle". The

findings concerning memory are equally pointed out; Sarkar (2025) refers to research showing that people remember less of what they wrote when they relied on AI to write texts, and a randomized experiment conducted by Kreijkes et al. (2025) in secondary schools found that students using large language models as their primary reading aid showed lower comprehension and retention than those who engaged with texts directly.
Linguistically, what is probably most significant in Sarkar's research is his approach to metacognition, the capacity to reflect on one's own thinking and on one's own language choices. Sarkar states that working with AI requires metacognitive effort; one must assess the AI's output, decide whether it reflects one's intentions and judge whether the words on the page are actually theirs. But crucially, this metacognitive demand arises precisely because of the direct engagement with language, the sentence-by-sentence text production as to how to say something, has been delegated to the machine. Tankelevitch et al. (2024) describe this as a structural change in the cognitive demands of knowledge. According to their findings, AI does not eliminate the need for thinking, but rather changes the way thinking is performed. Instead of actively engaging in the cognitive process of formulating ideas through language, users increasingly adopt a more detached and evaluative role, focused on reviewing and refining AI-generated content. In this sense, the individual no longer functions primarily as the author of the text, but rather as the editor of a draft produced by the machine as described by Sarkar (2025). This distinction is particularly significant for language development. Swain (1985) identifies the following process as a fundamental element to second language acquisition: the moment in which the learner must search for a word, navigate through a grammatical structure, or formulate an argument in a language that is not yet fully mastered, arguing that these steps are essential for linguistic development. In this perspective, the analogy Sarkar embraces from Bainbridge (1983) is particularly relevant. Bainbridge described the “ironies of automation” as the paradox where systems designed to reduce the workload of human operators tend to gradually weaken the skills that are required when those systems fail. Writers and language learners who consistently delegate linguistic decision-making to AI may face a similar risk. The cognitive and linguistic abilities developed through the processes of writing, noticing, selecting, revising and committing to linguistic choices are not fully maintained through the passive evaluation of AI-generated text. Instead, these skills may gradually weaken over time, often remaining unnoticed until they are required independently and can no longer be effectively performed.

Cognitive, Pragmatic and Sociolinguistic Dimensions of AI in ESL

The integration of generative artificial intelligence into higher education has acquired particular significance for students operating within English-medium instruction (EMI) and English as a second language (ESL) context. For these students, AI tools function not merely as instruments of efficiency, but as cognitive and linguistic frameworks that may either support or substitute the developing competence of the second language user. Youvan (2024), in his extended analysis of artificial intelligence as an instrument for cognitive augmentation, introduces a series of arguments from the perspective of applied linguistics that highlight the changes currently occurring in academic writing and speaking practices among multilingual students. This section synthesizes Youvan’s contribution through three convergent perspectives: cognitive, pragmatic and sociolinguistic, and considers the pedagogical implications that follow.
In terms of cognitive function, Youvan (2024) claims that human thought has always been bounded by the limits of natural language. The memory limitations first formalized by Miller (1956) and refined within Baddeley's (2003) model of working memory, impose particular burdens on learners who are required to compose in a language that is not their own. For EMI and ESL students, the cognitive load associated with academic production in English is substantially greater than that experienced by first-language speakers, since lexical search, syntactic structuring and rhetorical organization must each be conducted within a partially acquired linguistic system (Sweller, 1988; Kormos, 2012). AI-assisted writing tools may reasonably offload portions of the cognitive burden of surface-level production, allowing students to direct attention toward higher-order rhetorical and conceptual concerns. The major risk, however, is precisely the one Youvan himself identifies in his closing reflections, that over-reliance upon AI may inhibit the productive process through which language acquisition is consolidated.
The pragmatic dimensions of AI mediation are equally significant, though Youvan (2024) addresses them only indirectly. Pragmatic competence, the capacity to adjust language to context, audience and communicative purpose, is among the most demanding dimensions of second language proficiency to develop, partly, because it cannot be acquired through grammatical instruction alone (Bardovi-Harlig, 2013). For EMI and ESL students, the disciplinary conventions of Anglophone academic writing such as citation practices, evaluative stance and the management of academic voice, constitute a sustained

pragmatic challenge (Hyland, 2005). AI-mediated writing tools can produce text that is superficially compliant with these conventions, yet the deeper pragmatic reasoning that underlines expert academic discourse remains poorly modelled by current systems. Empirical work by Algouzi and Alzubi (2023) on AI-mediated reply suggestions, and research by Hohenstein et al. (2023) on the systematic positivity bias of AI-generated text, indicates that contemporary AI tools tend to converge toward a narrow band of pragmatically safe formulations: fluent, courteous but pragmatically generic.

From a sociolinguistic perspective, the integration of AI into second language writing raises significant questions of identity, voice and the distribution of linguistic authority. Academic writing is not the neutral transmission of information but the discursive construction of an authorial self within a scholarly community (Ivanic, 1998). For EMI and ESL students, the development of a recognizable academic voice in English constitutes simultaneously an intellectual achievement and a form of social positioning, signaling both competence and membership within a community of practice (Lave & Wenger, 1991). Youvan (2024) raises the concern that intellectual homogenization may emerge as an unintended consequence of widespread AI use; the sociolinguistic implications of this risk are particularly elevated for second language writers. The phenomenon resembles what Sarkar (2023) has termed "mechanized convergence": a gradual narrowing of academic writing toward a limited and more homogeneous style, caused not by formal rules but by the repeated use of similar AI-generated patterns.

These three perspectives — cognitive, pragmatic and sociolinguistic, are not separable concerns but interlocking dimensions of a single transformation. The capacity of artificial intelligence to reduce the cognitive load of L2 production is inseparable from its tendency to standardize pragmatic choices; the pragmatic effects of AI mediation are themselves embedded within the sociolinguistic dynamics through which linguistic norms are reproduced. For EMI and ESL students, the central question is no longer whether or not to engage with this technological shift, since the integration of AI into their writing and speaking practices has already significantly advanced, but rather in what conditions this engagement should take place. The pedagogical response, as Sarkar (2025) and Buçinca, Malaya and Gajos (2021) have separately argued, remains in the thoughtful and strategic projection of AI interaction, that does not diminish the productive cognitive effort, but on the contrary, preserves it.

Conclusion

The overall investigation and analysis carried out across the four sections, examining how generative artificial intelligence is reshaping the writing and speaking practices of ESL and EMI students, lead to the following conclusion; AI is no longer an external assistance to second language production but an active participant in it, shaping the words students choose, the structures they build and the voice through which they are recognized within an academic community. For learners who are still acquiring the language, the potential risks associated with the constant integration of AI-mediated text and speech assistance into their language development may be remarkably high.

We have examined whether AI operates as a scaffold that supports language development or as a replacement mechanism that substitutes for it. The answer is contradictory rather than definitive. AI-assisted tools can reasonably moderate the cognitive load associated with surface-level text production, allowing EMI and ESL students to direct their attention toward higher-order rhetorical and conceptual concerns. However, when used without critical evaluation and reflection, these same tools may diminish the productive process that Swain (1985) identified as central to second language acquisition. When that process is delegated to the machine, the developmental opportunities inherent in language production may consequently be reduced.

When analyzing written texts in English, the effects of AI are more consistent and measurable. AI-assisted writing tools systematically shorten sentences, reduce lexical variation and lead toward more concise, courteous and statistically default formulations. For L2 students this might carry a particular risk and cost; the conventional norms of academic writing, including evaluative stance, citation practices and the organization of academic voice, are exactly the pragmatic competences that AI can reproduce, while leaving the underlying reasoning underdeveloped. Therefore, a student may submit text that is completely compatible with conventional academic norms and requirements, yet, the same student has not learned to produce the text independently. In such cases, the produced text may reflect more of a technical compliance rather than genuine linguistic development or critical engagement with academic discourse. As a result, learners may become increasingly dependent on externally generated formulations instead of developing the cognitive and rhetorical skills required for self-sufficient academic writing

Despite individual competence, the article highlights a sociolinguistic risk for multilingual students. The fact is AI systems trained on standard varieties of English may promote linguistic homogenization,

gradually narrowing linguistic diversity toward a homogenous stylistic form. As a result, the distinctive voices and cultural perspectives of L2 students in global Anglophone discourse may be critically diminished.

However, in conclusion, the pedagogical solution is not to separate AI from language learning, but to integrate it purposefully and thoughtfully. Educational tools and tasks should preserve productive cognitive effort by prioritizing engagement over rapid task completion. In this way, AI can support and enrich language development rather than replace it. Positioning learners as active authors of their own writing and speaking, rather than mere editors of machine-generated text, has become a central concern in applied linguistics, language education and educational policy.

Designing Web Programming Course with Trend of Labor Market in Gen AI Driven World

Reza Moosaei

Queen Mary, University of London, United Kingdom

Abstract

Programming education remains a major challenge in undergraduate computing programs. Learning to program is not just about understanding a language's syntax; it also involves developing important cognitive skills such as computational thinking, abstraction, algorithmic reasoning, and structured problem-solving. In addition, students need soft skills like teamwork, critical thinking, and reflective thinking to succeed in real-world software development. The rapid growth of generative artificial intelligence (GenAI) is transforming how software is developed. While GenAI tools can automate routine programming tasks, they require developers to gain new skills in AI-assisted software development, system integration, and higher-level problem-solving. As a result, universities must rethink and update their programming curricula to meet changing industry demands. This paper explores how a programming course like web programming can be redesigned to include GenAI-related skills. Using web programming as a case study, we apply a proposed teaching framework to design a course that integrates both industry expectations and GenAI competencies. The goal is to better prepare students for GenAI-augmented software development roles and to support sustainable curriculum design in the age of generative AI.

Keywords: *Generative AI, Effective Teaching Framework, Programming Pedagogy, Higher Education.*

1. Introduction

In higher education digital age, there is a rising demand for programming talent. Companies worldwide consistently recruit programmers to address their digital needs, leading to an increase in student interest in the field from a broad range of backgrounds [1]. In response, a wide range of educational providers including schools, universities, coding bootcamps, and online learning platforms have expanded their programming curricula [2]. Despite this growth, a challenge persists: the need to design and implement effective pedagogical frameworks that not only support foundational programming competencies but also align with the rapidly evolving labor market. This challenge is particularly significant in the context of generative artificial intelligence (GenAI), which is transforming software development practices and redefining the skills required of future computing professionals [4]. Generative AI technologies have two main impacts on the labor market: on the one hand, workforce substitution occurs as technology replaces certain specialists by performing tasks autonomously, which represents a negative impact; on the other hand, these technologies drive new employment creation and professional transformation, as industries and businesses demand new skills and experience to work with generative AI technologies, representing a positive impact. It is critical to investigate the changes in the list of expected skills on the labor market in software development associated with new generative AI technologies. This allows education institutions to analyze and adapt curriculum development according to new skills that are in demand in the job market [4][5]. Figure 1 shows what GenAI tools and skills are demanded by industry in area of software development from employees.

Existing research on GenAI in education has largely concentrated on issues such as academic integrity, ethical considerations, and the broader influence of GenAI on teaching and learning practices. To date, most educational applications of GenAI have emphasized AI literacy initiatives, the development of institutional policies, and its role in writing-based assessments. In contrast, comparatively little attention has been given to the incorporation of GenAI into teaching framework for software development and programming education [6]. It is, thus, essential to have an effective GenAI powered teaching framework for software development and programming in higher education (HE). A teaching framework that provides principles, guidelines, methods, and techniques to help instructors understand how students learn and, consequently, how to teach effectively [2]. This framework should utilize AI-powered educational technologies to enhance teaching and learning effectiveness.

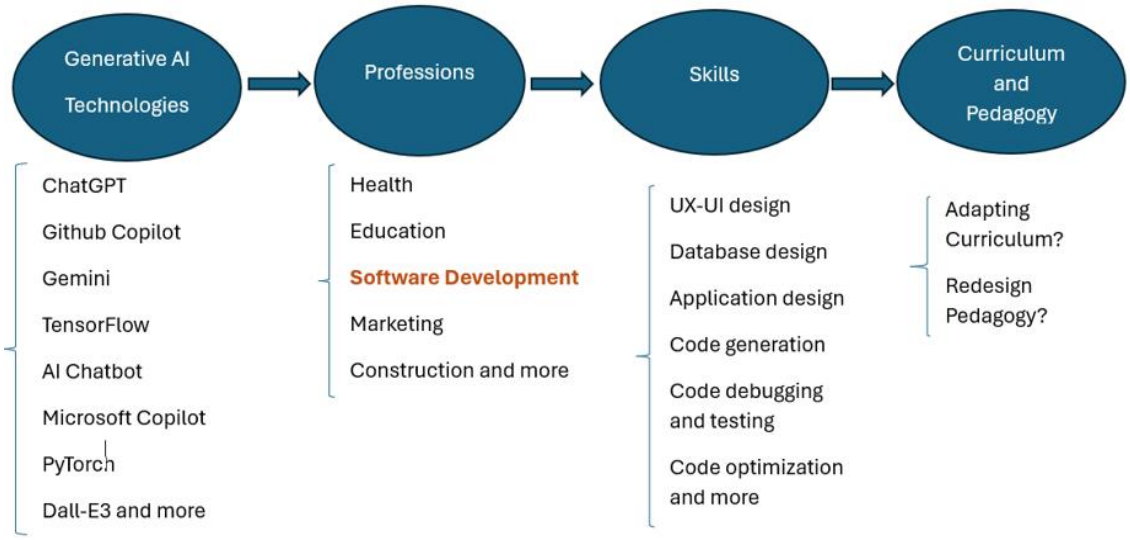

Fig. 1. GenAI Related Skills in Software Development

In this paper, we follow our proposed teaching framework in [7] and build a teaching framework for one of programming courses in HE called Web Programming. This framework presents a GenAI-empowered, group-based authentic designed for a Web Programming course. Specifically, the present work addresses the following research questions:

1. How can an effective teaching and learning framework be designed for programming courses to enhance student learning while aligning with industry-relevant skills?
2. How can generative AI be actively integrated into programming pedagogy to improve student learning outcomes while minimizing risks to academic integrity?

The remaining paper is organized as follows. Section 2 discusses our proposed teaching framework, and section 3 outlines the process of framework implementation for our web programming course. Finally, conclusions are presented in section 4.

2. Proposed Teaching Framework

Our previous paper [7] focused on programming pedagogy and in that work, we identified the essential components needed to build an effective teaching framework for programming which are elaborated further in the below (shown in figure 2).

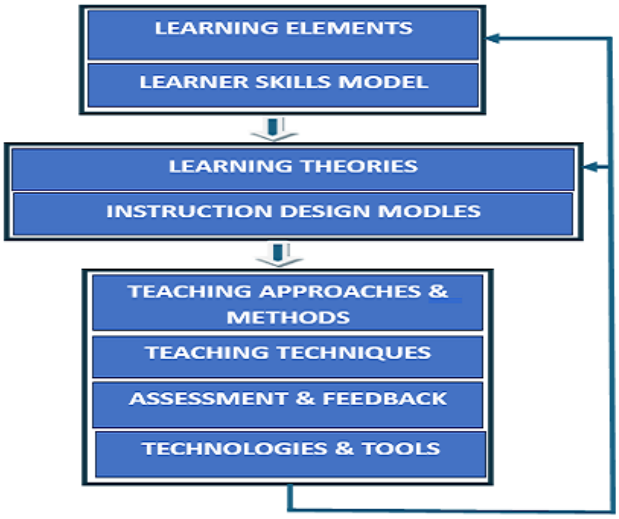

Fig. 2. Essential Components for Teaching Framework

A. Programming Learning Elements (Topics): refers to the core components of knowledge that students must learn in a programming course. It represents the building blocks of programming learning

objects including syntactic knowledge (language rules), conceptual knowledge (how constructs program), and strategic knowledge (how to apply them to solve problems).
B. Learners Skills Model: describes the progression of skills that students are expected to develop throughout a programming course. This model provides a structured view of skill development that supports course design, instructional planning, and assessment.
C. Learning Theories: Learning theories provide the pedagogical foundation for designing effective programming courses by explaining how learners acquire knowledge and learn.
D. Instructional Design Models: Instructional design models provide systematic approaches for planning, developing, and evaluating teaching and learning processes.
E. Teaching Approaches and Methods: Teaching approaches are the overall educational philosophies or strategies that guide instruction. Examples include teacher-centered and learner-centred approaches. In contrast, teaching methods are the specific activities used to implement those approaches in the classroom. Examples include hands-on labs, coding exercises, projects, group work, and discussions.
F. Teaching Techniques: Teaching Techniques are the specific, practical actions and tactic an instructor uses in implementation of a teaching method to support learning. For instance, in pair programming methods, the instructor can use a driver/navigator strategy (one student codes and the other reviews it).
G. Assessment and Feedback: Assessment and Feedback refer to the processes used to measure student learning and provide information that helps learners improve their performance. In education, especially in programming courses, assessment and feedback are essential for evaluating learning outcomes and guiding skill development.
H. Technologies and Tools: Technology has become a powerful educational tool, transforming how students learn, and teachers instruct. Digital devices, software, and internet-based resources enable a more interactive, personalised, and engaging classroom learning experience.
In next section, we describe the process of teaching framework implementation for our web programming course.

3. Teaching Framework Implementation for Web Programming Course

We selected web programming as case study for our study. Web programming has become a foundational skill in modern computing education due to the rapid growth of web-based applications, services, and platforms across nearly all industries. From e-commerce and social networking to data visualization and cloud services, the web has evolved into a primary medium for software deployment. As a result, higher education institutions face increasing pressure to design web programming courses that not only teach technical skills but also prepare students to adapt to continuously changing technologies and development practices. Instructors must balance fundamental concepts such as client–server architecture, HTTP, and web security with practical skills including front-end and back-end development, database integration, and responsive design. Normally this course is offered for second year students for Bachelor of Computer Science related programs. Additionally, students often enter these courses with varied backgrounds in programming, which further complicates course design and instructional strategies [8][9]. This paper explores the design of a web programming course that addresses these challenges and considering industry and GenAI related skills adapted to labor market demand, emphasize on hands-on learning, progressive skill development, and the integration of real-world development practices. By focusing on both conceptual understanding and practical application, the course aims to enhance student engagement, improve learning outcomes, and better prepare students for professional web development environments. The remainder of this paper describes the development of teaching framework for a web programming course.

3.1 Learning Objects Model for Web Programming

To design an effective teaching framework, instructors must first identify the core learning elements of programming courses. Prior works have classified programming knowledge into syntactic, conceptual, and strategic categories, encompassing language syntax, underlying principles, and logics [10][11]. Considering this, the learning elements of programming courses are organized into four categories: logic, programming language, programming (code), and tools. Each category includes key learning elements, such as writing, executing, and debugging code. Table 1 outlines learning objects for our web programming course and provides basis for defining learning objectives in web programming courses.

Table 1. Learning Object Model for Web Programming

Logic	Programing Language	Program/code	Tools
Computationally analyzing problem	Concepts and constructs	Write program	Code generation
Logic language	Syntax	Build and run	Build automation
Design algorithm	Design patterns and libraries	Debug and test	Debugging

3.2 Student Skills Model for Web Programming

We draw a skill model for web programming course under the models suggested by SFIA [12], CC2020 [13] and IT2017 reports [14]. The proposed model in table 2 consolidates the core hard and soft skills required for a web programming course. By categorizing skills according to type and proficiency level, the model provides structured guidance for syllabus design, informing the selection of learning materials, instructional methods, and classroom activities. Furthermore, the skill model serves as a reference point for evaluating the effectiveness of teaching methods and pedagogical techniques. By aligning instructional practices with clearly defined skill categories, instructors can more systematically articulate learning objectives and assess whether course outcomes are being achieved at both the lesson and program levels.

Table 2. Skill Model for Web Programming

Soft Skill	Professional Skills				
	Problem Solving			Critical Thinking	
	Behavior / Attitude				
	Motivation	Communication	Teamwork	Self-efficacy	Time Management
Hard Skill	Design Skills				
	Algorithm	Conceptual Knowledge		Syntactical	
	Implementation Skills				
	Strategical Knowledge	Test and debug		Tools	
	Generative AI Skills				
	Algorithm design			Code generation	

3.3 Learning Theory for Web Programming

It is important for instructors to base their teaching on appropriate learning theories, as these theories provide clear principles for how learning should take place. Learning theories guide the design of teaching approaches, methods, and classroom activities, ensuring that instruction is effective and aligned with how students learn best [15]. One widely used theory in practical and skills-based courses is constructivism. This theory suggests that learners build new knowledge by connecting new ideas to their previous experiences and existing understanding. Students develop deeper understanding by reflecting on and refining their prior knowledge. In practice, constructivist teaching strategies include problem-based learning, project work, research activities, and group collaboration [16].
We selected constructive learning theory as effective learning theory for our web programming course because:
- Learning by doing mirrors real-world web development
- Encourages problem-solving and critical thinking
- Constructivism values social interaction in knowledge construction. web programming naturally supports this through pair programming, code reviews, and group projects.

3.4 Instructional Design Model

Instructional design is a systematic process for developing effective teaching materials, learning activities, and instructional strategies to improve educational outcomes. Instructional design models provide structured guidance for instructors in planning and organizing educational programs, courses, or individual lessons. By following these models, educators can ensure that learning objectives are clearly defined, aligned with instructional activities, and effectively achieved [18]. We used ADDIE Model as a standard instructional design model including a five-phase model (Analysis, Design, Development, Implementation, and Evaluation) that provides a step-by-step approach to developing instructional materials. The ADDIE instructional design model is suitable for web programming courses because Its flexibility supports continuous improvement and provides a systematic framework for analyzing learner needs, designing structured learning experiences and evaluating both learning outcomes and instructional effectiveness.

3.5 Teaching Approach, Methods and Strategies for Web Programming

The student-centered approach is the most effective in involving learners and giving them responsibility for their learning path and progress [19]. Overarching within a teaching approach are the multiple teaching methods that develop depending on the principles of the teaching approach. A teaching method is a series of step-by-step actions teachers and students undertake to achieve specific learning objectives. Luxton-Reilly [10] describe a range of teaching methods based on a student-centered teaching approach for teaching programming. Practical examples of these methods for instructors in programming courses are project-, problem-, case-, and inquiry-based learning methods, as well as gamification, flipped-the-classroom, live-coding, and peer-instruction methods. In contrast, teaching strategies are the styles and tactics used in the classroom, sustaining a specific teaching method to accomplish a learning objective effectively. For instance, in pair programming, often used within project-based methods, the instructor can use a driver/navigator strategy (one student codes and the other reviews it), an unstructured strategy (two students work together in an ad hoc manner), or a ping-pong strategy (one student writes code and the other tests it, shifting roles regularly). Hence, instructors must be equipped with a palette of expertise to select and apply effective teaching methods and strategies, guided by the fundamental principles of the learning theory, instructional design model, learning elements, and an evaluation of students' skill levels, as discussed above [19][20].

Generative AI is transforming teaching and learning methods by shifting instruction from content delivery toward guided knowledge construction and higher-order thinking. Tools such as ChatGPT, Google Gemini, and Claude can generate explanations, examples, practice problems, simulations, and formative feedback on demand, enabling highly personalized and adaptive learning pathways. Instructors can use generative AI to design differentiated materials, create scenario-based learning activities, and automate feedback cycles, thereby freeing time for mentorship and conceptual discussion. For learners, these systems support idea generation, and iterative refinement of work, which can enhance metacognitive awareness and self-regulated learning [21][22][23].

Considering the effectiveness of various teaching methods and the emerging impact of GenAI, we adopt the following methods and strategies for delivering the web programming course in upcoming semester (as shown in figure 3):

- GenAI-powered flipped classroom: The flipped classroom is effective for web programming courses because it shifts content delivery outside the classroom and uses in-class time for hands-on coding, problem-solving, and collaboration. This approach supports active learning, accommodates diverse learner backgrounds, and enhances students' ability to apply programming concepts in real-world contexts. To support this, for each session we provide pre-class reading materials, short instructional videos, sample code demonstrations, and access to an online discussion forum. Additionally, students are encouraged to interact with GenAI as a "pre-class tutor," asking clarification questions and testing understanding before attending class. This Promotes self-regulated learning and prepares students for deeper in-class engagement. During class, generative AI is used to support higher-order learning activities such as analysis, evaluation, and collaborative problem-solving. Learners critically examine, refine, and compare AI-generated outputs with their own generated output. For mastery enhancement, students are encouraged to use generative AI after class to discover advanced solutions as well.
- Project based: Project-based teaching is effective for web programming courses because it integrates theoretical instruction with authentic, hands-on projects. This approach promotes active learning, enhances problem-solving skills, increases student engagement, and aligns academic learning

with real-world web development practices. We start with a real-world project that integrates core web technologies such as E-commerce web applications. We break the course into structured development phases and instruction is structured around iterative project milestones including requirements analysis, interface design, backend implementation, integration, testing, and deployment. Students are required to engage with GenAI as an object of critique and inquiry, which in turn strengthens their critical thinking skills, metacognitive awareness, collaborative engagement, and AI literacy.

- Live coding with GenAI powered pair programming: Live coding is effective in web programming courses because it shows real coding practices, makes problem-solving and debugging visible, and connects theory to hands-on work. Combining live coding with pair programming improves engagement, reduces cognitive overload, and models expert thinking. We use a driver/navigator strategy that one student will do coding, and the other student will review it. GenAI systems like ChatGPT add a new dimension by acting as adaptive collaborators that can generate code, explain logic, suggest alternatives, and simulate edge cases. In our approach, the instructor codes live while students query AI for alternatives and compare human versus GenAI reasoning.
- Lab learning activities provide a structured, hands-on environment that enhances both individual and collaborative learning in programming courses. During lab, instructors conduct workshops on coursework offer students dedicated time to apply theoretical concepts, experimenting with code, and receiving immediate guidance from instructor, fostering deeper comprehension and practical skills. Mini presentations of coursework progress during lab sessions, encourage students to articulate their problem-solving approaches, reflect on challenges, and gain constructive feedback, promoting self-regulation and communication skills essential for software development.
- knowledge check: End-of-lecture live quizzes are effective in web programming courses because they reinforce newly introduced concepts, provide immediate formative feedback, and support active engagement and early identification of learning gaps.

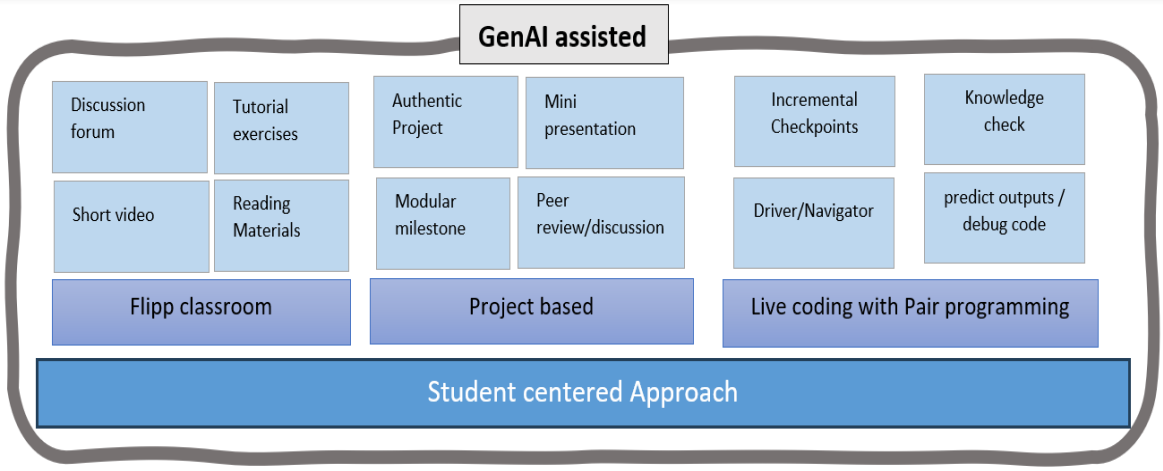

Fig. 3. Essential Components for Teaching Framework

3.6 Assessments

Assessments in programming courses should focus not only on code writing and correctness but also on problem solving processes, code optimization, testing and documentation practices. Well-designed assessments meet the course's learning outcomes and provide deeper learning, enhance critical thinking, and prepare students for the practical challenges of the industry [13]. GenAI technologies drive new professional transformation in programming, as software development industries demand new skills and experience to work with generative AI technologies. Therefore, it is critical to design assessments to cover the expected GenAI related skills in web programming such as web interface design, web database design and code generation. With the growing use of generative AI tools, some students may misuse these resources, increasing the risk of academic misconduct. To address this challenge, instructors should discuss AI with their students and consider revising their assessment designs. To reduce the risk of misconduct, instructors can rethink the types of assessments, break tasks into smaller components, provide sufficient time, ask for progress reports, and emphasize the process instead of the final product [21][22][23].

The assessment for our Web Programming course consists of two components: project coursework (60%) and a final exam (40%).

The coursework requires students to design and implement a website for a small business (such as car sales, real estate, or an online shop). The project is completed in groups of four students. Throughout the project, students must use GitHub as a collaboration and version control tool. This enables instructors to monitor the development process and track individual contributions. Assessment focuses on the development process as well as the final product. Each group is provided with a set of required system features, and every student is assigned responsibility for implementing a specific feature. Students must hold weekly meetings and submit meeting minutes along with progress reports. In addition, each group is required to deliver a live presentation demonstrating both the development process and the final product. This ensures that all group members have actively contributed to the project. Coursework project is broken down to three deliveries as follows:
Delivery 1 – Student generated website: students need to design and build website by using their learning knowledge from class. Students are not allowed to use AI tools and project must be entirely original and fully designed and developed by students.
Delivery 2 - GenAI-powered generated website: Students are allowed to use GenAI to build their website. By this way instructor makes sure that students have learned the GenAI related skills for designing web pages, database and generating codes.
Delivery 3 - AI powered platform for building websites: To keep students remaining up to date with current web technology in area of website development, students are required to investigate recent AI powered platform for website developments and present their findings through a live presentation.

3.7 Feedback and Survey

The structured feedback and survey results provide insight into how active learning strategies such as live coding, pair programming, and project-based learning impact student engagement and conceptual understanding. The findings can inform iterative course refinement and evidence-based instructional design. To evaluate the effectiveness of the implemented programming pedagogy, a feedback framework was employed. The feedback framework combines formative feedback, instructor feedback, and a post-course evaluation. Formative feedback was integrated throughout the course to support continuous improvement. The instructor feedback was used to assess depth of students' understanding and learning. A post evaluation was conducted to assess student perceptions of the teaching methodology. The evaluation included two separate surveys: one assessing students' perceptions of teaching effectiveness, and another investigating the reasons for students with a low-class attendance.

3.8 Conclusion

Programming education must adapt to both learning challenges and the growing impact of GenAI on software development. This paper introduced a redesigned web programming course that combines active learning methods such as flipped classrooms, live coding, pair programming, project-based learning, and authentic assessment with a GenAI-powered teaching framework. Rather than replacing foundational skills, GenAI is used to support critical thinking, reflection, collaboration, and evaluation of AI-generated code. The framework aims to strengthen core programming competencies while also developing industry-relevant AI skills, including prompt engineering, validation of AI outputs, and responsible AI use. Findings suggest that GenAI can improve engagement and learning when integrated thoughtfully within structured and reflective learning environments. The study highlights the importance of balancing strong programming foundations with AI-augmented development practices and positions GenAI as an opportunity to innovate programming pedagogy and curriculum design in higher education.

Abstract

This article is a study based on the ENGAGE Youth project (Empowering Next Generation Advocates for Global Education), financed by the European Commission, Ref. no.: 2024-1-RO01-KA220-YOU-000250540. A group of youth and educational institutions from France, Czechia, Germany, and Romania are implementing the project. All of these organizations have rich experience with projects in Europe, youth development, human rights, and inclusion. The ENGAGE Youth project fills a need by providing an online course and training programmes for youth leaders (YLs) at both national and international levels. These programs focus on EU values, cultural diversity, inclusion, social justice, and civic participation. The project aims to equip youth leaders with the knowledge, skills, tools, and methods they need to include everyone and teach young people about democracy and European values. The article presents the courses developed within the project. The online course examines important topics such as EU values, intercultural dialogue, inclusion, social justice, leadership, digital citizenship, project management, impact assessment, motivation, and interconnection. The face-to-face international training session builds on the online course and further focuses on experiential learning, active participation, and co-creation. It aims to assess and refine the online course material, improving participants' skills in project design, impact evaluation, and youth engagement, with a strong focus on translating knowledge into tangible community actions. The article outlines the primary ideas derived from the findings of the international training course for youth leaders.

Keywords: *youth development, youth leaders, human rights, inclusion, international training, online course*

Context

The 73 million young people in Europe who are between the ages of 13 and 30 make up a significant part of the Europe's population and can influence its future [1]. However, 24.1% are at risk of poverty or social exclusion, with the Czech Republic having the lowest rate at 9.9% in 2024 (Eurostat) and Romania having the worst at 29.5% [1]. Additionally, studies show that younger generations lack a sense of belonging to the European Union since they typically tend to be less informed, active, and interested in democratic processes [2, 3, 4, 5]. Such views might seriously undermine democracy, particularly in light of the enormous challenges Europe is facing from the rise of alternative radical forms of participation and growing anti-democratic tendencies. Research shows that experiences of inclusion and exclusion are associated with civic engagement [6, 7, 8, 9, 10, 11]. Therefore, in order to prevent disengagement from the European project, we must continuously supply knowledge and useful settings in an inclusive and significant way. Promoting democratic principles and understanding, as well as including young people in democratic processes and decision-making, are important EU priorities. Information, authority and voice, power sharing, openness, accountability, and both material and non-material assistance are necessary for meaningful inclusive young civic engagement, underscoring the necessity of customized engagement tactics.

The ENGAGE Youth Project: Aims, Partnership, Target Groups and Results

The European ENGAGE Youth project (2024-1-RO01-KA220-YOU-000250540) aims at filling the gaps in today's youth development. It allows youth leaders (YL) to empower youth with real tools and inspiring activities that are based on European ideals, democratic processes, social justice and inclusiveness. It seeks to promote awareness of diversity and inclusion across Europe, by providing all youth, especially those at risk and those with impairments, equal access to opportunities. The overall impact of the project is positive societal change and the tackling of pressing social challenges [12].
The partnership is made up of NGOs with rich and fruitful experience in European projects, youth development, human rights and inclusion from France, Czech Republic, Germany and Romania.
The target group of the project is young people directly related to youth (youth leaders, youth workers and educators), those who can further disseminate the information (multipliers/facilitators), young people interested in the issues of the project and young people with fewer opportunities.
What sets the ENGAGE Youth project apart is its comprehensive and multi-dimensional approach, with research as the core pillar that drives all activities. This research influences the formation of knowledge and skills, the development of resources and the co-creation processes in international sessions. It also informs the development of useful exercises, discussions, feedback and awareness initiatives. Thanks to the wide and inclusive approach of the project, including theoretical, practical and digital tools, its results are impactful and transferably successful: the code of ethics, self-assessment tool, online course and international training session.

The Online Course

The online course responds to youth leaders' needs related to youth development as they were identified by a questionnaire conducted on an impressive number of participants. The insights revealed that the course should be structured as a flexible, blended programme that combines theoretical knowledge with practical exercises, case studies, and mentorship opportunities. The online course has 10 modules and 20 practical activities designed to actively engage youth in inclusive and democratic participation. The modules focus on topics identified as priorities by the research findings, including Europe and young people, social justice and equity, cultural identity, civics and leadership, project management, digital citizenship, diversity and inclusion, motivation strategies, gender, social, economic, and health, and impact evaluation. The platform is flexible and accessible, enabling youth leaders to continue their learning and professional growth at their own pace thanks to the platform, which also allows updates about best practices, concerns, and innovations in youth leadership, advocacy, and civic involvement. The online course includes multimedia content (videos, podcasts, images, etc.), quizzes or interactive exercises accommodating diverse learning styles, needs, and preferences. Moreover, its engaging and dynamic content can enhance youth leaders' motivation to have a significant impact on their communities and beyond.

Description of the International Training Session and its Future Developments

Building on the online course, the face-to-face international training session followed a non-formal education approach and further focused on experiential learning, active participation, and co-creation of knowledge. It aimed to assess and refine the online course material, improving participants' skills in project design, impact evaluation, and youth engagement, with a strong focus on translating knowledge into tangible community actions. The training programme for youth leaders (YLs) was designed as a practical, participatory and learning experience within the ENGAGE Youth project. The training promoted exchange of experiences and good practices among youth workers and engaged young people; it tested and experimented inclusive methods developed within the Engage Youth project to foster young people's civic engagement; it built and strengthened a European network of individuals and organisations working in youth work, non-formal education and active citizenship. The international training session focused on youth civic engagement and the inclusion of all young people, and took place in Oparenský Mlýn, Czech Republic, from 26 to 29 March 2026.
The target group consisted of youth work professionals and volunteers (youth workers, educators, teachers, association staff and volunteers) and young people engaged in associations, civic initiatives or civic service programmes; young activists and civil society actors interested in participation and inclusion issues. The training involved 25 participants sent from the partner organisations across Europe: Romania, Germany, Czech Republic and France.

It was developed in response to the needs of youth leaders and young people identified through an empirical questionnaire, which gave the programme a strong evidence-based foundation. Its main aim was to present the project to YLs and to test a selection of inclusive methods developed to foster young people's civic engagement, participation and active citizenship.
The ENGAGE Youth international session brought together YLs from project countries with different backgrounds, experience, and culture, to share best practices, tools and resources, thus enriching their experience, cultural awareness and understanding, promoting inclusion, tolerance, solidarity. Through interactive sessions, with colleagues from diverse cultural backgrounds and by examining various perspectives YLs learned to foster inclusive spaces, embrace diversity, and prevent and combat discrimination.
Participants gained invaluable insights into the ENGAGE methods that they could use effectively or adapt to their own contexts and how to apply these methods with their youths to increase inclusion, civic engagement and bring about positive social change (Table 1). What makes these methods useful is their inclusive, participatory nature and their ease of adaptation to different contexts. They assist YLs to create learning spaces through dialogue, cooperation, creativity and reflection, beyond traditional teaching. According to the youth leaders who attended the training sessions, these methods encouraged them to work as a team, be creative, listen actively, be aware of inclusion and diversity, plan projects, exchange experiences and prepare for action with young people.
The methods together can cultivate practical facilitation skills and a deeper ethical awareness. They help young people to learn about European values, to identify inequality, to communicate respectfully, to reflect on their experiences, to analyse community problems and to become more active citizens. This is why they are of particular importance in multicultural youth work where participation, inclusion and mutual understanding are essential.

Table 1.

Method	**Short description**	**Main objectives**	**Why it helps youth leaders**
EU in Action – Design Your Own diverse topics in a non-violent and constructive way. **EU Nation!**	This is a creative group activity where YLs explore European values, EU institutions and democratic processes by imagining and designing their "EU country." To explain complex concepts in an accessible way the method can include videos or visual materials.	To raise awareness of European values, active citizenship, democracy, participation and cooperation; to encourage creativity and teamwork.	It assists YLs in providing interesting and useful explanations of complex European subjects. The approach enables young people to learn through creativity, dialogue, and teamwork rather than merely presenting the EU through theory.
Art of Active Listening	A communication-based activity focused on respectful dialogue, listening, and empathy. It can be used to help participants discuss sensitive topics in a constructive and non-violent way.	To develop active listening, empathy, respectful communication, respect for different opinions and intercultural dialogue.	It provides youth leaders with a useful tool for facilitating group discussions, particularly when young people have diverse cultural backgrounds, experiences, or viewpoints. It encourages safer communication and lowers the risk of misunderstanding or conflict.
Understanding Equal Opportunities – A Sweet Life for Everyone	A role-play activity that places participants in diverse, two sided-coin positions. It helps them experience and reflect on exclusion, inequality, and access to opportunities.	To increase awareness of discrimination, inclusion, diversity and equal opportunities.	It helps youth leaders make abstract issues such as inequality or exclusion more concrete. As the activity can stir strong emotions, it also trains youth leaders how to manage sensitive topics carefully and responsibly.
Dixit Cards	A reflective method using image cards to help participants express feelings, impressions and learning	To support reflection, feedback, introspection and	It helps YLs create a safe and creative space for participation. The cards encourage young people to

	outcomes. It is especially useful when participants may find it difficult to speak directly.	emotional expression.	express thoughts, feelings indirectly, which can be useful in multicultural or multilingual context.
Problem Tree – Solution Tree	A structured group method where participants identify a community problem, explore its causes and effects, and then turn these into plausible solutions and actions.	To develop critical thinking, teamwork, project planning and community action.	It helps YLs guide young people from identifying a problem to figuring out realistic solutions. It is applicable, accessible and useful even for groups with no prior experience in project planning.
Waterdrop Interview	A reflective and evaluative method encouraging participants to share experiences and learning gains and to realise the value of their actions.	To support evaluation and recognition of learning impact.	It offers excellent opportunity for YLs to gather feedback and encourages young people to realise how important their participation can be.

Further Developments

Participants' international experience will be further enriched through, first of all, national cascade experiences and, then, interactive, "into-action" sessions with colleagues from diverse cultural backgrounds. In the first stage, YL will pilot the project proposed methods to verify their usability and impact. This stage will enhance YLs knowledge of the methods they can use, their abilities to apply them to their context and their leadership skills. This will boost their confidence in building trust and mobilizing community to tackle challenges and create social cohesion. The interactive, "into-action" sessions will encourage the exchange of ideas, best practices, and experiences among YLs and youths, internationally and nationally. This will ensure the practical and applicable part of the project. The international "into-action" sessions will also provide opportunities to establish partnerships with peers and organizations from Europe focused on promoting youth engagement and civic participation. Ultimately, the international action sessions may contribute to YLs engaging in their society and becoming successful agents of change, and in their turn enabling young people to become knowledgeable, alert, and involved citizens in society.

Evaluation of the Training Programme

The international training session took place in Oparnensky Mlyn, an old mill, which has roots back to the 16th century. The aim was to bring together YLs from project countries with different backgrounds, experience, and culture. The programme followed the same topics as the online course. The training session unfolded in an engaging and dynamic atmosphere stimulating communication, collaboration and creativity. Participants learned not only from trainers but also from each other by sharing positive experiences and valuable lessons. Examining the evalution methods can exemplify how creative and inspiring the training session was.
The first evaluation format was a formal evaluation, where the participants filled in a questionnaire (See Findings and Discussion). The second method (Figure 1) was a voting method: the participants had to vote with colored cards whether the aims for the ENGAGE international training session were achieved (green=yes, orange=maybe, red=no).

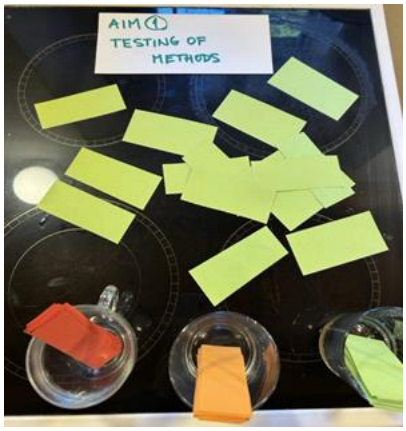

Fig. 1.

The “Sharing best practices, tools and resources” method (Figure 2) followed the same strategy. The high majority of participants thought that this aim was achieved.

Fig. 2.

The “target evaluation” method (Figure 3) allowed multiple categories to be evaluated anonymously. The participants had to make a dot with a pen for each criterion (organisation, content, trainers, atmosphere, venue, and food); the closer the dot was to the centre, the more satisfied they were with the category. The dots in the content appeared to be positioned slightly in the middle. The majority of the participants seemed to be pleased with the different categories. However, there were some issues, such as one participant being dissatified with the organisation and the venue was not being suitable for five participants.

Fig. 3.

The “Head-heart-hand” method (Figure 4) was a multifaceted method that asked participants to consider their experience through three lenses: head - what they learned, heart - what touched them or stirred their interest and finally hand - what they would do differently and what their suggestions were.

Fig. 4.

The course generally enjoyed appreciative feedback from participants. Participants showed their interest in learning new strategies and tactics for working with young people, such as innovative and creative approaches and techniques such as problem/solution trees, as well as strategies that are captivating and enjoyable for larger groups. They also emphasized that the course met their expectations related to their need for understanding diversity, developing active listening skills, and learning from other participants' professional experiences. Additionally, several youth leaders stated they improved their English language proficiency and communication strategies to use when working with young people.
The participants expressed their interest in the participatory activities, such as open-space conversations, games, and energizers, which they will definitely use to increase youth's engagement. The stories, experiences, openness and obvious enthusiasm they all shared touched everybody. The general positivity, the variety of perspectives on youth work, and the chance to network and gain knowledge from peers throughout the world were all encouraging.
The course was successful because it gave participants fresh perspectives on the work with young people and created an inspiring environment of excitement and sharing. The practical exercises and the vibrant idea sharing were the most valued features. Participants would welcome more in-depth training sessions in the future and are excited to put what they have learnt into practice. Overall, they liked the location and the venue. Their main points of criticism were that the seminar room was a bit small, that it had to be rearranged between sessions and meals, and that an additional space for sessions or informal time would have been beneficial.
To sum up, the participants learnt some new methods, were positively impacted by each other's motivation, optimism and ideas and wanted to adapt the methods to their target groups or take some advice and good practices to improve their youthwork. The participants were very happy about the contents of the training and the fact that they met other inspiring people. The flexibility of the programme and the organisators was really appreciated, and the nature close-by was a good occasion to explore other faces of the Czech Republic.

Findings and Discussion: Main Characteristics and Innovative Features

As most of the participants emphasised, one of the main characteristics of the programme is its strong non-formal education approach. The course combines ice-breakers, energisers, teamwork activities, role play, reflection tools, co-creation sessions and open-space discussions. Activities such as Power Tower and the Banana Song helped create group energy, trust and interaction, while methods such as EU in Action - Design Your Own EU Nation! Art of Active Listening, A Sweet Life for Everyone, Problem Tree - Solution Tree, and Waterdrop Interview supported deeper learning around European values, cultural identity, inclusion, project planning and impact evaluation.
The multicultural dimension of the training was also one of its key strengths. The session brought together 25 participants coming from diverse backgrounds, from partner organisations across Europe. This diversity created a rich learning environment in which participants could exchange experiences, compare youth work realities in different countries, and reflect on inclusion, diversity and active citizenship from multiple perspectives. The European character of the programme was reinforced through its focus on EU values, EU institutions, civic engagement and cooperation among organisations working in youth work, non-formal education and active citizenship.
A key innovative feature of the programme is that it does not only present theoretical content, but invites participants to test, adapt and evaluate practical methods that can later be used with young people. For example, participants were encouraged to choose which methods would be most suitable for their own groups and to reflect on why. The co-creation session, "From Learning to Action," also supported

participants in developing national plans to put the methods into practice with young people. This makes the course action-oriented and directly transferable to youth work settings.
The training also placed strong emphasis on co-creation and peer learning. Participants were not only asked to take part in activities, but also to reflect on how these methods could be used with their own groups. The session “Choosing the Method for My Group” encouraged participants to assess the relevance and adaptability of different tools for their local contexts. The “From Learning to Action” co-creation session further supported participants in developing plans in national groups for organising follow-up activities with young people. This approach transformed the training into a collaborative space where knowledge was jointly produced through exchange, experimentation and shared reflection.
The international training session was strongly participatory in both design and delivery. Rather than positioning participants as passive recipients of information, the programme invited them to test, adapt, discuss and evaluate the methods developed within the ENGAGE Youth project. Activities such as Power Tower, EU in Action - Design Your Own EU Nation! Art of Active Listening, Problem Tree – Solution Tree, and the Waterdrop Interview encouraged active involvement, teamwork, reflection and group problem-solving. This participatory structure allowed youth leaders and engaged young people to learn through experience, dialogue and practice, which is central to non-formal education.
The way the training session integrates European values and institutions with active listening, cultural identity, disability inclusion, equal opportunities, community action and impact evaluation is another innovative element. The participants appreciated the use of videos to define and clarify complex EU-related concepts as well as the creative tasks such as designing an EU country, which encouraged teamwork, imagination and active engagement.
Additionally, the programme also demonstrated the role of reflection and emotions in learning. Tools such as Dixit cards encouraged introspection and feedback, helping participants express their impressions and make sense of their learning experience. Role-play activities, especially those dealing with privilege and disadvantage, helped participants better understand exclusion, diversity and social inequalities, although the programme also recognises that such methods need careful facilitation because they can produce frustration or strong emotions.
As discussions revealed, participants attending such a course can gain several important benefits. They can strengthen their facilitation skills, improve their understanding of inclusion and diversity, learn new non-formal education methods, and become better prepared to support young people’s civic engagement. They can also develop stronger communication, teamwork, project planning and evaluation competences. At the same time, they benefit from international networking, peer learning and the opportunity to exchange project ideas and good practices with other youth leaders and organisations.
Practical transferability was another important characteristic. The training was designed not only to develop participants’ understanding, but also to equip them with concrete methods that could be applied in their own context. Activities such as Problem Tree - Solution Tree were considered clear, structured and usable even with participants who had limited prior knowledge, because they supported inclusion step by step in the thinking processes. This makes the programme particularly valuable for youth leaders who need adaptable tools for working with diverse groups of young people in different educational, civic and community settings.
Overall, the international training session can be understood as a participatory and multicultural learning space that combined non-formal education, peer exchange, co-creation, and practical experimentation. Its innovative value lies in the way it connected European values with inclusive youth work methods and transformed them into concrete tools for civic engagement. By attending the training, participants gained not only knowledge, but also confidence, methods, networks and practical strategies for supporting young people’s participation in diverse communities.

Conclusions

The international training session was both a pedagogical and practical activity. Thus, the participants in the international training session were able to use the training session as a hands-on learning engaging in various activities on inclusion and active citizenship as well as a training programme. The main value of the international training session was that it combined three different areas of education: non-formal education, multicultural and experiential exchange, and practical application of learning. The participants did not only gain an academic experience regarding European common value systems and civic engagement, but also gained exposure to experiential learning methods such as teamwork, role playing, reflectivity, peer learning and co-creating and therefore provided them with an opportunity to use that experience to assist them in the real-life application of their practices. Thus, the international

training session afforded the participants in this training session an opportunity to cultivate ways to adapt what they learned in the international training session back in their own communities. Another critical issue that the participants of the international training session gained from the training was the development of their competencies in facilitative roles aiming at supporting inclusive and democratic participation of youth. Through the training session, the participants developed tools to assist young people in being able to voice their thoughts and opinions, listening, working together, analysing problems, understanding diversity and taking action in their communities. In its entirety, the programme contributed to Youth Leaders' professional development and enhanced the overall quality of their work. This training programme's innovation does not result only from implementation of new techniques, but also from combining multiple techniques into one coherent learning pathway that includes: European Values, Inclusion, Cultural Identity, Disability Awareness, Project Management, Impact Measurement, and Community Action. It provides participants with opportunities to co-create knowledge with others in addition to actively engaging in the learning process.

There are some limitations with the programme, such as requiring longer time periods for certain reflective activities and careful management needed for activities using techniques such as Open Space and Role Play so that all participants could understand the process and feel comfortable. Despite these limitations, the programme represents a strong model for training youth leaders generally, as it develops competencies in professional practice, encourages democratic participation and supports development of inclusive environments for Youth Work throughout Europe.

Abstract

The rapid evolution of cyber threats and the increasing number of security incidents targeting academic environments have emphasized the need to strengthen cybersecurity education in higher education institutions (HEIs) [1], [2]. Universities are not only responsible for preparing future cybersecurity professionals but also for ensuring that students, researchers, and administrative staff develop adequate awareness and skills to mitigate cyber risks. In this context, gamification is gaining attention as an innovative educational approach capable of improving learning effectiveness and supporting the development of a stronger cyber posture within academic institutions [3]. The need for cyber training has also been reaffirmed by recent European regulations on the topic such as Network and Information System Security. This paper explores the role of gamification in cybersecurity education and examines how game-based learning strategies can contribute to both student training and the upskilling and reskilling of institutional personnel [4]. Typical gamification elements, such as interactive learning, simulations of real cyber-attack scenarios, challenges, and reward systems, transform traditional learning processes into experiential activities where participants can actively apply theoretical knowledge and test different strategies in a safe and controlled sandbox environment [5],[6]. Given the dynamic nature of cybersecurity threats, the relevance of this approach is particularly significant in the context of continuous professional development, where organizations need to invest in professional development and reskilling initiatives. Within this context, the study focuses on the Italian Ministry of University and Research initiative known as the Cyber Sapere program, which contributes to the implementation of the National Cybersecurity Strategy [7]. The program promotes the transfer of cybersecurity knowledge, specialized training courses, and expert consultancy to higher education institutions. Its objective is to strengthen institutional resilience by fostering a systemic approach to cybersecurity education that involves students, researchers, and academic staff. Drawing on the experience of the Ministry of University and Research, this paper proposes a replicable and measurable best-practice model that can support policymakers, academic communities, and industry stakeholders in strengthening cyber resilience, promoting a culture of secure innovation, and enhancing digital skills across the research ecosystem.

Keywords: *Gamification, cybersecurity, education, upskilling, reskilling*

1. Introduction

Public and private institutions today face a landscape of growing exposure to cyber threats. The open nature of academic ecosystems, combined with a diverse user base and the strong interconnection between research, teaching, and administrative activities, makes Higher Education Institutions (HEIs) particularly vulnerable [1], [2]. Targeted attacks against academia have increased in recent years, highlighting vulnerabilities that are not exclusively technological but also involve the behaviors of individuals and organizational shortcomings. In this context, cybersecurity training becomes essential. Academia is not only responsible for preparing future cybersecurity professionals, but must also ensure that students, researchers, and administrative and technical staff adopt behaviors appropriate to managing cyber risk. However, traditional training models are often passive, comprising lectures and static e-learning modules, and show clear limitations in their ability to produce lasting behavioral change. In light of these weaknesses, gamification is becoming increasingly more established as an innovative approach in the field of education. Integrating game design elements into educational contexts turns learning into a more active and engaging process, encouraging user participation and interaction [3]. In

the field of cybersecurity, this translates into the ability to simulate realistic scenarios, allowing participants to test decisions and strategies in controlled environments through the use of learning platforms that also leverage Artificial Intelligence [4]. At the same time, digital transformation and evolving security frameworks are redefining competency requirements in academic research. Therefore, it is becoming necessary to promote structured upskilling and reskilling courses to face changing professional needs [5], [6].
Within this context, this study examines the "Cyber Sapere" initiative, promoted by the Italian Ministry of Universities and Research. The objective is to assess how much more effective gamified approaches are compared to traditional models in promoting behavioral change, contributing to skills development, and supporting the alignment of academic institutions with national and European cybersecurity strategies. Therefore, this paper aims to offer a systematic analysis and empirical evidence on a model that could potentially be replicated in complex settings.

2. Literature Review

Recent literature highlights how academic institutions are increasingly adopting structured frameworks for managing cybersecurity, often inspired by international standards and European guidelines [5]. However, these frameworks tend to focus on technology and institutional procedures, neglecting the human element, which represents one of the primary risk factors. This imbalance is part of the reason why, despite the adoption of advanced policies and tools, many organizations continue to experience vulnerabilities related to user behavior.
In this context, gamification emerges as a possible tool for addressing these limitations [2]. Established research shows that introducing interactive digital learning platforms into training can increase user engagement and motivation, encouraging more active participation [3], [7]. In cybersecurity, incorporating simulations, challenges, and interactive scenarios into training programs brings learning closer to real-world situations, helping participants develop practical skills more effectively. Despite this, traditional awareness programs remain widespread in academic institutions, and while they help educate participants, they often prove ineffective at changing user behavior in practice, particularly in the medium and long term. The literature highlights a persistent gap between theoretical knowledge and practical application, which represents one of the main weaknesses in cybersecurity management [8], [9]. At the same time, the development of digital skills is becoming increasingly important. The gap between the supply and demand for cybersecurity skills and STEM competencies in general is now widely acknowledged at the European level, prompting organizations to commit to continuous investment in training strategies. In this context, innovative approaches such as game-based learning can offer more flexible and adaptive solutions, capable of supporting tailored learning experiences [5], [6]. While gamification has attracted considerable attention in recent years, the literature still presents some significant gaps. In particular, empirical evidence on the long-term effectiveness of gamification remains limited, and models that integrate training, regulatory requirements, and organizational practices are still underdeveloped. Furthermore, no clear operational models have yet emerged that can be replicated in complex academic settings. This study aims to address these gaps through a systematic analysis of the "Cyber Sapere" case, both at the ministerial level and within individual universities and Higher Education Institutions (HEIs).

3. Methodology

This study aims to integrate quantitative and qualitative evidence to assess the effectiveness of the "Cyber Sapere" program. This approach makes it possible to document all measurable data regarding participation and user performance, as well as qualitative elements, such as the way the training experience is perceived by participants and any changes in their behavior [6].
The research data were collected during the implementation of the program across several Italian Higher Education Institutions and the Ministry of Universities and Research. The participating institutions vary considerably in size, digital maturity, and organizational model, providing a range of contexts in which to evaluate the program. Data sources include metrics generated by the training platform, results from gamified activities, satisfaction surveys distributed to participants, and qualitative feedback gathered through direct interactions with them. The analytical framework was built around three main factors: behavior — focusing on levels of engagement, knowledge retention, and the ability of users to develop safer habits; skills development — aiming to assess the extent to which the program contributes to upskilling and reskilling, both in terms of technical skills and broader competencies; strategic alignment

and replicability of the model — focusing on consistency with European regulatory frameworks and the potential for adaptation across different organizational contexts.
The assessment of the program's effectiveness draws on an integrated set of indicators. Analysis of baseline data helps direct training toward institutions with the greatest need to improve their security posture and expand employee competencies, while data regarding the participants' performance in simulations allows for an assessment of their ability to apply skills in realistic scenarios. At the same time, qualitative analysis of feedback provides a complementary perspective, useful for understanding the impact of the training experience at both an organizational and cultural level.

4. Case Study: The “Cyber Sapere" Program

The "Cyber Sapere" program was developed by the Ministry of Universities and Research (MUR) in collaboration with the National Cybersecurity Agency (ACN), as part of the National Cybersecurity Strategy 2022–2026 [10]. The program is a joint cybersecurity initiative aimed at universities, Higher Education Institutions for Fine Arts, Music, and Dance (AFAM), and the MUR. The objective is to promote a culture of cybersecurity, enhance the digital skills of users, strengthen their security posture, and contribute to the overall resilience of the national academic system. The program is structured around three distinct areas. The first is training, which aims to improve the basic cybersecurity skills of students and staff at MUR, universities, and AFAM institutions through e-learning courses, instructional materials, training programs, and on-site workshops. This need is grounded in the awareness that basic cybersecurity skills — and STEM competencies in general — are of primary importance and require sustained investment. This is further supported by the literature, which highlights a significant skills gap in the Italian labor market [11].
The second area is prevention, aimed at strengthening the ability of staff at the Ministry, universities, and AFAM institutions to identify and counter cyber threats through hands-on exercises in the form of simulated phishing campaigns. The third area is analysis and monitoring. The initiative aims to establish a structured and ongoing framework of training and operational activities focused on analyzing and monitoring MUR assets, ensuring an accurate and up-to-date assessment of risks associated with applications in use.
Prior to the training, a skills assessment was conducted to identify the needs of the staff at the Ministry, universities, and AFAM institutions, measuring their average level of cybersecurity preparedness [6]. The results set the guidelines for the training plan, helping to identify content and topics aligned with the actual needs of the intended participants. The table below summarizes the results of the cybersecurity skills assessment questionnaire.

Table 1. Key results of the cybersecurity skills assessment questionnaire

Type of entity	Entities involved	Users involve	Certificates issued	Awareness level
Universities	103	11.413	14/25	Intermediate
AFAM	129	1.299	14/25	Intermediate
Ministry	1	141	13/25	Intermediate
Totals & Media	233	12.853	14/25	Intermediate

The program offers two complementary training formats: e-learning courses and in-person classes. In both cases, participants were required to complete a skills assessment test and a satisfaction survey at the end of each course.

4.1 E-learning Training Courses

The first format consisted of both synchronous and asynchronous e-learning sessions. Synchronous e-learning sessions took place on Microsoft Teams, open to a large group of users specifically selected by each institution and the MUR. Given the large number of participants, interaction was limited to the chat function, with responses provided by the instructor. The course totaled 32 hours, divided into 8 sessions of 4 hours each. The table below presents the key KPIs for the synchronous e-learning courses, including user satisfaction scores.

Table 2. Key KPIs for synchronous e-learning training courses

Type of entity	Entities involved	Users involve	Certificates issue	Satisfaction questionnaires	User satisfaction
Universities AFAM	100 148	1.151 781	974 435	426	3.52 / 5.00
Ministry	1	38	35	24	3.83 / 5.00
Totals & Media	249	1.969	1.444	450	3.54 / 5.00

Asynchronous e-learning sessions were reserved for MUR staff only, with the course being conducted on CyberGuru, an e-learning platform built around a multimedia micro-learning approach. The course was structured into modules organized with increasing difficulty to support the gradual development of skills and ensure participants stay current with evolving cyber threats. The course totaled 27 hours. The table below presents the key KPIs for the asynchronous e-learning courses, including user satisfaction scores at the time of writing.

Table 3. Key KPIs for asynchronous e-learning training courses

Type of entity	Entities involved	Users involved	Certificates issue	Satisfaction questionnaires	User satisfaction
Ministry	1	390	264	59	4.49

4.2 In-person Classes

During in-person training sessions, the "Cyber Sapere" program adopted an innovative method based on the principles of edugaming — a tool for active learning. Each session begins with a preliminary phase in which major cyber threats are contextualized through an analysis of data drawn from operational arrangements provided by the National Cybersecurity Agency [9], with specific concern for the field of education.

Participants are then directly involved in a structured competition covering important cybersecurity topics, designed to stimulate learning through gamification. Specifically, participants are asked to use the Kahoot! platform to answer a series of questions on the topic. Individual performance is assessed on the basis of two criteria: the accuracy of answers and the speed of completion.

Following each question, the topics covered in the test are explored further through multimedia materials and micro-lessons delivered by qualified instructors to consolidate the knowledge acquired while encouraging critical reflection on the subjects.

Finally, to recognize and reward the top performers, the three participants with the highest rankings receive prizes in the form of promotional materials and branded merchandise provided by the program organizers.

This approach was adopted to encourage active participation and greater engagement, based on the premise that game-based learning can offer advantages over conventional teaching methods [12].

At the time of writing, 11 in-person training events have been held at the Ministry, universities, and AFAM institutions, each lasting 2 hours. The table below presents the key results of the in-person training courses, while subsequent tables provide a breakdown by institution for courses held at specific universities and AFAM institutions, organized by geographic area (North, Central, and South Italy).

Table 4. Key KPIs for in-person training courses

Type of entity	Entities involved	Users involved	Certificates issue	Satisfaction questionnaire	User satisfaction
Universities AFAM Ministry	8 2 1	235 30 39	235 30 39	212 30 37	4.60 / 5.00 4.88 / 5.00 4.28 / 5.00
Totals & Media	12	272	272	192	4.58/ 5.00

Table 5. Key KPIs for in-person training courses at universities (by geographic area)

University	Users involved	Satisfaction questionnaire	User satisfaction
Universities in Central Italy	40	-	-
Universities in Northern Italy	35	-	-
Universities in Northern Italy	23	23	4.54 / 5.00
Universities in Southern Italy	23	23	4.69 / 5.00
Universities in Northern Italy	17	17	4.37 / 5.00
Universities in Southern Italy	35	35	4.48 / 5.00
Universities in Central Italy	38	38	4.61 / 5.00

5. Discussion

A detailed analysis of user satisfaction data across the three training formats tested within the "Cyber Sapere" program — synchronous e-learning, asynchronous e-learning, and in-person sessions structured around edugaming concepts — shows that participants clearly favor in-person training experiences featuring interactive game-based dynamics. In particular, the in-person edugaming format achieved an overall user satisfaction score[1] of 4.54 out of 5, approximately 30% higher than the 3.54 out of 5 scored by the synchronous e-learning course, and 2% higher than the 4.49 out of 5 scored by the asynchronous e-learning course.
Based on data from all three course types, the results are illustrated in the diagram below.

[1]The satisfaction score for each course was calculated as a weighted average of the ratings received and the number of completed questionnaires.

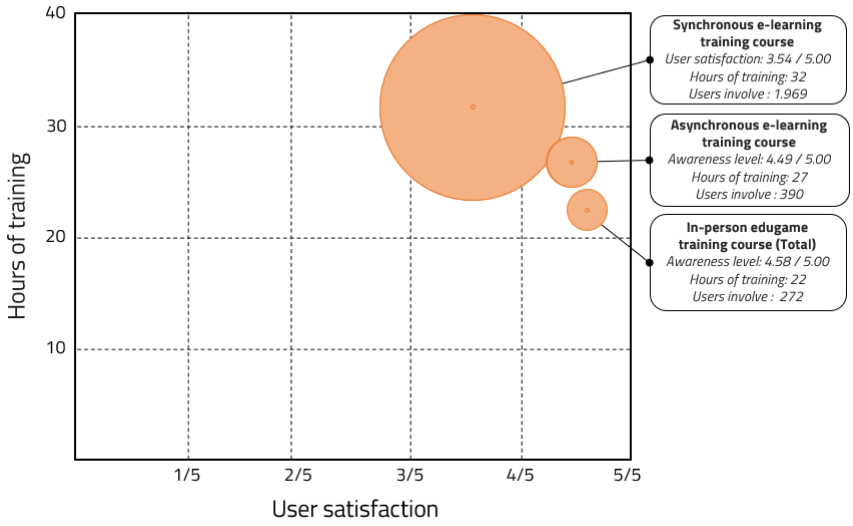

Fig. 1. Relationship between course satisfaction levels, number of training hours, and number of users involved across the training formats of the "Cyber Sapere" program

The chart illustrates the relationship between three key variables: course satisfaction levels, number of training hours, and number of users involved — the latter represented by bubble size. Specifically, the size of each bubble is proportional to the number of participants trained. The distribution of points on the chart also allows for a joint interpretation of training volume and perceived learning effectiveness. Points in the upper right area represent situations marked by a high number of training hours combined with higher satisfaction levels. In summary, the best results are represented by the largest bubbles in the upper right area, as they simultaneously reflect broad participation, intensive training activity, and a positive assessment of the learning experience.

The quantitative results show that edugaming-based teaching methods foster a stronger perception of learning effectiveness. This finding is consistent with the literature on experiential learning and gamification, which suggests that incorporating game-based elements into educational contexts can stimulate intrinsic motivation, facilitate the understanding of complex concepts, and encourage active participation [12].

By contrast, e-learning formats — while offering significant advantages in terms of flexibility, accessibility, and scalability — appear to generate lower levels of perceived satisfaction in the context analyzed. In particular, asynchronous sessions, while useful for independent learning, are less effective at supporting interaction and peer exchange, whereas synchronous sessions allow for real-time interaction but fall short of fully replicating the experiential and immersive quality of in-person activities. Interactions with participants and institutional leadership where in-person training took place revealed a significant level of interest in the adopted edugaming method. This was further reflected in the willingness expressed by institutions to plan future training initiatives based on the same approach. Overall, these findings appear to support the hypothesis that users prefer an edugaming format.

6. Conclusion

It should be noted that this study was conducted on a purposive and diverse sample of academic institutions and organizations. While not fully representative of the entire academic landscape, the sample of training participants is statistically significant, both in terms of the number of institutions involved and the number of participants. The academic background shared by participants helps contain intra-sample variability, strengthening the internal validity of the analysis and improving the reliability of the empirical findings. In particular, the consistency of the professional profiles of the participants facilitates data normalization, reducing the incidence of confounding factors and increasing the overall robustness of the results.

Overall, user satisfaction data suggest that integrating innovative teaching methods based on edutainment and gamification, tested in in-person training contexts, may represent a key factor in improving the perceived effectiveness of training programs. These findings support the adoption of

hybrid teaching models in which the digital component is complemented and enhanced by immersive and interactive experiences, aiming to maximize learning outcomes and user satisfaction.
Despite clear empirical evidence of a higher level of satisfaction with edugaming-based solutions among training participants, the "Cyber Sapere" program initially chose to reserve this approach exclusively for in-person activities. On the one hand, this choice fosters closer interaction between participants and instructors with positive effects on learning and teaching dynamics; on the other hand, it introduces a significant scalability limitation, as it reduces both the number of course hours and the number of participants that can be reached. While this choice is entirely sustainable, this constraint could become particularly relevant if the initiative were to be expanded with the goal of extending the training offering to a broader audience or making the format replicable in non-academic settings as well.
A further relevant aspect in assessing the effectiveness of edugaming solutions and training programs in general concerns whether the learning experience can generate significant and lasting changes in organizational culture and individual behavior, but measuring the impact of specialized training courses on the overall security posture of the academic system — one of the program's strategic objectives — is particularly complex. This is due to the highly dynamic nature of cyber threats and the limited size of the participant sample. This complexity reflects the inherent limitations of training impact assessment models [13] and the evaluation of return on investment (ROI) [14]. In particular, assessing the effects on organizational behavior and, above all, on systemic outcomes presents significant challenges, especially in complex and constantly evolving contexts such as cybersecurity. While it is reasonable to assume that individual training sessions produce positive effects on participants, it is equally clear that a systemic and ongoing approach to training is necessary. Therefore, it is essential to ensure that training is consistent, widespread, and sustained over time, reaching all members of the academic community — including administrative and technical staff, faculty, and leadership — in order to bring about structural change in security culture and organizational behavior.
As the program's implementation period draws to a close, and in light of the analysis of further training activities planned within the "Cyber Sapere" initiative, it seems appropriate to consider introducing additional measures to complement those already implemented. In particular, the adoption of e-learning edugaming solutions could be considered, with the goal of expanding the participant base while maintaining an adequate level of immersiveness. This approach would combine the benefits of edugaming in terms of engagement and interactivity with greater scalability and accessibility, while also expanding the content beyond basic training to include highly specialized courses.
A further area of intervention concerns the introduction of a cyclical assessment process to measure progress in security posture, building on the initial assessment conducted as part of the initiative. This activity should be conducted according to a structured methodology framework to ensure the consistency, replicability, and reliability of results.
Finally, it is proposed that training activities be supported by systematic awareness-raising initiatives aimed at engaging the main representatives of academia. The objective is to promote greater awareness of the importance of continuous, widespread, and pervasive cybersecurity training, in line with the strategic goals of the program.

Using AI in Creating Visual Materials for a Course in British Culture and Civilization

Irina-Ana Drobot

Technical University of Civil Engineering Bucharest, Romania

Abstract

The purpose of this paper is to analyse the benefits of using artificial intelligence tools such as Chat GPT in order to create, based on a given material and on given instructions, visual materials such as collages for a course in British Culture and Civilization. This course has been taught by the author of the present paper during the academic year 2025-2026, second semester, to second year BA level students specialized in Translation and Interpretation, having English as a main foreign language. The course curricula was designed by the author of the present paper to be built around the way in which various historical references from the past of British culture and civilization are still relevant today. As we walk throughout cities and rural areas, and as we look at landscapes throughout the territory of the UK, we can see various details that can be explained based on the history of the UK, starting from names of London boroughs, which take us to the ancient Roman past of these areas, and ending up with 18th and 19th century Great Britain, which were the main time periods when modern society as we know it today began, based on various important institutions such as tea and coffee houses. The author of the present paper has used her class materials and her prompts to create, for the last courses, collages in order to illustrate for students various topics, starting from the UK shopping malls, types of houses in London, and moving on to influence of the 18th-19th century UK institutions, and typical British stories such as mystery and detective stories. We know that visual materials may have a high impact since we rely most of all on the visual sense in order to understand the world and get our information about the outside world. The methodological framework is made up of teaching techniques, visual impact, cultural awareness and psychology.

Keywords: *Psychology, visual sense, cultural empathy, cultural awareness*

1. Introduction

Using AI as a tool to help us in our work has already become a current practice nowadays. Of course, we need to distinguish between ethical and non-ethical ways of using AI in our activities, ranging from students' work to researchers' work, as well as from looking for information regarding how to organize a trip, or how to redesign our home interior, to using AI agents in order to help in putting posts on online social media regularly, using our knowledge and our written communication style. AI can be used to a widely accepted extent when we need to do work fast, such as when working with data and sorting out through information, or when sending emails and creating suitable message faster than we would do if we were to compose each and every email. When we speak about doing our own work, we need to be cautious as to what extent we can use AI, so that we do not have entire sets of homework and papers written by AI in our place.

AI can bring the past to life, if we consider how we can take photographs and information from the past, and ask AI to create pictures for us, reconstructing certain places and animating certain scenes, such as those from old, historical areas and houses in cities. Plenty of visual materials can be created with the help of AI, starting from images and posters with both images and information, to sketches and progress of history of cultures, as well as posters with presenting certain topics and issues, together with the conclusions if we take into account teaching a course in British Culture and Civilization.

The present paper focuses on the way in which Chat GPT was used to create a series of visual materials for some of the courses of lectures for a course in British Culture and Civilization taught by the author of the present paper during the second semester of the academic year 2025-2026, to students in the Translation and Interpretation Specialization at the Technical University of Civil

Engineering, the Faculty of Engineering in Foreign Languages, Department of Foreign Languages and Communication. The author of the present paper has created a curricula for this course of lectures starting from references to the past which are still around in British society and which make up their common context of everyday life discussions, and which needs to be understood starting from the historical episodes and personalities by members outside British culture. British culture is made up of a series of references which can be traced to the past or to various ideas about how the British culture and identity can be portrayed in order to be unique and immediately recognizable due to its specific features. Starting from the questions: Where can we find the British spirit nowadays? What is uniquely and typically British? What are values typical for the British? we can go through mainstream and popular culture elements, as well as through the history of British culture. As examples, we can consider how tv shows such as Doctor Who (which ran from 1963 to the present) presents us with a typical British lord, even if he is shown in a science fiction setting, where he travels in space and time. What matters is his attitude. Another tv show, Downtown Abbey (2010-2015), presents us with the lives of a typically British aristocratic family and their servants during the early 20th century, showing us their typical lifestyle and behaviour. British humour is present in Monty Python's Flying Circus (1969–1974), where we see dry humour, as well as absurd situations. In addition, outsiders can associate British culture with typical British heroes and characters, such as James Bond, Sherlock Holmes, Robin Hood, the latter being used metaphorically in debates about taxes and redistribution. We can also think about personalities with strong associations with British culture, such as William Shakespeare. Writers such as George Orwell, through their work, are references in debates dealing with topics such as free speech, surveillance, and speaking and revealing the truth in the political world. Contemporary characters such as Harry Potter and stories in this series make references to boarding school nostalgia, which is specific to members of British culture and part of their everyday life, common reality. In this way, a course in British Culture and Civilization can set up and trace some important landmarks for Romanian students in order to be able to adapt to the British society and to understand their common universe of references. They may be familiar with everyday life rituals and practices, such as the 5 o'clock tea, using the weather as a topic for small talk, queuing as a sign of discipline, respect, and politeness, pub culture, where socializing takes place, famous foods such as fish and chips. They may also be familiar with British attitudes such as emotional restraint, which is expressed in the idea of the "stiff upper lip," as well as to their saying "sorry" very frequently, and with their use of self-deprecation, irony, and understatement (e.g. saying "not bad" instead of "very good"). They may also be familiar with the importance of monarchy and constitutional tradition and they may know some of the historical events and personalities. At the same time, they need to be prompted to take a deeper, more analytical look, at British culture and society, and to understand that the British monarchy stands for continuity, unity, as well as for national identity, that the Magna Carta represents a foundation of liberty and of the rule of law, that Winston Churchill is a symbol of leadership, national resilience and wartime unity, who is frequently used as a historical reference in relation to these ideas in contemporary political speeches, that Margaret Thatcher is referred to in debates about free markets, privatization, as well as national sovereignty, that the World War II is a symbol of endurance and collective sacrifice, often referred to as "The Blitz Spirit," that the Industrial Revolution is used as a reference to innovation and economic transformation in discussions on this topic. In addition, this course raises awareness to the still existing talk in British society about class and social structure, in relation to accent – where we see the division between Received pronunciation, or RP English, associated with the upper and upper middle classes vs the regional accents, such as Scouse, Geordie, and Brummie for the working class - , and to education – where we see the division between public and private schools and universities, between Oxford and Cambridge for the elites vs other universities. Values that are part of the British culture and identity are also mentioned in the course of lectures, e.g. fair play, common sense, the rule of law, tolerance, liberty. The slogan *Keep calm and carry on* from World War II is revived in present-day talk in British society, and it refers to British emotional restraint and composure. The specific type of British communication is also presented, which is indirect and which means that it focuses on avoiding conflicts. Avoiding conflicts is also signalled based on the use of humour as an emotional buffer. Historical landmarks of Great Britain, such as the Roman period and other influences are presented based on the names of the London boroughs, whose etymology reveals the way in which various areas that are now urban were rural in the past. The course of lectures also underlines the key time periods in the historical development not just of British society, but of societies all over the world: the 18th century and the Victorian Age. During these ages, societies as we know them today have begun to take shape. The 18th century brought tea and coffee houses into social and intellectual life, with intellectual debates available, democratically, for all social classes. The Victorian Age gave the start to the Industrial Revolution and to the possibility

of social mobility, as well as to the prevalence of life in urban areas.
With the last courses of lectures, the teacher decided to prompt students to see how previous knowledge gained in the beginning courses can be applied to various British cultural products, and also to look at various aspects in present British society, and of life in contemporary Great Britain based on their significance from the past, by using visual materials created with the help of Chat GPT.

2. Materials and Methods

A course in British Culture and Civilization wishes to make students feel a sense of cultural empathy with the members of British society. The historical aspects are part of the background knowledge which they should have in common with the members of the contemporary British society, in order to better relate to them and not to feel left out. After setting up the basis, with historical references and their relation to the present-day world, with the values and communication style of British culture, with national traits the British themselves consider to belong to them, this course of lecture continues with presenting students with ways in which they can relate to the British culture members, starting with cultural products which originate in British culture but which were afterwards influential in all other cultures, and which are certain stories and genres of stories. Fiction serves as a well-known way to build and develop empathy skills for readers, and British fiction is no exception. One of the courses of lectures focused on mystery and crime fiction, which could be traced back to the Victorian-age penny dreadfuls, which were cheap serial publication, costing one penny, about exciting and thrilling happenings. The material created with the help of Chat GPT based on prompts and additional details along the process was the following one, shown in Fig. 1 below:

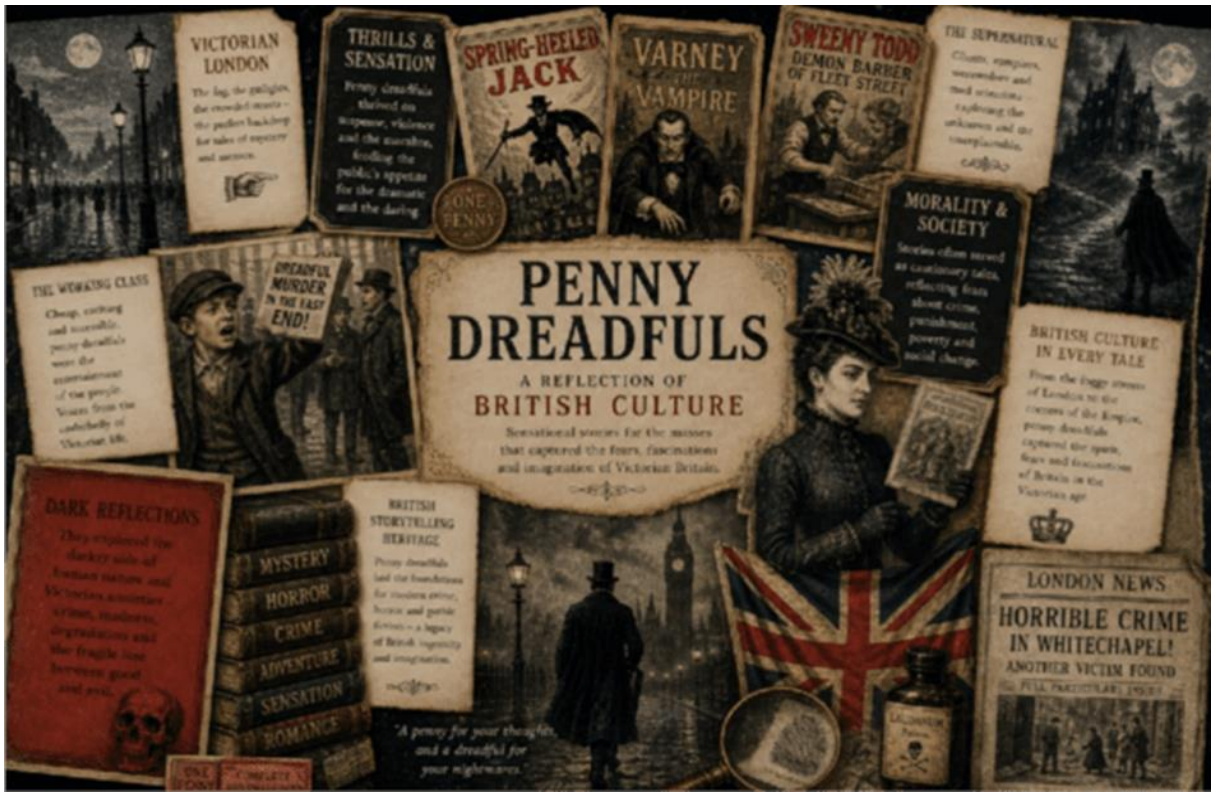

Fig.1. Victorian Penny Dreadfuls

The visual material in Fig. 1 raises the students' awareness to the context of Victorian London, to the aspect of its street, to its working class, to the issues worrying the Victorians and making them fear at the time, which were all present in the Victorian dreadfuls, as well as to the features included in these stories, e.g. horror, adventure, romance, mystery, crime, sensation, etc. A newspaper headline about a crime committed during these times shows how these stories reflected issues present during Victorian society. Most of all, this visual material prompts students to think and to understand how Penny Dreadfuls were a reflection of British culture, making them understand them by relying on their notions of history regarding the Victorian Age. The Victorian Age – or, at least, some of its aspects, come to life once they are explored based on such stories.

Victorian and Edwardian ghost stories could also be traced as the source of contemporary-day mystery, thriller, suspense, and crime stories, full of unexpected plot twists, just like the Victorian penny dreadfuls. These stories contain the main ingredients of novels and stories that remain successful to these days. The penny dreadfuls contained plenty of examples of anti-heroes, fighting for justice in society, while the Victorian and Edwardian ghost stories included plenty of fantasy elements, and they made reference to the aristocratic mansions with all of their secrets and mysteries from the past. Fig. 2 below tries to help students enter the atmosphere of Victorian and Edwardian ghost stories, to consider some famous titles, as well as to create a picture of the living society of the times, not based on historical dates and mainstream events, but based on everyday life:

Fig. 2. Victorian and Edwardian Ghost Stories

In addition, the lecture discussed novels by Agatha Christie, which are still enjoyed nowadays by readers from all over the world, and which present us with typical, emotionally restrained British cultures, speaking RP English, and with detective relying on reason and logic in solving various crimes, who once again seem typically British. The novels by Agatha Christie prompt readers to consider the origins of their own perception about members of British culture as very polite, emotionally restrained, and also using indirect communication and dry humour. From the previous stories, which were based on ghost hauntings, irrational mysteries with irrational explanations, with a loss of contact with reason and down-to-earth reality, we reach with the stories of Agatha Christie a highly down-to-earth British society, whose members rely strongly on reason and where everything is reduced to rational explanations. By the end of the stories, everything has been explained based on reason, and we have realized that everything can have a logical explanation. A complete picture of British cultural life and society is presented in the novels by Agatha Christie, if we look at the visual material proposed for this part of the lecture, in Fig. 3. We can find typical British settings, references to pubs and social life, reflections of typical British values, class and society, the British weather, manners, a sense of fair-play, as well as scenes related to travel where the railways are present, which were part of the society of those times, making modern life possible and comfortable. The novels by Agatha Christie are so familiar to all of us, that we may notice how we may have not been aware that they belong to a culture different than our own. We have all been transposed into the stories and felt in a very familiar world.

Fig. 3. British Culture in Agatha Christie's novels

UK malls, part of everyday current life, are illustrated in Fig. 4 below:

Fig. 4. UK malls.

Students understand how the UK prefers a shopping area in the city where people can walk or use public transport and not rely on cars, which makes them different from US malls which rely mostly on personal cars for transport. There are also famous UK shopping centres and historical shops, which show students that the history of the place remains an important part of British identity.
Types of houses in the UK (shown in Fig. 5 below) allow students to experience a sense of specificity tied to place:

Fig. 5. Types of houses in the UK.

They are introduced to the current visual aspect of UK life, and are also presented with how London apartments are very small. They are so small because of high demand of property and high property prices, as well as since London was built for terraced houses, not big appartments in Georgian and Victorian times, and also since the destruction of large city areas by bombings in World War II led to housing shortages after the war.
The course of lecture relied on visual materials, which are frequently used for the learning of English as a foreign language [1] – and this course in culture and civilization also helps students develop their foreign languages skills. While the learning of any topic is made easier based on visual materials, these materials can be considered the most natural way of learning for us, since we human beings rely on our visual sense more than on the others in order to gain our knowledge about the surrounding, external world [2]. Teaching this course with visual materials should make learning effortless, or as effortless and natural as possible, since students are used to gain their information about the surrounding world in this way in everyday life contexts. The course was designed as a trip in time and space, through the main timelines and aspects of British culture and society. It was intended to help them adapt to life in contemporary British society, since they may have the opportunity to study or even work there in the future, not just to simply visit Great Britain as tourists. When we adapt to a place, we need to consider both mentalities and the visual aspect of the places. We are aware that the small size of London apartments can be uncomfortable in the long term for someone coming from another culture. The unfamiliarity of a place, both regarding its visual aspect and habits, as well as unfamiliar references of the members of the respective culture, can lead to us experiencing culture shock, which can make us

not accept the cultural differences, feel uncomfortable, and not be able to function properly in the respective environment, e.g. at school or at work [3]. A course in culture and civilization can help prevent such situations, through building up background knowledge and through establishing cultural empathy [4] with members of another culture.
Such materials can be created manually by the teacher or by using tools such as various programs (e.g. Photoshop) as well, not just by using AI to generate these collages. The advantage of using AI to create these visual materials lies, however, in the fast pace within which they can be made available, as well as in the way in which teachers without any expertise in creating such material manually, themselves, or by using specialized programs like Photoshop can create visual materials with a highly professional look. AI can become a tool or a partner for teacher wishing to improve the visual aspect of the materials they use for class. Unlike a human partner, AI can take the minimal amount of time to help teachers create visual materials that can amaze everyone. If teachers use AI programs such as Chat GPT, obtaining visual materials no longer depends on their own talent and knowledge of software programs to create such materials. All they need is knowledge of the materials they want to be transferred into the visual medium. The Chat GPT free version ensures a fast and convenient variant of tool able to help anyone create visual materials for their courses. In addition, teachers can have a dialogue with Chat GPT and help improve these materials, which happens faster than in the case of a human being who could be a collaborator. Teachers may need much more time to create these visual materials than Chat GPT, even if they have enough digital skills, which gives AI an advantage. The visual materials are created almost on the spot, and they have a highly professional value.

3. Results

When we relate to another culture, we need to take into account their specific psychology, which can be understood based on notions of cultural awareness. We have seen certain features of the British, as well as their values, mentalities, common historical references, and communication style, which can help us build a psychological portrait. We can start relating to such a portrait based on considering how their stories have also been our own as we were growing up or even later in life, such as mysteries, adventure stories, detective and crime fiction, and, nowadays, thrillers. These stories allow us to consider both familiar and specific elements, since these stories do include typical British culture elements and references, and especially those related to a certain time period. As we become aware that we owe to British culture the way our society looks today, with its institutions and democratic possibilities, we realize that we may already be familiar with some aspects of this culture.

4. Discussion and Conclusions

By drawing British culture closer to students, and by making them aware of how they can be more familiar with it than it may be visible at first sight – including their close connections with everything related to the English language and with English-speaking cultures – we can help prevent for them the experience of culture shock. This method holds true not just for British culture and society, but also for any other culture and society. We can replicate the same steps: becoming aware of influences on our culture and on world culture, of how we may already be familiar with some aspects of the apparent foreign culture, of the image we have built of its members, and then by looking at historical and past references still of importance to today's life of its members. Afterwards, values, beliefs, principles, attitudes, practices, traditions, may also be considered. In addition, the visual identity of a place is also important and is, after all, the first one we notice as tourists or as temporary inhabitants of a foreign country.

Hands-On Learning through Pattern Design: A Stereotype Printing Workshop in Higher Design Education

Olinda Martins

ID+ Research Institute for Media and Culture, University of Aveiro, Portugal

Abstract

This paper examines the pedagogical potential of a stereotype-printing workshop conducted in the Reprography course of the Design degree at the University of Aveiro. The study explores how hands-on, tactile engagement with manual printing techniques can support the learning of contemporary technical content in the field of graphic production and encourage the development of more meaningful visual solutions. The workshop challenged students to design modules featuring abstract motifs, subsequently produced in MDF, and to generate patterns by combining them. Students followed the entire production process, from graphic conception and preparation of final artwork to two-color printing. This approach recreated the fundamental principles of letterpress printing using limited workshop resources. The research methodology combined participant observation, visual documentation, and informal conversations with participants [1]. The results suggest that this type of workshop-based practice consolidates specific technical knowledge and fosters creative exploration that departs from common digital assumptions. The study concludes that integrating workshop practices and artisanal printing technologies into higher design education strengthens practical know-how, technological understanding, and a critical relationship between traditional means and contemporary practices, even in resource-constrained academic contexts. The relationship between manual know-how and sensory learning, as discussed in Hands-On Type [4] and The Touching Charm of Print [3], further supports the relevance of this pedagogical approach.

Keywords: *stereotype printing, patterns, workshop education, graphic production, graphic design, know-how*

1. Introduction

Since the 1970s, movable type printing has been progressively replaced by offset, which was in turn reinforced by desktop publishing in the late 1990s, a technology that, while democratizing graphic design and production, simultaneously contributed to the homogenization of visual solutions. The resulting loss of the tactile dimension and the unpredictable character typical of analog printing processes has gradually narrowed the creative and sensory repertoire of contemporary designers.

In contrast, recent years have seen renewed interest in reintegrating these obsolete printing technologies into higher design education.

This paper documents and analyzes a stereotype printing workshop developed within the Reprography course of the Design degree at the University of Aveiro during the 2021/2022 academic year. The workshop invited students to design modules featuring abstract motifs, produced in MDF through laser engraving, and to combine them into two-color printed compositions, following the procedural logic of movable type printing.

The study seeks to demonstrate how direct engagement with hands-on printing practices, even in academic contexts with limited material resources, contributes to developing the technical, creative, and reflective skills that an exclusively digital environment cannot provide.

2. Teaching Reprography at the University of Aveiro

Within the Design degree at the University of Aveiro, the Reprography course, taught in the first semester of this study cycle, aims to develop students' ability to recognize the limits of reprographic technology as factors for enhancing the expressive and creative potential of design work.

In this course, reprography is approached within the broader scope of graphic reproduction devices, processes, and equipment, along a dual chronological and technological axis. The syllabus is organized around three archetypal systems—mask, stamp, and transfer—to which other printing systems that do not fit the preceding categories are added. A further objective of the course is to familiarize students with the sequence of processes leading from graphic conception to finished product, namely final

artwork, prepress, printing, and finishing. This approach is conducted through theoretical and theoretical-practical classes.
The high number of enrolled students (between 40 and 55 per year) and the limited course load of two hours per week pose a considerable challenge for carrying out printing workshop activities, all the more so in a context where the available material resources are scarce, comprising only a single intaglio press. Finding creative pedagogical solutions that reconcile the syllabus requirements with these constraints, therefore, becomes essential.

3. Framework

3.1 The Technological Context and Know-How

The gradual shift away from so-called hot metal (lead type) toward cold type (phototypesetting), later driven by the expansion of desktop publishing software, led to the contemporary reality that Dias and Meira describe precisely: "(...) the consequence of this evolution is a saturated market where results are increasingly homogeneous (...)" [4]. Graphic solutions have become predominantly predictable, stripped of the tactile dimension and the unexpected character that distinguishes techniques such as letterpress or risography.
Against this backdrop, such technologies are increasingly recognized as holding significant potential for training new designers, both for the material experience they offer and for the conceptual possibilities they open up.
Several higher education institutions maintain or have come to incorporate workshops using this kind of technology, giving students access to a more tactile practice that broadens the way they think about design.
To quote Dias and Meira once again, "these workshops have proven to be a contribution to training on several fronts," fostering an understanding of the typographic profession and of how technological change has shaped the current state of reprographic printing, while at the same time deepening sensory knowledge through direct contact with physical matter—movable type, ink, substrate—as opposed to the digital medium, creating a space of inquiry capable of exploring all the dimensions referred to above [4].
But how might this kind of knowledge find concrete application in design practice?
One possibility is offered by the example of designer Dafi Kühne, who "(...) taking advantage of proof-press printing (...) extends his palette of materials for producing printing forms to a myriad of materials and technologies (...), which he explores avidly, without fear or conservatism" [4]. His approach is not that of a traditionalist seeking to recover a lost craft, but that of a contemporary designer for whom analogue and digital are not opposed terms: the workflow moves continuously between computer and press, and the choice of printing form is determined by the requirements of each project rather than by allegiance to a particular tradition [4]. These experiments are incorporated into work that responds to real-world briefs, yet whose final product carries the expressiveness and tactility that the digital medium cannot reproduce. The pedagogical relevance of the workshop discussed in this paper is direct; the use of laser-engraved MDF matrices follows the same logic, transposed to a resource-constrained academic setting.

3.2 Learning Through Practice — Know-How

The very etymology of *aprender* (the Portuguese verb "to learn"), from the Latin *apprehendere*—"to hold, to grasp"—situates the origin of knowing in the gesture of the hand, inscribing the body at the heart of the act of knowing [5]. It is this lineage that the tradition of learning by doing reactivates: the conviction that there is a kind of knowledge which is not transmitted through statements, but built in action, in contact with matter, and through attentive repetition.
This conviction resonates with Tim Ingold, for whom the only way to truly learn something—to know it from within—is to discover it for ourselves, by our own means [5]. Knowledge does not precede the practice that would apply it: it emerges from it. Know-how thus resides in the gesture and in the direct relationship with matter—a dimension of knowledge that is difficult to verbalize and can only be acquired by doing.
In education, this orientation has a long lineage, and it is in typography itself that it finds one of its most telling examples. Beginning in 1920, Célestin Freinet introduced a typography workshop into the classroom, in which pupils composed and printed a school newspaper—a method in which the act of typographic making was, simultaneously, a means of production and an instrument of learning [5]. For

Freinet, materially composing a word by handling the type was equivalent to knowing it "from every angle" and to fixing it in visual memory more intensely than handwriting would [5]. The same conviction runs through the devices of Fröbel and Montessori, for whom the hand is the instrument of intelligence, and, closer to our own time, through the laboratories of Bruno Munari, in which one learns by designing and manipulating [5]. Today, this tradition is being reactivated in typography and risography workshops, such as the Charles Nypels Lab or Knust, which restore a tactile and experimental dimension to higher education [6].

In the specific field of design, Nigel Cross argues that design constitutes an autonomous form of knowledge—designerly ways of knowing—distinct from the sciences and the humanities and grounded in making, in inventing, and in solving ill-defined problems [7]. This is a knowledge produced within the action itself: in stereotype printing, each decision—the amount of ink, the pressure, the alignment of the matrices—is made, assessed, and corrected in the moment. As Frascara et al. maintain, design methods are means through which a transformative praxis, productive of knowledge, is embodied [8]. It is this quality that Beckloff captures concerning typographic composition:

"Letterpress composition and printing reinforces the fundamentals of art and design and introduces designers to a new rhythm and mode of visual communication. Students must plan the layering depth of a piece from the outset through scale, color, and value. As they mix the ink color, they work with the inherent transparency of printing inks and learn to respond to the previous layer and to the printed color. Ultimately, there is no 'Undo' as in their digital comfort zones. There is an improvised quality implicit in the work, a need to adapt and move forward. (...)" [2]

4. Workshop

4.1 Context and Objectives

This workshop was developed within the Reprography curricular unit of the undergraduate Design program at the University of Aveiro, during the 2021/2022 academic year. The class, with 39 students, was organized into 8 groups in order to streamline both the creative work and the printing process. The exercise, part of a broader set of assignments developed throughout the semester, aimed to introduce students to a printing technique of industrial origin (movable type printing/stereotype printing), transposed into a non-industrial context while preserving the classic stages of the process and the logic of printing multiples.

In a curricular unit that is predominantly theoretical, it becomes necessary to find strategies that give students access to practical contexts so that this technical knowledge can be incorporated more naturally into their design practice. This is precisely what the workshop aims to provide: an understanding of the technique, recognition of its creative potential, and the possibilities for including it in future work.

Managing a class with such a large number of students was also a challenge, requiring organizational strategies that would ensure everyone could print within a very limited time frame. Hence, the decision was made to work in groups, while still preserving the possibility of individual authorship as a part of the process.

4.2 Methodology

This case study adopts a qualitative research approach, grounded in a pedagogical framework that conceives of learning as an active, dialogic, and experience-based process. Drawing on Freire's critique of the banking model of education, in which students are treated as passive recipients of knowledge rather than active participants in its construction, and on his conception of praxis as a continuous cycle of action and reflection [9], this workshop was designed to position know-how as a mode of thinking and knowing. In this approach, although students are provided with guiding directives, it is through hands-on workshop practice and through trial and error that embodied knowledge is achieved.

For Frascara et al. [8], design methods generate not only responses to situations but also new knowledge, a premise that frames the workshop as a setting where students learn by producing knowledge of their own, rather than receiving it.

To document this case study, the following data collection methods were used:

— Participant observation: the learning process, students' engagement, the technical challenges, and peer interaction (particularly the mutual support among students) were recorded through notes gathered over the course of the workshop sessions, capturing significant moments, conversations, and relevant observations.

— Visual documentation: photographic records of the process and of the results obtained.
— Informal interviews: casual conversations conducted with students before, during, and after the workshop, aimed at exploring their expectations, learning experiences, challenges, and discoveries, as well as their perception of the value of learning through practice.

4.3 Workshop Proposal, Structure, and Development

The initial brief asked each student to design (individually, yet already within a group setting) a 40 × 40 mm matrix featuring an original graphic motif, intended to coexist with the proposals of the other members of the same group and to be used in one or more final compositions. These matrices were to have the particular feature of being arranged in different configurations, giving rise to distinct and varied graphic patterns.
To deepen students' understanding of the logic of modular composition, a demonstrative example developed by the instructor was presented.

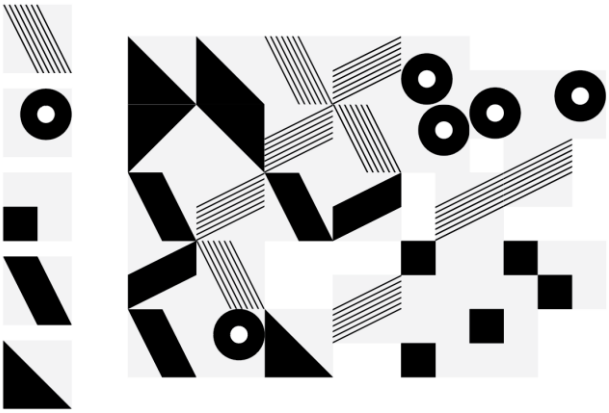

Fig. 1. A set of matrices (left) and one possible composition derived from them (right), developed by the instructor.

After each group had designed and selected its matrices, these were reproduced three-dimensionally, resulting in stereotype matrices, that is, matrices whose printing elements are in relief. Each group prepared a digital document with an engraving layout comprising a total of 35 matrices (5 originals × 7 repetitions), used for the laser engraving of the MDF. This process was carried out by the technician of the Department of Communication and Art workshop, with the students supervising.

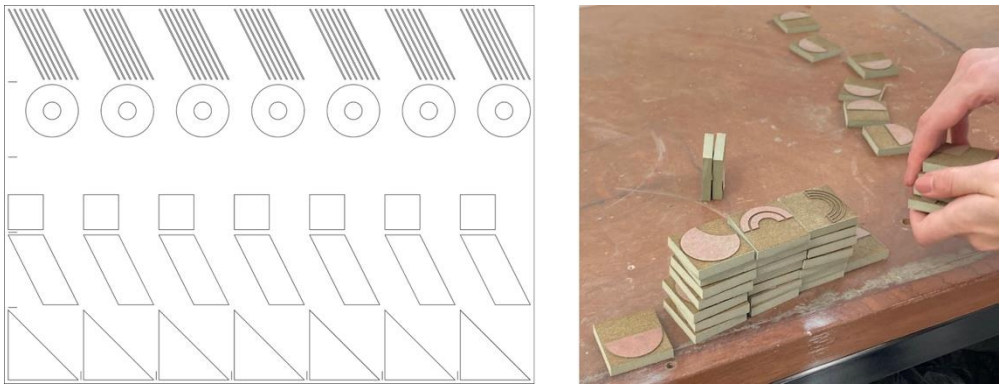

Fig. 2. Digital matrix layout and matrices produced in MDF.

Complementary material was developed to allow the printing layouts to be assembled. This material included a base (form) for fitting the matrices together and a set of blank, non-printing elements (of a lower height), whose function is to create the unprinted areas, keeping the composition contained within the selected format.

Fig. 3. Examples of the assembly of the matrices and the blank material on the base.

With the matrices available, each group designed a graphic composition to be printed in two colors in A3 format. This premise (printing in two direct colors) entailed assembling two distinct compositions that worked together, allowing the groups to take advantage of overlaps or (mis)alignments.

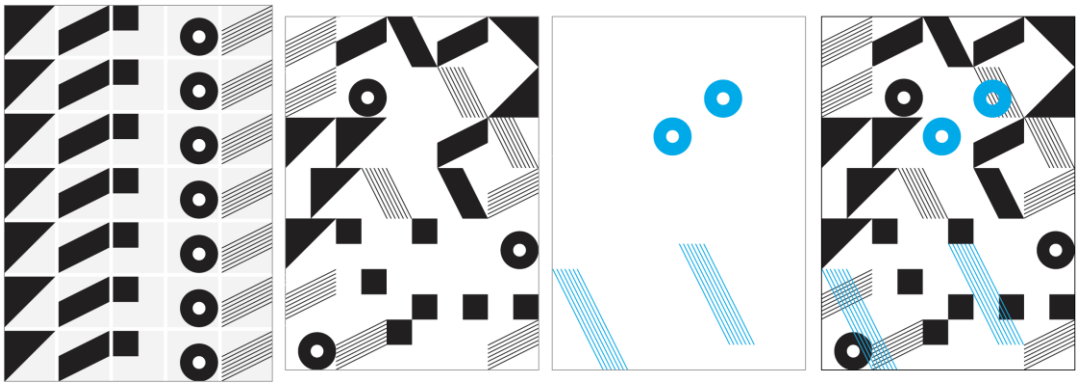

Fig. 4. Set of matrices, color separation (A and B), and a simulation of their overlay.

All of this work was considered preparatory to the printing session.
On the day of the workshop, each of the 8 groups had two hours to carry out initial experimentation and final printing, producing 10 copies in color A, 10 copies in color B, and 10 copies resulting from the combination of colors A and B. The choice of the paper type and weight to be used was the responsibility of each group. Some groups also experimented with printing on other substrates, such as papers of different weights and colors, cardboard and fabric, thereby creating complementary compositional solutions.

Fig. 5. Various moments of the printing process.

Fig. 6. Printed examples (1) of matrix, printed color separation and the result.

Fig. 7. Printed examples (2) of matrix, printed color separation and the result.

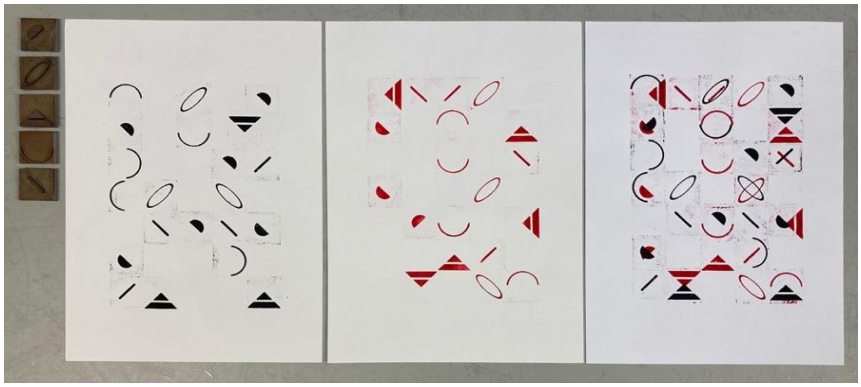

Fig. 8. Printed examples (3) of matrix, printed color separation and the result.

Fig. 9. Other printing substrates.

Groups were given the option of continuing to print outside the workshop setting, whether to pursue further experimentation or to refine the copies already produced.

The process concluded with an online presentation of the results obtained.

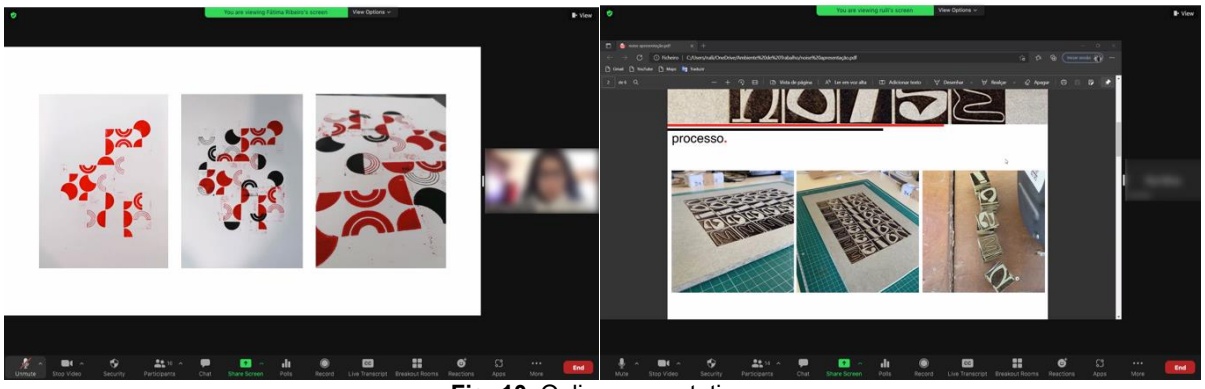

Fig. 10. Online presentations.

5. Discussion of Results

5.1 Technical Engagement with the Printing Process

The initial contact with the technology proved challenging for most students. The novelty of the process (assembling the matrices, preparing the base, managing the ink, and controlling the pressure on the printing press) gave rise to difficulties that were progressively overcome through repetition and growing familiarity with each stage. This learning curve, far from being an obstacle, was a meaningful pedagogical moment: the gradual overcoming of technical difficulties translated into a more conscious and informed command of the process.

The recurring cycles of inking, pressing, evaluating, and adjusting embodied what Freire describes as praxis: action and reflection oriented toward transformation [9]. Each misprint became an object of examination rather than a failure to be discarded, a variable to be identified (excess ink, insufficient pressure, a misaligned matrix) and corrected in the next attempt. In this regard, Beckloff's observation that "there is no 'Undo' as in their digital comfort zones" [2] acquires its full pedagogical weight: the impossibility of erasure compels students to think before and during the act of making, not only after it. The gap between digital simulation and printed result was thus not experienced as a deficiency but as the very ground of learning, consistent with the broadening of sensory knowledge that Dias and Meira identify in workshop practice [4].

5.2 Material Constraint and the Repositioning of the Digital

A particularly revealing dimension of the workshop was the way material constraints generated, rather than limited, creative possibilities. Several groups, having completed the initially planned compositions, extended the exercise on their own initiative, printing on cardboard, kraft paper, and fabric; deliberately misaligning the second color pass to produce unexpected chromatic interactions; combining matrices in configurations not foreseen at the design stage. These departures were not deviations from the brief but discoveries within it. Moments in which the fixed parameters of the medium (a 40 × 40 mm matrix, two ink colors, a single press) opened a creative space that the digital environment, with its infinite undo and its predictive simulation, tends to foreclose. This resonates with Cross's claim that designerly knowledge emerges from the situation itself, produced in the act of making [7].

The pedagogical intent of the workshop, it should be emphasized, was not to oppose the analogue to the digital, nor to propose a return to obsolete technologies. It was, more precisely, to displace the digital from its position as the unmarked default of design practice and to make it visible as one option among others. By encountering the assumptions that letterpress logic makes explicit (the fixed matrix, the sequential layer, the irreversibility of the printed mark), students gain a vantage point from which their common digital tools become legible as carrying assumptions of their own: about composition, about revision, about the relationship between intention and outcome. This estrangement is itself a pedagogical outcome, and one that aligns the workshop with the broader argument advanced throughout this paper.

6. Final Remarks

This study has shown that integrating hands-on printing practices into higher design education is not only feasible in resource-limited contexts but also pedagogically relevant and warranted. Direct engagement with analogue matrix-based printing technologies (in this case, stereotype printing) generates forms of knowledge that the digital environment cannot provide: embodied know-how, the management of unpredictability, an awareness of the sequential process, and an appreciation of the object produced. These results suggest that such experiences consolidate specific technical knowledge, stimulate creative exploration, and foster in students a more critical and informed relationship with the digital tools they use on a daily basis.

The apparent enthusiasm observed at the end of the workshop, expressed informally by students, suggests the pedagogical impact of an experience that demands presence, attention, and physical commitment to the process.

It is worth emphasizing that the model presented here is replicable in academic contexts that lack a printing press. The fundamental principle, adapting the logic of letterpress printing to matrices produced with accessible materials and technologies, can be transposed to different institutional realities, provided that the underlying pedagogical intent is maintained: to position making as a mode of thinking and knowing.

The main limitation of this study lies in the qualitative and informal nature of the data collection instruments used. The absence of more structured instruments, such as questionnaires or systematic assessment forms, limits the generalizability of the results. Future research could benefit from a more formal methodology, one that would allow results to be compared across different editions of the workshop or across different institutional contexts.

In a design education landscape increasingly dominated by the digital, the recovery of manual practices does not represent nostalgia, but a well-grounded response to the visual homogenization that characterizes the present. Integrating the analogue into the curriculum is, above all, a way of preparing designers who are more aware, more critical, and better able to inhabit the space between what technology allows and what creative intent demands.

Reinterpreting Graphic Heritage through Design Practice: A Pedagogical Case Study

Cristiana Serejo

ID+ Research Institute for Design, Media and Culture, Portugal
Polytechnic University of Cávado and Ave, School of Design, Barcelos, Portugal

Abstract

This article describes an academic design project developed in the undergraduate Graphic Design programme at the School of Design (ESD) of the Polytechnic University of Cávado and Ave (IPCA), in collaboration with the Municipality of Braga, as part of the Braga Capital of Culture (2025) programme and the centenary celebrations of Master José Veiga (1925 - 2002). A key figure in Braga's visual culture, Veiga produced an extensive body of work in drawing, graphic arts, and urban festive decoration, particularly for the Holy Week and St John's Day Festivities.
Two exhibitions were organised to reinterpret and disseminate Veiga's graphic heritage, combining reproductions of archival works – including posters, logos, lighting plans and urban decorative designs – with design projects developed by ESD/IPCA students. In the Graphic Design curriculum, students developed two exercises focused on visual identity and typography, aimed at creating contemporary visual sistems connected to Braga's cultural identity and festive traditions.
Combining theoretical research, semiotic analysis and practical experimentation, the project was structured in three phases: analytical research into Veiga's visual language; exploratory graphic experimentation; and the synthesis and formalisation of design proposals. The results, demonstrate the pedagogical and cultural potential of design practice as a process of critical reinterpretation of visual heritage, highlighting the relationship between historical graphic identity, contemporary visual language and cultural transmission.

Keywords: *Design Teaching; Visual Identity; Cultural Identity; Master José Veiga;*

1. Introduction

The project, developed as part of the Graphic Design degree programme at the School of Design of the Polytechnic University of Cávado and Ave (ESD/IPCA), in collaboration with the Municipality of Braga (Portuguese Capital of Culture 2025), is a notable example of how design education can serve as a tool for cultural mediation and the reinterpretation of visual heritage. As part of the centenary celebrations of *Mestre* (Master) *José Veiga* and the *Braga Capital of Culture 2025* programme, the project sought to establish a critical relationship between the city's visual heritage and contemporary design practices, whilst promoting pedagogical processes of research, experimentation and visual production.
Master José Veiga is a key figure in the 20th-century Braga's visual culture, noted for his work in drawing and the graphic arts and, above all, for the design of decorative elements associated with the *Semana Santa* (Holy Week) and *São João* (St. John's Day) festivities. The identity-forming dimension of his work highlights the capacity of graphic design and visual language to construct symbolic systems linked to the city's collective memory and cultural representation. As Fernando Pinheiro (2000) notes, José Veiga's work has established itself as a visual heritage deeply rooted in the urban life of the city of Braga, reflecting simultaneously tradition, religiosity and popular spectacle.
Building on this legacy, the students were challenged to develop contemporary graphic proposals capable of reinterpreting the formal, chromatic and symbolic elements present in the artist's work. Through this semiotic approach, students explored the processes of symbolic construction present in his visual language and developed experimental exercises in visual identity and typography, applying principles of form, colour, hierarchy, and composition. This project can be understood as both a pedagogical exercise in visual communication and a critical framework for reflecting on the relationship between design, cultural memory and graphic heritage. By reinterpreting the visual legacy of Master José Veiga, the project has created a dialogue between historical references and a contemporary visual language. This allows students to explore the role of design as a cultural and symbolic practice.

2. Theoretical Framework

The project's theoretical framework draws on contributions from visual communication theory, semiotics, visual syntax and identity systems, particularly the works of Joan Costa [1], Daniel Chandler [2], D. A. Dondis [3] and Fernando Pinheiro [4].
These authors provided the conceptual basis for understanding visual heritage as an active system of visual signs capable of generating new meanings within contemporary design practice, rather than simply as a historical archive.
Fernando Pinheiro's work on Master Veiga is a key historical and cultural reference for the project. In *Mestre José Veiga: O Artista Tranquilo – Vida e Obra de um Artista Consagrado Pela Cidade de Braga* (2000), Pinheiro documents the artist's contribution to Braga's visual culture, emphasising the relationship between his artistic production and the city's symbolic identity.
This understanding of visual production as a cultural system is closely linked to Daniel Chandler's thoughts on semiotics. In *Semiotics: The Basics* (2005), he argues that images operate as systems of signs whose meanings are culturally constructed and socially interpreted. From this perspective, the visual elements present in Master Veiga's work, such as ornamental structures, religious iconography, typographic forms and chromatic compositions, cannot be interpreted as mere aesthetic objects. Instead, they serve as carriers of collective meanings associated with local traditions, spirituality, celebration and urban identity.
The semiotic dimension of the project was further reinforced through the exploration of visual language and compositional principles set out by D. A. Dondis in *La Sintaxis de la Imagen* (2008). Dondis proposes that visual communication operates through a 'visual syntax', composed of formal relationships such as balance, contrast, rhythm, proportion, hierarchy and scale. These principles enable visual messages to achieve coherence, expressiveness and clarity of communication.
Dondis also emphasises that visual literacy encompasses more than just technical skill; it involves the capacity to critically interpret and construct visual meaning. This perspective was particularly important in the educational context of the project, in which students were encouraged to move beyond stylistic imitation and engage in critical design thinking.
The relationship between visual identity and symbolic construction was further developed through the theoretical contributions of Joan Costa. In *Design para os Olhos – Marca, Cor, Identidade, Sinalética* (2011), he examines how visual identity systems function as strategic instruments of communication and recognition. For Costa, identity is not restricted to logos or formal aesthetics; rather, it emerges through coherent visual systems that can express cultural values, institutional narratives and collective belonging. This perspective was particularly relevant to the students' proposals, which aimed to create contemporary visual symbols connected to Braga's festive traditions and graphic memory.
Integrating these theoretical perspectives shows how design education can be an interdisciplinary space for producing knowledge, combining historical research, cultural analysis, visual experimentation and critical interpretation. Rather than treating heritage as a static object of preservation, the project approached graphic memory as an evolving and dynamic field of visual culture. By reinterpreting Master Veiga's archive, students explored processes of cultural transmission, where contemporary design practice acts as a mediator between the past and the present.
The resulting exhibitions reinforced this dialogical relationship by placing historical works and contemporary student proposals side by side. This curatorial strategy revealed how graphic heritage can generate new visual narratives while preserving its symbolic and cultural significance. The coexistence of archival material and experimental design outcomes showed that heritage's value lies not only in conservation, but also in its ability to inspire reinterpretation, critical reflection and renewed cultural relevance.
Ultimately, the project highlights the importance of connecting design education with local cultural contexts and historical archives for pedagogical purposes. By engaging directly with Braga's visual heritage, students developed technical and conceptual design skills, as well as a deeper awareness of the social and cultural responsibilities of graphic design.

3. Methodology

The project's theoretical framework draws on contributions from visual communication theory, semiotics, visual syntax, typography and identity systems. This establishes a methodological structure that guides the analytical and practical dimensions of the design process. As the project focused on reinterpreting Master Veiga's graphic work, it adopted a methodology combining historical investigation, semiotic analysis, visual experimentation, and conceptual synthesis.

The first methodological stage focused on research and analytical observation. Students began by examining archive materials related to Master Veiga's work, including posters, typographic compositions, decorative studies, lighting plans and urban festive designs. This involved identifying recurring visual structures, symbolic motifs, compositional systems and chromatic strategies in the artist's work. Through close visual analysis, students were encouraged to understand the formal qualities of the works and their cultural and communicative functions within Braga's visual identity.
This analytical phase was strongly influenced by semiotic theory, particularly the concept that visual artefacts function as systems of signs within social and cultural contexts. Semiotic analysis enabled the students to decode these symbolic dimensions and transform them into conceptual references for contemporary design proposals.
A second methodological component involved studying visual syntax and compositional organisation. This stage was particularly important for understanding how Master Veiga structured large-scale festive compositions and graphic systems intended for public spaces. By analysing the relationship between form, colour, typography and ornamentation, the students developed an awareness of how visual language can guide perception and produce an emotional and symbolic impact.
The project methodology incorporated exploratory and experimental design practices. Students explored how colour, typography, symbols and compositional structures could function together as elements of identity associated with Braga's festive culture. The methodology therefore extended beyond isolated graphic objects, encouraging the development of integrated visual systems that were both consistent and culturally relevant.
Another important methodological aspect of the project was the relationship between theory and practice. The design process was conceived as a reflective activity in which research, analysis, experimentation and production continuously informed one another. Students were encouraged to justify formal decisions conceptually, relating visual outcomes to the theoretical frameworks and cultural references. This pedagogical approach reinforced the idea that graphic design is a form of critical and cultural inquiry as well as a technical discipline.
The final methodological phase involved synthesis and formalisation. At this stage, students refined their proposals to create coherent visual outcomes inspired by Braga's cultural heritage.
These proposals were then presented in exhibitions alongside original works by Master José Veiga, establishing a dialogue between the historical archive and contemporary interpretation. This curatorial dimension became an extension of the methodology itself, reinforcing the continuity between research, design experimentation and public cultural dissemination.
Overall, the adopted methodology demonstrates how graphic design education can integrate historical research, theoretical reflection and creative practice into a unified pedagogical framework. By combining semiotic analysis, visual syntax, identity systems and experimental design processes, the project enabled students to critically engage with historical graphic artefacts, developing contemporary visual responses that are firmly grounded in cultural memory and local identity.

4. Practical Design Exercises – Case Study

As part of the Braga Capital of Culture 2025 programme and the centenary commemorations of Master José Veiga (1925–2002), two exhibitions were organised to disseminate and reinterpret Veiga's graphic legacy. The exhibitions brought together reproductions of original works, including posters, logos, lighting plans and urban decorative compositions, sourced from personal and municipal archives. They were displayed alongside projects and experimental exercises developed by students from the School of Design (ESD/IPCA).
This case study examines two design exercises developed in the undergraduate Graphic Design curriculum. Focusing on visual identity and typography, the projects aimed to explore the creation of visual systems that could express regional identity and critically engage with Braga's key festive traditions.

4.1 The Aim: Master Veiga's Legacy

José Veiga (1925-2002), also known as Master Veiga, occupies a significant position in the visual and cultural history of Braga. He is particularly renowned for his contributions to drawing, graphic arts, urban ornamentation and festive visual culture. Recognised locally as an artist deeply connected to the city's identity and traditions, Veiga produced an extensive body of work combining artistic sensitivity with a profound understanding of Braga's symbolic and cultural landscape. His work reflects technical skill, aesthetic refinement, and a strong capacity to translate collective memory and regional identity into

visual form. Born in Braga in 1925, Veiga developed his artistic practice within a context strongly influenced by religious traditions, popular festivities and urban ceremonial culture. Throughout his career, he became particularly associated with the visual representation of Braga's most emblematic celebrations, namely the Holy Week processions and the St. John's festivities. These events, deeply rooted in the city's collective experience, provided a context in which graphic design, scenography, ornamentation and public visual communication intersected.

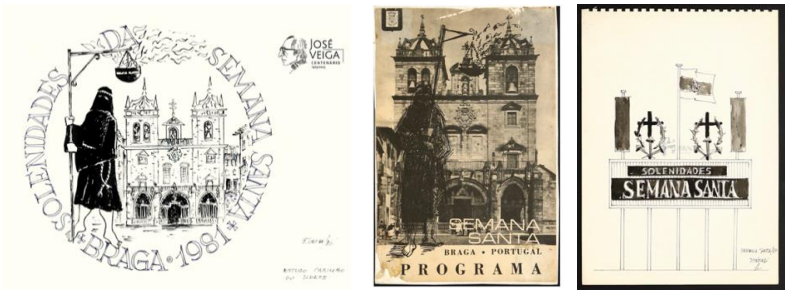

Fig. 1. Master Veiga's sketches and drawings for posters and decorations of the festivities (1980 – 1982). (© José Veiga Fund – Braga Municipal Archive)

According to Fernando Pinheiro (2000), Veiga was widely recognised for the coherence and originality of his artistic language, characterised by precision in drawing, ornamental richness, and a strong sense of compositional balance. He demonstrated an ability to merge traditional decorative motifs with modern graphic sensibilities, producing visual systems that were simultaneously popular, symbolic and formally sophisticated. This capacity enabled his work to become deeply integrated into Braga's urban identity, transforming temporary festive decorations into lasting visual references in the city's collective memory.
One of the most distinctive features of Master Veiga's work was his involvement in designing illuminated structures and decorative installations for public festivities. These large-scale urban compositions incorporated graphic rhythm, symmetry, repetition and chromatic contrast, revealing a sophisticated understanding of visual perception in architectural and public spaces. The ornamental structures created for Holy Week and St. John's celebrations often combined religious symbolism with festive exuberance, creating environments that served as both artistic compositions and shared cultural experiences.
Veiga's graphic work also included posters, logos, lettering, illustrations, and visual identity elements for institutional and cultural events. His graphic language was characterised by his careful attention to typography, ornamental detail, and symbolic communication. Many of his posters and visual compositions strike a balance between figurative representation and geometric organisation, demonstrating a visual logic that anticipated contemporary concerns within graphic design and visual identity systems. Colour played a central role in his artistic practice. His colour choices often emphasised contrast and luminosity, particularly in projects intended for public celebrations and nocturnal urban settings. Light itself became an expressive medium in many of his festive installations, transforming streets and public squares into immersive visual landscapes. Through these interventions, Veiga contributed to the creation of a unique visual atmosphere that has come to symbolise Braga's cultural identity.
Another important aspect of his work was the relationship between craftsmanship and graphic composition. Although much of his work emerged in the context of festivities and was therefore ephemeral, his projects reveal rigorous planning and compositional discipline. His drawings and preparatory studies demonstrate an attention to proportion, rhythm and structural organisation, aligning his work with principles commonly associated with graphic design and visual communication. This combination of artisanal sensitivity and graphic rationality is what makes his visual language unique.
His work is a prime example of how graphic and decorative arts can contribute to the development of urban identity and collective memory. By integrating artistic practice with public celebration and cultural representation, Master Veiga created a visual language that connected community, ritual and space. His archive, comprising drawings, plans, posters, decorative studies and graphic compositions, represents an invaluable artistic collection and an important document of Braga's visual culture throughout the twentieth century.

4.2 Exercise 1: Identity Signs in the Graphic Work of Master Veiga – Holy Week Posters

This exercise was developed by approximately 40 second-year students of the bachelor's degree in graphic design, in the scope of the Graphic Design Project II course, and took place over four sessions of three hours each. The students were organized into groups of two to three members.
The exercise was based on an analysis of Holy Week posters designed by Master Veiga for the city of Braga. It aims to identify the visual and identity-related elements that characterise the author's graphic language and visual aesthetics. By examining these works, students could understand how formal composition, symbolism, typography, colour and graphic synthesis contribute to creating a coherent and recognisable visual identity. Supported by a theoretical contextualisation of the formal and conceptual principles of identity design and an understanding of the theoretical and practical requirements of basic identification signs, students explored graphic solutions for different logo and brand typologies, including typography, form, and colour to develop visual systems capable of communicating Braga's cultural identity and the symbolic universe associated with its festive traditions.

Fig. 2. Master Veiga's posters for the Holy Week festivities (1957 – 2002).
(© José Veiga Fund – Braga Municipal Archive)

This visual analysis reveals a graphic language that is strongly defined by formal synthesis, symbolic expressiveness and chromatic restraint. The compositions are characterised by simplified forms, strong contrasts, balanced relationships between figure and background, and a clear visual hierarchy.
Religious and cultural symbolism also plays a central role in Master Veiga's visual language. Recurring motifs, such as crosses, processional figures, candles, crowns of thorns and references to Braga's religious architecture, are stylised and integrated into highly synthesised compositions with symbolic and identitarian dimensions.
Colour is another fundamental component of the poster's visual impact. Composed predominantly of black, purple, red, white and gold tones, the chromatic palette conveys values associated with solemnity, spirituality, sacrifice, purity and tradition. The restrained use of colour and the emphasis on contrast contribute to the emotional and symbolic intensity of the graphic compositions, Meanwhile, typography assumes both informational and visual functions. The use of serif typefaces, balanced compositions and clearly structured hierarchies reinforces the posters' ceremonial and institutional character while contributing to their visual coherence.

Fig. 3. Students' proposals: colour palette; typography; abstract, figurative and typographic symbols (©IPCA).

Within this framework, students developed proposals exploring various approaches to visual identity. Typographic solutions focused on the expressive and structural potential of letterforms, while abstract proposals explored geometric and symbolic synthesis. On the other hand, figurative approaches incorporated stylised representations directly associated with the iconography of Holy Week. These exercises enabled students to investigate how visual identity design can communicate cultural, historical and emotional values through coherent and memorable graphic systems.

4.3 Exercise 2: 'Quadrícula' (Grid) Workshop

The '*Quadrícula'* workshop took place in a classroom setting with 40 first-year bachelor's degree in graphic design (ESD/IPCA). The workshop began with a detailed observation and critical analysis of posters and lighting design sketches created by Master Veiga for the St. Jonh's Festivities in Braga. During this initial phase, the students were encouraged to identify and analyse the key graphic and symbolic elements that define those festivities visual language. These elements included compositional structures, iconographic motifs and stylistic characteristics.

Fig. 4. Veiga's posters for St. John's festivities (1955 – 2002). (© José Veiga Fund – Braga Municipal Archive)

Fig. 5. Veiga's original drawings for the lightening and decorations of St. John's festivities (n.d.). (© José Veiga Fund – Braga Municipal Archive)

Building on this analytical foundation and drawing inspiration from Master Veiga's approach to constructing visual compositions, the students developed a modular grid system ('quadrícula'). This grid system served as a structural framework for organising visual elements, providing the basis for the creation of original icons and symbolic interpretations.

Fig. 6. (left) Master Veiga's graph paper drawings for planning colour lamps used in festive decorations (n.d.). (© José Veiga Fund – Braga Municipal Archive) **Fig. 7.** (right) Students' graph paper drawings (© IPCA).

Within this system, each student translated their graphic explorations into modular units, exploring rhythm, repetition and structure as compositional principles. The grid ensured visual coherence and encouraged a systematic and controlled approach to image construction, reflecting processes commonly used in typographic and identity design.

Using *FontStruct*® software [6] (for modular typeface design), students digitally constructed their proposals, resulting in the creation of a set of symbolic typefaces designed for download and practical

application. This digital translation of analogue exploration enabled students to grasp the relationship between structure and flexibility in type design, as well as the constraints and potential of modular systems.

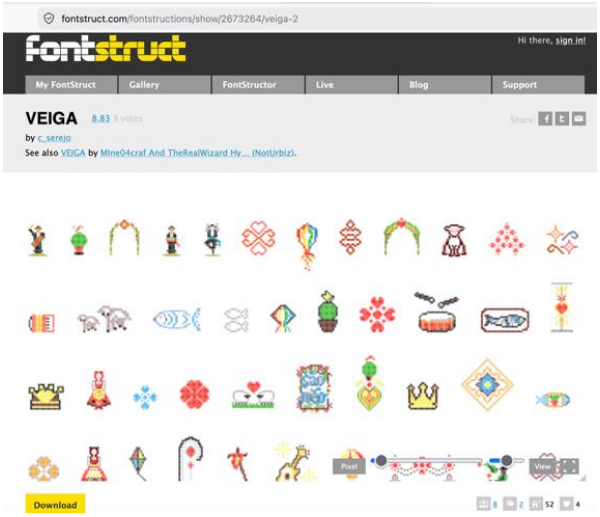

Fig. 10. (left) Final digital drawings of VEIGA symbols typeface [6], ready to download. **Fig. 11.** (right) Page with VEIGA symbols already in use.

The exercise aimed to stimulate systematic thinking and foster the creative appropriation of traditional elements, encouraging a contemporary reinterpretation of the Braga St. Jonh's Festivities visual heritage.

5. Final Considerations

This project demonstrated how graphic design education can function as a pedagogical, cultural and critical practice simultaneously. By analysing and reinterpreting the graphic legacy of Master José Veiga, students explored the relationship between graphic heritage, cultural memory and contemporary visual communication through processes of visual research, semiotic interpretation and experimental design.
Integrating theoretical frameworks related to semiotics, visual syntax and identity systems enabled students to understand visual culture as an active field of symbolic production, capable of generating new meaning through contemporary design practice, rather than simply as a historical archive. By analysing Master Veiga's work, the students developed an awareness of how visual forms, colour, typography and composition contribute to the construction of collective identity and urban cultural representation.
Practical exercises reinforced the value of connecting historical research with experimental methodologies. Through processes of observation, abstraction, synthesis and format experimentation, students produced contemporary graphic proposals based on Braga's festive traditions and visual culture. Rather than simply reproducing historical forms, the exercises encouraged critical analysis and

reinterpretation, enabling students to transform historical materiality into new visual graphics adapted to current contexts of communication and design practice.
The exhibitions played a key role in establishing a dialogue between the past and the present. By presenting student projects alongside original works from Master Veiga's archive, they revealed how graphic heritage can remain culturally relevant through reinterpretation and educational engagement. This curatorial approach emphasised design's ability to bridge memory, identity, and contemporary visual language, underscoring the vital role of archives as dynamic educational and cultural resources.
This case study also demonstrated the importance of collaborative work between higher education institutions and cultural organisations in promoting local heritage and public cultural participation. The collaboration between ESD/IPCA and the Municipality of Braga provided students with the opportunity to engage directly with the city's visual heritage, contributing to the dissemination and contemporary reinterpretation of a significant cultural legacy within the framework of Braga's 2025 European Capital of Culture programme.
Ultimately, this case study confirms the potential of design education to contribute to processes of cultural transmission, critical reflection, and visual innovation. By connecting design pedagogy with local heritage and collective memory, the project established a framework in which contemporary graphic practice becomes a form of cultural enquiry and a means of renewing the symbolic significance of historical visual identities in contemporary society.

Abstract

The rapid integration of generative artificial intelligence (AI), particularly within artistic practices, challenges established pedagogical paradigms [1] and reinforces transformations associated with the post-digital condition [2]. Ethical concerns persist regarding originality, authorship, and the reconfiguration of creative labour [3]. At the level of international policy, both the EU AI Act [4] and the OECD Digital Education Outlook [5] emphasise responsible AI integration in education, highlighting transparency, risk management, and the development of AI literacy as strategic priorities for higher education institutions.
This paper presents an exploratory diagnosis of AI adoption among students enrolled in the Arts and Multimedia degree at the Viseu School of Education, Portugal. Drawing on survey data collected in October 2025 (n=90), the study analyses usage patterns, domains of application, levels of confidence, and student perceptions regarding AI tools. Results indicate that the majority of students (57,8%) who use AI (n=53) integrate it primarily through self-directed initiative, with pronounced use in image generating or editing, programming support and colour palette definition. Participants report moderate confidence in selecting appropriate platforms and acknowledge a strong perceived need for external guidance. Perceptions are markedly sceptical regarding AI reliability for decision-making and data privacy, while students strongly agree that AI tends to produce stereotyped images.
In the context of research on AI in higher education [6] and current international regulatory frameworks, this study argues that the integration of AI in arts education cannot be guided solely by technological trends. The definition of effective pedagogical strategies must be grounded in a situated understanding of student practices and perceptions and crucially, in the recognition that ease of use does not imply critical engagement. Diagnosing student perceptions thus emerges as a necessary first step toward aligning technological innovation, ethical responsibility, and AI literacy within contemporary arts education.

1. Introduction

What schools should teach today is a question that remains ever-relevant and of vital importance. The challenges posed by the widespread use of generative artificial intelligence in everyday life and in the learning practices of higher education students raise urgent questions across all disciplines. We are interested in the specific case of education in Arts and Multimedia, where issues such as authorship, originality, creativity and graphic identity are not resolved through efficiency or process optimisation, but involve core disciplinary values such as the meaning of learning trough making, the relationship between intention and artefact, and the cultivation of aesthetic judgement [1]. As Siagian et al. [3] emphasise, generative AI raises critical questions regarding the attribution of creative work and the dilution of individual artistic contribution; these tensions become even more complex when considered in light of the ambivalent attitudes that the students themselves, artists in training, express towards AI as a creative agent [7].
International regulatory frameworks such as the EU AI Act [4], the OECD Digital Education Outlook [5] or the European Commission's Ethical Guidelines on the Use of Artificial Intelligence (AI) and Data in Teaching and Learning for Educators [8], identify AI literacy as a strategic priority for higher education, emphasising the need for responsible adoption that encompasses critical awareness, ethical reasoning and practical competence. However, these frameworks are necessarily generic, and their translation into situated pedagogical practice requires empirical grounding to understand who uses AI, how, and

with what perceptions and expectations. It is precisely in this gap that we find the relevance of this contribution.
This article presents an exploratory assessment of AI adoption among students on the Bachelor's degree in Art and Multimedia at the Polytechnic Institute of Viseu, School of Education, in Portugal. Data were collected via a survey in October 2025 (n=90), covering the three academic years of the degree programme. The aim is not to evaluate the tools themselves, but to understand the current landscape of students' practice as a basis for informed and responsible pedagogical interventions, in line with the call by Zawacki-Richter et al. [6] for evidence grounded in situated practices.
The article is organised as follows: Section 2 situates the study within the theoretical and political debates on AI in arts education; Section 3 describes the methodology; Section 4 presents the results; Section 5 discusses the results in dialogue with the literature; Section 6 concludes with implications for pedagogical practice and directions for future research. In a study that draws on an examination of students' practices and perceptions, it seemed appropriate to us that their voice should also be present in the structure of the text. It is from this voice that the central argument emerges: students describe AI as simultaneously 'convenient' and 'potentially disempowering', a tool which, whilst facilitating processes, can weaken critical thinking.

2. Theoretical Background

2.1 AI and Arts Education: Between Tool and Co-Creator

The post-digital condition, as theorised by Conrad, Leijsen and Héritier [2], describes a cultural state in which digital technologies are no longer perceived as a novelty but have become part of everyday creative practices. The emergence of generative AI represents a profound shift in how artists and students collaborate with technology, one that they are called upon to reflect upon. By producing probabilistic results derived from vast training datasets, AI tools position themselves not as neutral instruments, but as co-creative agents with their own aesthetic tendencies and cultural biases, a dimension which, as we shall see, the students themselves identify and problematise.
Fleischmann [1] documented these tensions within the context of graphic design education, showing how generative AI introduces significant conflicts between technological availability and disciplinary identity. For art students, the issue is not merely learning to use a new tool, but negotiating what it means to be an author, what distinguishes an aesthetic decision from an algorithmic suggestion, and to what extent the creative process can be delegated without losing meaning.

2.2 To Make or to Generate? Tensions in Visual Arts

Questions regarding authorship, what makes a work original, or what distinguishes creation from reproduction, have long been central debates in the visual arts, and the integration of generative AI has reignited them. As Siagian et al. [3] point out, generative AI raises critical questions about the attribution of creative work and the dilution of individual artistic contribution. When a student uses a generative system to obtain an image, define a colour palette or generate code, the *locus* of creativity becomes ambiguous, with direct implications for the formation of their expressive artistic identity and, considering the educational context, for the assessment criteria that should be prioritised to ensure academic integrity.
This ambiguity often manifests in technical domains before becoming apparent in aesthetic ones, but tends to spread throughout the entire project. When students turn to AI to solve programming problems, as the data from this survey document shows, they often do so without questioning the extent to which this technical delegation influences subsequent creative decisions. Latikka et al. [7] demonstrated widespread acceptance of the use of AI for technical optimisation across various fields of knowledge and activity, but the closer the use of AI comes to the core of creative practice in the arts, the less positive its acceptance becomes, with greater value placed on human creative intelligence and artistic expressiveness.
Making implies intentionality, embodiment, iteration, the resistance of the material, learning from error, the integration of error, and discovery during the creative design process. Generating implies prompting, selection and curation, which are real skills, but of a distinct nature. Generative systems also tend to reproduce the dominant patterns of their training data, producing results that mirror established aesthetic conventions, a tendency towards visual stereotyping that the data from this study confirm and which diminishes the possibility of a plural visual culture. The pedagogical question is not which of the two practices is superior, but whether students develop an awareness of the difference and the ability to

move between them with critical discernment, which leads us to the need to develop, with the students, the ability to identify, understand, interpret, create and communicate.

2.3 AI Literacy and Regulatory Frameworks

The concept of AI literacy refers to the set of skills that enable people to critically understand AI technologies and use them in an informed manner in different contexts of life and work [9]. This is a concept that goes beyond technical competence: it involves critical, ethical, and reflective dimensions that are particularly relevant in arts education, where easy access to tools does not guarantee a critically situated use.

In the European context, the European Commission's Ethical Guidelines [8] serve as a reference framework for the responsible use of AI in education. The document identifies four fundamental ethical considerations—human agency, equity, humanity and justified choice—and proposes a set of emerging competences for educators, organised into six domains, ranging from professional engagement to facilitating students' digital competence. It is important to highlight from this guidance document that the most advanced AI systems do not assess collaboration, social skills, or creativity, a gap of relevance to arts education. The EU AI Act [4] reinforces this framework through risk-based governance, explicitly requiring users of AI systems to ensure adequate levels of literacy. The OECD Digital Education Outlook [5] expands on this agenda at a systemic level, calling for pedagogical approaches that are not only technical but also ethical and critical, and recognising that the widespread adoption of generative AI poses specific challenges to which higher education institutions have not yet responded adequately.

A common denominator to these three frameworks, however, is their necessarily generic nature. The systematic review by Zawacki-Richter et al. [6] demonstrated that existing research on AI in higher education is dominated by perspectives from computer science and STEM fields, with a very limited presence of authors from education departments. The authors conclude that there is a critical lack of pedagogical and ethical reflection on the implementation of AI and call for research centred on the situated practices of students and educators. It is precisely this gap that the present study addresses: the need to understand students' uses of AI, what they perceive, and where they feel they need guidance. The empirical analysis that follows is based on this premise.

3. Methodology

This study adopts an exploratory and descriptive research design, combining quantitative data with open-ended responses of a qualitative nature. The exploratory approach reflects the diagnostic purpose of the study, which is to generate a situated understanding (at the Polytechnic Institute of Viseu, School of Education) of the adoption of AI among a specific student population (students in the third year of the bachelor's degree in art and Multimedia), without seeking to test pre-established hypotheses.

The data collection instrument was a structured questionnaire, developed specifically for this study and made available online in Portuguese via the Google Forms platform in October 2025. The questionnaire was preceded by an informed consent form, with participation being voluntary and anonymous. It was organised around six dimensions: 1) identification of academic year and prior experience with AI in the visual arts; 2) contexts, types of use, platform preferences and modes of access; 3) perceptions of AI within the visual arts; 4) frequency of use for personal and academic projects; 5) self-perceived autonomy in the use of AI; 6) overall opinion on the use of AI in three words. Responses were of the open-ended, closed-ended, and five-point Likert scale types.

The questionnaire was administered in a classroom setting to all students present at the respective sessions, one per academic year, with one of the co-authors always present. The total number of respondents (n=90) is distributed across the three academic years of the study programme.

The analysis of quantitative data was based on descriptive statistics, including frequencies, percentages, and measures of central tendency for the Likert scale items. The open-ended responses were subjected to content analysis with inductive thematic categorisation. Given the exploratory and diagnostic nature of the study, no inferential tests were applied.

4. Findings

4.1 Adoption Profile: Prevalence, Platforms and Contexts

The 90 students surveyed are distributed across the three academic years of the programme as follows: 40.0% are in the first year (n=36), 38.9% in the second year (n=35), and 21.1% in the third year (n=19).

Of the 90 participants, 58.9% (n=53) stated that they use or have used AI in the context of the visual arts, constituting the *corpus* for the analysis. Analysing the figures by academic year, the majority of occasional users coexist, however, with a minority of occasional users who have no experience of using these tools, suggesting that adoption, although widespread, is neither universal nor uniform.

Table 1. Students use of AI in Visual Arts.

Academic Year	Number of Responses		Students use of AI in Visual Arts			
	(n=)	(%)	Yes (n=)	Yes (%)	No (n=)	No (%)
Year 1	36	40,0%	15	41,7%	21	58,3%
Year 2	35	38,9%	22	62,9%	13	37,1%
Year 3	19	21,1%	16	84,2%	3	15,8%
Total	**90**	**100%**	**53**	**58,9%**	**37**	**41,1%**

Regarding the contexts in which AI is used in the visual arts, the questionnaire identified formal contexts in pre-university and university education, whether at the teacher's suggestion or on the students' own initiative, as well as its use for personal artistic projects. The responses point to a predominance of self-directed use by students. It is considered significant that first-year students who report using AI demonstrate a practice that was established during their high school education. As the survey was conducted at the start of the academic year, the use of AI by these first-year students is not guided by relevant higher education lecturers; however, second- and third-year students provide good indicators of the integration of AI into the teaching practice of lecturers in the Art and Multimedia degree programme. In the context of independent use of AI within the degree programme, students demonstrate increasing confidence over the course of the three-year programme, a confidence that can also be interpreted as dependence.

Table 2. Contexts in which students use AI in the Visual Arts.

Academic Year	Contexts in which students use AI in the Visual Arts									
	In secondary education, recommended by a teacher		In secondary education, on my own initiative		In current degree programme, recommended by a teacher		In current degree programme, on my own initiative		For personal art projects	
	n=	%	n=	%	n=	%	n=	%	n=	%
Year 1 (n=15)	9	60,0%	10	66,7%	2	13,3%	7	46,7%	8	53,4%
Year 2 (n=22)	2	9,1%	6	27,3%	10	45,5%	14	63,6%	10	45,5%
Year 3 (n=16)	2	12,5%	1	6,3%	7	43,8%	12	75,0%	8	50,0%
Total (n=53)	**13**	**24,5%**	**17**	**32,1%**	**19**	**35,9%**	**33**	**62,3%**	**26**	**49,1%**

Among student users, access is almost exclusively via free versions of generative AI platforms (94.3%), with ChatGPT clearly dominating the open-ended responses (notably for programming purposes, as we shall see in 4.2). Of the 46 validated responses, 44 mention the use of ChatGPT (95.7%), 27 of which exclusively (61.4%). These are followed by the platforms Gemini (18.2%), DeepSeek (6.8%), Adobe Firefly / Adobe AI (6.8%) and, to a lesser extent, BLACKBOX AI, Leonardo AI, Luma AI, ElevenLabs, Suno, Hyper3D and, for learning support or the distribution of AI resources, KnowUnity and CivitAI. Although several generative AI platforms were identified, the concentration on a general-purpose platform (ChatGPT), accessed in its most limited version, indicates that the diversity of creative AI tools available remains largely unexplored by students.

4.2 Domains of Practice: What Students Actually Do

To analyse the types of tasks for which students identified the use of AI within the field of Visual Arts (n=53), the data was collated from multiple-choice and open-ended responses, resulting in eight tasks: Programming; Generating or Editing Images; Defining Colour Palettes; Generating or Editing Audio; Generating or Editing Video; Generating 3D Models; Researching a Topic; Summarising / Improving Text. Each task is examined in terms of the total number of references made by students and then

organised by academic year. The analysis shows that Generating or Editing Images is the most frequently cited application area, having been mentioned by 26 students (49.1%). This is followed by the task of Programming with 24 references (45.3%) and Defining Colour Palettes with 16 entries (30.2%). Researching a Topic was mentioned 12 times (22.6%) and Summarising / Improving Text received 8 responses (15.1%). The domains Generating or Editing Audio, Generating or Editing Video and Generating 3D Models recorded considerably lower figures, ranging from 9.4% to 5.7%.
Analysis by academic year shows that students increase their use of AI throughout their studies, accounting for 27.3% in the first year, 33.3% in the second year and 39.4% in the third year. This progression is consistent with the evolution of the Art and Multimedia curriculum, given that the modules gradually introduce new or more complex skills and areas of application, creating a need to explore different domains of AI use.
The greatest percentage increase in usage across the three academic years is seen in Programming (+464%), suggesting that at the time of the questionnaire, first-year students had not yet explored this area (only 13.3%), in contrast to third-year students, among whom the identification of usage is widely shared (75.0%).
A comparison of AI use by the types of tasks identified by students and the platforms they use suggests that its application remains predominantly technical in nature, rather than manifesting as a tool for aesthetic or creative exploration. The disciplinary contexts confirm this trend; the most frequently cited subjects are technical in nature, followed by theoretical subjects where AI is used to support writing and research. Its use in traditional artistic practice contexts, such as drawing or painting, remains minimal.

Table 3. Types of tasks for which students identified the use of AI in the Visual Arts.

Academic Year	Types of tasks for which students identified the use of AI in Visual Arts															
	Programming		Generating or Editing Images		Defining Colour Palettes		Generating or Editing Audio		Generating or Editing Video		Generating 3D Models		Researching a Topic		Summarising / Improving Text	
	n=	%	n=	%	n=	%	n=	%	n=	%	n=	%	n=	%	n=	%
Year 1 (n=15)	2	13,30%	10	66,70%	3	20,00%	1	6,70%	3	20,00%	2	13,30%	5	33,30%	1	6,70%
Year 2 (n=22)	10	45,50%	10	45,50%	6	27,30%	1	4,50%	1	4,50%	0	0,00%	3	13,60%	2	9,10%
Year 3 (n=16)	12	75,00%	6	37,50%	7	43,80%	1	6,30%	1	6,30%	3	18,80%	4	25,00%	5	31,30%
Total (n=53)	**24**	**45,30%**	**26**	**49,10%**	**16**	**30,20%**	**3**	**5,70%**	**5**	**9,40%**	**5**	**9,40%**	**12**	**22,60%**	**8**	**15,10%**

4.3 "Practical but Addictive"

To gauge students' perceptions of their preparedness and the impact on the outcomes of AI-based projects, we included a section of questions using a Likert scale and a final open-ended question. Most responses reveal the students' ability to take a critical stance, which tends to be positive, although some contradictions are evident.
As for work efficiency, opinions are mostly distributed around the middle of the scale (43.4%), but if we combine the most optimistic ratings (4 and 5 points), we account for 86.8% of the responses.
Conversely, regarding privacy and data protection, students are divided between the scepticism of the middle of the scale (34%) and the pessimism of the lower ratings (1 and 2 points), accounting for a total of 92.5% of responses.
Students reject reliance on AI for making important decisions (Mo=1) through a significant negative rating (1 and 2 points) of 79.2%, and are unanimously critical in the aesthetic and conceptual domains, with the production of stereotypical images garnering agreement from 66.1% (scores of 4 and 5 with Mo=5) of respondents, suggesting that direct experience of using AI in the visual arts fuels, rather than dampens, critical thinking.
The need for external help is the statement with the most dispersed distribution (32.1% of responses are at points 1 and 2, 15.1% in the middle of the scale and 50.9% at points 4 and 5) and the one that contrasts most with the perceived ease of use (79.3% of students state they have no difficulty in understanding or using AI). This tension between the ease of understanding and using AI and the reliance on support for informed and efficient use is analytically relevant, particularly for pedagogical guidance, as it demonstrates that students feel prepared to perform simple AI-assisted tasks but require guidance for uses involving a higher degree of complexity.

In the open-ended responses, phrases such as “practical but addictive”, “innovative but worrying”, and “useful but destructive” succinctly capture the structural ambivalence that runs through these students’ entire relationship with AI.

5. Discussion

The results of this study show that Art and Multimedia students at the Polytechnic Institute of Viseu, School of Education use AI in a self-directed manner, focusing on a general-purpose platform in its free version, and progressively throughout their course of study.
The most significant finding regarding adoption patterns is that 95.7% of users rely on ChatGPT (61.4% exclusively), with 94.3% using the free version, in line with the findings of the study by Pontes et al [10] for students up to the age of 17. A general-purpose platform accessed in its most limited version does not equate to a diverse ecosystem of creative tools. The diversity of specialised tools for generating or editing images, audio and video, generating 3D models, Programming, and other tasks, remains largely unexplored, indicating that these students do not yet possess AI literacy in the sense defined by Long and Magerko [9]; that is, they do not yet demonstrate the ability to select, evaluate and critically use a diverse range of tools in accordance with specific objectives.
The entry of AI through the technical domain is the second relevant point for this discussion. Programming shows the greatest variation in use across academic years (+464% from the first to the third year), although this is consistent with the development of the curriculum. However, in a course where technique and expression are inseparable, this trajectory is not neutral. The delegation of coding decisions conditions, even if imperceptibly, subsequent creative decisions, a continuity that the post-digital condition helps to frame. In this regard, Conrad, Leijsen & Héritier [2] note that technical and aesthetic tools have never been so closely intertwined, but it is important to recall Latikka et al. [7], who demonstrate that public acceptance of AI is lower the closer it is to the creative decision.
Of relevance to future pedagogical implications is the dissociation between ease of use and informed critical capacity. Most students do not consider AI difficult to use but acknowledge needing guidance for efficient use and express only moderate confidence in choosing platforms.
It is worth highlighting the consistency of the assessment regarding the visual stereotypical nature of AI-generated images, which is consistent with what Siagian et al. [3] identify as the tendency of generative systems to reproduce dominant patterns from training data, thereby undermining the possibility of a pluralistic visual culture. Students are critical and sceptical regarding the adoption of AI in their artistic practice, using it with reservation, an approach that is in line with the recommendations identified as appropriate by the EU AI Act [4] and the European Commission’s Ethical Guidelines [8].

6. Conclusions

This study presented an exploratory analysis of AI adoption among Art and Multimedia students at the Polytechnic Institute of Viseu, School of Education, Portugal, which demonstrated that AI adoption is well established (n=53, corresponding to 58.9% of the total number of students surveyed, n=90) and that it occurs predominantly in a self-directed manner. The progression of students using AI within the Visual Arts, from 41.7% in the first year to 84.2% in the third, documents not an emerging trend, but an ongoing transformation to which the degree programme and the institution will need to find an appropriate response.
The implications are concrete. The institutional response should not focus on the basic introduction of the tools, which students already use, but on creating the conditions for a broader, more critical, and discipline-specific use. This implies explicitly incorporating AI literacy into the curriculum, expanding the technological ecosystem to which students have access, and recognising the scepticism students demonstrate as a pedagogical starting point, not as resistance to be overcome, in line with the priorities, recommendations and international guidelines of the OECD and the EU. The study has limitations that must be acknowledged, starting with the sample being limited to a single institution and level of study, a cross-sectional and descriptive design, and a time frame that the speed of technological evolution quickly renders outdated. Future research would benefit from longitudinal approaches, comparisons across institutional contexts, and intervention studies that evaluate specific pedagogical strategies for AI literacy in arts education.
In summary, what this study suggests is simple yet demanding: before deciding what to teach about AI, it is necessary to listen to what students already know, already do, and already question. It is from this listening that an informed, critical pedagogical strategy can emerge, one that counters the reactive stance of teachers to become proactive.

Abstract

This paper analyzes a pedagogical project developed at the University of Saint-Étienne School of Art and Design (ESADSE), in February 2026, as part of an ERASMUS+ higher education teaching mobility program, and outlines the next stage of this educational initiative based on the results obtained. The project began with meetings with representatives from the host institution's International Relations department, which allowed us to outline the objectives and prepare the in-person week. The implementation of staff mobility programs facilitate the establishment of significant educational exchanges and the strengthening of international cooperation agreements [1]. It's important to emphasize the significance of this type of program and the opportunities created through the implemented mobility: it creates opportunities for cultural exchange, leading to a cross-pollination of ideas from one institution to another. The project involved the implementation of teaching approaches in the delivery of a practical workshop on drawing, character design, and creation. This allowed us to understand how students apply concepts of creative and visual representation when developing a character within a specific framework [2]. The workshop promoted imaginative thinking among the students, by their defining of silhouettes and visually representing personality traits based solely on their understanding of an object as described by a classmate. Further educational opportunities that contributed to this understanding included the presentation of reference materials, monitoring and discussion with individual students, the promotion of communication skills, and the collection of student feedback from a survey. The monitoring and discussion along with the survey enabled the analysis of the contributions regarding the various dimensions and stages implemented. The preparation of the workshop results from teaching practice, based on the various methods and techniques of observation and representation used in the Drawing Curricular Unit (UC) of the Graphic Design degree course at the School of Design (ESD) of the Polytechnic University of Cávado and Ave (IPCA), where research, analysis and drawing stages aim to produce an illustrative representation of a character design with distinctive characteristics. Key stages leading to the creative process were applied, and the results show that the students were able to apply them in the process of creating a character design, thereby developing their critical, creative and visual communication skills. Thus, it was found that the application of specific pedagogical practices, techniques and resources inherent to drawing, as well as assessment strategies, are important analytical tools for the continuous improvement of the pedagogical approaches used in the teaching of drawing.

Keywords: *Pedagogical Approaches, Character Design, Practical Results, Erasmus Teaching Mobility*

1. Introduction

The ERASMUS+ teaching mobility scheme in higher education facilitates significant academic exchange and strengthens international cooperation [1]. Recognizing these benefits, a teaching mobility initiative was proposed to develop a workshop at the University of Saint-Étienne School of Art and Design (ESADSE). In fact, the benefits associated with this type of mobility [3] [4] were successfully fostered, particularly in terms of professional relationships and intercultural connections with partners, which laid the groundwork for future collaboration on teaching programs.
Furthermore, it is important to note that such initiatives can play an important role in institutions' educational plans, in terms of "curricular innovation and the development of study programs, teaching methods, the dissemination of best practices in teaching and research, and learning through

benchmarking"[2] (p. 121) [5, own translation]. These factors prompted us to reflect on and reorganize our teaching practices to enhance our professional development. According to Ivasciuc et al. (2025), faculty exchange programs highlight these key areas: reflective, student-centered teaching; increased student engagement; and the development of directly applicable classroom techniques (pp.4-5) [3]. These elements proved to be extremely motivating and were therefore considered in the planning of the upcoming workshop.

The teaching mobility took place between February 9th and 13th, 2026, successfully fulfilling the project's primary objectives. These goals included strengthening the partnership with the University of Saint-Étienne School of Art and Design through site visits and a formal review of their drawing curriculum. A key focus was observing and understanding the pedagogical approaches used in drawing instruction, in direct collaboration with local faculty. To further our research, the program facilitated an exchange of teaching experiences designed to foster innovation. This included the development of a student project proposal and the opportunity to observe the learning processes firsthand at the host institution.

The project began with online meetings involving representatives from the host institution's International Relations department, providing an opportunity to align objectives and prepare for the onsite visit. During these initial discussions, we outlined the intent to develop an innovative pedagogical approach through a practical character design workshop. This workshop explored how students apply concepts of creative and visual representation and the session's structure was informed by ours prior teaching experience, specifically drawing from Graphic Design degree course at the School of Design (ESD) of the Polytechnic University of Cávado and Ave (IPCA).

This paper presents the theoretical framework of the pedagogical approach, followed by an analysis of the workshop's process, the results obtained, and a discussion of future developments.

2. Pedagogical Approaches for the Workshop

Within drawing courses we teach, pedagogical activities are structured around the core competencies students must acquire: the formal language of drawing, representational techniques, and the communicative strategies essential to a designer's workflow. Accordingly, the curriculum is organized into distinct stages that guide students through foundational observation and representation, transitioning into complex exercises that demand advanced creative and communicative skills. Each student's progression is intentionally structured, ensuring that learning is evidenced by cumulative developmental responses and documented growth over time. Educators must therefore consider a variety of pedagogical strategies to determine which best facilitates the student's learning of the core content. In this regard, we have conducted research on this topic with the aim of analyzing, in a first phase and from a broad perspective, the impact of applying these pedagogical measures on student learning [6]; and, in a second phase, more specifically, on drawing-centered learning in higher education design courses.

In this regard, it is worth noting the study conducted by Suyo-Vega, Fernández-Bedoya, and Meneses-La-Riva (2024), whose primary objective was to "synthesize innovative pedagogical best practices within the university context" (p.1) [7], stating that:

> "*Its importance lies in its direct impact on the quality of university education. These best practices not only enhance the student learning experience but also strengthen the ability of academic institutions to adapt to student needs. By understanding these practices, it is possible to promote and/or improve certain strategies, thus enhancing the quality of higher education*" (p.3) [7].

With a focus on this aspect - improving the students' learning experience [8] - and recognizing that student-centered learning offers benefits "such as intrinsic motivation, personalized learning experiences, and active participation," (p. 352) [9] the goal was to contribute to this effort. Consequently, it was recognized that it is very important to continuously evaluate the pedagogical practices used in teaching drawing and the ways in which they impact the learning process. Turning to more specific content, it is worth mentioning the research by Zimmermann and Coutinho (2020), which proposes an approach to teaching drawing "based on the design process and interdisciplinary relationships"[3] (p. 157) [10, own translation], noting that such an approach involves "thinking of drawing as part of a design process, interconnected with the conception of ideas, communication among the various professionals

[2]Original Text: "Esta influência manifesta-se, segundo os inquiridos, sobretudo ao nível da inovação curricular e dos programas de estudos, dos métodos de ensino praticados, na difusão de boas práticas de ensino e investigação e na aprendizagem por benchmarking".
[3]Original Text: "abordagem de ensino do desenho baseada no processo projetual e relações interdisciplinares"

involved in the process, as well as its relationship with users"[4] (p. 166) [10, own translation]. These new approaches can be explored at various levels, manifesting in drawing exercises that center on a defined "design problem", involving the following creative processes: "Perception, Communication, Investigation, and Action"[5] (p. 167) [10, own translation]. In a way, the presentation of the assignment, along with the analysis of the students' results, illustrates the work process and the learning that took place.

In terms of the practical side of the project – workshop - was instrumental in fostering *student-centered learning* [8, 9], focused on a specific drawing problem to be solved. It is important to note, however, that the "correlation between teaching-learning methodologies and learning outcomes" (p. 121) [8] was analyzed with a view to the content to be covered in the workshop, the intended learning outcomes, and the time allotted for its implementation.

Accordingly, the workshop's work plan included an initial phase of research into how pedagogical dynamics could be structured with a view to the drawing exercise to be carried out by the students, which would involve the illustrative depiction of a character with distinctive traits [2]. In developing critical, creative, and visual communication skills, the challenge focused on depicting an animal figure, followed by an exploration of human expressions adapted to the context of the created figure. The steps were defined with the following learning practices and objectives in mind:

Practice to be implemented	Learning objectives
Present a challenge to be interpreted through drawing	Foster imagination and creativity through drawing Develop analysis of a specific topic
Encourage the practice and exploration of drawing, cutting, and collage	Promote free and capable exploration through practice Develop exploratory practical exercises
Present new questions and steps to be addressed through drawing that encourage research into themes	Encourage students to take the initiative as independent learners to research and solve the problems presented Promote research on a specific topic
Present examples as guiding elements for the drawRaising students' awareness to be developed	Provide a broader understanding of the subject Encourage research and the search for references
Give students space to ask their own questions	Enable students to manage their own autonomy in their projects Allow students to voice their questions for discussion
Promote collaborative and group work	Share their doubts and questions Foster a sense of trust and well-being among students through collaborative sharing and peer support Promote motivation and inclusion for everyone
Create an opportunity for a group drawing exhibition	Provide insight into the group's overall work Create a discussion around the various ideas presented
Collect feedback through an anonymous questionnaire	Create an opportunity to voice students' criticisms Provide an opportunity to indicate perceived difficulty levels Make available the option to be heard and offer suggestions for improvement

3. Practical Development of the Workshop

As mentioned before, the conceptual framework of this workshop is rooted in ours drawing teaching practices. These practices emphasize diverse modes of observation and representation, where research and analysis culminate in the illustrative depiction of characters with distinctive traits. The exercises are designed to be demanding, intensifying investigative practices to push students toward diverse visual solutions. This approach fosters rapid development in sketching while encouraging critical reflection on the character's movement, pose, and expression. While grounded in direct observation, the primary challenge lies in the transition: moving from a static study to representing a character from various angles and situating it within a narrative environment [11].

This staff mobility initiative allowed for an international exchange of methodologies coinciding with ESADSE's Workshop Week. Approximately 60 first-year students participated, including a small cohort of exchange students. The information related to the workshop is organized into the following four chapters:

- 3.1: Introductory Exercise: Tactile perception and memory
- 3.2: Development of Silhouettes: Experimental collage and rapid iteration

[4]Original Text: "pensar o desenho como parte de um processo projetual, interligado à concepção de ideias, à comunicação de diferentes profissionais envolvidos no processo, bem como sua relação com os usuários".
[5] Original Text: "percepção, comunicação, investigação e ação".

- 3.3: The Final Idea - Character Design
- 3.4: Finalization and Feedback

3.1 Introductory Exercise: Tactile Perception and Memory

We started the first day visiting the school and exchange information about the workshop and its demands. The practical session began the next day, in the morning, with a "blind" sensory exercise: a random student was selected to describe an abstract wooden animal sculpture using only the sense of touch. While the teachers assisted in clarifying specific descriptions, the rest of the class attempted to sketch the object based solely on the verbal cues of tactile qualities: weight, shape, and texture.
This phase was made significantly more challenging by the language barrier; as Portuguese instructors teaching a predominantly French-speaking class, some specific technical terms were inevitably lost in translation. However, we viewed this not as a hindrance, but as a pedagogical opportunity. Since the objective was to serve as a foundation for original creation, the "miscommunications" allowed for more unexpected and diverse visual results. Interestingly, despite these linguistic hurdles, the final sketches produced in this first phase bore a striking resemblance to the actual sculpture, demonstrating the power of tactile and visual communication over verbal precision.
This phase forced an exchange between the students' own visual memories and the oral description provided. A primary observation during this stage was the difficulty students faced in translating verbal-tactile information into spatial and volumetric representations on paper (Fig. 1). At the end of the description, the object was revealed, and the students compared their initial sketches with the real piece, noting the divergence between their mental constructs and the actual object.

Fig. 1. The tactile interpretation phase: a student conveys the sculpture's form through touch, while the class translates the oral description into sketches and the first examples of sketches created by the students, based on the oral description provided.

3.2 Development of Silhouettes: Experimental Collage and Rapid Iteration

Building on the initial sketches, the next phase focused on the search for silhouettes based on the description once provided. This took place right after the oral description of the object, still during the morning. In the original curriculum at IPCA, this process spans several weeks; however, for this intensive workshop, the methodology was adapted to favor speed and experimentation.
We introduced a collage-based approach using magazines and scissors. Students were encouraged to gather images (Fig. 2), or even pieces of textured papers (Fig. 3), that echoed their initial shapes to create new, unexpected visual connections. While not all students chose to use collage, some preferring to stick to traditional drawing or a mixture of both (Fig. 3), the technique was proposed as a tool to bypass creative blocks and generate a high volume of silhouettes in a short time. This stage was highly influenced by the experimental approach of Pixar Art Director Deanna Marsigliese [12], focusing on the silhouette as the foundation of character recognition. To conclude the morning session, all work was displayed on the floor for a collective viewing and discussion.

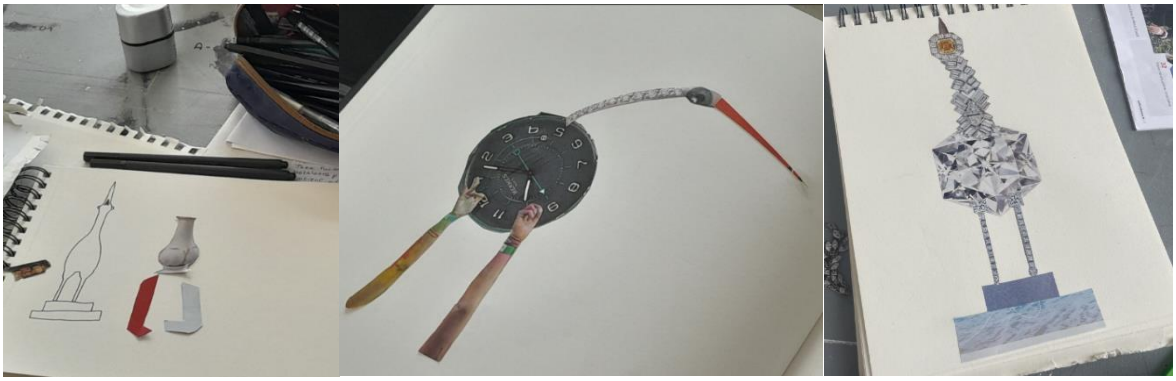

Fig. 2. Representation of the selection of different collages based on the shapes of the previous sketches and examples of collage approach created by the students.

Fig. 3. Example of the mixture of both traditional drawing and other textured paper, and examples of drawing silhouettes experimentation with the work of the students displayed on the floor of all the silhouettes created.

3.3 The Final Idea - Character Design

The final three-hour afternoon session began with a presentation of professional authors and examples of work produced by students at IPCA. This sparked an interesting dialogue regarding institutional differences; notably, ESADSE students mentioned that character design is not typically a core subject in their bachelor's program, which resulted in high engagement and curiosity toward the subject.
Following this, students selected one of their own silhouettes to refine. The objective was to move beyond the abstract shape and develop a finalized look, incorporating specific expressions and a deeper understanding of the character's anatomy. Students were free to use their preferred materials, with most opting for pencil and pen (Fig. 4). The workshop concluded with a final session of sharing the work on the floor, fostering peer-to-peer reflection on the different creative paths taken.

Fig. 4. Development of Expression, final looks of different characters, and Character Development with different poses and expressions, created by the students.

3.4 Finalization and Feedback

To conclude the study, a questionnaire was distributed to 60 participants to evaluate the methodology's impact. However, only 14 students provided detailed responses, around 23%. This lower engagement may be attributed to the post-event distribution of the survey; requesting feedback after the participants had already left proved less effective than anticipated. For future iterations, administering the questionnaire during the final minutes of the workshop would likely yield a higher response rate.
Here is a description of those results of the pedagogical approach: 86% of the students expressed high satisfaction with what they learned, with 93% stating that the level of difficulty was perfectly calibrated to their skills. Notably, despite the language barrier, 100% of respondents found the instructors' explanations to be clear, underscoring the effectiveness of using visual and tactile demonstrations as a universal teaching language.
The experimental "silhouette collage" technique, which was a specific adaptation for this 8-hour format, was particularly well-received, with 71% of the group finding the materials and methodology engaging. The final word clouds highlight that students most valued the "playful" and "experimental" nature of the project.
Furthermore, the data suggests a lasting impact on the students' creative interests:

- 79% of participants expressed a desire to continue developing their characters beyond the workshop.
- Students identified several paths for future development, specifically mentioning animation, 3D modeling, and the exploration of multiple poses and environments.

In conclusion, the feedback confirms that there is a significant interest in Character Design within the ESADSE students. The workshop succeeded in bridging the gap between abstract observation and finalized character illustration, providing students with a new set of tools for rapid iteration and creative expression. Also, the data collected in the questionnaire served as important analytical tools [13], thereby helping to consolidate the practice that had been implemented and encouraging its continuation in the future.
At the conclusion of the workshop, it was clear that the defined steps had facilitated a working process that enabled the achievement of the learning objectives initially set.

4. Future Developments

Building on the results of the initial workshop at ESADSE, the next stage of this initiative aims to transition from a short event focusing on individual drawing techniques toward a comprehensive, structured exchange program. By leveraging the Erasmus+ Blended Intensive Program (BIP) model, we intend to deepen students' drawing practice through a character-driven storytelling project, while maintaining the agile, collaborative nature of international mobility.
Regarding the program's theme, character design serves as an ideal interdisciplinary base for exploring drawing practices. It sits at the intersection of various fields, requiring students to synthesize anatomy, semiotics, narrative structure, and technical software proficiency. This multifaceted nature allows the program to bridge the gap between creative expression and professional design requirements, while having the chance to think about their creative work through differentiated drawing practices.
Regarding the structure, the transition to a BIP model is a pedagogical imperative. As noted by Ivasciuc et al. (2025), faculty and student mobility are critical for fostering reflective teaching and high levels of student engagement [3]. Extending the timeframe through a blended format will allow for a deeper exploration of project-based learning, where cultural exchange and collaborative practice become integral to the design process. This structural shift directly supports institutional goals, as mobility schemes are proven facilitators of curricular innovation and the dissemination of best practices through international benchmarking [1] [5].
Future iterations will maintain the spirit of graphical experimentation while introducing project-based constraints. These will challenge participants to evolve from experimental studies to a more structured design process, where drawing serves as the foundational skill for creativity, ideation, and communication. By introducing guidelines for specific outputs – such as animation, video games, branding, or mascot design – we enable students to explore the various dimensions of character creation, professional design processes, and the impact of characters on society. This extended timeframe allows for a deeper synthesis of creative expression and technical requirements, such as readability and functionality. Consequently, students learn to utilize drawing as an essential tool in their artistic education and future careers.
Ultimately, this program offers a dual benefit: it provides teaching staff with a platform for cross-institutional pedagogical reflection and curriculum development, while offering students an intensive

environment to refine their artistic practice. This model ensures that the initiative remains responsive to both the creative interests of the participants and the evolving professional demands of the design field.

5. Final Considerations

The ERASMUS+ teaching mobility enabled the achievement of the objectives set during the workshop at ESADSE. It is considered that the benefits of this faculty exchange were realized, as evidenced not only by the academic mobility between institutions, but also, above all, by a useful and stimulating reflection on how to employ teaching approaches that promote student learning in a specific subject.
The work process developed during this professional and cultural exchange was extremely important and motivating, contributing to the teachers' professional development and to the establishment of cultural ties that open opportunities for future collaboration on teaching programs.
In the context of mobility, the workshop preparation focused on analyzing pedagogical approaches that could actively contribute to a process with structured learning objectives. Accordingly, the practical component involved several stages, and a work plan was developed that was initially presented during the initial online interactions with the higher education institution and then implemented during the in-person week.
The approach adopted focused particularly on a practical, *student-centered learning process*, with a drawing problem to be solved serving as the starting point. Creativity and the imaginative process were explored through defined stages, beginning with the creation of a character design based on a real object that was only revealed later. The defined practices were implemented with the primary goal of providing students with an experiential, collaborative, discussion-based, and sharing-oriented learning experience, and to assist them in this creative process.
The results show that the students were able to develop this creative and critical reflection process, as documented during the final presentation and in the feedback provided by the students in the questionnaire. Applying the questionnaire was undoubtedly a very useful strategy. However, expanding the questionnaire's reach to more students will be an area for improvement in the next phases of this project.
The aim is to continue this project by expanding the workshop into a Blended Intensive Program. This program will continue to promote interaction among higher education institutions, recognizing that the extended timeframe will allow for a deeper exploration of other contents and will continue to provide teaching staff with a platform for pedagogical reflection, with ongoing analysis of the application and impact of teaching practices on the learning process.

Curriculum Development

Cultivating Future Engineers: An Integrated Project-based Learning Model in Learning Factory – A Case Study in Chinese Engineering Education

Zhanzhan Liu[1], Qing Zhang[1] *, Wenyi Zhang[1]

[1]Fundamental Experimental Teaching Department, Nanjing University of Aeronautics and Astronautics, China

Abstract

With the rapid development of artificial intelligence and automation technology, the role of information technology and human-machine interaction in modern engineering manufacturing has become increasingly prominent. However, traditional engineering education curricula are mostly limited to single-discipline knowledge transmission, making it difficult to meet the demands of future engineers for composite knowledge, systematic thinking, and innovative capabilities. To address this, we proposed a 3D project-based learning (PBL) model that integrates the "Learning Factory" concept. The model relies on high-fidelity industrial production environments, introduces real engineering constraints, and designs a tiered task structure of "general entry + open challenge." By constructing a 3D teaching framework comprising "Design Thinking – Do (engineering practice) – Develop (iterative extension)," it standardizes and guides the implementation of project directions across different specialties. Currently, this model has been implemented on a university engineering practice teaching platform, covering real industrial projects including intelligent manufacturing production lines, industrial robot material handling, and intelligent audio systems. An analysis of 575 undergraduate students shows that student performance in the project course is positively correlated with prior academic achievement (GPA) but was not fully explained by GPA. This suggests that the model provides students with opportunities to demonstrate abilities through forms of performance beyond conventional academic assessment.

Keywords: *Learning Factory, Engineering Education, Project-Based Learning*

1. Introduction

Manufacturing work is increasingly organized around digital systems, automation, data, and human-machine collaboration. In Industry 4.0 settings, production is connected with cyber-physical systems, networked services, real-time data, and flexible manufacturing, which has pushed engineering programs to reconsider curriculum, laboratory work, and student project activities [5], [8]. Studies of future engineers' skills under Industry 4.0 also suggest that universities need to respond to changing educational and workforce requirements rather than treating digital production as a matter external to engineering education [13]. Discussions of Industry 5.0 extend this pressure by highlighting disciplinary convergence, human-centric design, and human-machine interaction as parts of future engineering work [6].

For undergraduate education, this change requires more than adding new technical content. Future engineers need to handle complex, cross-disciplinary problems and connect engineering knowledge with professional skills and real-world practice [7], [17]. PBL environments have been associated with students' perceived development of teamwork, communication, self-directed learning, and problem solving, which helps explain why generic competences have become a central concern in engineering education [3]. The curriculum problem therefore concerns both what students should know and how students move from problem framing through design, implementation, and iteration.

Project-based learning offers one route for creating such experiences. Reviews of PBL in engineering education show that it has been widely adopted because of its expected contribution to professional knowledge and transferable skills [4]. Recent work also links PBL with real-world skill development when projects are connected with technology, integrated curriculum, multidisciplinary work, simulation, and professional environments [11]. However, a project becomes educationally valuable when the task is well framed, students are supported during implementation, and the learning process connects to broader curriculum goals. This problem becomes sharper in engineering practice courses that contain multiple project modules. PBL practices differ across course, cross-course, curriculum, and project

levels, and recurring challenges appear for students, teachers, and institutions [4]. For a large-scale engineering training platform, the central question is how different projects can share a common learning process across modules.

Multidisciplinary PBL cases make this point more concrete. Collaborative engineering projects involving several specialties require coordination of project phases, partner roles, resources, and assessment of both technical and professional learning [9]. Integrated multidisciplinary PBL cases using Design Thinking also show the need for targeted supervision, trained teaching teams, and attention to the learning process rather than the prototype alone [14]. Teachers need to act as instructional designers and scaffolders; without this, PBL adaptations lose effectiveness [16]. These studies show that cross-disciplinary project learning requires coordinated scaffolding across project assignments.

Learning Factory approaches provide a useful environment for this kind of curriculum problem. Abele et al. [1] describe Learning Factories as systems that combine learning or teaching with production environments and support experiential learning in realistic manufacturing settings. The Heilbronn Learning Factory shows how project-based production engineering can be organized around industrial-like activities while developing professional and social competences [2]. Sackey et al. [15] propose didactic design parameters for an Industry 4.0 Learning Factory. Learning Factory thinking is relevant because it makes production flow, constraints, collaboration, and improvement visible as connected parts of engineering practice.

The present case is situated in a Chinese university engineering training center, where extensive equipment and practice resources serve students from diverse majors, years of study, and technical backgrounds. In this setting, the main challenge is how to organize diverse project directions into a coherent curriculum.

In this paper, we proposed an integrated Learning Factory-based 3D PBL model for a university-wide engineering practice course platform. The model connects different project directions through Design Thinking, Do, and Develop, and is illustrated through industrial production-line and other smart-product projects. Student-level GPA and course-score data are used as a supplementary exploratory analysis of whether project-course performance reflects practical and integrative performance beyond prior academic achievement. The study does not test the causal effectiveness of PBL; its contribution is to explain a curriculum construction logic for large-scale, cross-disciplinary engineering practice education.

2. A Learning Factory-Based 3D PBL Course Platform

The course design examined in this paper starts from an institutional context. The engineering training center serves the whole university, receives students with varied technical backgrounds, and operates a portfolio of short-cycle engineering projects. In this setting, the main curriculum problem is how to organize diverse project directions into one coherent engineering practice platform. The Learning Factory-based 3D PBL model is used for this purpose. It gives different project directions a shared process of Design Thinking, Do, and Develop, while each direction retains its own technical content.

The engineering training center is a university-wide unit that provides engineering literacy and skill development. Engineering training is a required, credit-bearing component with variable load depending on the program: art and management students may take one- or two-credit craft projects; those in engineering typically complete three to five credits, totaling 32 to 160 training hours.

The center serves more than 3,000 students each year, drawn from engineering, science, art, management, and other schools, most participating between the second and third undergraduate years. Some need initial exposure to engineering processes and product thinking; others are ready for circuits, robotics, programming, or system-level design. A curriculum for this setting has to preserve disciplinary differences while maintaining course coherence.

2.1 Project-Based and Learning Factory-Based Curriculum

To make the system more effective, each project is constructed as a project-based engineering practice unit. Most project units carry 1-2 credits. A typical unit is a two-credit, 64-hour project completed over approximately two weeks by teams of three to four students. The expected outputs include a physical artifact or operational system, a technical development report, and a final presentation or defense. These outputs define a complete practice cycle: students interpret a task, plan functions, divide work, learn necessary techniques, implement and test the system, and explain the result.

The project portfolio currently contains around fifteen directions and continues to expand. These directions are grouped into four major clusters: Aerospace and Advanced Systems, Intelligent Systems and Robotics, Smart Devices and Embedded Systems, and AI and Intelligent Perception. Figure 1

presents the full project portfolio. These directions are project tracks within one course platform. They carry distinct technical requirements, but they are governed by a common learning process.
The platform uses a tiered task structure to make this common process workable for mixed-background students. Teachers provide a project theme and a function list divided into basic, advanced, and open-ended functions. Basic functions define the minimum task boundary for all teams. Advanced functions create technical depth. Open-ended functions allow students to add features, optimizations, or product ideas according to interest and capability. This structure accommodates students at different preparation levels.
The Learning Factory approach turns the center's equipment and projects into a curriculum environment. The engineering training center has equipment, practice spaces, embedded systems, robots, manufacturing resources, and intelligent application scenarios. These resources create the material basis for engineering practice, but the old curriculum mainly focus on equipment operation. A student may operate a machine, assemble a component, or complete a procedure without understanding system flow, design constraints, team coordination, or the relation between a technical decision and an application context. In this course platform, Learning Factory logic treats project tasks, tools, constraints, collaboration, testing, and iteration as connected parts of learning. This enables a shared 3D PBL process to guide diverse project directions.

2.2 The 3D PBL Model for Course Organization

The 3D model operates at the course-module level rather than the curriculum-system level. Frameworks such as CDIO guide how entire engineering programs are structured across multiple years. The 3D model addresses a different problem: how to govern the practical process within short-cycle project modules so that diverse directions share a common learning sequence. As shown in **Figure 2**, the model consists of Design Thinking for task entry, Do for implementation under engineering constraints, and Develop for iterative improvement and explanation.
Design Thinking creates the entry into the engineering problem. Students analyze the task context, identify user or application needs, examine requirements, and recognize constraints before implementation begins. Market analysis and application investigation bring scenario, demand, cost, feasibility, safety, product function, and industrial relevance into the task. Students also draw system flowcharts, decompose functions and technologies, and identify the knowledge they need to learn during implementation. This phase gives students with different backgrounds a shared way to interpret the project before they begin using equipment or writing code.
Do turns the planned solution into technical work. Depending on the project direction, students may design circuits, order and solder PCB boards, model product housings, manufacture parts, assemble mechanisms, program controllers, configure industrial robots, integrate sensors, apply AI algorithms, test systems, or debug abnormal behavior. Implementation exposes dependencies among requirements, components, manufacturing conditions, testing environments, and team decisions. Operation is tied back to the functions and constraints identified earlier.
Develop turns first completion into improvement and explanation. Students examine whether the outcome meets the original requirements, identify remaining problems, refine the solution where possible, document the process, and present the result. Teacher guidance and process review continue throughout the project rather than appearing only at final submission. The open-ended function items make iteration necessary because teams often need to adjust goals, improve stability, refine interfaces, or optimize systems after feedback. A partially successful project can still produce learning when students can explain what failed, why it failed, and how the solution could be improved.

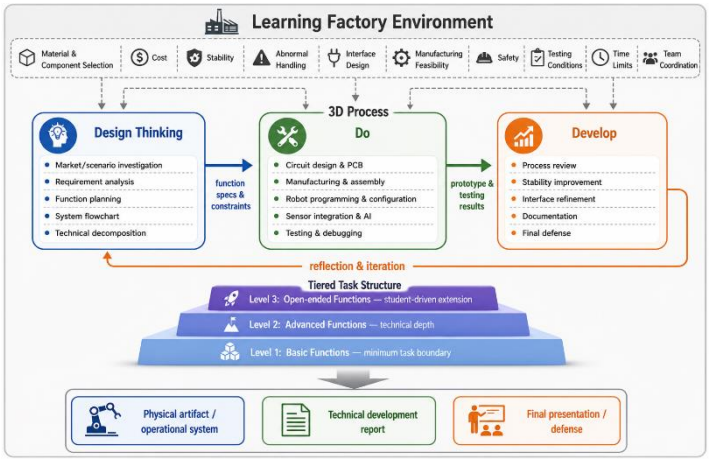

Fig. 2. The integrated Learning Factory-based 3D PBL model

2.3 Course Assessment

The 3D model aligns project directions through process requirements. Design Thinking focuses on problem framing and function planning, Do on implementation and testing, and Develop on review, documentation, and defense. This alignment works for a broad course platform whose project directions are technically diverse.

Assessment follows the same construction logic. In the current course design, project quality acceptance accounts for 40% of the grade, final defense for 20%, technical development report for 20%, and engineering literacy for 20%. Project quality focuses on whether the artifact or system meets required functions and operates with acceptable stability. The report and defense evaluate how students explain design decisions, testing results, and improvement plans. Engineering literacy is assessed through process observations, including collaboration, safety awareness, cost consciousness, and professional conduct.

This assessment structure keeps the platform from being judged only by final product completion. The final artifact is one piece of evidence alongside the broader process of implementation, testing, and iteration. The 3D model thus gives technically diverse project directions a common educational structure.

3. Representative Project Cases

The cases in this section are selected to make two routes of the course platform visible. The industrial robot production-line project represents learning through production flow, equipment coordination, tooling, and process stability. The electronic system and smart product projects represent learning through demand analysis, circuit design, fabrication, debugging, product integration, and presentation. They are representative rather than exhaustive. Other directions in the platform, such as AI vision inspection, intelligent vehicles, UAV autonomous systems, spacecraft design, aircraft power systems, and flapping wing robots, follow the same course logic with different technical content.

3.1 Case 1: Industrial Robot Production-Line Project

The industrial robot production-line project places students in a production-like task environment. The baseline task requires teams to complete a product-oriented process around an aluminum workpiece. Students must connect robot motion with tooling, process sequence, safety, and product quality.

In Design Thinking, students analyze the production task, identify required operations, clarify the handling and processing sequence, and draw a process flowchart. The teacher-provided function list gives all teams a baseline task, while advanced and open-ended items allow teams to go further. One advanced task asks students to adapt a gripper so the robot can hold a writing brush and complete calligraphy strokes. This requires a non-standard end-effector: students must handle grip structure, trajectory control, and tool-center-point setting.

In Do, students work with robot programming environments to configure task paths, test action sequences, adjust coordinates, and debug failures. Typical problems include inaccurate positioning, unstable transfer, unsuitable processing paths, and unsafe motion. In Develop, teams compare the result with original requirements, revise parameters, and present their debugging process in the final report and defense.

3.2 Case 2: Electronic System and Smart Product Development Projects

Electronic system and smart product projects represent another route of the course platform. Examples include oscilloscope systems, smart sockets, and intelligent audio systems. These projects require students to develop a usable device, from demand analysis through circuit design, fabrication, and product assembly.

In Design Thinking, students analyze the use situation and product functions before circuit design begins, clarifying measurement, control, safety, and interface requirements. The function-list structure defines a clear design scope for each project: basic functions set the minimum product behavior, advanced functions add technical depth, and open-ended functions allow teams to improve stability and usability. This structure also supports mixed-background teams, as students can contribute through different roles.

In Do, students use EDA software to design circuits, fabricate PCB boards, solder components, model an enclosure, and integrate the circuit, housing, interface, and program into a product prototype. Implementation problems often appear as noisy signals, unstable measurement, poor circuit-housing fit, or unreliable control. In Develop, teams revise circuits, adjust enclosures, improve stability, and explain remaining limitations in the final defense. The product allows students to discuss trade-offs among function, cost, reliability, and usability.

The two cases show how different project carriers enact the same curriculum construction logic. In both cases, students begin by clarifying the problem and constraints, then implement a system under practical conditions, and finally review, document, and defend their work. This shared process keeps the portfolio coherent.

4. Learning Effects and Exploratory Analysis

Due to data limits, the analysis has a narrower diagnostic purpose. It examines whether the project course gave students opportunities to demonstrate forms of performance that were not fully predicted by prior academic foundation.

GPA serves as the comparison variable because it represents prior academic foundation accumulated through conventional, examination-oriented coursework. If the project course assessed the same type of learning as theory courses, course scores would closely mirror GPA rankings. The analysis uses complete matched records of 575 students from one college who had both GPA and numeric course scores in the project course. Course registration data for a subset of students provided additional boundary indicators, such as self-reported prior foundation and team average GPA. Project directions were not compared because students selected certain project as they wanted.

The 575-student sample shows a high level of course completion and performance. The mean course score was 86.74, with a standard deviation of 7.24 and a median of 88. The score distribution was concentrated in the upper range: 69.7% of students scored 85 or higher, and 39.8% scored 90 or higher. This pattern fits the nature of a guided project-based engineering practice course.

The high-score concentration should be interpreted through the assessment standard. The final grade is based on project quality acceptance, technical development report, defense, and engineering literacy. This process-oriented assessment gives students multiple ways to demonstrate performance through implementation, debugging, collaboration, documentation, and presentation. It also creates a ceiling effect, because final scores alone cannot fully distinguish the quality of design reasoning, teamwork, iteration, or engineering judgment.

4.1 GPA and Course Score Correlation

Prior GPA was positively associated with project-course performance. In the matched sample, the Pearson correlation between GPA and course score was $r = 0.43$, $p < 0.001$, and the Spearman correlation was $rho = 0.49$, $p < 0.001$. A simple linear regression showed that GPA explained 18.9% of the variance in project-course scores, $R^2 = 0.189$. A sensitivity check excluding scores below 60 produced a similar result, $r = 0.42$ and $R^2 = 0.176$. These results show that prior academic achievement matters in the project course.

The same results also show that GPA has limited explanatory power over course performance. If project-course scores were almost entirely determined by GPA, the course would mainly reproduce students' existing academic ranking. The observed pattern shows that GPA is related to performance, but most score variation remains outside the GPA-only model. This result is consistent with the assessment structure of the course, which includes implementation quality, technical reporting, defense, and engineering literacy in addition to task completion.

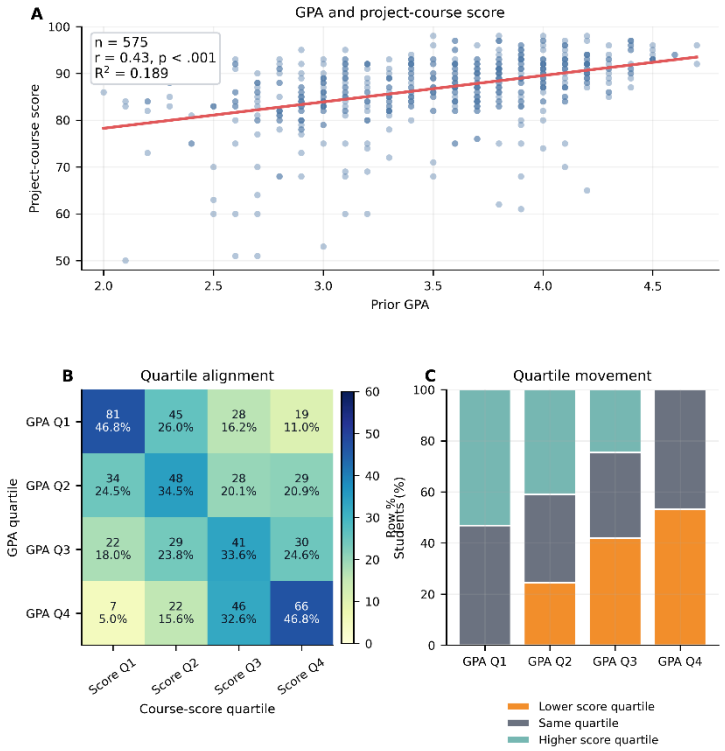

Fig. 3. Association between prior GPA and project-course scores (N = 575). **(a)**Scatterplot of GPA vs. course score with regression line (r = 0.43, R^2 = 0.189); **(b)**Cross-tabulation of GPA quartiles and course-score quartiles. Only 41.0% of students remained in the same quartile; **(c)**Movement from GPA quartile to course-score quartile.

The quartile comparison provides additional descriptive evidence. The cross-tabulation between GPA quartiles and course-score quartiles showed a statistically significant but moderate association, *chi-square* (9, N = 575) = 122.99, $p < 0.001$, *Cramer's* V = 0.27. Only 41.0% of students were in the same GPA and course-score quartile, while 59.0% were placed in a different course-score quartile. Among students in the lowest GPA quartile, 53.2% moved to a higher course-score quartile. This comparison should be read as supplementary because course scores were concentrated in the upper range, but it supports the same bounded interpretation: the course-score distribution was not a one-to-one reproduction of the GPA distribution.

The lower-GPA group provides a concrete view of this performance space. Among students with GPA at or below 3.0, 41.3% obtained project-course scores of 85 or higher, and 14.7% obtained scores of 90 or higher. In the lowest GPA quartile, 46.2% reached 85 or higher and 17.9% reached 90 or higher. A residual check led to a similar interpretation: 60.7% of students in the lowest GPA quartile scored above their GPA-predicted value, and 26.6% exceeded the predicted value by more than five points. The supported claim is narrow: strong project-course performance was not restricted to students with the strongest prior GPA.

The subset of registration data helps define the boundary of this claim. Students who reported prior research experience, competition experience, or related technical preparation had higher project-course scores than those without such records, with an average score of 89.94 compared with 86.56. In the metadata-linked subset, adding self-reported prior foundation increased the explained variance only slightly, from 21.8% to 23.6%. Team average GPA was also associated with course score, r = 0.43, $p <$ 0.001. These results confirm that background experience and team conditions still matter in an open-ended engineering practice environment.

The exploratory analysis supports a bounded interpretation of the curriculum: the project course gave students different opportunities to demonstrate performance. This interpretation is supported by the fact that project-course performance was associated with prior GPA but had substantial unexplained variance. The course-score distribution partly departed from GPA-based academic ranking, and many lower-GPA students achieved strong or above-predicted project-course outcomes. These findings are consistent with the idea that the course assessed practical, collaborative, and process-oriented work in addition to prior academic achievement.

5. Discussion and Conclusion

The Chinese engineering training center context gives the model a specific educational meaning. Such centers often function as university-wide platforms rather than as ordinary course units. They may have substantial hardware resources, manufacturing spaces, robots, embedded systems, and digital equipment, while also serving large numbers of students from different schools. This institutional form creates a tension. The center has the resources to provide rich engineering practice, but its students vary widely in background, motivation, professional goals, and technical preparation.

The integrated 3D PBL model addresses this tension by combining accessibility with challenge. Basic functions give all teams a feasible entry point. Advanced functions provide technical depth. Open-ended functions allow students with stronger preparation or clearer interests to extend the project. Teacher guidance and process review prevent the course from becoming an unguided competition in which only previously prepared students can benefit. The Learning Factory environment keeps the work connected to engineering constraints.

The model also fits the cross-disciplinary nature of the platform. Students from non-engineering or less technically intensive programs may complete different levels of technical exploration compared with students from automation, computer science, or mechanical engineering. They can still participate meaningfully through user scenario analysis, product design, process planning, documentation, presentation, or market-oriented investigation. Students with stronger engineering backgrounds can engage more deeply with control, circuit design, programming, AI, manufacturing, or system integration. The shared process allows both forms of participation to remain within one course system.

Several limitations should be made explicit. The study is based on a single university engineering training center, so the model should be understood as a context-rich case rather than a universally validated framework. The quantitative evidence is exploratory and does not include a comparison group, pre-post competence measures, or validated scales. The current analysis also does not directly measure the competencies that the model targets, such as systems thinking, interdisciplinary integration, or innovation. These require more direct evidence aligned with the 3D process in future work.

Within the limits of a single-case exploratory design, this study offers a practical contribution to engineering education. The integrated Learning Factory-based 3D PBL model provides a curriculum mechanism for making project-based learning coherent, guided, and expandable in a large-scale practice platform. By aligning problem framing, implementation, and iterative development, the model helps diverse students encounter engineering work as a process of reasoning, making, testing, improving.

Perceptions of Secondary Stage Students of the Role of the School Library in the Development of Reading and Writing Skills in Kuwait

Khuloud Alazemi[1], Bibi Alajmi[2]

[1,2]Department of Information Studies, College of Social Sciences, Kuwait University, Kuwait

Abstract

This study explores the perceptions of the role of the school library in supporting reading and writing development among secondary stage students in Kuwait. Employing a quantitative research method, this study uses a structured questionnaire to collect data from secondary stage students regarding their views, experiences, and attitudes toward the role of the school library in supporting their reading and writing skills development. This research contributes to improve reading and writing skills development among students in the secondary stage and to enhance understanding of the educational role of the school library. Moreover, the study places the school library within the broader educational context as a learning environment which supports literacy development and students' engagement. By highlighting students' perceptions, this research sheds a light on how school libraries are viewed not only as resource centers but also as potential active agents in the learning process, academic growth, and skill development. The findings provide insights that may inform educators, school leaders, and policy makers about the necessity of developing curriculum that integrate the school library effectively within the secondary stage education system, in particular reading and writing instruction. This research also offers implications for improving library practices and promoting effective usage of the school library as a crucial part of the learning process.

Keywords: *school libraries; reading skills; writing skills; secondary stage students; Kuwait*

1. Introduction

Reading and writing are the cornerstone of lifelong learning, personal development, and academic progress. They are not merely about decoding and recognizing words, but also involve critical thinking, understanding, and communication skills that enable the modern student to navigate the learning environment. In Kuwait, enhancing reading and writing remains an ongoing challenge, especially among secondary stage students, despite ongoing curriculum modifications. Many students still struggle to acquire the essential literacy skills needed for lifelong learning and academic success.

In an ever-changing technological world and an increasing flow of information, the importance of solid reading and writing skills cannot be overstated. Strong literacy skills influence students' educational progress and personal development as they shape academic trajectories, professional opportunities, and lifelong learning goals. These skills are also recognized as critical factors for sustainable development, which makes their cultivation a central priority for educational systems worldwide. In Kuwait, this challenge is compounded by diverse student backgrounds, varying levels of learning skills, and unequal access to learning resources, all of which create additional barriers to developing robust reading and writing competencies.

School libraries, rich in educational resources and potential learning support, have been neglected and underutilized over the years. This raises an essential question about how students perceive the contribution of school libraries to their reading and writing development. This study therefore aims to explore secondary stage students' perceptions of the role of the school library in supporting reading and writing skills development.

2. Significance of the Study

The significance of this study lies in its potential to bridge a key gap in understanding how school libraries are perceived to contribute to the enhancement of students' reading and writing skills within Kuwait's secondary education system. By exploring students' perceptions, the research highlights the educational value of libraries not only as repositories of knowledge but also as dynamic learning environments that can cultivate curiosity, critical thinking, and academic competence.

3. Problem Statement

Enhancing reading and writing skills among students in Kuwait, particularly secondary stage students, is an ongoing challenge. Although the Ministry of Education has implemented curriculum improvements, many students still struggle with these skills, especially as they are necessary for lifelong learning. Diverse student backgrounds and unequal access to educational resources have contributed to the complexity of skills development in Kuwaiti schools.

School libraries, despite their rich resources, are often neglected and underutilized. Over the years, the role of the school library in supporting the curriculum has diminished, raising a crucial question: how do secondary stage students perceive the role of school libraries in the development of their reading and writing skills? The research aims to explore these perceptions and highlight the perceived significance of library resources in enhancing reading and writing skills development.

4. Literature Review

Benefiting from school libraries in supporting the curriculum is widely recognized as a vital step toward enhancing students' literacy skills [1] [2]. Research emphasizes that the professional role, leadership, and self-efficacy of school librarians strongly influence students' information literacy because librarians guide them in locating, evaluating, and using information effectively [3] [1]. Studies in Kuwait similarly indicate that school librarians' practices—when aligned with curriculum goals and supported by adequate training—contribute to improved information literacy and academic growth through targeted activities and instructional support [2]. These findings position the school library as more than a repository of books; it is a structured learning environment that can scaffold students' engagement with reading and writing tasks [1] [2].

A substantial body of international research shows that well-resourced and professionally staffed school library programs are associated with higher levels of student achievement and reading motivation [4] [5] [7]. When libraries receive sufficient funding, maintain diverse and up-to-date collections, and employ qualified librarians, students tend to display stronger reading outcomes, higher test scores, and more positive attitudes toward reading [7] [8] [9]. Large-scale studies from multiple U.S. states and other countries report that students in schools with effective library programs and trained staff often outperform peers in schools where such provision is weak or absent [4] [7] [10] [12]. These effects are frequently observed even after controlling for socioeconomic factors, suggesting that the quality of the school library program can make an independent contribution to literacy outcomes [7] [10] [12].

The characteristics of effective school libraries are consistently highlighted across the literature. Key features include the presence of a full-time qualified librarian, a rich and varied print and digital collection, access to technology, and systematic collaboration between librarians and classroom teachers [4] [7] [8]. Conceptual work on school libraries describes them as "dynamic agents of learning," arguing that their informational infrastructure supports deep learning when it is embedded in classroom instruction rather than treated as an add-on [13]. In such models, librarians co-design lessons, teach information literacy, and provide ongoing guidance on research and writing tasks, thereby strengthening students' independent learning skills [13] [14].

Information literacy frameworks further underline the central role of school libraries in teaching students to locate, evaluate, and ethically use information [1]. Evidence shows that many students rely heavily on search engines and rarely apply critical evaluation criteria, which underscores the need for explicit instruction in information and digital literacy [15]. School libraries that integrate structured information literacy programs into the curriculum help address these gaps by offering guided practice in evaluating sources, using digital platforms, and citing materials appropriately [1] [13].

The literature also establishes a close link between reading proficiency, academic success, and lifelong learning, with poor reading skills placing students at continued risk of underachievement [6]. School library programs that provide diverse, age-appropriate materials, promote both curricular reading and reading for pleasure, and ensure equitable access to books can mitigate these risks [7] [9]. Time spent reading, supported by library resources, has been shown to improve vocabulary, writing style, grammatical competence, and spelling, particularly for students who may not have alternative access to books at home [9].

Finally, collaborative relationships between librarians and teachers emerge as a recurring factor in successful library programs [8] [13] [14]. When librarians are recognized as instructional partners, and when library activities are integrated into classroom assignments, school libraries are more likely to contribute meaningfully to students' reading and writing development [7] [8] [13]. These international

and local findings provide an important foundation for examining how Kuwaiti secondary school libraries can function as active agents in promoting literacy skills and supporting quality education.

5. Methodology

5.1 Research Design

This study uses a quantitative research design to explore students' perceptions of the school library's role in developing reading and writing skills through a structured questionnaire. The questionnaire was selected for its ability to gather data from a larger group efficiently and to provide an accurate representation of participants' views and experiences.

5.2 Data Collection

Data were collected using a structured questionnaire distributed to students through the online learning management system MyU. Responses were recorded electronically through Google Forms. The questionnaire included closed-ended and Likert-scale items, and students were informed of the purpose of the study, assured of anonymity, and participation was voluntary.

5.3 Participants and Sampling

The participants consisted of secondary school students enrolled in grades 10, 11, and 12 at one selected secondary school. The school was chosen based on accessibility and institutional cooperation. A total of 62 students completed and submitted the questionnaire and constituted the final sample. A convenience sampling technique was employed due to accessibility and feasibility within the research timeframe.

5.4 Instrument

The data collection instrument was a structured electronic questionnaire created using Google Forms. It included sections on demographic information, school library habits, perceptions of the school library, reading skill support, writing skill support, and one open-ended question for further comments. The questionnaire items were adapted from established instruments used in studies of school library impact and collaboration. They were reviewed to ensure clarity and relevance to the Kuwaiti secondary education context and organized into sections measuring students' school library habits, perceptions of library resources, and perceived support for reading and writing skills [4] [5] [8].

6. Findings

6.1 Demographic Information

Table 1. Demographic Information

		Frequency (n)	Percentage (%)
Gender	Female Male	100%	
Grade	10	20	32.3%
	11 Arts Track	18	29%
	11 Science Track	17	27.4%
	12 Arts Track	-	-
	12 Science Track	7	11.3%

All participants were female students. In terms of grade level, 32.3% were from grade 10, 29% from grade 11 arts track, 27.4% from grade 11 science track, and 11.3% from grade 12 science track, while there were no participants from grade 12 arts track.

6.2 School Library Habits

Table 2. School Library Habits

Statement	Frequency (n)		Percentage (%)
How often do you visit the school library?	Daily	-	-
	Several times a week	8	12.9%
	Once a week	4	6.5%
	Several Times a month	4	6.5%
	Rarely	25	40.3%
	Never	21	33.9%
On average, how much time do you spend in the school library per visit?	Less than 15 minutes	37	59.7%
	From 15 to 30 minutes	23	37.1%
	From 30 to 60 minutes	2	3.2%
	More than an hour	-	-
What is the primary reason for visiting the school library?	Reading for fun	22	35.5%
	Research and Academic Work	11	17.7%
	Use of library computers	3	4.8%
	Attend a library event	4	6.5%
	Meet friends/Socialise	17	27.4%
	other	5	8.1%
Did you visit the school library this academic term?	Yes	42	67.7%
	No	20	32.3%
How do you usually hear about library activities or new resources?	School Advertisements	23	37.1%
	Teachers	12	19.4%
	Friends	13	21%
	Library Staff	1	1.6%
	Posters	13	21%
Do you have a library membership/card?	Yes	1	1.6%
	No	61	98.4%

The findings indicate limited school library use. While 12.9% of students visited the school library several times a week, 40.3% reported visiting rarely and 33.9% reported never visiting. Most students spent less than 15 minutes per visit. Reading for fun was one of the most common reasons for visiting the library, but nearly all students reported not having a library membership card.

6.3 Perceptions of the School Library

Table 3. Perceptions of the School Library

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
The school library provides activities or programs that contribute to my literary development	-	11.3%	29%	41.9%	17.7%
The school library offers learning materials and resources that support my academic success	3.2%	1.6%	33.9%	41.9%	19.4%
The school library staff provide assistance that helps students feel supported and included.	1.6%	-	21%	51.6%	25.8%
I regularly use the school library for reading or writing-related activities.	4.8%	14.5%	33.9%	30.6%	16.1%
The library's resources are up-to-date and relevant for developing reading and writing skills.	4.8%	12.9%	24.2%	38.7%	19.4%

Students generally expressed positive views about the school library's resources, staff support, and contribution to academic success. Many agreed that the library provides activities and materials that support literacy development and that staff assistance helps students feel supported and included. However, regular use of the library for reading or writing-related activities was weaker than these positive perceptions.

6.4 Reading Skill Support

Table 4. Reading Skill Support

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
The school library provides effective resources (such as books, reading lists, or digital materials) that help improve my reading skills.	4.8%	6.5%	30.6%	43.5%	14.5%
The school library organizes reading programs or events that motivate me to read more often.	6.5%	12.9%	19.4%	35.5%	25.8%
The school library provides quiet and comfortable spaces suitable for focused reading.	-	6.5%	16.1%	38.7%	38.7%
The school library recommends books that match my reading level and interests.	1.6%	4.8%	25.8%	40.3%	27.4%
The school library provides access to digital reading platforms (e.g., e-books or audiobooks) that support my reading practice.	6.5%	14.5%	25.8%	35.5%	17.7%
The school library staff assist me in finding reading materials that support classroom learning.	-	11.3%	32.3%	40.3%	16.1%
The school library displays reading materials that promote a reading culture among students.	3.2%	4.8%	32.3%	45.2%	14.5%

Students' perceptions of the library's contribution to reading development were largely positive. Many agreed that the library provides effective reading resources, quiet and comfortable spaces, suitable recommendations, digital reading platforms, and materials that promote a reading culture among students.

6.5 Writing Skill Support

Table 5. Writing Skill Support

	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
The school library offers reference materials (e.g., grammar guides, writing manuals) that help me improve my writing skills.	1.6%	8.1%	30.6%	46.8%	12.9%
The school library provides access to digital tools or research materials that support academic writing.	1.6%	6.5%	37.1%	41.9%	12.9%
The library staff assist students in locating materials that strengthen research and writing assignments.	1.6%	3.2%	33.9%	46.8%	14.5%
The school library organizes workshops or sessions focused on improving writing skills.	6.5%	11.3%	22.6%	43.5%	16.1%
The library provides access to citation tools and writing software (e.g., Grammarly, Turnitin, etc.).	4.8%	6.5%	38.7%	37.1%	12.9%
The library offers examples of high-quality student essays or research projects for guidance.	1.6%	8.1%	33.9%	37.1%	19.4%
The school library collaborates with teachers to support writing assignments and projects.	3.2%	1.6%	29%	38.7%	27.4%

Students also reported generally positive perceptions of the library's role in supporting writing skills. Many agreed that the library offers reference materials, digital tools, staff assistance, workshops, examples of student work, and collaboration with teachers to support writing assignments and projects. Nevertheless, writing-related support appeared less visible in practice than reading-related support.

7. Discussion

This study shows a clear contrast between students' positive perceptions of the school library and their low level of actual use. Students generally recognized the value of the library's resources, spaces, and staff support, especially for reading development, but many did not visit the library regularly. This suggests that the availability of resources alone does not guarantee regular use or strong engagement. The very low rate of library membership and the limited frequency of visits indicate a weak library culture within the selected school. This implies that, despite the presence of resources and supportive staff, students may not perceive the library as an integral part of their everyday learning practices. The disconnect between positive attitudes and actual usage mirrors international findings that passive provision of resources alone does not foster engagement; rather, integration into classroom activities, active promotion, and clear alignment with curriculum tasks are needed to encourage regular library use.

The findings also indicate that reading support appears stronger and more visible than writing support. Responses to the open-ended question suggest that students want dedicated library periods, more workshops, more active promotion, and a wider variety of books and resources. These suggestions point to the need for stronger integration of school libraries into classroom learning and daily school life, where librarians and teachers work together to design activities that support both reading and writing development.

8. Conclusion

This research investigated secondary stage students' perceptions of the role of school libraries in developing reading and writing skills in Kuwait. Using a questionnaire with 62 female students from one selected secondary stage school, the study found that although students recognize the importance of

school libraries, actual usage remains limited. The findings highlight the need for stronger promotion, better visibility of services, and closer collaboration between librarians and teachers.
Future initiatives should focus on positioning the school library as an active part of the curriculum rather than a supplementary facility. This can be supported by integrating library resources into classroom activities, promoting regular library visits, strengthening staff support, and improving access to resources for both reading and writing.
For educational professionals, the findings underscore the importance of treating the school library as a collaborative partner in teaching rather than an optional add-on. Strengthening collaboration between librarians and teachers, investing in digital and print resources that support both reading and writing, and promoting structured programs such as dedicated library periods, workshops, and reading or writing competitions can help transform the library into an active learning hub. For policymakers and school leaders, the results highlight the value of funding, staffing, and policy frameworks that support sustained library-based literacy initiatives in Kuwaiti secondary schools.

Incentivizing Continuous Learning to Master New Skills and Knowledge in Engineering Undergraduate Students: Collaboration Strategy and Performance Assessment

Elena Gabriela Cabral Velázquez[1], Luis Alberto Mejía-Manzano[2], Manuel Antonio Caudillo Melgoza[3], Alondra Yuliana Ramírez Suaste[4]

[1,2,3,4]Tecnologico de Monterrey, School of Engineering and Sciences, Mexico

Abstract

The current Educational Model of the Tecnologico de Monterrey frames teaching-learning strategies that ensure the development of competencies at the end of the student's professional training process. These competencies are key elements to perform and adapt head on work and social scenarios currently unforeseen. On this line, the present work integrates results of an experience at a specific level, which promoted the development of transversal competencies according to the expected attributes to crown the graduation profile in engineering. With emphasis on the knowledge-skills guiding axis, an activity was designed collegially, requiring addressing content, solving a real problem, and integrating a performance evaluation system to manage one's own learning. The deployment involved active learning strategy linked to a collaborative work system. The essential elements of the methodology were the definition of roles, the setting of common objectives, teamwork and its processing, as well as recognizing and generating a positive interdependence with a high level of responsibility and commitment on the part of the student. The obtained results were: approximate a global process developing activities typical of professional practice; confirm the degree of progress in skills such as problem solving, evaluation of components and own reasoning; and evaluate and provide feedback on the process to project it into equivalent scenarios.

Keywords: *Higher education, Lifelong learning, Active Learning, Collaboration, Transversal Competencies, Student performance*

1. Introduction

The accelerated growth of today's societies demands the inclusion of professionals who solve complex problems and drive progress and transformation towards a common good [1]. Thus, an unavoidable change in training processes is expected from education that privileges the development of strategic competencies and, in turn, promotes reflection on the need to sustain the development of professional and personal competencies, it is to say, encourages lifelong learning [2]. Under this premise, in the Educational Model of the Tecnologico de Monterrey, which is based on competencies [3], strategies and training experiences contextualized in a reality for ensuring, the capacity to act in the face of challenges of a changing and uncertain world, we performed an opportune intervention for foresting lifelong learning framed on the active learning linked to a collaborative work system with engineering students enrolled in the first year of the exploration stage, 2022 – 2023.

2. Development

2.1 Theoretical Framework

In today's societies, there are great challenges to create value and prosper, in order to achieve the well-being of people [4], which shows the need for greater collaboration among actors, distinguishing their different development and leadership capacities [5]. Regarding the insertion of professionals with a greater capacity for action, adaptation, interaction and reflection for decision-making [6], it entails a significant condition of comprehensive training contextualized in real experiences and under the framework of learning to learn, learning to do, learning to live together and learning to be [7]. Therefore, it is essential to distinguish vital functions of responsibility, leadership and resilience, both at the individual and community level, that is, with individual capacities and social competencies [8].

Lifelong learning is a broad term that refers to continuous learning throughout a person's life. Organizations like the European Commission, UNESCO, and the OECD agree that it involves the ongoing development of knowledge, skills, and competencies [9]. A literature analysis allows to identify the skills that are considered for lifelong learning, these may be classified as cognitive, meta-cognitive and social-emotional skills. The first group contemplates problem solving, critical thinking, information literacy and research skills; the second group has self-direction and lifelong learning orientation, reflection, learning regulation and planning (stepwise processing, self-testing), learning management; and the third group are teamwork and collaboration, oral and written communication, empathy and personal agency, networking and social support [10, 11, 12, 13, 14]. Particularly, in engineering students, the development of lifelong learning skills acquires essential importance due to rapid technological change, globalization, and evolving labor market demands. Studies have already emphasized that engineering graduates must develop not only technical expertise but also transferable skills [15,16]. Literature research on the topic since 2019 focuses on the idea that lifelong learning enables engineering students to continuously improve their competencies, update their knowledge, and remain professionally relevant throughout their careers [17]. Under this panorama, it is undeniable that higher education institutions have a fundamental role in the integration of experiences for the formation of those skills and in preparing them to adapt to future challenges.The framework of the Tec21 Educational Model of the Tecnológico de Monterrey (MTec21) defines for its students the development of transversal and disciplinary competencies for their comprehensive training (**Figure 1**); these transversal competencies relate the student to their environment [18].
The present work was based on challenge-based learning (CBL) and collaborative learning (CL), integrating a performance evaluation system to manage one's own learning [19, 20].

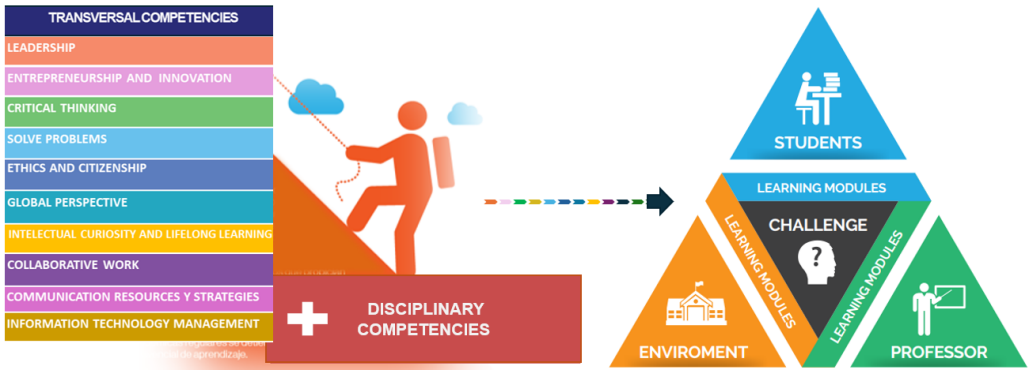

Fig. 1. Main transversal competencies and their linking to disciplinary competences in Tec21 Model

For the development of these competencies, four methodological actions are planned that allow the development of competencies to be organized and put into practice according to the level and moment in which the student is:

1. Analyze the competencies and their impact with other competencies in the study plan;
2. Plan and coordinate the development of problems to be solved in order to achieve mastery of the competencies established in a training unit;
3. Select the most appropriate ways to promote the learning of conceptual, procedural and attitudinal content in an integrated manner;
4. Use a varied selection of teaching strategies [21].

2.2 Innovation Description

In terms of the TEC21 Educational Model, an activity was designed that addresses the need for changes in training spaces to promote a high capacity for skill development and application of knowledge, which integrates elements of an active process of collaboration and life experience under the guiding axis of knowledge mastery-skill development, as well as the curricular definition that leads the student to complete their comprehensive training process based on transversal (TC) and disciplinary (DC) competencies. For the planning of the exercise, focused on the student and the level of competency development, a base collaboration group responsible for the deployment, monitoring and evaluation was integrated, made up of teachers linked to the course of training units or UF (Spanish acronym for Unidades de Formación), effectiveness staff and student mentoring [22].

The activity aimed at engineering programs (2019 plans) of the Tecnológico de Monterrey, established in the first and second periods, scheduled in the second academic semester February-June of 2023, allowing the inclusion of students, 28 and 30, enrolled in the Bioengineering and Chemical Processes, Innovation and Transformation, and Applied Sciences avenues.

Essential parts

Competencies

- Identification of the level of scope and linked UF, **Figure 2.**

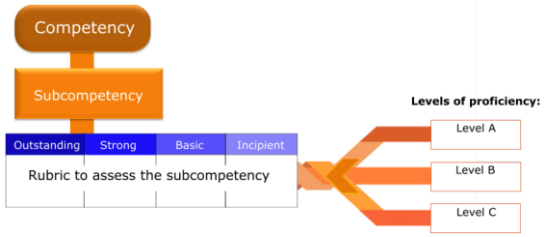

Fig. 2. Context of achievement levels when competency is assessed in a UF

- Attitudinal and procedural knowledge that precedes, student's own conditions, progress-moment in the study plan.

Didactic strategy and auxiliary techniques:

- Active learning, linked to reality and Collaborative Learning (CL) to maximize individual and group learning; both focused on seeking to develop skills in challenge resolution (CBL), openness to dialogue, interaction and reflection.
- Training in key elements of the base academic group, MTec21 Didactics.
- Integration of collaborative work teams.

Significant spaces for collaboration:

- Classroom and laboratories for individual activities that are integrated into teamwork, with elements of a work context (problems, definition of common objectives, leadership, self-management to reach completion and delivery).

Procedural and attitudinal content

- Modularization of theoretical-practical content.
- Definition of stages for solving the problem
- Guiding conditions to know the criteria for participation and development of the activity.

Evaluation:

- Evaluation committee made up of the group of teachers.
- Observation rubric, measurement of the competencies by individually evaluating evidence based on key actions, **Table 1.**

Table 1. Example of bases for the structuration of an observation rubric

Competencies		Quality criteria
Correctly solves problems of reality, based on precisely delimiting the problem and the intervening variables, selecting and strategically applying the appropriate methods and techniques to analyze information, and correctly interpreting. Integrate the results to propose the solution.	Solves the questions of reality	correctly
	Defines the problem and the variables	with precision
	Selects and apply methods and techniques	relevant
	Interpret the results	in integrated way

The evaluation considers general observation rubrics and survey. The general observation rubrics measures the progress on the challenge, content, self- and peer-assessment (**Table 2**) while survey supports the final stage of evaluation and reflection. As indicated in **Table 2**, the level of achievement is defined in four terms: Outstanding 100 (greater than or equal to 95), Solid 88 (81-94), Basic 75 (70-80) and Incipient 55 (Less than or equal to 69).

Table 2. Observation rubric example

Nivel	Outsanding	Solid	Basic	Incipient
	100	88	75	55
Generic Descriptor	Shows *optimal performance* , corresponding in its totality (or almost) to the demands of the sub-competencies, aligned with the correct defined for the evidence.	Shows *appropriate performance* , corresponding mainly to the demands of the sub-competencies, aligned with the correct defined for the evidence.	Shows *acceptable performance* and manages to meet the minimum demands of the sub-competencies, aligned with the context defined for the evidence.	Shows poor *performance* and therefore fails to meet the demands of the sub-competencies, aligned with the correct defined for the evidence.

As technological tools, Canvas platform, Excel and Mentímeter were used.

2.3 Implementation of the Innovation

The academic group in charge, previously trained, participated in a differentiated way, assuming various roles: action research, designers, facilitators, mentors, tutors, and evaluators. The mentor and director facilitated interviews and information that allowed the evaluation of scenarios of action by the students, for example risk factors. It should be noted that, due to an agreement on the handling of confidential information, some data and real names of people are omitted in this report.
The competencies to be developed were identified, which are conducive to the graduate profile of the engineering careers (Chemistry, Biotechnology, Sustainable Development, Industrial Engineering, Data Science Engineering, Mechanics Engineering and Agrochemistry).
The participating UFs were: F1010B-Application of thermodynamics in process engineering (24 students) and F1011B-Analysis of electrical systems in process engineering (30 students). By delimiting the work's extension, an example of identified TCs is shown in **Table 3.**

Table 3. Example of TCs in the UF impacting the graduate profile

Competencies in UF	Level of achievement	Graduate profil competencies
Solves problems and questions about reality, based on valid and reliable methodologies.	A	Solve problems
Evaluates the solidity of one's own and others' reasoning, based on the identification of fallacies and contradictions, which allows them to form their own judgment regarding a situation and problem.	A	Critical thinking
Evaluates various information technologies, with openness in the search and implementation of relevant alternatives in the transformation of professional practice	A	Management of information technologies

To justify the expected levels of achievement in the focus groups, two actions were carried out:

- The preparation in knowledge and skills of previous UFs (F1002B Period 1: Process modeling and F1003B Period 2: Conservation laws in process engineering) was recognized (**Tables 4** and **5),** beginning on the exploration stage.

Table 4. Competencies and achievement level at UF, first and second semester

Stage: Exploration. Disciplinary Competencies			
UF/Disciplinary Competencies	**Substantiates**	**Solve Problems**	**Period**
F1002B	Explains (A)	Make decisions (A)	1/2nd
F1003B	Demonstrate (A)	Implement actions (A)	1/3d
F1010B	Explains (B)	Evaluate components (A)	2/1st
F1011B		Evaluate components (A)	1/2nd
		Generate proposals (A)	

Table 5. Competencies and achievement level at UF, first and second semester

Stage: Exploration. Transversal Competencies				
UF/ Sub Competencies	**Reasoning**	**Comunication**	**Digital Transformation**	**Semester/ Period**
F1002B	Critical Thinking Solves question problems (A)	Written language (A)		1/2nd
F1003B	Scientific Thinking Solves question problems (A)	Written language (A)		1/3d
F1010B			Evaluate and look for alternatives (A)	2/1st
F1011B	Scientific Thinking Solves question problems (A) Scientific Thinking Evaluate your own reasoning (A)			2/2nd

- A general overview of risk and protection factors was provided for review, the measurement of which is derived, in terms of High, Normal and Low levels, from the application of a survey upon admission, for example:
  - *Resilience (R). Adaptive ability to get ahead or recover from a stressful situation.*
  - *Comprehensive well-being (CWB). Social and psychological prosperity, taking an interest in one's activities, feelings and emotions.*
  - *Psychological flexibility (PF). Positive evaluation of emotions, coping with feelings and emotions.*
  - *Goal orientation (GO). Setting goals and having the motivation to achieve them.*
  - *Support networks (SN). Perceiving that they have the support of peers, family, tutors and mentors*.

The percentage of students in the interest groups that reflected a Low level in the different protection factors were *R*: 29 %; *CWB*: 14 %; *PF*: 7 %; *GO*: 7 %. Only *SN* showed a response at High and Normal levels.

Then, the workspaces and theoretical-practical content were established by the academic team defining:

- Classrooms for interaction and laboratories for experimentation.
- Modularization and programming oof dosed knowledge during the process of solving the challenge (corresponding to Mathematics, Computing and Physics in a greater concentration).
- Multidisciplinary teams of 3-4 members.
- Active process that integrated the elements of collaboration to solve a challenge, and programming of the theoretical-experimental progress, of the time period corresponding to 5 weeks (**Figure 3**).

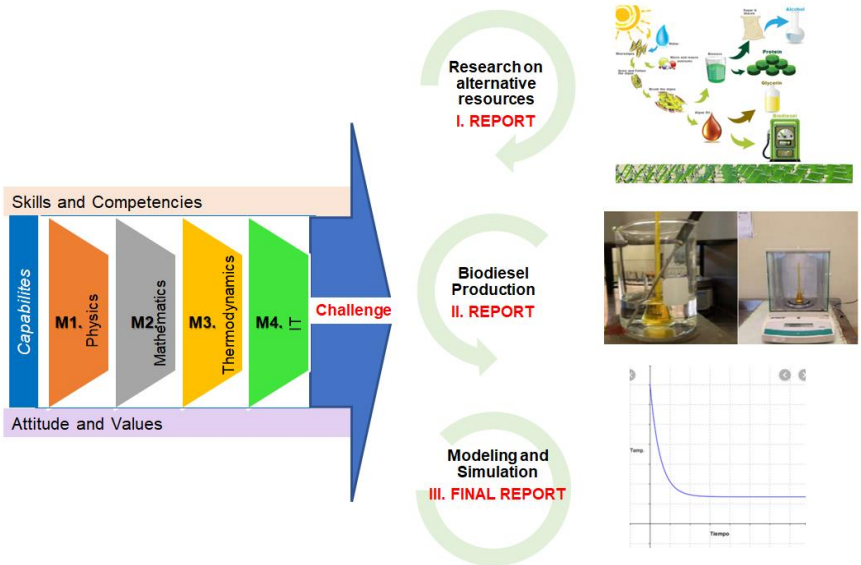

Fig. 3. Example of modularization of content in a UF

Example of challenge: *Modeling and Simulation of the charge and discharge processes of an RC circuit powered with an alternating voltage source*

Objective: Design and build an electrochemical cell system using natural substrates that supplies voltage to an RC circuit and simulate its charge and discharge process in Matlab.

The performance measurement corresponding to a level of competency achievement was carried out based on the observation guides and is exemplified in **Table 6**, with an individual measurement.

Table 6. Example of individual result obtained from the observation rubric

Student A	Outstanding	Strong	Basic	Incipient	Did not provide evidence
	4	3	2	1	0
SEG0502 Solves problems and questions of reality, based on valid and reliable methodologies					
SEG0502	Correctly solve the questions of reality, starting from precisely defining the problem and the intervening variables, selecting and strategically applying the relevant methods and techniques for information analysis, as well as correctly interpreting the results to propose the solution.	Correctly solve the questions of reality, starting by clearly defining the problem and the intervening variables, by strategically selecting and applying the relevant methods and techniques for information analysis, as well as by correctly interpreting the results to propose the solution.	Partially solves the questions of reality, by defining the problem and/or the intervening variables with imprecisions, by selecting and applying the relevant methods and techniques for information analysis inconsistently, as well as by interpreting the results in an acceptable way to propose the solution.	Incorrectly solves the questions of reality, by vaguely delineating the problem and/or the intervening variables, by selecting and applying the relevant methods and techniques with errors for the analysis of information, or by misinterpreting the results to propose the solution.	Did not provide evidence

In parallel and through the availability of information on the institutional platform, a comparison was generated between the interest group and the total population, regarding the level of achievement of the competencies (**Figure 4**).

Fig 4. Example of a comparison of achievement levels, interest group – total population

3. Results and Discussion

Educational models require a component of systematic analysis on variables that intervene in the process to contextualize the moment and conditions in which the student finds himself; giving way to the design of strategies, methodologies and guidelines that favor the development of competencies; expressed with continuous adaptation.

Collegial collaboration, Academia, Mentor, and Institutional Effectiveness were essential to guide the work in a clear and strengthened context within the educational process that required the mastery of knowledge and development of competencies.

Through the Mentimeter platform managed by the collegiate group, the application of perception and training monitoring surveys was made possible at the end of the period, they recognized in collaborative work the following skills: analysis-synthesis, decision-making, communication, and time management (**Figure 5).**

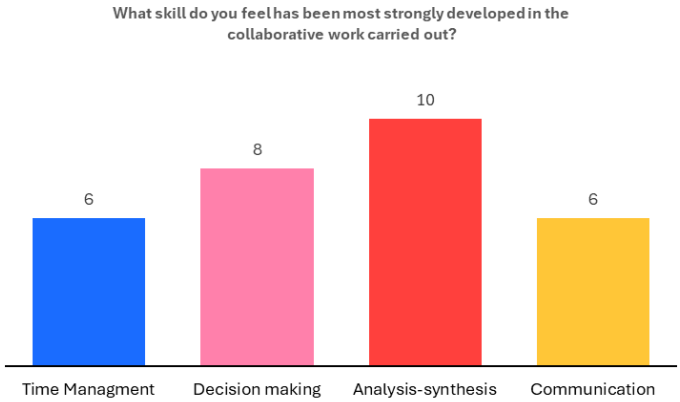

Fig. 5. Example of perception and trainned skills in collaborative work, interest group

- To carry out collaboration: co-responsibility, active listening, tolerance.
- For professional development: problem solving, knowledge of processes, evaluation of properties
- Skills learned from someone on the team that helped improve the learning process: understanding, optimism, resilience and not giving up, tolerance, problem solving, analysis and description, analytical thinking, commitment, effort, perseverance, methodology, dedication, preparation time.
- When facing the resolution of a real problem: Knowledge of methodologies for problem solving, life experience, learning in a real context, development of skills.

Results obtained from the institutional survey confirmed that the strategy is a favorable condition for achieving objectives:

Student A: … *it makes me more perseverant, especially learning to study, to know the origin of things and indirectly forcing myself to grow as a person*.

Student B: … *feeling limited in concepts and computing generated a lot of frustration, but when I began to analyze the problems and look for ways to justify them, I accepted the challenge to continue.*

The identification of precedents and the analysis of the competencies to be developed in relation to their level of achievement and impact on the competencies defined in a graduate profile, was essential to contextualize the moment and the conditions that the student presented during the process of developing the competencies.

The incorporation of differentiating elements of auxiliary techniques such as active and collaborative learning, to a base scenario of challenge resolution, fostered significant learning environments and the development of skills; In summary, the student:

- Faced with the scenario of searching for and analyzing alternative solutions to a proposed challenge in multidisciplinary collaboration teams, being sensitive to the need to know to collaborate, showing more open behavior, flexibility and tolerance in interaction and more active participation.
- Distinguished in practice the different roles of the group members: project integrator, guide for the fulfillment of objectives, results verifier.
- Skills for interaction were strengthened such as listening and effective communication.
- In the solution process, he analyzed and evaluated components, reflected on conditions, made contributions from his area of knowledge, formulated judgments on the proposal and made decisions.
- It was important for the student to work in a collaborative and orderly manner, allowing him to learn from others, learn and apply methodologies, and enhance the development of new skills in the context of co-responsibility and organization.

The integrated measurement by the evaluation of individual evidence confirmed the level of achievement of the competencies. Although, due to the interest of the study, emphasis was placed on the DCs of the UF, the analysis of the skills that are recognized to be developed or strengthened allowed us to conclude about the impact on other graduation competencies: leadership, intellectual curiosity and passion for learning, collaborative work.

Similar results were found in similar studies and contexts. In a case study in the linguistics department at Necmettin Erbakan University in 2018-2019, 28 students in a Project-Based Learning (PBL) declared in the interviews that the activity dealing with a social problem developed in them skills such as active learning, creativity, motivation and critical thinking; these considered lifelong learning skills [23]. In another work at the Portucalense University in Portugal with 18 students of the first year of the Social Education bachelor´s program, the students recognized critical thinking, capacity for initiative, creativity and project management (research skills, decision making and organization) like lifelong learning skills gained when they had a PBL experience using generative artificial intelligence (IA) tools for supporting the project development [24]. Both references evidence the role of CBL at the university level for enhancing lifelong learning skills.

4. Conclusions

The challenging world requires professionals with constant abilities for lifelong learning. These skills can be shaped in undergraduates in higher education through real contextualized experiences with CBL. Tec21 Model, with their elements, contributes to the development of lifelong learning skills found as transversal or disciplinary competencies in its engineering programs. Hence, in this intervention, a formed academic group with multiple roles designed real scenarios where engineering students of the second semester solve problems by applying TCs and DCs in a collaborative environment with CBL and giving them theoretical and practical content.

In the applied surveys, the undergraduates manifested that during the collaborative work, analysis-synthesis was the skill better developed, followed by decision making in second place, and time management and communication as both skills in the third place.

The results show the impact of the experience when incorporating differentiating elements in the teaching-learning process for the development of competencies in response to a need for change. Among some other findings, several important ideas were found and reaffirmed. Personalizing learning maximizes life experiences and reflection, thereby emphasizing the flexibility of the scenarios. A collaborative environment raises the capacities to do, based on continuous learning and social interaction, governed by cognitive flexibility, leading to more open, organized, and systemic behavior.

As final reflexion, it is recommended that the experience be projected in equivalent scenarios, suggesting to continue with the study to systematize the relationship between risk factors and development of competencies throughout the curricular program and obtain more conclusive results.

Mandatory AI Use as a Catalyst for Reflective Practice in Graphic Design Education

Ivo Fonseca

ID+ Research Institute for Design, Media and Culture
Department of Communication and Art, University of Aveiro, Portugal

Abstract

The growing presence of Artificial Intelligence (AI) in creative workflows has intensified debates around authorship, originality and learning in higher education. This paper critically reflects on an experience-based pedagogical intervention implemented in a Master's programme in Graphic Design, where the use of AI was made compulsory rather than restricted. Students were asked to design a personal self-promotion kit, combining printed artefacts and a digital portfolio, while maintaining a structured diary documenting their interaction with AI tools throughout the design process. Drawing on a qualitative analysis of students' reflective reports, process diaries and teaching observations, the study examines how enforced transparency and documentation influenced students' learning and design thinking. Rather than framing AI as a productivity tool or a threat to academic integrity, the intervention approached AI as an object of critical literacy within studio-based learning. Findings indicate that AI was predominantly used as a cognitive and organizational support for early-stage exploration, problem framing and technical facilitation, while its limitations, such as visual standardization, literal interpretations and weak material sensitivity, were consistently identified. The requirement to document iterations, failures and decision-making processes fostered reflective practice and slowed down otherwise accelerated workflows, reinforcing students' awareness of authorship and responsibility. Mandatory engagement with AI did not diminish creative agency; instead, it repositioned students as critical mediators who curate, evaluate and transform algorithmic outputs through human judgement. The paper argues that integrating AI within reflective, process-oriented pedagogical frameworks can strengthen critical thinking, ethical awareness and AI literacy in design education, offering a constructive alternative to prohibition-based responses to emerging creative technologies.

Keywords: *Artificial Intelligence; Design education; Reflective practice; Design authorship; AI literacy*

1. Introduction

The rapid normalisation of generative Artificial Intelligence (AI) in creative workflows has produced an unsettled debate within higher design education. On the one hand, design professionals increasingly describe AI tools as instruments of ideation, prototyping and acceleration; on the other, design educators face the difficult question of how to introduce these tools into curricula without either prohibiting them – and pushing their use underground – or naturalising them as a transparent productivity device. Both responses, in different ways, sidestep what is arguably the central pedagogical challenge: cultivating, in design students, a critical literacy in generative AI that treats it as an object of inquiry rather than as a tool of mere convenience.

The literature has begun to articulate this challenge but has only partially answered it. Recent scoping work [9] indicates that, while research on generative AI in design education has grown more than sixfold since the public release of ChatGPT in late 2022, the field remains methodologically nascent and theoretically thin: most studies do not specify measurable outcomes, employ no theoretical framework, and concentrate on a narrow geographic range. The same review identifies graphic design as a particularly under-researched sub-discipline. Within this emerging literature, Fleischmann's recent work [10, 12] proposes a structured curricular response to the integration of generative AI in design education and documents converging international practices – including the requirement that students submit "AI usage statements" alongside their work. Across these contributions, the curricular proposal is broadly consistent: AI literacy should be foregrounded, prompt engagement should be made visible through reflective documentation, and the designer's reconfigured role – as curator, mediator, decision-maker – should become an explicit object of teaching. What this literature does not yet provide is sustained empirical analysis of what such a structured curricular response produces when implemented and rigorously analysed.

This paper presents one such analysis. The empirical site is a Master's-level elective unit in Graphic Design, in which the use of generative AI was made compulsory rather than optional, and reflective documentation in the form of a weekly experimentation diary was made obligatory. Nine students developed a personal self-promotion kit articulating a printed component and a functional website, with AI integrated as an explicit support across all four phases of the design process. The corpus of technical-critical reports and process diaries produced by these students is here analysed through reflexive thematic analysis [4]. The aim is not to determine whether students benefited from AI, nor to measure the effect of AI on creativity, but to surface the patterns through which students articulated and made sense of mandatory engagement with AI within a structured pedagogical context.
The paper makes two contributions. First, it offers an empirical test of the structured curricular response that the literature has so far formulated chiefly at the level of proposal, documenting a set of findings that complicate the prevailing vocabulary of efficiency and threat. Second, it positions a Portuguese case within a sub-disciplinary and geographic gap – graphic design, Southern European higher education – that the most recent scoping review of the field [9] explicitly identifies as under-investigated.
The remainder of the paper is organised as follows. Section 2 situates the work within the pedagogical traditions of design and the emerging literature on generative AI in higher education. Section 3 describes the pedagogical context and the assignment design. Section 4 articulates the methodological procedure and its ethical commitments. Section 5 presents the four themes that organise the findings. Section 6 discusses their implications, and Section 7 concludes by noting limitations and proposing directions for further inquiry.

2. Theoretical Framework

2.1 Reflective Practice and Process-Oriented Learning in Design Education

Design education has long understood itself as a discipline of practice rather than of declarative knowledge. The studio, identified by Shulman as one of the professions' signature pedagogies [15], is where students develop technical skill alongside professional judgement and the capacity to act under uncertainty. At the heart of this pedagogical model lies Schön's account of reflective practice [1] and its dual notions of reflection-in-action and reflection-on-action: the designer learns by acting, observing the consequences of action, and articulating the knowledge that emerges. Kolb's experiential learning cycle [2] provides a complementary structure, and Cross [3] adds that designers' problem-framing is constitutive rather than derivative – designers do not solve problems given in advance but construct the problem in the act of proposing solutions. Together, these frameworks justify the place of the journal, the diary or the process portfolio in design pedagogy: reflection becomes consequential only when it is rendered visible and traceable.

2.2 Generative AI in Higher Design Education: An Emerging and Uneven Field

The emergence of generative AI in higher education has produced an expanding but methodologically uneven literature. A recent scoping review by Musiienko [9], drawing on 156 studies indexed in the Web of Science Core Collection between 2017 and 2026, documents a 6.4-fold increase in publication volume following the public release of ChatGPT in late 2022 while concluding that the field "remains theoretically underdeveloped and methodologically nascent". Among design sub-disciplines, graphic design is dramatically underrepresented, accounting for only 1.9% of the corpus, despite the centrality of image-generation tools in current AI discourse, and is explicitly identified as an under-researched discipline requiring focused investigation [9].
Within this emerging field, the work of Fleischmann offers the most sustained programme of inquiry into generative AI in design education. Two studies are particularly relevant: a survey of 74 design students at an Australian university [10] and qualitative interviews with nine design educators across El Salvador, Indonesia and Denmark [12]. The latter identifies three transversal themes: AI as a "thinking partner", the persistence of manual-first pedagogy as a cognitive anchor, and the rising importance of "prompt literacy" as a new professional competency. Across both studies, Fleischmann consistently argues that AI should be introduced into design curricula in a structured rather than *ad hoc* manner, and that reflective documentation of AI use should function as a metacognitive strategy rather than as a procedural requirement. However, neither study analyses the student-produced material that such a structured curricular response generates. The present paper is positioned within this gap.
The broader literature converges on a vocabulary that is internally consistent across institutional contexts. The designer is repeatedly described as moving from "maker" to "curator" or "director" of AI-

generated material [9, 12]. Bartlett and Camba [11] document, in product design education, concerns about originality and ethics that closely parallel those expressed in the graphic design context. Hwang and Wu [13], working with image-generation tools in a graphic design course, propose the figure of the "content creator" as a way of describing the designer's reconfigured role. Lupetti et al. [14] add a further dimension, drawing attention to the environmental costs of generative AI in design education and arguing for a critical literacy that includes ecological reasoning. This last contribution is especially relevant because environmental concerns emerged spontaneously in the present study's corpus, suggesting that the issue is not idiosyncratic but part of a wider critical horizon.

Two critical perspectives complete this framing. Selwyn [6] argues against the technosolutionist narratives that frame AI primarily as an efficiency device, urging a vocabulary of literacy, context and power. Bearman, Ryan and Ajjawi [7] map the discourses of AI in higher education and identify three dominant framings – efficiency, threat to academic integrity, and inevitable opportunity – none of which adequately captures the pedagogical question of how AI becomes an object of critical inquiry rather than a tool of production. Holmes, Bialik and Fadel [8] further frame AI literacy as a competency to be cultivated rather than a skill to be acquired. The present study is positioned within this critical orientation: it does not ask whether AI should be used in design education, nor whether students enjoy using it, but what happens, pedagogically, when its use is made compulsory and reflexively documented within a structured studio assignment.

3. Pedagogical Context and Assignment Design

The assignment that constitutes the empirical site of this study was designed and delivered within the unit *Design e Tecnologias*, an elective unit offered in the first semester of the first year of the Master's degree in Graphic Design at the School of Applied Arts (ESART) of the Polytechnic Institute of Castelo Branco, Portugal, during the academic year 2025/26. The author was the unit's Invited Assistant Professor at the time and is the sole designer and analyst of the intervention; the analysis presented in this paper was conducted after his transition to a full-time position at the University of Aveiro, Portugal, where it forms part of his current research activity at ID+. The cohort of nine students consisted of recently enrolled Master's students who had self-selected into an elective unit explicitly framed around the intersection of design and emerging technologies, and were therefore at an early formative stage in the negotiation of their professional identity as designers while also having actively chosen a context in which engagement with technological tools was foregrounded.

The assignment, titled *Self-Promotion Kit – Design and AI*, was framed by the working assumption that the contemporary graphic designer must develop critical literacy in generative AI, understood neither as a productivity device nor as a threat to authorship, but as an object of design inquiry in its own right. Students were required to develop a personal self-promotion kit articulating two complementary components: a printed component, conceived at full scale and to professional production standards, and a functional website prolonging the same identity into the digital domain. The printed component could take the form of any combination of graphic supports – catalogue, brochure, poster, manifesto, or other formats – provided that it operated as a coherent expression of the student's emerging identity as a designer. The choice to centre the assignment on a self-promotion kit, rather than a fictional client brief, was deliberate: artefact and subject coincide, since students design the visual identity through which they will represent themselves as designers entering the profession (see Section 6.2). AI was to be used as an explicit support throughout the four phases of the design process – Discover, Define, Develop and Deliver – and all interactions with AI tools were to be documented in a weekly process diary.

The pedagogical structure unfolded across eight sessions over a thirteen-week period, organised around four phases: an introductory session framing the question of authorship under AI; visual identity development and iterative production of printed prototypes (three sessions); development of two successive functional versions of the website (two sessions); refinement of digital interactivity (one session); and final in-class presentation (one session). Submission was made through the institutional learning management system on 12 January 2026.

Three features of the assignment are decisive for the analysis that follows. The first is the obligatory and transparent character of AI use: students were not permitted to opt out, nor were they permitted to use AI without documentation. This deliberately inverts the dominant pattern in higher education, where AI is either prohibited or tacitly tolerated, with the consequence that its use becomes either covert or unreflexive. The second feature is the compulsory diary, conceived not as a record of activity but as a metacognitive device intended to slow the production cycle, expose decision-making and render the iterative structure of the work traceable. The third feature is the dual material constraint: the requirement to produce both a printed artefact and a functional digital interface forced students to confront the

differential behaviour of generative AI across material domains, an opposition that emerged as analytically productive in the subsequent thematic analysis. The intervention therefore operationalises, in a specific national and disciplinary context, the structured curricular response that Fleischmann [10] argued for at the level of proposal, and articulates with the practices of "AI usage statements" and prompt justification that Fleischmann [12] documented internationally.

4. Methodology

This study employs a qualitative interpretive approach to examine the material produced by students during and after the assignment. The aim is not to measure the impact of generative AI on creativity through quantifiable indicators, but to surface the patterns through which students articulated, problematised and made sense of their interactions with AI within a structured pedagogical context. Given this aim, *reflexive thematic analysis* in the sense recently consolidated by Braun and Clarke [4, 5] was selected as the analytical method. The study is framed within an interpretivist orientation with a critical-constructionist inclination: themes are understood as analytical constructions produced by the researcher in iterative engagement with the corpus rather than as entities awaiting discovery in the data; meaning is taken to be situated and shaped by the researcher's interpretive position; and heterogeneity within the corpus is treated as a property to be represented rather than as noise to be filtered.

4.1 Corpus

The corpus comprises the technical-critical reports and the experimentation diaries produced by the nine students enrolled in *Design e Tecnologias* during the academic year 2025/26. Reports range in length from approximately 1,500 to 9,000 words; diaries vary more widely, from short captioned visual logs to extended weekly written entries. The combined textual corpus, after extraction and cleaning, totals approximately 31,700 words. Visual material accompanying the submissions – printed pieces, screenshots, mockups, prompt outputs – was consulted as context but was not subject to systematic analysis, since the focus of the study is on the verbal articulation of the design process.

4.2 Ethical Procedure

The reports and diaries were originally produced as coursework for academic assessment, not as research data. To use this material for research purposes, individual informed consent was obtained from each of the nine students through retrospective contact by email. The consent request explained the scope and purpose of the publication, clarified that all citations would be anonymised through alphanumeric codes (S1 to S9), specified that no visual material would be reproduced, and offered the option to refuse without academic consequence. All nine students consented to the use of anonymised excerpts. Excerpts were reviewed to remove or generalise indirect identifiers that might enable re-identification.

4.3 Analytical Procedure

The analysis followed Braun and Clarke's [4] six-phase reflexive procedure: familiarisation, inductive coding in a structured matrix preserving provenance, iterative aggregation into candidate themes, review against the corpus as a whole, consolidation, and writing-up. Internal variation within themes, including formulations that complicate or partially counter the dominant pattern, was retained rather than excluded.

4.4 Researcher Position and Limitations

The author is, simultaneously, designer, lecturer and analyst of the intervention. This concentration of roles has both an interpretive advantage – depth of contextual knowledge – and an analytical risk: confirmation bias. To mitigate this risk, theme names were not fixed in advance but constructed through iterative engagement with the material, and points at which the corpus diverges from the pedagogical intention were sought out and explicitly retained. Three further limitations should be acknowledged: sample size (nine students; the findings are not offered as generalisable); single-coder design; and the partially mediated nature of the textual corpus, since several students declared the use of AI tools in editing their reflective writing – a complication treated as itself part of the phenomenon under study.

5. Findings

The thematic analysis constructed four themes that organise the patterns observed across the corpus. The themes are presented in the order in which they structured the design process for the participating students, from initial encounter with AI tools to retrospective evaluation of the experience. Each theme names a dominant pattern; internal variations are retained within the analytical narrative rather than smoothed over.

5.1 AI as Cognitive Scaffold Rather Than Authorial Agent

Across the corpus, students consistently describe AI as a tool that supported the organisation of thought, the structuring of unclear ideas, and the accelerated exploration of conceptual and visual possibilities. AI is recurrently positioned as an aid to ideation, not as a producer of authorial decisions. The reflective vocabulary the students adopt – "organising the thinking", "structuring", "clarifying", "accelerating exploration" – converges on a model of AI as cognitive scaffold rather than creative agent. S8 articulates this most directly, noting that the tool *"acts as an instrument for organising thought, not for generating concepts"*, while S4 describes how *"AI was integrated as a support tool, not as an autonomous creative agent"*. The convergence of formulation across distinct voices is itself part of the finding. This framing aligns with the wider literature on generative AI as a "thinking partner" [12], but it also reflects the deliberate framing of the assignment, which positioned AI explicitly as a support across the Discover, Define, Develop and Deliver phases. Depth of internalisation varied across the corpus: while several students articulate the framing with conceptual sophistication, others adopt the same vocabulary in a more functional register.

5.2 Friction, Slowing and the Productive Role of Documentation

Contrary to the dominant narrative of AI as a productivity accelerator, several participants reported that mandatory AI use slowed their work, generated frustration, and required iteration cycles that exceeded those of unaided practice. Under the conditions of obligatory documentation imposed by the assignment, this difficulty became available for reflection: the weekly diary forced students to translate the experience of misalignment between intention and output into language, and in doing so to make explicit the criteria, preferences and intentions that would otherwise have remained tacit. The dual finding – that mandatory engagement produces friction, and that obligatory documentation transforms friction into learning material – recurs across the corpus and stands as one of the central patterns of the analysis.
S4 articulates the experience of slowing directly: *"I often spent more time on AI than producing from scratch"*. S6 describes how *"the difficulty hindered the creative process; it took time to understand how to use it"*. The most quantitatively striking instance is S8, who reports that *"about 29 versions of the website were generated; small prompt changes produced significant layout shifts"* before concluding the work through a further iteration cycle of comparable magnitude. The pattern is consistent: mandatory AI use, far from removing struggle from the design process, introduced new forms of struggle – versioning loops, prompt reformulation, repeated rejection of generated material.
This pattern does not, however, operate uniformly. At least one student articulates a different relation to difficulty: S7 narrates initial trouble with AI tools but resolves it through a strategy of *"maximum specificity in prompting"* that effectively eliminates friction rather than transforming it into reflective material. This case is instructive precisely because it shows that the transition from difficulty to reflection is not automatic: a student may respond to friction by optimising it away rather than by documenting and interrogating it.

5.3 The Asymmetry Between Print and Digital

The dual material constraint of the assignment – printed component plus functional website – produced a recurrent and analytically productive asymmetry in the corpus. Students consistently report that AI was less effective in supporting decisions about the printed component, where considerations of scale, sequence, paper, binding and bodily interaction with the artefact required forms of judgement that the AI did not adequately scaffold. S4 puts this directly: *"in the printed portfolio AI tended towards literal interpretations"*. In contrast, AI was reported as significantly more useful in the digital component, where it lowered the technical threshold of website production, generated functional code or layouts, and operated within a domain whose conventions are more amenable to algorithmic manipulation. S4 again: *"in the digital portfolio AI proved more effective as it facilitates more technical processes"*.

The asymmetry surfaces a distinction that prevailing accounts of AI in design education have rarely articulated: AI's pedagogical effects are not uniform across material domains, and the materiality of the artefact mediates the cognitive contribution of the tool. For most students, the asymmetry is articulated pragmatically: AI is *more useful for the technical aspects of the website*. For S7, however, the same asymmetry is articulated through an ethical-environmental register: she used AI principally in the digital domain because doing so aligned with her own concern for energy efficiency in the design process. This second formulation extends the discussion of tacit knowledge in design practice [10] by suggesting that print and digital not only make different demands on tacit understanding but invite different normative framings of when and why AI engagement is justified.

5.4 Reconfiguration, Not Dissolution, of Authorship

Across the corpus, students articulate a consistent reframing of their role as designers, not as a loss of authorship in the face of automation, but as a redistribution of authorial activity. The students describe themselves as curators, editors, decision-makers, mediators between human intention and algorithmic output. S4 puts the reframing most concisely: *"the designer's role will evolve from executor to curator, editor and strategist"*. S1 echoes this in describing *"a transition from the role of craftsman to that of strategist and visual curator"*. This vocabulary is not imposed by the assignment; the brief uses the term "mediator", but the language of curation, editing and selection emerges in the reflective writing in formulations that are recognisably the students' own. The convergence of vocabulary across distinct individual trajectories, and across the international literature [9, 12, 13], suggests that the figure of the designer-as-curator is not a rhetorical commonplace but a substantive reorganisation of design practice that is being negotiated, in real time, by the practitioners themselves.

The reframing is not, however, articulated in a single register. S7 formulates the same shift in markedly more anxious terms, suggesting that *"the junior designer's future lies not in execution speed but in management capacity"* – a formulation that positions curatorship as a strategic response to perceived professional threat rather than as a serene reappropriation of authorial role.

A further dimension surfaces in two of the reports: a small but consistent articulation of environmental and ethical concerns about the use of AI, including its energy cost. S7 frames this most directly: *"the ethics of this project rests on ecological responsibility"*, complemented by her observation that *"the use of AI was guided by energy efficiency"*. S8 articulates a related concern: *"ethical reflection came to include awareness of the invisible costs of automated generation technologies"*. This articulation, which echoes recent critical work on the environmental impact of generative AI in design education [14], emerges as part of the same reconfiguration of authorship: to be a designer who works with AI is, for these students, also to be a designer who must take responsibility for the choice to do so. Supported by a minority of the corpus rather than by the majority, the articulation is an emerging minority position rather than a generalised pattern; its analytical significance lies less in its frequency than in its independent emergence, in two distinct voices, in formulations not solicited by the assignment.

6. Discussion

The four themes presented in Section 5 articulate, in the voices of the participating students, a set of patterns that the wider literature has identified at the level of proposal but rarely surfaced in the textured form that a structured pedagogical intervention permits. This section reads those themes against the literature, identifies points of convergence and tension, and discusses the implications of the present case for the wider field.

6.1 Confirmation, Extension and Tension with the Literature

The first theme – AI as cognitive scaffold rather than authorial agent – confirms a finding that has emerged repeatedly across recent studies, including Fleischmann's account of "AI as a thinking partner" [12] and the broader literature on prompt engagement as a metacognitive practice. The vocabulary the students adopt ("organising thought", "structuring", "clarifying") closely tracks the language documented in Australian, Danish, Indonesian and Salvadoran contexts [10, 12]. The convergence is striking precisely because the participating students did not have access to that literature; the formulation is one they reach independently, in negotiation with the assignment and with the tools themselves.

The second theme departs more clearly from the dominant narrative in the literature. Industrial accounts of generative AI consistently describe acceleration, speed and efficiency as its primary affordances [10]; even critical accounts that warn against uncritical adoption [12] do so by reference to AI's excess of

fluency rather than to its difficulty. The students in this corpus describe a more uncomfortable experience: AI, far from accelerating their work, often slowed it; far from removing struggle from the design process, it introduced new forms of struggle – versioning loops, prompt reformulation, repeated rejection of generated material. The pedagogical lesson is not that AI is slower than expected, but that mandatory engagement, when reflexively documented, transforms friction from an obstacle to a learning surface – though, as the findings have shown, not for all students and not always.

The third theme – the asymmetry between print and digital – articulates a finding that is largely absent from the existing literature, which has tended to treat AI's effects on design as if they were uniform across material domains. The students consistently report that AI was less effective in supporting decisions about the printed component, where considerations of scale, sequence, material and physical interaction with the artefact resisted the algorithmic vocabulary of the tools, and significantly more useful in the digital component, where AI lowered the technical threshold of website production. The asymmetry is analytically productive because it surfaces the role of materiality in mediating the cognitive contribution of AI: print and digital make different demands on the tacit understanding designers bring to AI engagement, and AI engages differently with each in consequence.

The fourth theme – reconfiguration, not dissolution, of authorship – converges with what the broader literature has begun to call the shift from "maker" to "curator" [9] or from "designer" to "director" [12]. The vocabulary of curation, mediation and decision-making is articulated by the participating students with notable consistency and in formulations that are recognisably their own rather than imposed by the assignment brief. The convergence is not uniform in register, however: while several students frame the shift as an expansion of authorial agency, at least one articulates the same reconfiguration in markedly more anxious terms, positioning curatorship as a defensive adaptation to perceived professional pressure. A subsidiary strand of this theme – the articulation of environmental and ethical concerns about AI use – deserves particular emphasis. Two students independently raise ecological responsibility as part of their design reasoning, in formulations not prompted by the assignment and aligned with recent critical work on the environmental costs of generative AI in design education [14]. The articulation is supported by a minority of the corpus rather than by the majority, and its analytical significance lies less in its frequency than in its independent emergence in distinct voices. That this concern emerges at all, framed as part of the designer's professional responsibility rather than as an external imposition, suggests that ethical literacy is being internalised as an integral dimension of authorship rather than as a separate compliance requirement – at least for some students.

6.2 The Artefact and the Subject

A pedagogical decision that warrants explicit discussion is the choice to centre the assignment on a self-promotion kit rather than on a fictional client brief. In conventional studio assignments, the artefact and the subject are kept separate: the student designs for an external party, and the rejection of mediocre output carries no personal cost. In the present case, the artefact and the subject coincide: the kit represents the student as a designer entering the profession. We hypothesise that this coincidence is one of the conditions that produced the patterns observed, particularly the systematic rejection of AI-generated material as "not me" reported across multiple cases. When the cost of accepting standardised output is the standardisation of one's own professional self-presentation, the threshold for acceptance rises. This is a hypothesis the present corpus cannot definitively test, but it is consistent with the data and worth marking as a conjecture for further inquiry. It also suggests a practical curricular implication: assignments in which AI use is mandatory may benefit from a high degree of personal investment in the artefact, as a pedagogical multiplier of reflective engagement.

6.3 Implications for the Field

Three implications follow for the wider field. First, the structured curricular response that the literature has been calling for [10] is implementable, produces analytically rich material, and can be defended ethically and methodologically when the appropriate procedural commitments are in place. Second, the dominant rhetoric of AI as a productivity device deserves complication: when AI use is mandatory and reflexively documented, friction and slowed engagement emerge as primary pedagogical resources. The three discourses mapped by Bearman, Ryan and Ajjawi [7] – efficiency, threat to academic integrity, inevitable opportunity – do not adequately capture this pedagogical possibility, and a fourth orientation, organised around critical literacy and structured reflection, deserves explicit articulation alongside them. Third, the development of AI literacy in design education appears to entail not the rejection of AI nor its

naturalisation, but its repositioning as an object of design inquiry – something the designer thinks *with* and *about*, rather than something the designer simply uses.

7. Conclusion

This paper has reported on a pedagogical intervention in which generative AI use was made compulsory within a Master's-level graphic design unit, and student engagement was rendered traceable through obligatory weekly diaries. The reflexive thematic analysis of the resulting corpus constructed four patterns: AI as cognitive scaffold rather than authorial agent; friction and slowed engagement as a counter-narrative to dominant accounts of AI as efficiency device; the asymmetry between AI's effects on print and digital components; and the reconfiguration, rather than dissolution, of authorial agency, including the articulation of environmental and ethical concerns. These patterns are dominant but not uniform: the corpus also includes more utilitarian engagements, anxious framings of the designer's reconfigured role, and at least one case in which friction was optimised away rather than transformed into reflection.

Two contributions follow. The first is empirical: the study offers a qualitative analysis of student-produced material from a structured intervention combining mandatory AI use with obligatory reflective documentation, complicating the prevailing vocabulary of efficiency and threat by documenting difficulty, slowed engagement and material asymmetry as outcomes. The second is positional: the study contributes a Portuguese case to a sub-disciplinary and geographic landscape mapped as significantly under-researched [9].

The limitations of the study are explicit. The sample is small and the corpus partially mediated; the analyst is also the educator, and the findings are presented as theoretically suggestive rather than as statistically generalisable. The pedagogical context is specific: an elective unit in a Portuguese polytechnic Master's programme, with a particular cohort and a particular brief. No claim is offered that the same patterns would emerge under different framings.

Three directions for further inquiry follow naturally from this work: replication across institutional contexts, attentive to the variables that the present case holds fixed; longitudinal study of how the dispositions documented here evolve as students move into professional practice; and cross-disciplinary comparison across design sub-disciplines that may engage AI under materially different conditions. Whatever the trajectory of generative AI itself, design education's task is unlikely to consist in choosing between adoption and prohibition. It is more likely to consist in cultivating, in students, the critical literacy through which AI can be read as one more material of design – a material with particular affordances, particular costs, and a particular relationship to the question of who, in the act of designing, is doing the deciding.

Cultivating AI-Ready Graduates: Curriculum Coherence and Tiered Competency Development in Business Education

Evelina Atanassova[1], Andrea Munro[2], Laura Galloway[3]

[1,2,3]UMass Global, United States

Abstract

As artificial intelligence reshapes professional practice, business education faces a curricular design challenge: how to embed AI capability development without reducing it to tool training or isolating it within a single course. This paper presents a theoretically grounded, qualitative curriculum design study that advances a Tiered Curriculum Integration Approach to embed eight workforce-relevant AI competencies across a Bachelor of Business Administration (BBA) program in a US-based university. The study positions AI integration not as technological adoption, but as a problem of curriculum coherence, cognitive development, and the urgent need to build AI competency in business education in response to the evolving business needs. Drawing on curriculum theory, adult learning theory, and constructivist pedagogy, the framework reconceptualizes AI competency development as a vertically scaffolded process across the undergraduate experience. The research documents a multi-phase qualitative methodology used to identify and define eight core competencies aligned to business workforce expectations: AI literacy and fundamentals; data privacy literacy; advanced prompt engineering; AI tools and automation; programming AI agents; critical thinking and problem-solving; strategic AI use; and AI communication skills. Competencies were derived through environmental scanning of employer discourse, review of AI literacy frameworks, and iterative faculty working sessions using thematic analysis. The conceptual contribution of the study lies in the development of a four-tier integration model, namely Foundations, Creation and Control, Building and Evaluation, and Leadership and Impact, explicitly mapped to Bloom's Taxonomy and the principles of constructive alignment. Rather than adding AI content horizontally, the model vertically scaffolds cognitive complexity from foundational comprehension to strategic evaluation and ethical leadership. This structure reflects constructivist assumptions that learners build knowledge through progressively complex engagement and aligns with adult-learning principles that emphasize relevance, autonomy, and authentic problem contexts. In the next phase of the project, curriculum mapping workshops engaged faculty in aligning course learning outcomes, assessment practices, and AI competencies within existing disciplinary structures. This process operationalized alignment between institutional goals, professional standards, and course-level pedagogy without requiring wholesale curriculum redesign. As a result, this study contributes a replicable model for university programs seeking to systematically and ethically integrate AI into curricular design.

Keywords: *curriculum design, AI curriculum integration, AI competencies, business education*

1. Introduction

Artificial intelligence (AI) is rapidly transforming business functions, decision-making processes, and workforce expectations. From marketing analytics to financial forecasting and operations management, AI-enabled tools are becoming embedded across industries [5]. As a result, business graduates are increasingly expected to demonstrate not only familiarity with AI technologies but also the ability to critically evaluate, ethically apply, and strategically leverage AI in organizational contexts. Despite this shift, responses within business education have often been fragmented. Many institutions have introduced standalone AI or analytics courses, while others incorporate isolated assignments using generative AI tools. These approaches, however, frequently emphasize tool usage over deeper cognitive and ethical competencies and lack program-level coherence [16]. As a result, students may graduate with uneven exposure to AI concepts, limited critical evaluation skills, and insufficient preparation for real-world applications.

This paper argues that AI integration is fundamentally a curriculum design problem, rather than merely a technological or instructional issue. Specifically, the challenge lies in systematically embedding AI competencies across a program in ways that align with cognitive development, disciplinary learning, and professional expectations. We address it through a Tiered Curriculum Integration Approach that embeds

AI competencies across a Bachelor of Business Administration (BBA) program. The approach is grounded in curriculum theory, constructivist learning principles, and adult learning theory, and it emphasizes vertical scaffolding of competencies across courses rather than horizontal addition of content. The purpose of this paper is to document the qualitative design process used to (1) identify workforce-relevant AI competencies, (2) develop a tiered curriculum integration model aligned with Bloom's Taxonomy, and (3) map these competencies across a BBA curriculum. The study contributes a theoretically informed and practically applicable model for business schools seeking coherent and ethical AI integration.

2. Theoretical Framework

2.1. Curriculum Design and Constructive Alignment

Curriculum design has long been understood as an intentional and systematic process of aligning learning outcomes, instructional activities, and assessment practices [10]. Building on this foundation, [2] introduced the concept of constructive alignment, which emphasizes the alignment between what students are expected to learn and how they are taught and assessed. In the context of AI integration, constructive alignment highlights the limitations of ad hoc approaches. Simply introducing AI tools into assignments does not ensure that students develop meaningful competencies. Instead, AI-related learning outcomes must be explicitly defined, supported through appropriate learning activities, and assessed through authentic tasks. Without such alignment, AI integration risks becoming superficial and disconnected from broader educational goals.

2.2 Constructivist Learning Theory

Constructivist theory posits that learners actively construct knowledge through interaction with content, context, and experience [4], [14] Learning is not a passive process of information acquisition but an active process of meaning-making, shaped by prior knowledge and social context. Applying constructivism to AI education suggests that students must engage with AI tools in meaningful, context-rich ways. Rather than simply learning about AI concepts, students should experiment with AI outputs, evaluate their accuracy, and refine their use based on feedback. This iterative engagement enables deeper understanding and supports the development of higher-order thinking skills.

2.3 Adult Learning Theory

Adult learning theory, or andragogy, emphasizes that learners are self-directed, goal-oriented, and motivated by relevance to real-world contexts [7]. In business education, this implies that learning experiences should be authentic, problem-centered, and directly applicable to professional practice. In the context of business education, this implies that AI competencies must be situated within authentic disciplinary contexts rather than taught as abstract or purely technical skills. Students are more likely to internalize AI-related knowledge when it is directly connected to managerial decision-making, ethical dilemmas, and organizational challenges. Consequently, AI integration must occur within existing business courses, where students can apply AI tools to meaningful problems rather than treating AI as a separate domain.

2.4 Bloom's Taxonomy and Cognitive Development

Bloom's Taxonomy provides a framework for understanding cognitive progression, ranging from lower-order skills, such as remembering and understanding, to higher-order skills, such as evaluating and creating [1]. Effective curriculum design requires scaffolding learning experiences to support this progression. In business education, this progression is particularly important. Students must first understand fundamental concepts before applying tools, analyzing outputs, and ultimately using AI strategically and ethically. Aligning AI competencies with Bloom's Taxonomy ensures that learning is developmentally appropriate and cognitively rigorous.

2.5 Instructional Design Principles for Competency Development

To translate constructive alignment from a curriculum-planning principle into learning experiences, the study is additionally informed by instructional design frameworks that specify how skill development is

sequenced and reinforced. Merrill's Five Principles of Instruction emphasize problem-centered learning, activation of prior knowledge, demonstration, application, and integration [9], providing rationale for designing authentic, workplace-relevant AI tasks that recur across tiers with increasing complexity. As learners engage in each tier, Gagné's Nine Events of Instruction offer micro-level structures, ensuring that learners receive clear expectations, guided practice opportunities, actionable feedback, and opportunities to transfer learning into workplace application [6]. Together, these frameworks support mastery progression by combining authentic performance with systematic scaffolding, supporting this study's goals of developing AI capability through sustained, program-level integration.

2.6 Synthesis

Together, these theoretical perspectives underscore the need for a structured, aligned, and progressive approach to AI integration. A tiered curriculum model enables institutions to move beyond fragmented interventions toward a coherent framework that supports both cognitive development and professional readiness. Importantly, such an approach reframes AI not as a discrete content area but as a capability that must be developed through sustained, aligned engagement across the curriculum. Within this framing, AI competencies are not endpoints but developmental outcomes that evolve as students' progress through increasingly sophisticated levels of learning and practice. Ultimately, these theoretical perspectives support the central premise of this study: that meaningful AI integration in business education requires a tiered, programmatic approach that ensures coherence, cognitive progression, and alignment with professional practice.

3. Methodology

This study employs a qualitative, design-based research approach focused on curriculum development. Design-based research is particularly appropriate for addressing complex educational challenges, as it involves iterative design, implementation, and refinement of educational interventions in real-world contexts [15]. Unlike purely evaluative or experimental methods, this approach prioritizes the development of theoretically grounded and practically applicable solutions, making it well-suited to emerging areas such as AI integration in higher education. Our focus is on understanding how AI competencies can be identified, structured, and embedded within an existing program in a way that is both pedagogically sound and institutionally feasible.

3.1 Data Sources

The development of the AI competencies was informed by three primary qualitative data sources: (1) environmental scanning of workforce expectations, (2) review of AI literacy frameworks, and (3) faculty working sessions. These sources were intentionally selected to triangulate perspectives from industry, scholarship, and disciplinary practice, ensuring that the resulting competencies were both theoretically grounded and practically relevant.

The first data source involved an environmental scan of industry reports, professional publications, and job postings to identify emerging expectations for AI-related skills in business roles. This process included reviewing publicly available job descriptions across business functions such as marketing, finance, and human resource management, with particular attention to language referencing artificial intelligence, automation, data-driven decision-making, and digital tools. In addition, reports from consulting firms were examined to capture broader trends in workforce transformation driven by AI adoption. Through iterative review, patterns emerged emphasizing not only technical familiarity with AI tools, but also the ability to critically evaluate AI outputs, apply AI in decision-making processes, and communicate insights effectively. These findings informed the initial set of competency categories and ensured alignment with real-world business expectations.

The second data source consisted of a review of existing AI literacy and competency frameworks, including those proposed by Long and Magerko [8], UNESCO [12], and the U.S. Department of Labor's Artificial Intelligence Literacy Framework [13]. These frameworks provide structured definitions of AI-related knowledge, skills, and attitudes, often emphasizing interdisciplinary understanding and ethical awareness. The review focused on identifying common constructs across frameworks, such as foundational AI knowledge, data literacy, ethical reasoning, and human-AI interaction. Particular attention was given to how these frameworks conceptualize AI literacy beyond technical expertise, incorporating critical thinking, societal impact, and responsible use.

The third data source involved a series of working sessions of the AI Pedagogy and Curriculum task force. These sessions served as a critical mechanism for contextualizing and operationalizing AI competencies within the BBA curriculum. The members engaged in collaborative discussions to interpret the preliminary competency categories, assess their relevance to disciplinary learning outcomes, and identify opportunities for integration within existing courses. Activities included reviewing sample assignments, mapping competencies to course objectives, and discussing appropriate levels of cognitive complexity based on course sequencing. These discussions were iterative, with competencies refined over multiple sessions based on faculty feedback and consensus-building.

3.2 Analytical Approach

Data were analyzed using thematic analysis [3]. The analysis was primarily inductive, allowing themes related to AI competencies and workforce expectations to emerge through a repeated review of the collected materials. Initial codes were developed based on recurring themes related to AI skills, competencies, and workplace applications. Initial coding focused on identifying recurring references to AI-related knowledge, skills, behaviors, and professional expectations across the environmental scan, literacy frameworks, and faculty discussions. Similar concepts were grouped into broader competency categories, which were subsequently refined through comparison across data sources.

The analytical process was iterative rather than strictly linear. Preliminary competency categories were discussed and revised during working sessions, during which participants evaluated their relevance, clarity, and applicability within business education contexts. These conversations helped refine the scope of individual competencies and distinguish between foundational and more advanced AI capabilities. For example, competencies related to basic AI literacy and tool usage were differentiated from those emphasizing strategic judgment, evaluation, and leadership.

In addition to identifying competency domains, the analysis also informed the development of the tiered integration structure. Patterns across the data suggested that AI competency development should occur progressively, with students moving from conceptual understanding toward increasingly complex applications and evaluations. These observations supported aligning the framework with Bloom's Taxonomy and informed the differentiation of curriculum-integration levels across the BBA program.

While the study did not aim to develop a formal theory, the analytical approach provided a structured and collaborative process for translating broad workforce and educational trends into an operational curriculum framework. The analysis emphasized practical applicability, curricular coherence, and alignment with the professional expectations of contemporary business education.

4. Development of AI Competencies

The development of the institutional AI competencies represented the transition from conceptual exploration to operational curriculum design. Building on the environmental scan, review of AI literacy frameworks, and collaborative faculty working sessions, the project focused on translating broad workforce and educational trends into a coherent competency structure appropriate for undergraduate business education. Rather than positioning AI as a standalone technical specialization, the framework conceptualized AI capability as an applied professional skill set that could be integrated across the BBA curriculum.

Throughout the development process, particular attention was given to ensuring that competencies reflected both workforce relevance and pedagogical applicability. Early discussions within the task force identified a common limitation in many AI integration efforts: an emphasis on procedural tool use without sufficient focus on evaluation, interpretation, and professional judgment. In response, the framework was intentionally designed to support higher-order engagement with AI technologies by emphasizing critical thinking, strategic application, ethical reasoning, and communication alongside technical interaction.

The framework was also developed to support the scalable integration within existing curricular structures. Rather than requiring wholesale program redesign, competencies were articulated in applied terms that faculty across business disciplines could adapt to existing course outcomes, assignments, and assessment practices. This approach aligned with institutional priorities related to innovation, equity, and collaboration.

Three considerations guided the refinement of the competencies. First, the framework prioritized workforce applicability by emphasizing the ability to apply AI in problem-solving and decision-making contexts relevant to contemporary business practice. Second, ethical reasoning and responsible AI use were embedded throughout the competency structure rather than isolated as a standalone topic,

reinforcing the importance of accountability, bias awareness, and critical evaluation, aligning with emerging guidance such as the U.S Department of Labor's AI skill standards [13]. Third, the competencies were structured developmentally to support progressive learning across the undergraduate experience, enabling students to move from foundational understanding toward more advanced application, evaluation, and strategic use of AI. The intent is to create a scaffolded learning experience, operationalized through Gagné's Nine Events of Instruction [6], which correspond to increasing levels of cognitive complexity, as outlined in Bloom's Taxonomy.

The resulting framework identified eight interconnected AI competencies designed to function as an integrated skill stack across the BBA curriculum (see Figure 1). These competencies were intended to be reinforced across courses and aligned with course-level outcomes, assessment strategies, and increasing levels of cognitive complexity throughout the program.

Fig. 1. AI Skill Stack

5. Tiered Curriculum Integration Model

To operationalize the AI competency framework within the BBA curriculum, a four-tier curriculum integration model was developed to support a structured implementation across courses and program levels. Rather than relying on isolated assignments or standalone AI instruction, the model was designed to facilitate intentional integration that could evolve alongside technological and workforce changes while remaining adaptable to existing curricular structures.

The tiered approach reflects the study's theoretical grounding in constructive alignment, constructivist learning theory, and adult learning theory by emphasizing developmental progression, repeated practice, and authentic application. Instead of organizing learning around specific AI tools, the model centers on transferable competencies and cognitive processes that can be adapted as technologies continue to change. This competency-centered approach was intended to reduce curricular disruption while providing faculty with a flexible structure for integrating AI within disciplinary contexts.

The model consists of four progressively complex levels: Foundations, Creation and Control, Building and Evaluation, and Leadership and Impact (see Figure 2). Each tier represents increasing levels of cognitive engagement, professional application, and learner autonomy. Together, the tiers provide a scaffolded progression that moves students from foundational understanding of AI concepts toward strategic, ethical, and contextually informed use of AI in professional settings.

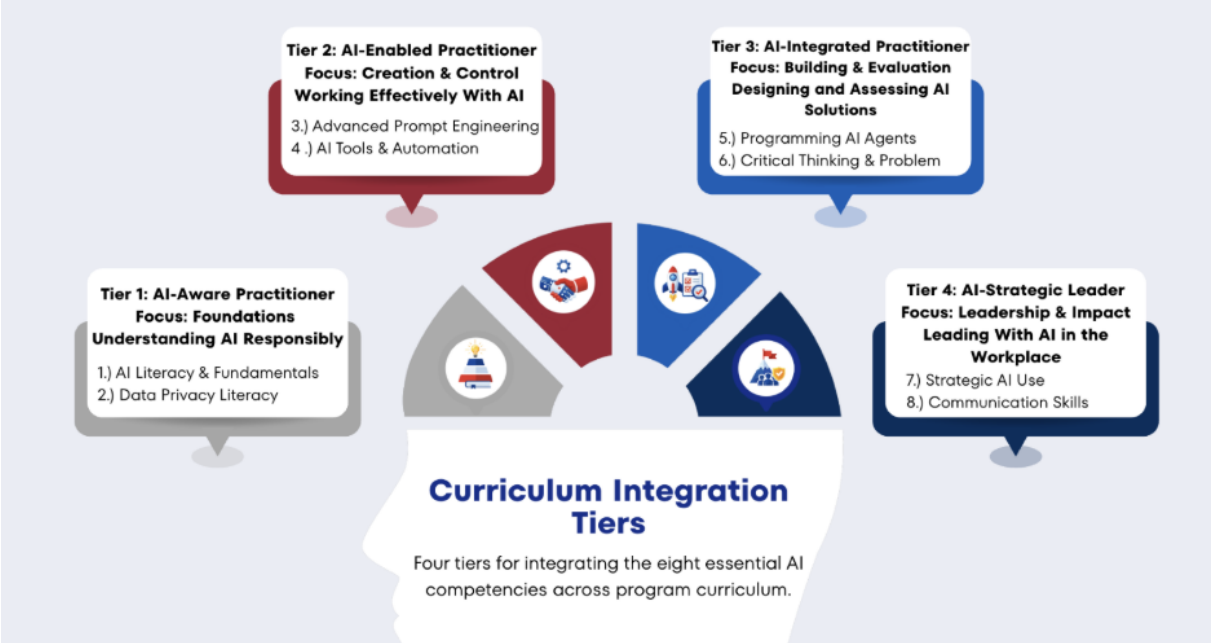

Fig. 2. Curriculum Integration Tiers

The first tier, **Foundations**, focuses on developing basic AI literacy, including understanding core concepts, limitations, risks, and ethical considerations associated with AI technologies. At this level, students are introduced to AI terminology, foundational principles, and responsible use practices. Learning activities emphasize comprehension and awareness, aligning primarily with the lower levels of Bloom's Taxonomy, such as remembering and understanding.

The second tier, **Creation and Control**, emphasizes intentional interaction with AI tools through applied use, prompt development, and reflection on how inputs influence outputs. At this stage, students begin using AI to support learning and problem-solving activities while developing awareness of the strengths and limitations of AI-generated content. Learning experiences focus on application and experimentation, supporting progression toward greater learner agency and technological fluency.

The third tier, **Building and Evaluation**, shifts toward more advanced engagement with AI-supported processes and outputs. Students are expected to critically evaluate AI-generated information, assess accuracy and bias, and apply AI within discipline-specific contexts to support analysis and decision-making. This tier emphasizes higher-order cognitive processes associated with analysis and evaluation, including judgment, refinement, and evidence-based reasoning.

The final tier, **Leadership and Impact**, focuses on strategic and ethical application of AI within organizational and societal contexts. At this level, students are expected to communicate AI-informed insights to diverse audiences, consider broader ethical and professional implications, and demonstrate leadership in responsible AI use. Learning activities emphasize evaluation, synthesis, and creation, aligning with the highest levels of Bloom's Taxonomy.

Collectively, the four tiers provide a vertically scaffolded structure for integrating AI competencies across the curriculum. By distributing competency development across courses and program stages, the model supports gradual skill development, reinforces learning through repeated engagement, and reduces cognitive overload for adult learners, balancing academic, professional, and personal responsibilities. Most importantly, the framework positions AI competency development as an ongoing and integrated component of business education rather than a discrete technical skill acquired in isolation.

6. BBA AI Curriculum Mapping

Following the development of the tiered curriculum integration framework, the next phase of the project focused on operationalizing the model within the BBA curriculum through program-level mapping. Curriculum mapping is widely recognized as a mechanism for strengthening alignment between program outcomes, instructional practices, and student learning progression [11]. In the context of AI integration, the mapping process served as a strategy to translate abstract competency categories into discipline-specific learning experiences distributed across the undergraduate business curriculum.

The mapping process was guided by the principles of constructive alignment [2], scaffolded learning, and competency-based curriculum design. Rather than treating AI as a standalone subject area, the approach positioned AI competency development as an integrated, developmental process embedded within existing business disciplines. This design reflects emerging perspectives in higher education that emphasize AI literacy as a cross-functional professional capability rather than a purely technical specialization [8].

Courses were mapped according to the four-tier integration model based on three primary considerations: (1) the cognitive complexity of course-level learning outcomes, (2) the degree of authentic AI application appropriate within the specific discipline and corresponding workforce setting, and (3) the developmental progression of students across the program. Hence, introductory courses emphasizing foundational business concepts and digital literacy were aligned with Tier 1 (Foundations), while intermediate and advanced courses requiring applied analysis, evaluation, strategic decision-making, and professional communication were aligned with progressively higher tiers.

The mapping process intentionally emphasized authentic assessment and contextual application. Consistent with adult learning theory, students engage with AI within meaningful disciplinary contexts rather than through isolated technical exercises [7]. For example, in Principles of Macroeconomics, students evaluate AI-generated economic forecasts and assess their limitations, while in Business Statistics, students refine prompts and compare AI-assisted analyses with manually generated results. At more advanced levels, students move toward evaluating AI-supported strategic recommendations, designing AI-enabled workflows, and communicating AI-informed insights to organizational stakeholders.

The progression across tiers also reflects increasing levels of cognitive complexity aligned with Bloom's Taxonomy [1]. Early-course integration focuses on comprehension, awareness, and responsible use, while upper-level courses emphasize evaluation, judgment, synthesis, and strategic leadership. This developmental structure supports repeated exposure and reinforcement of competencies across courses, which is consistent with constructivist perspectives emphasizing iterative knowledge construction through progressively complex engagement [4], [14].

Importantly, the curriculum map was designed to support sustainable faculty adoption and curricular flexibility. By centering competencies rather than platform-specific tools, the framework allows faculty to adapt assignments and learning activities as AI technologies continue to evolve. This approach also minimizes the need for extensive course redesign by embedding AI competencies within existing learning outcomes and disciplinary practices. Instead, it presents as a natural enhancement of the existing curriculum.

Figure 3 illustrates the operationalized BBA AI curriculum map, including representative courses, aligned competencies, and examples of authentic assessments and learning activities across each tier. The map demonstrates how AI competency development can be distributed systematically across a business curriculum to support progressive, ethical, and workforce-relevant learning experiences.

Fig. 3. BBA Program AI Integration Map

7. Conclusion

As artificial intelligence continues to reshape business practice, business education must move beyond isolated tool adoption toward coherent and developmentally structured curriculum integration. This study contributes to curriculum theory by extending principles of constructive alignment and scaffolded learning to program-level AI competency development within a BBA curriculum. The Tiered Curriculum Integration Approach provides a practical and scalable framework for embedding AI competencies across program courses while supporting ethical reasoning, cognitive development, and workforce relevance. Importantly, the framework was intentionally designed to enhance and modernize existing curriculum structures rather than require a complete program overhaul. By embedding AI competencies within existing disciplinary courses through learning activities and assessments, the model offers institutions a more sustainable and adaptable pathway for curricular innovation. This approach allows business programs to increase workforce relevance and respond to evolving employer expectations while minimizing disruption to faculty workload, accreditation structures, and established curricular sequencing. Because the BBA pilot has not yet been implemented, the present study is limited to the design and development processes underlying the framework. Future research will examine implementation outcomes, including student learning, faculty experiences, and the longitudinal development of AI competencies across the program.

Are Functional and Critical Digital Skills Distinct? Evidence from Set Bifactor-ESEM Using the yDSI among Students

Emil Frashëri

Fan S. Noli University of Korca, Albania

Abstract

This study investigated the structural validity of students' digital skills by comparing eight competing measurement models, including Confirmatory Factor Analysis (CFA), Exploratory Structural Equation Modeling (ESEM), and bifactor-ESEM variants, using data from a sample of 603 university students. All models aimed to assess both critical and functional digital skills, providing a comprehensive evaluation of the multidimensional structure of digital competence. Model performance was evaluated using robust fit indices: χ^2, RMSEA, CFI, TLI, and SRMR. The Set bifactor-ESEM model demonstrated superior fit (χ^2 (368) = 729.47, RMSEA = .040 [90% CI: .036–.045], CFI = .994, TLI = .992, SRMR = .022), outperforming both traditional CFA and Full bifactor-ESEM models. Examination of the latent structure highlighted distinct patterns across the two digital skill domains. Critical skills adhered to a predominantly unidimensional configuration anchored by the general factor, whereas functional skills exhibited a clearly multidimensional structure informed by their specific subdomains. The general factors of the two layers were only weakly correlated (r = .29), despite being statistically significant. Two subcomponents tied to strategic and creative digital skills showed a significant cross-set association. In contrast, the majority of factor correlations obtained from the full ESEM model were statistically non-significant (e.g., CIC–TO: r = .025, p = .894; CIC–INP: r = .067, p = .606), highlighting the empirical separation of critical and functional skills. These findings suggest that digital skills are best conceptualized as a layered construct, comprising interrelated but structurally distinct domains. Implications for assessment design, educational interventions, and theoretical modeling are discussed.

Keywords: *digital competence; yDSI; critical digital literacy; Set bifactor-ESEM; WLSMV; higher education*

1. Introduction

In an increasingly digitalized society, acquiring digital competence is essential for meaningful participation in social, economic, and civic life. Established frameworks such as DigComp [1] and the cross-nationally validated youth Digital Skills Indicator (yDSI) [2] conceptualize digital competence as a multidimensional construct that spans information, communication, content creation, safety, and problem-solving. A core feature of these frameworks is the distinction between functional and critical digital skills. Functional skills involve procedural and task-oriented digital practices, whereas critical skills encompass evaluative, reflective, and harm-mitigating capacities essential for informed digital engagement [3].

The short yDSI scale reflects this structure through two heterogeneous item sets: functional skills are measured through behavioral self-report items, while critical skills rely on knowledge-based items. With this design, some overlap among items is expected within each layer, yet overlap between layers is deliberately restricted to maintain their conceptual separation.

Integrating these components into the core of educational curricula is increasingly regarded as a priority [4]. Still, to shape curricula that genuinely support students, it is important to understand more precisely how functional and critical skills work together.

Given the multidimensionality of digital competence, appropriate methodological models are needed to capture its internal structure accurately.

2. Methodological Overview of Competing Latent Variable Techniques

For hierarchical constructs, bifactor specifications are often recommended to separate general (G) and specific (domain-level) sources of variance. Bifactor-ESEM [5] extends this logic with ESEM's flexibility, and Set bifactor-ESEM further constrains the space of cross-loadings to within-set relations, providing a principled compromise among fit, parsimony, and interpretability. Meta-analytic evidence indicates

that bifactor-ESEM models generally yield superior fit and more defensible parameters for complex educational constructs [6].
Exploratory Factor Analysis (EFA) is a data-driven method for identifying latent dimensions without imposing prior structural constraints. All items freely load on all factors, with oblique rotations used to obtain interpretable patterns. EFA is valuable for probing dimensionality and detecting cross-loadings when theory is limited, but it is not confirmatory and does not provide global fit indices for hypothesis testing. Consequently, it is less suitable when specific item–factor relationships are theoretically expected [7].
Independent Cluster Model CFA (ICM-CFA) specifies that each item loads on a single factor, with all cross-loadings fixed to zero.
This strict structure provides strong confirmatory control and allows the use of global fit indices. The model is highly parsimonious and straightforward to interpret, making it suitable when constructs are clearly separable and cross-loadings are negligible. However, the zero cross-loading assumption is often unrealistic for multidimensional constructs, leading to inflated factor correlations and compromised discriminant validity, as frequently observed in digital competence research [7].
Full ESEM integrates the flexibility of EFA with the hypothesis-testing capabilities of SEM. All non-target cross-loadings are freely estimated, typically under target rotation to approximate the intended structure. This approach generally achieves better fit and more realistic factor correlations than CFA, accommodating construct-relevant multidimensionality without post hoc modifications. Lower parsimony and the presence of numerous cross-loadings can complicate interpretation, particularly when theoretical guidance is weak [6], [7].
In *full Bifactor-CFA*, each item loads on a general factor (G) and one specific factor, while all cross-loadings remain fixed to zero. This structure separates general and domain-specific variance, making it informative for hierarchical constructs. The prohibition of cross-loadings can lead to misfit or biased estimates when multidimensional cross-loadings are plausible [5], [8].
Full Bifactor-ESEM combines bifactor logic with ESEM flexibility, allowing items to load on G and cross-load on multiple specific factors. It offers the most comprehensive representation of hierarchical, multidimensional constructs and often reduces bias in loadings and correlations relative to CFA. This approach is highly parameterized, necessitating large sample sizes and a strong theoretical foundation; it may also present estimation challenges [5], [6].
In *Set CFA (Second-Order or Set-Restricted Confirmatory Factor Analysis*), items are organized into theoretically defined sets (e.g., functional vs. critical), with cross-loadings between sets fixed to zero. Within each set, standard CFA constraints are applied. This structure preserves the a priori conceptual distinction between item types, supporting model parsimony and interpretability. However, cross-loadings within each set remain constrained to zero, which may lead to inflated factor correlations and biased estimates of specific factors [9].
Set-ESEM (Set Exploratory Structural Equation Modeling) permits cross-loadings within theoretically defined item sets (e.g., within functional or within critical items), while constraining cross-set cross-loadings to zero. This approach typically employs target rotation and strikes a balance between model realism and parsimony. Compared to CFA, it reduces inflation of factor correlations, and unlike full ESEM, it avoids over-permissiveness by preserving the theoretical structure of item types. Set-ESEM is particularly well-suited for modeling item heterogeneity but requires clear theoretical justification for the definition of item sets. However, it is less flexible than full ESEM when cross-set cross-loadings are substantively meaningful. [7], [9].
Set bifactor-ESEM extends Set-ESEM by adding a general factor. Items load on G and on set-specific factors, with cross-loadings allowed only within sets. It is ideal for hierarchical structures with heterogeneous item formats (e.g., functional behavioral items vs. critical knowledge items), capturing both general and specific variance while preserving theoretical separation between sets, enhancing discriminant validity and interpretability. Set bifactor-ESEM is more complex than Set-CFA or Set-ESEM. It requires adequate sample size, strong theory, and careful rotation specification [5], [9].

2.1 Why Set-Level Modeling Is Well-Suited to the yDSI

Digital competence is increasingly conceptualized as a multidimensional construct comprising both foundational operational abilities and higher-order evaluative capacities. Empirical and conceptual work reinforces a functional–critical distinction within this construct: Study [3] shows that functional skills support engagement with digital platforms, whereas critical skills guide judgment and strategic responses in complex digital environments. Another study [10] similarly classifies functional and critical literacies as distinct yet complementary categories within broader digital literacy models. The yDSI

formalizes this dual-layer structure by explicitly separating functional and critical aspects across its four skills domains, and its mixed item formats (behavioral vs. knowledge) justify set-level constraints that prevent cross-set contamination while allowing for within-set cross-loadings [2]. This measurement architecture aligns directly with Set-ESEM specifications and, for hierarchical modeling, with Set-bifactor ESEM, which enables estimation of a general digital competence factor spanning both sets while preserving domain-specific and set-specific variance [5], [9].
Meta-analytic work indicates that bifactor-ESEM families often provide superior fit and more trustworthy parameters than their CFA counterparts for educational constructs that are simultaneously general and domain-specific [6]. A study [11] identified a bifactor-ESEM solution as the most suitable representation of teachers' ICT competence beliefs, with a clear separation between the general factor and domain-specific components such as safety and collaboration.
The aim of this study is to determine whether functional and critical digital skills are represented as distinct yet interconnected domains of digital competence through the empirical modeling of the correlational structure of yDSI indicators using advanced analytic approaches, including the Set bifactor ESEM model. Alternative modeling strategies are compared to identify the most parsimonious and theoretically coherent representation of digital competence. Through the clarification of the relationship between functional and critical skill layers, the theoretical understanding of digital competence is refined, and more robust, evidence-based assessment and curriculum development in higher education are supported, ensuring that both skill sets are addressed in a balanced and pedagogically meaningful manner.

3. Method

3.1 Participants and Procedure

Data were collected from students at *Fan S. Noli University of Korça*, located in southeastern Albania. Participation was voluntary and anonymous, and responses were submitted via an online questionnaire, in full compliance with ethical standards approved by the Rector and university's Ethics Council.
The measurement instrument was based on the short version of the Youth Digital Skills Indicator (yDSI) [2] and included two sets. The first consisted of 24 items measuring functional digital skills across four dimensions: Technical and Operational Skills (TO), Information Navigation and Processing Skills (INP), Communication and Interaction Skills (CI), and Content Creation and Production Skills (CCP). These items were rated on a six-point Likert scale ranging from 0 (*I do not understand what you mean by this*) to 5 (*Very true of me*), with an additional option (*I do not want to answer*) coded as 99 and treated as missing value.
The second set comprised 9 items assessing critical digital skills across three dimensions: Information Navigation and Processing (INPC), Communication and Interaction (CIC), and Content Creation and Production (CCPC). These items used a four-category response format: 1 (*Definitely not true*), 2 (*Definitely true*), 3 (*I'm not sure*), and 99 (*I do not want to answer*), with the latter also treated as missing value. A total of 603 students participated (M_{age} = 22.07; *SD* = 5.72; years; 69.3% female). The sample size closely approximated the recommended minimum of 630 participants, as calculated using Soper's (2025) a priori sample size calculator for structural equation modeling [12]. This estimate was based on an anticipated effect size of 0.15, a desired statistical power of 0.80, and a model structure involving four latent and 24 observed variables.

3.2 Data Analysis

All models were estimated in Mplus (Muthén & Muthén) v. 8.11, using the Weighted Least Squares Mean and Variance adjusted (WLSMV) estimator, which is well-suited for ordinal data. WLSMV treats variables as categorical, uses polychoric correlations, and provides robust parameter estimates and standard errors even when normality assumptions are violated [7]. It is particularly effective for scales with five or fewer response categories and performs reliably with sample sizes over 200 [13], [14].
To assess the structural validity of digital competence, eight competing models were tested, including Full ICM-CFA, Full ESEM, Full bifactor-CFA, Full bifactor-ESEM, Second-order Set ICM-CFA**,** Set-ESEM**,** Set bifactor-CFA**,** and Set bifactor-ESEM.
Model fit was evaluated using χ^2, CFI, TLI, RMSEA (with 90% confidence interval), and SRMR, following established guidelines [15]. Thresholds for acceptable to excellent fit were defined as CFI/TLI ≥ .90/.95, RMSEA ≤ .08/.05, and SRMR ≤ .08. Given the chi-square test's sensitivity to sample size and model complexity, it was interpreted in conjunction with other indices [16].

4. Results

4.1 Model Fit Evaluation

Among the competing models, the Set bifactor-ESEM model (M8) demonstrated the most balanced and superior fit: χ^2 (368) = 729.47, RMSEA = .040 (90% CI: .036–.045), CFI = .994, TLI = .992, and SRMR = .022 (Table 1). These values meet or exceed conventional thresholds for excellent model fit.

Table 1. *Model fit for competing measurement models*

	Models	χ^2	df	RMSEA	90% CI	CFI	TLI	SRMR
M1	Full ICM-CFA	1362.968	474	.056	.052 .059	.986	.984	.044
M2	Full ESEM	716.867	318	.046	.041 .050	.994	.990	.021
M3	Full Bifactor-CFA	1426.246	462	.059	.055 .062	.985	.983	.043
M4	Full Bifactor-ESEM	621.322	292	.043	.039 .048	.995	.991	.019
M5	Set ICM-CFA 2 order	1317.458	487	.053	.050 .057	.987	.986	.045
M6	Set ESEM	940.023	402	.047	.043 .051	.992	.989	.025
M7	Set Bifactor-CFA	1482.861	482	.059	.055 .062	.984	.983	.051
M8	Set Bifactor-ESEM	729.468	368	.040	.036 .045	.994	.992	.022

Note. χ^2 - Chi-square; df - degrees of freedom; TLI - Tucker-Lewis Index; CFI - Comparative Fit Index; RMSEA - Root Mean Square Error of Approximation [90%CI]; SRMR - Standardized Root Mean Square Residual

Compared to other models, Set Bifactor-ESEM outperformed both traditional CFA-based models and fully exploratory ESEM variants (see Table 2).

Table 2. *Fit Index Differences Supporting Model Selection Based on Parsimony and Structure*

Model Comparison	$\Delta\chi^2$	Δdf	ΔRMSEA	ΔCFI	ΔTLI	ΔSRMR	Meet criteria
M2-M1	-646.101	-156	-.010	.008	.006	-.023	Yes
M3-M1	63.278	-12	.003	-.001	-.001	-.001	No
M4-M2	-95.545	-26	-.003	.001	.001	-.002	No/Yes
M6-M2	223.156	84	.001	-.002	-.001	.004	Yes
M6-M5	-377.435	-85	-.006	.005	.003	-.020	Yes
M7-M5	165.403	-5	.006	-.003	-.003	.006	No
M8-M4	108.146	76	-.003	-.001	.001	.003	No/Yes
M8-M7	-753.393	-114	-.019	.010	.009	-.029	Yes

For instance, the Set Bifactor-CFA model (M7) yielded higher RMSEA (.059) or SRMR (.051), and lower CFI (.984) or TLI (.983), indicating poorer fit and inflated error. When comparing Set Bifactor-ESEM (M8) with Full Bifactor-ESEM (M4), M8 showed better performance on RMSEA (.040 vs. .043) and TLI (.992 vs. .991), two indices that penalize for lack of parsimony. Although M4 slightly outperformed M8 on CFI (.995 vs. .994) and SRMR (.019 vs. .022), this pattern is identical to the findings reported by Marsh et al. (2011). They noted that Full-ESEM models may achieve slightly better fit on certain indices due to increased flexibility, but this often reflects capitalizing on chance, especially when the difference in chi-square is proportional to the difference in degrees of freedom.

4.2 Latent Structure and Factor Correlations

The Set Bifactor-ESEM model revealed low correlations between the general factors representing functional and critical digital skills (r = .29–.30), providing strong empirical support for their distinctiveness (Figure 1). In contrast, the Set Bifactor-CFA model produced substantially higher G-factor correlations (r ≈ .77), suggesting inflated overlap likely due to the restrictive assumption of zero cross-loadings. These findings reinforce the realism and flexibility of ESEM-based approaches in modeling multidimensional constructs. In the context of the Set B-ESEM solution, statistically significant cross-set correlations were detected solely among the INP and CCP sub-dimensions.

The choice of the best-fitting model reflects not only statistical fit but also adherence to theory, interpretability of parameter estimates, and parsimony, tempered by sample size considerations. When CFA and ESEM models yield similar fit and factor correlations, CFA may be preferred for its simplicity, especially in small samples. However, when ESEM models demonstrate substantially better fit and more clearly differentiated factors, they should be preferred.

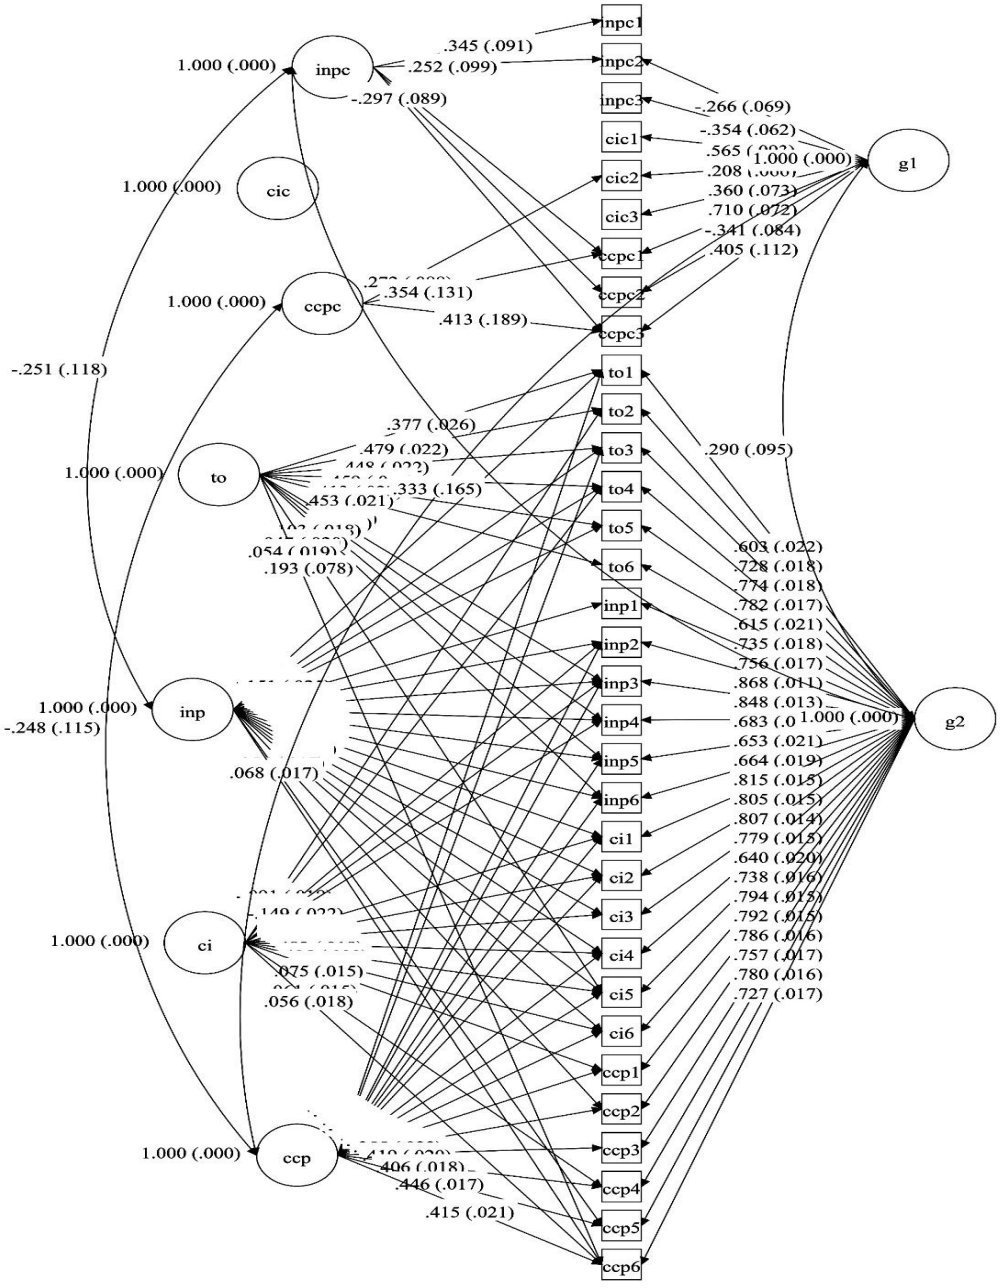

Fig. 1. *Standardized loadings (only statistically significant) of Set B-ESEM*

4.3 Structural Differentiation between Skill Domains

A closer inspection of item-level loadings revealed differential structural behavior between the two skill sets:

- For critical digital skills, the Set bifactor-ESEM model showed a dominance of the general factor, with most items loading significantly on G and relatively weak or non-significant loadings on their designated sub-factors. This pattern supports a unidimensional structure for critical skills under the constraints of the Set B-ESEM framework.
- For functional digital skills, the same model exhibited a more nuanced structure, where items loaded meaningfully on both the general factor and their respective sub-factors (e.g., TO, INP,

CI, CCP). This indicates a multidimensional configuration, with both general and domain-specific influences contributing to item responses.

In contrast, the Full bifactor-ESEM model revealed a more integrated structure across both domains. Specific factor loadings were stronger and more interpretable, and cross-loadings were present across items, suggesting a multidimensional latent structure overall. However, the general factor was less dominant for critical items, and the clarity of unidimensionality was reduced.

In summary, the Set bifactor-ESEM (Set B-ESEM) model offers the most accurate and theoretically sound representation of digital competence in this study. It confirms the hypothesized structure, reduces model bias, and adheres to best practices in multidimensional modeling by balancing statistical rigor with conceptual clarity.

The evidence supporting this conclusion includes:

- Low general factor (G-factor) correlations, indicating limited overlap across domains.
- Superior model fit of Set B-ESEM compared to alternatives.
- Distinct behavior across different item sets, reinforcing the need for a nuanced approach.

Together, these findings demonstrate that functional and critical digital skills are distinct yet interrelated domains, best captured through a parsimonious bifactor-ESEM framework, such as Set B-ESEM (see Table 3).

Table 3. *Modeling Approaches for Multidimensional Constructs: A Conceptual Comparison*

Model	Cross-loadings allowed	General factor included	Parsimony	Interpretability	Typical use case	Key advantage
Full ICM-CFA	No	No	High	Limited (rigid)	Simple, clean structures	Most parsimonious
Full ESEM	Yes (all)	No	Low	Complex	Multidimensional constructs	Realistic item behavior
Set-ESEM	Yes (within sets)	No	Moderate	Balanced	Distinct item sets (domains/methods)	Fit + structure preserved
Set B-ESEM	Yes (within sets)	Yes	Moderate	High	Hierarchical + item-type heterogeneity	General + specific variance, minimal bias

5. Discussion

This study aimed to evaluate the structural validity of digital competence by comparing eight competing measurement models, with particular focus on the bifactor-ESEM framework. The findings provide compelling evidence for the superiority of the Set bifactor-ESEM model, both in terms of statistical fit and theoretical interpretability. More importantly, the results offer nuanced insights into the distinctiveness between critical and functional digital skills, which has important implications for digital competence theory and assessment.

Structural Validity and Model Selection: The Set bifactor-ESEM model demonstrated excellent fit across all indices, outperforming both traditional CFA models and fully exploratory ESEM variants. Its balance between parsimony and flexibility allowed for a more realistic representation of the latent structure, avoiding the inflation of factor correlations commonly observed in ICM-CFA models. The low G-factor correlations (r = .29–.30) between critical and functional sets further support the hypothesis that these are distinct but related constructs, rather than manifestations of a single underlying dimension.

Within the Set B-ESEM model, a statistically significant association between functional and critical digital skills was identified only for the INP and CCP sub-dimensions. This pattern indicates that strengthening strategic (INP) and creative (CCP) functional digital skills may contribute to enhanced development of the corresponding critical digital skills linked to these domains. Such findings highlight the importance of supporting both layers of competence in an integrated manner, particularly in areas where functional proficiency has the potential to reinforce higher-order critical capacities.

Domain-Specific Structural Patterns: A key contribution of this study lies in the *differential structural behavior* observed across the two skill domains:

- For critical digital skills, the Set bifactor-ESEM model revealed a pronounced general-factor dominance: item loadings clustered on G, while specific-factor loadings were weak or non-significant. Such a configuration indicates that critical skills function as a unified construct, likely reflecting an overarching evaluative or judgment-based competency.

- Functional digital skills, however, exhibited a differentiated structure: items loaded substantively on their sub-factors while still contributing to the general factor. This pattern underscores the domain-specific and task-oriented nature of functional competence.

Emerging evidence supports this functional–critical distinction. Study [3] showed that functional and critical digital skills are mobilized differently in real-world civic action, reinforcing their conceptual separation. In contrast, the Full bifactor-ESEM specification in this study blurred these boundaries: although it increased specific-factor variance and enabled cross-loadings, it reduced the coherence of the general factor, especially for critical skills, highlighting a trade-off between flexibility and theoretical clarity.

Implications for Theory and Practice

These findings have several theoretical and practical implications:

1. *Clarifying the multidimensional architecture of digital competence:* The differentiated structure observed in Set bifactor-ESEM supports the conceptual separation between critical and functional digital skills, aligning with frameworks that treat digital competence as a multidimensional construct (e.g., [1], [3], [17]). This distinction helps refine existing frameworks by positioning functional skills as domain-specific operational abilities and critical skills as higher-order evaluative capacities grounded in reflective judgment.
2. *Strengthening construct validity through appropriate modeling:* Findings showing differential model performance (Set bifactor-ESEM vs. Full bifactor-ESEM) highlight the importance of choosing modeling structures that respect theoretical boundaries. The dominance of a general factor in the critical domain supports a unidimensional conceptualization, while the multidimensionality of functional skills confirms their domain-embedded nature. Theoretically, this suggests that digital competence is not a uniform construct but a hierarchical configuration that needs tailored representation.
3. *Advancing measurement theory in digital education research:* The results underscore that flexibility in measurement (e.g., allowing extensive cross-loadings) may undermine interpretability when constructs are expected to remain distinct. Theoretical work in digital competence should therefore prioritize models that balance complexity with conceptual clarity, ensuring that measurement aligns with pedagogically meaningful distinctions.
4. *Designing curricula that target both functional and critical layers:* Programs should intentionally integrate learning outcomes that build both:

- Functional skills: operational, technical, and domain-specific competencies (e.g., navigating platforms, managing information, producing content).
- Critical skills: evaluation, reflective judgment, bias recognition, ethical and safety-related reasoning.

Curricula must avoid treating digital competence as a monolithic skill and instead develop structured progression from functional to critical capacities.

5. *Supporting adaptive, evidence-based program design:* The hierarchical nature of digital competence indicates that:

- Foundational functional skills should be taught early (baseline operational literacy).
- Critical skills should be embedded across the curriculum as transversal competences.

This ensures students gradually move from tool-use proficiency to reflective digital citizenship and informed decision-making

6. Conclusion

This study provides empirical evidence that functional and critical digital skills form distinct yet interconnected layers of digital competence. Using Set bifactor-ESEM, we demonstrated that critical skills are best represented as a largely unidimensional construct, dominated by a general evaluative factor, whereas functional skills retain a multidimensional configuration aligned with domain-specific operational tasks. These structural differences reinforce contemporary theoretical work emphasizing the layered nature of digital competence and highlight the importance of selecting modeling approaches that respect established conceptual boundaries.

The results show that the Set bifactor-ESEM model provides a clearer and more interpretable structure of digital competence than more flexible alternatives. Although the Full bifactor-ESEM specification increased specific-factor variance, it weakened the coherence of the general factor, especially in the critical domain. Set bifactor-ESEM therefore emerges as the most theoretically aligned framework for

digital-skills assessment. These insights, in turn, support curricula that balance operational competence with evaluative digital judgment, reflecting the layered architecture of digital competence.
Overall, the findings enhance theoretical clarity around digital competence, validate more precise modeling strategies, and inform the development of curricula that better prepare students for evolving digital demands.

Limitations and Future Directions

While the Set bifactor-ESEM model provided the best representation of the data, its structure is partially constrained by theoretical assumptions. Future research should explore hybrid models that allow for partial cross-loadings while preserving interpretability. Additionally, longitudinal designs could help determine whether the structural distinction between critical and functional skills holds over time and across developmental stages.
The study relied on data collected from students at a single institution, a factor that may limit the generalizability of the findings.

Shaping Future Learning through Digital-Skills Profiling

Emil Frashëri

Fan S. Noli University of Korca, Albania

Abstract

In contemporary knowledge societies, higher education institutions face a growing misalignment between the digital competence that graduates possess and the levels required by an increasingly digitalized labor market. Effective curriculum reform requires a theoretically coherent and methodologically rigorous understanding of digital skills as a construct and the heterogeneity with which these skills are distributed across student populations. Although digital skills are widely acknowledged as multidimensional and hierarchically structured, as reflected in conceptual frameworks such as DigComp, empirical studies addressing heterogeneity continue to rely on scale scores or factor scores derived from restrictive measurement models (e.g., Independent Cluster Model Confirmatory Factor Analysis, ICM-CFA), which fail to adequately capture the coexistence of global and specific dimensions and their interrelationships. Recent methodological advances emphasize the need to model digital skills using bifactor Exploratory Structural Equation Modeling (B-ESEM) and to use factor scores from such models as indicators in Latent Profile Analysis (LPA). This approach enables the clear disaggregation of level and shape differences, allowing for more meaningful, substantive, and interpretable student profiles. The present study aims to identify homogeneous subgroups of university students based on multidimensional digital skill patterns using LPA based on B-ESEM factor scores, and to contrast this approach with LPA solutions based on scale scores and ICM-CFA factor scores. Findings highlight the superior informational richness and classification accuracy of the B-ESEM-based profile solution, with meaningful implications for differentiated, targeted, and personalized curriculum design in higher education.

Keywords: *digital skills, curriculum design, latent profile analysis, bifactor-ESEM, higher education*

1. Introduction

European higher education systems face a growing mismatch between graduates' skills and the demands of increasingly digitalized labor markets. In response, digital competence is now widely regarded by policymakers as a foundational requirement for employability, economic resilience, and civic participation. Rapid technological change, driven by automation, artificial intelligence, data intensification, and hybrid work models, has made the effective use of digital information and tools essential across sectors.

Despite this recognition, digital skills remain unevenly integrated into higher education curricula. Treating them as optional or peripheral limits graduates' preparedness for contemporary work environments. At the same time, students differ substantially in their existing digital competencies due to variation in prior education, socioeconomic background, discipline, and learning trajectories. Uniform curricular solutions therefore risk inefficiency, either failing to support lower-skilled students or under-challenging more advanced ones.

From a policy perspective, effective curriculum reform requires evidence on how digital competencies are structured within student populations. Specifically, it is necessary to identify meaningful profiles that capture both overall levels of digital competence and distinct patterns of strengths and weaknesses across skill domains. Such knowledge enables targeted interventions, more efficient allocation of educational resources, and better alignment between higher education outcomes and labor market needs.

Established policy frameworks, particularly DigComp [1], conceptualize digital competence as a multidimensional construct comprising interrelated domains, alongside an overarching general competence. However, conventional measurement approaches often inadequately represent this structure, producing biased estimates that limit the value of subsequent analyses. When used for student profiling, such measures tend to capture only broad level differences, providing limited guidance for targeted policy action.

Recent advances show that pairing strong measurement models with person-centered methods produces more actionable insights. B-ESEM captures overall and domain-specific digital skills, and LPA transforms these results into clear competence profiles. This integrated approach strengthens the policy usefulness of digital-skills data and directly supports informed curriculum design.

2. Digital Skills as a Multidimensional and Hierarchical Construct

Contemporary conceptualizations define digital skills as a multidimensional construct extending beyond technical proficiency to include cognitive, communicative, creative, and evaluative capacities. This view mirrors the embedding of digital technologies in learning, employment, and professional practice.
The European Commission's DigComp framework formalizes this view by identifying several interrelated domains of digital competence. These domains function in a complementary manner, with competencies such as information literacy, communication, content creation, and safety mutually reinforcing one another.
This interdependence implies a hierarchical structure, consisting of an overarching level of general digital proficiency alongside domain-specific competencies that capture distinct patterns of strengths and weaknesses. Accurately representing this structure is essential for informing policy-relevant analyses and for designing targeted, efficient curriculum interventions.

2.1 Measurement Models for Capturing the Multidimensional Structure of Digital Skills

Accurately assessing digital skills requires measurement models capable of representing multidimensional item behavior. Traditional confirmatory factor analysis (CFA), grounded in the Independent Cluster Model [2], constrains cross-loadings to zero, despite substantial evidence that items often reflect multiple skill domains. For complex constructs such as digital skills, this assumption produces oversimplified representations and systematically biases parameter estimates [3, 4]. When true cross-loadings are suppressed, construct-relevant variance is misallocated, typically inflating factor correlations and distorting construct definitions [5].
This limitation highlights the need for models that explicitly account for multidimensional item structure. Exploratory structural equation modeling (ESEM) [6] addresses this issue by allowing theoretically guided cross-loadings under confirmatory control, better capturing the inherent overlap among digital skill domains. However, both CFA and ESEM lack the capacity to model hierarchical structures, leaving the coexistence of general and domain-specific competencies unrepresented.
Bifactor CFA models overcome this limitation by estimating a general factor alongside specific domain factors, enabling a clearer partitioning of shared and domain-specific variance [7]. Integrating bifactor modeling with ESEM yields bifactor ESEM (B-ESEM), which simultaneously models cross-loadings and hierarchical structure, offering a comprehensive framework for representing interconnected digital skills [8].
Methodological research recommends comparing CFA, ESEM, bifactor CFA, and B-ESEM to detect construct-relevant multidimensionality [9]. B-ESEM improves the validity of digital skills measurement by clearly separating general proficiency from specific skill domains.
Importantly, factor scores derived from B-ESEM provide a robust foundation for person-centered analyses, enabling the identification of student profiles that reflect both overall digital competence and distinct domain-level configurations.

2.2 Latent Profile Analysis

Latent Profile Analysis (LPA) [10] is a person-centered statistical methodology designed to identify homogeneous subgroups within a heterogeneous population based on individuals' scores on multiple continuous indicators. Unlike traditional cluster analysis, LPA is model-based and probabilistic, offering robust fit indices, classification accuracy measures, and replication tests that validate the extracted classes.

LPA equation is: $f(\mathbf{y}_i \mid \boldsymbol{\theta}) = \sum_{c=1}^{C} \boldsymbol{\gamma}_c f_c(\mathbf{y}_i \mid \boldsymbol{\mu}_c, \boldsymbol{\Sigma}_c)$, where, $f(\mathbf{y}_i \mid \boldsymbol{\theta})$, as the distribution of a set of scores y_i, given model parameters $\boldsymbol{\theta}$, is a function of the proportion of class c, $\boldsymbol{\gamma}_c$, and the class specific distribution, $f_c(\mathbf{y}_i \mid \boldsymbol{\mu}_c, \boldsymbol{\Sigma}_c)$, given its mean $\boldsymbol{\mu}_c$ and covariance metrics, $\boldsymbol{\Sigma}_c$.

Latent Profile Analysis (LPA) is widely used in psychology and education to identify unobserved subgroups that cannot be detected through variable-centered approaches. In educational research, LPA has been applied to motivation, engagement, well-being, and, more recently, students' digital behavior and digital competence.

Digital-skills LPA studies differ considerably in their use of item-level or aggregated indicators. While [11] is transparent about indicator choice, this clarity is often lacking elsewhere [12], hindering interpretation and comparison.

Despite their convenience, scale scores do not account for measurement error or reflect the underlying latent structure of digital competence. As a result, LPA based on scale scores tends to yield profiles driven primarily by overall level differences (e.g., low, medium, high), offering limited insight into domain-specific skill patterns. Methodological research therefore emphasizes that person-centered analyses should be grounded in robust variable-centered models that accurately represent construct multidimensionality [13].

Using factor scores derived from ICM-CFA only partially addresses this issue, as these scores remain constrained by restrictive assumptions, including zero cross-loadings. Such limitations can distort profile solutions and obscure meaningful qualitative differences. In contrast, bifactor ESEM generates factor scores that explicitly separate general and domain-specific components while preserving cross-domain information.

When B-ESEM factor scores are used in LPA, resulting profiles capture both level and shape differences, yielding richer and more interpretable classifications. This approach has been successfully applied in occupational and educational psychology to model complex psychological constructs [5, 14]. However, no published research has yet applied B-ESEM–based LPA to digital skills, despite their clearly demonstrated hierarchical and multidimensional structure.

***Purpose of the Study**:* Addressing this gap, the present approach identifies digital-skills profiles that capture both overall competence and distinct domain-level patterns. These differentiated profiles offer direct value for policy and practice, enabling targeted, adaptive, and evidence-based curriculum interventions. As such, B-ESEM–based LPA represents a significant methodological advance for digital-skills assessment and curriculum development.

This study demonstrates these advantages by showing that B-ESEM–derived profiles are psychometrically robust, theoretically coherent, and practically actionable, offering a strong foundation for more responsive and effective digital-skills curricula in higher education.

3. Method

3.1 Participants and Procedure

An online survey was administered via Google Forms to students across four faculties at Fan S. Noli University of Korça as part of a university-funded digital skills project. The sample included 599 students (69.3% female; *M* age = 22.09, *SD* = 5.75). Ethical approval was obtained from relevant institutional authorities, and participation was voluntary and anonymous.

The survey comprised socio-demographic items and the 24-item short Youth Digital Skills Indicator (yDSI; Helsper et al., 2020). The instrument was translated and culturally adapted through expert review. A preliminary test–retest evaluation with 30 students, administered three weeks apart, demonstrated good temporal stability (Spearman's $\rho \approx .80$).

3.2 Sample Size

Prior research suggests that 300–500 cases are adequate for stable Latent Profile Analysis solutions [15]. ESEM-based Monte Carlo simulations demonstrated adequate estimation quality, with standard error bias below 5% and MSE below .02 at $n = 350$. The final sample exceeded this threshold, supporting robust parameter estimation.

3.3 Measure

Students' digital skills were assessed using the validated 24-item Youth Digital Skills Indicator (yDSI) [16], covering four functional domains: Technical–Operational (TO), Information Navigation–Processing (INP), Communication–Interaction (CI), and Content Creation–Production (CCP). The problem-solving and safety domains were excluded due to conceptual overlap. Items were rated on a 0–5 scale; "prefer

not to answer" responses were treated as missing. The yDSI shows strong psychometric validity across multiple EU countries.

3.4 Data Analysis

All analyses were conducted in Mplus 8.11 (Muthén & Muthén). Three sets of LPA indicators were used: (a) summed scale scores for the four yDSI domains, (b) standardized factor scores from an ICM-CFA model, and (c) standardized factor scores from a bifactor ESEM model, identified in prior work as the best-fitting structure [17] among the CFA/ESEM configurations recommended for comparison [9]. Models were estimated using WLSMV, recommended for ordinal indicators and samples above 200 [18].

For each indicator set, two- to seven-profile LPA models were estimated using MLR with 1,000 random starts, 200 initial iterations, and 100 final optimizations, allowing means and variances to vary across profiles. Model selection followed standard multi-criteria guidelines [19], drawing on AIC, BIC, SABIC, entropy, smallest class percentage, and the adjusted Lo–Mendell–Rubin (aLMR) and Bootstrap Likelihood Ratio Tests (BLRT). BIC favored simpler models [20], entropy ≥ .80 signaled good accuracy [21], and classes <5% were viewed as potentially spurious unless theoretically meaningful [22]. The aLMR was interpreted cautiously due to instability, and the BLRT due to its sensitivity to minor likelihood improvements [23].

4. Results

4.1 Latent Profile Analysis Based on yDSI Sum Scores

LPA using the four yDSI sum-score indicators showed improved fit from the two- to five-class models, as indicated by decreasing AIC, BIC, and aBIC values (Table 1). Entropy remained high (.865–.914), with the three-class model showing the strongest classification (.914). The aLMR test supported only the two- and three-class solutions, whereas the BLRT remained significant across models but was interpreted cautiously due to its tendency to over-extract classes.

Table 1. *Fit Indices from Three Person-Centered Models*

7 Profiles	.26259	.41851	.00000	.00000	.22098	.09792	.00000

Thus, only the three- and four-class models were considered viable (Table 3).
In the three-class solution, Class 1 (35.47%) showed uniformly low digital skills; Class 2 (53.46%) showed moderate but even skill levels; and Class 3 (11.07%) showed high skills, especially in CI and CCP.
In the four-class solution, three classes differed only in magnitude, and the additional class did not offer conceptual distinction, with one class mean not reaching statistical significance.
Balancing fit indices, parsimony, aLMR results, class size, and interpretability, the three-class model provided the most coherent and theoretically meaningful representation of heterogeneity in digital skills based on yDSI sum scores.

4.2 Latent Profile Analysis Based on ICM-CFA Factor Scores

LPA based on the four ICM-CFA factor scores showed improving fit from the two- to five-class models, with decreasing AIC, BIC, and aBIC values and consistently high entropy (.883–.952). The aLMR test supported solutions up to five classes but not beyond, while the BLRT remained significant across all models (Table 1).
Among the three-, four-, and five-class solutions (Table 3), the three-class model reflected only quantitative differences: a very low-skill class (24.33%), a moderate-skill class (56.37%), and a high-skill class (18.87%), all showing uniform patterns across dimensions. However, the lowest-skill class had a non-significant mean, limiting its distinctiveness.
The four-class solution largely replicated the three-class structure but introduced a small (3.83%) subgroup with exceptionally high INP and CCP scores, representing a distinct high-performing group.
The five-class model added a meaningful low-performing subgroup (7.52%) with deficits across all domains, including TO dimension. All latent means were statistically significant, and the remaining classes aligned closely with those in the four-class solution.
Considering statistical fit, aLMR and BLRT support, high entropy, and the substantive value of distinguishing both an advanced and a very low-performing subgroup, the five-class solution provided the most informative representation of heterogeneity in the ICM-CFA factor scores.

4.3 Latent Profile Analysis Based on Bifactor ESEM Factor Scores

Using bifactor ESEM factor scores, the LPA incorporated both a general digital-skills dimension (quantitative variation) and four specific dimensions capturing qualitative differences across domains. Fit indices improved steadily from the two- to five-class models, with decreasing AIC, BIC, and aBIC values and high entropy (.927–.956). The aLMR and BLRT test supported up to five classes, while nonsignificant results for larger solutions, along with fragmented and near-empty classes (Table 2), indicated over-extraction.

Both the four- and five-class models showed significant latent means. The four-class model demonstrated strong fit, high entropy (.927), significant aLMR and BLRT values, and no classes below 5%. In this solution, 41.85% of students scored below average on the general factor, while nearly 10% showed stronger general and specific digital skills (Table 3).

The five-class model achieved the lowest information criteria and excellent entropy (.952), but included a small class (3.63%), below recommended stability thresholds. Despite its size, this class provided meaningful insight by illustrating how severe INP deficits can substantially depress overall digital competence. The remaining classes were interpretable, distinct, and adequately sized.
Balancing statistical fit, class stability, and substantive interpretability, the five-class bifactor ESEM solution was identified as the optimal profile structure.

5. Discussion

This study compared three latent profile analysis (LPA) strategies for identifying heterogeneity in students' digital competence: (a) yDSI sum scores, (b) ICM-CFA factor scores, and (c) bifactor ESEM factor scores. Although all approaches produced statistically adequate solutions, the B-ESEM–based LPA generated the most informative and educationally meaningful profiles because it simultaneously captured *overall digital skill levels* and *qualitative differences across specific domains*. This dual perspective provides a depth of interpretation not attainable with sum scores or ICM-CFA models.

***Limitations of Sum Score and ICM-CFA Approaches*:** LPAs based on yDSI sum scores and ICM-CFA factor scores primarily detected *quantitative* variation, producing "low–medium–high" profiles with minimal differentiation across TO, INP, CI, and CCP. While statistically acceptable, these solutions reflect a single continuum of ability and offer limited insight for targeted curriculum design.
The ICM-CFA approach added nuance by identifying two small but meaningful subgroups: a high-performing group distinguished by strong INP and CCP skills, and a vulnerable group with very low competence across all domains. While these findings support differentiated teaching, the profiles did not reveal qualitative patterns because the ICM-CFA model constrains both cross-domain relationships and hierarchical structure.

***Advantages of the B-ESEM–Based LPA*:** The B-ESEM approach substantially improved profile interpretability by modeling both the general digital-skills factor and domain-specific qualitative variation. Controlling for overall ability exposed meaningful differences in INP and CCP that were masked in the previous models. The resulting profiles combined level and shape differences, offering deeper insight into how students' strengths and weaknesses interact.
Notably, B-ESEM revealed that strategic (INP) and creative (CCP) skills exert disproportionate influence on overall competence. Students with severe INP deficits displayed sharply lower general scores, while profiles with strong CCP performance showed elevated digital proficiency. These distinctions, central for curriculum design, are uniquely identifiable through B-ESEM.

***Why the B-ESEM Approach Is Optimal*:** The B-ESEM–based LPA offered the strongest combination of statistical fit, class stability, conceptual clarity, and policy relevance. It simultaneously captured quantitative differences in students' overall digital competence and qualitative variation across the four specific dimensions, producing distinct and interpretable subgroups that reflect realistic digital-skill configurations. Although two classes in the ICM-CFA and B-ESEM solutions fell below the conventional 5% threshold, both yielded meaningful substantive insights, suggesting that such cutoffs should not be applied rigidly when small groups represent genuine educational needs.

Implications for Targeted and Differentiated Curriculum Design
The B-ESEM profiles provide direct guidance for evidence-based curriculum improvement. The identification of INP and CCP as key differentiators among high-performing students suggests curricula should incorporate activities that strengthen information evaluation, synthesis, complex problem-solving, and creative content production. These components align closely with contemporary digital-literacy frameworks.
Conversely, the detection of a subgroup lacking foundational digital skills highlights the need for remedial, scaffolded instruction focused on operational tasks, safety practices, and structured digital routines. Without such support, these students risk marginalization in digital learning environments and future labor markets.
Because B-ESEM profiles include both level and shape information, they offer a strong foundation for tiered, adaptive, and personalized curriculum pathways. Institutions can design differentiated learning trajectories that match students' strengths, address specific deficits, and allocate resources strategically.

This stands in clear contrast to “one-size-fits-all” curricula that overlook substantial within-population variability.

6. Conclusion

By comparing three modeling strategies, this study demonstrates that B-ESEM–based LPA provides the most powerful method for uncovering meaningful digital-skills heterogeneity. By separating general competence from specific qualitative dimensions, B-ESEM offers diagnostic precision that raw scores and ICM-CFA models cannot achieve.
The identification of INP and CCP as critical drivers of overall digital ability, and the detection of both high-performing and at-risk subgroups, provides actionable evidence for curriculum modernization. These insights support institutional strategies that embed digital skills in a differentiated, targeted, and personalized manner. Accordingly, the B-ESEM approach not only advances methodological practice but also provides a strong empirical basis for equitable and responsive digital-skills policy and curriculum design within higher education.

Scalability by Design: Leveraging DACUM and AI to Standardize Implementation Fidelity in Global Educational Interventions

Leslie Rosales

Universidad del Valle, Guatemala

Abstract

This research addresses the challenge of sustainable scalability in educational interventions by focusing on implementation fidelity as the cornerstone for success. The study argues that scientific precision in defining facilitator tasks is essential to replicate impact without compromising effectiveness. Utilizing the DACUM methodology, the author deconstructed staff responsibilities into measurable tasks to bridge the gap between theoretical models and classroom practice.
The study involves the validation of a monitoring instrument for Asociación Grupo Ceiba. Psychometric analyses, including Classical Item Analysis and Exploratory Factor Analysis, confirm the instrument is reliable and valid for assessing consistency. The findings also highlight Artificial Intelligence as a valuable tool for generating item banks, provided they undergo expert validation. Ultimately, this work provides a robust framework to ensure educational interventions remain effective as they scale.

Keywords: *Implementation fidelity, DACUM methodology, scalability, educational monitoring, psychometric validation, Artificial Intelligence.*

1. Introduction

The success of a high-quality educational intervention lies not only in its local results but also in its scalability; that is, its ability to replicate its impact on a large scale without compromising its original effectiveness [13]. However, this expansion process faces a critical challenge: ensuring that implementers faithfully execute the model while maintaining the flexibility needed to make appropriate adaptations to each context. In this sense, the sustainability of an intervention depends directly on the consistency and quality of its implementation over time and across different locations [4].
To achieve this balance, it is imperative to define with scientific precision what those responsible for implementing the program should do. This research argues that the foundation of successful implementation lies in a rigorous analysis of the responsibilities and tasks of the staff, specifically the teacher or facilitator, who acts as the final link in the delivery of educational services to the beneficiary [4].
Defining tasks is insufficient without a mechanism to verify the consistency of their implementation across different locations and over time. This technical need requires the design of a monitoring instrument that serves as an empirical bridge between the theoretically conceived educational model and teachers' practice. For this instrument to be a legitimate tool for decision-making, it must meet the criteria of validity and reliability [8].
Therefore, this research focuses on piloting and validating the monitoring instrument for the implementation of the flexible education model of Grupo Ceiba. This study used the **DACUM** (*Developing A Curriculum*) methodology as a starting point to break down the specific competencies and tasks of the facilitator within an educational model. Artificial Intelligence (AI) was also used for the comprehensive generation of observation items for the instrument.
Within this framework, the instrument's validity is based on the results derived from the DACUM process, ensuring that the items accurately represent the model's elements. Additionally, its reliability relies on translating these elements into observable tasks, allowing for an objective, consistent, and verifiable measurement of facilitators' performance in the field. This research demonstrates the validation of an instrument for monitoring the implementation fidelity of Grupo Ceiba's flexible education model through its group of facilitators.

1.1 Implementation Fidelity and Sustained Scalability

One of the fundamental premises for scaling an educational innovation is its proven effectiveness. However, when an innovation is not implemented as intended, the likelihood of it failing to achieve the expected results is high. This phenomenon underscores the critical need to measure the degree of implementation fidelity before proceeding with any scaling efforts. An innovation may appear ineffective when the underlying problem is low fidelity, which raises doubts about the true causality of the results obtained [7].
Implementation fidelity is defined as the degree to which a practice is carried out according to the intended model, under the assumption that the success of any educational change depends on precise execution [7]. This concept is multidimensional and encompasses five key dimensions: dosage, adherence, responsiveness, quality, and differentiation. Of these, "quality" is particularly relevant to this research, as it includes the capacity for adaptive or flexible implementation depending on the context, evaluating the performance of the facilitator. Other dimensions analyze adherence to the model's components, the dosage of intervention received, user satisfaction, and the impact of the program's added value.
To measure these dimensions, especially in a complex educational model, subjective reports are insufficient. Century, Rudnick, and Freeman (2010) argue that direct observation is the most reliable and valid method for measuring fidelity, distinguishing between structural and instructional components [4]. However, for the observation to be rigorous, fundamental methodological questions arise: **what exactly will be observed in a facilitator while implementing the educational model? And are we confident that we are measuring implementation consistently and valid?**
It is at this point that the present research introduces the analysis of work tasks using the DACUM methodology. To answer the question of the degree of adaptive implementation of the educational model, it is imperative to break down the implementer's functions into observable tasks. The DACUM process provides the scientific basis for the validity of the measurement instrument, ensuring that what is observed at the sites coincides with the critical components of the original design. Furthermore, transforming these functions into concrete behavioral items ensures the reliability necessary to determine whether the variations at each site are valid pedagogical adaptations or deviations from the model.

1.2 The DACUM Method

The DACUM (*Developing A Curriculum*) methodology is based on a pragmatic and collaborative approach to occupational analysis, starting from the premise that expert workers are the professionals best qualified to define their own work. This method posits that any occupation can be accurately described by identifying the specific tasks performed by successful workers, recognizing that each of these actions demands particular knowledge, skills, and attitudes for its effective execution. Under this "learning by doing" philosophy, the process takes place in an intensive workshop where a panel of 5 to 12 experts, under the guidance of a facilitator, breaks down the occupation into general functions and measurable tasks. The final result is a detailed competency map that translates work experience into a structured job profile, which serves as a scientific basis for the design of training programs, intervention monitoring, and performance evaluation systems [14].
The DACUM method offers significant competitive advantages over traditional occupational analysis methods, such as direct observation or individual interviews. One of its main strengths is its time and cost efficiency, as it allows for the consolidation of data in just two days of group work, whereas other methods would require weeks of data collection [14]. Furthermore, by relying on a panel of experts currently performing the work, the method ensures superior content validity, capturing the real behaviors and tasks demanded by the labor market, in contrast to academic approaches that tend to become outdated quickly [9]. Finally, the collaborative nature of the process fosters immediate consensus and a sense of ownership among employers and educational institutions, facilitating a smoother transition from curriculum design to on-the-job implementation [5].

1.3 Analysis of the Nature of the Tasks: Complexity and Difficulty

In the study of human performance, tasks are defined as the fundamental activities that individuals must perform to progress in both their personal and professional lives [11]. The literature has shown that the intrinsic characteristics of these tasks not only condition job performance but also shape an individual's social behavior [11]. One of the most critical variables for classifying these activities is their complexity.

Highly complex tasks place substantial demands on the performer's skills, knowledge, cognitive functions, and memory [11]. Therefore, to determine whether performance in an intervention is satisfactory, it is imperative to analyze the relationship between task complexity and the outcome, allowing us to establish whether the observed performance aligns with the expected performance.
Several authors have attempted to define cognitive complexity from multiple dimensions. Wood (1986) proposes a tripartite model [17]:

- **Component Complexity:** Refers to the volume of different acts and information signals that must be processed.
- **Coordinative Complexity:** Linked to the nature of the relationships between inputs and final products.
- **Dynamic Complexity:** Originating from the variability of the environment that alters these relationships.

Other theoretical frameworks have expanded on this view. Campbell (1988) identifies the presence of multiple paths and outcomes, conflicting interdependence, and uncertainty in relationships as sources of complexity [7]. Bonner (1994), for his part, articulates complexity around information processing (input, process, and outcome), emphasizing the quantity and clarity of information [7]. Finally, Harvey and Koubek (2000) extend Wood's work by proposing dimensions of scope, structure, and uncertainty [7]. Taking together, these perspectives reinforce the idea that the quantity, interaction, and variation of the elements of a task are the main determinants of its complexity.
It is essential, however, to distinguish between task complexity and difficulty, concepts often used interchangeably in literature but considered distinct in this research. This paper proposes a critical conceptual distinction: complexity is an inherent property of pedagogical design (the 'what' and 'how' of the educational model of Grupo Ceiba), while difficulty is redefined as operational feasibility ('how frequent'). Thus, while complexity is stable and depends on the design, difficulty is variable and depends on the individual's interaction with their work environment, moving away from the traditional view that subordinates it solely to the subject's perception of self-efficacy.
This distinction between complexity and difficulty underscores the importance of a thorough occupational analysis. In the context of Grupo Ceiba's flexible education model, the facilitator's tasks are highly complex, as the intervention requires not only following a protocol (elements of the educational model) but also adapting information to the student's changing environment (uncertainty). Furthermore, difficulty, understood as feasibility, depends largely on contextual factors.

1.4 The Use of AI to Develop Standardized Instrument Items

The integration of Artificial Intelligence (AI) into the development of items for standardized instruments represents one of the most dynamic frontiers in contemporary psychometrics, as highlighted at the 2026 NCME (National Council on Measurement in Education) conferences. The use of artificial intelligence allows for the automatic generation of items at an unprecedented scale and speed, facilitating the creation of extensive item banks and reducing the risk of content exposure [2;12]. However, recent NCME research emphasizes that this potential must be balanced with strict psychometric rigor; authors such as Hao et al. (2024) and Bulut et al. (2024) warn of the need for "responsible AI" frameworks to mitigate algorithmic bias and ensure construct validity [10; 3]. In this sense, it is proposed that AI should not replace, but rather enhance the work of content experts, using *prompt engineering* and semantic alignment strategies to ensure that the generated items maintain the necessary relevance and fairness in large-scale evaluations [16].

2. Methodology

This research is based on a psychometric instrumental design, aimed at developing and validating an instrument to measure the fidelity of implementation in the Grupo Ceiba educational model. The procedure integrates the DACUM occupational analysis for content delimitation, Haladyna 's (2006) guidelines for scale construction [8], and Shoukri 's (2010) criteria for reliability analysis, item analysis, and internal structure of the instrument [15].

2.1 Participants

The study was conducted in collaboration with the Grupo Ceiba Association of Guatemala. Technical validation and piloting were carried out with the 53 Grupo Ceiba facilitators who implement a flexible educational model at their respective locations up to January 2026. Additionally, a panel of experts,

comprised of 8 to 12 facilitators with more than 3 years of experience and regional coordinators from the institution, participated in the DACUM workshop.

2.2 Instrument Development Procedure

Following the test development cycle proposed by Haladyna (2006), the process was structured in five validation phases [8]:

Phase 1: Domain Definition and Content Validity. To ensure that the instrument accurately represents the essential element of the original design of the educational model, an intensive workshop was conducted using the DACUM (*Developing A Curriculum)* methodology. In this phase, the panel of experts broke down the facilitator's role in general responsibilities and specific, measurable tasks. This process translated the facilitator's role into measurable responsibilities and tasks, ensuring content validity from the design's foundation. Subsequently, these tasks underwent a validation survey to determine their frequency and importance, yielding a criticality index for each. The criticality index is a metric used to rank elements (tasks) based on their frequency of implementation and importance within the educational model [6].

Phase 2: Specification table and item construction. Based on the criticality index, a specification table was developed to determine the number of observation items to be included in the observation instrument, distributed according to the estimated criticality for each one.

Table 1. Table of Specifications

Area of responsibility of the facilitator	Number of items according to criticality index to be included in the instrument
Pedagogical agreement	14
Administration	9
Assessment	7
Monitoring	8
Maintenance	1
Divulgation	8
Total	47

Phase 3: Exhaustive generation of possible items to observe in a facilitator. Once the table of specifications was developed, items were generated, worded as observable actions. For this, the artificial intelligence tool Google Gemini was used, and it was asked to suggest all possible ways to observe each task on the task map obtained in the DACUM workshop, without any limit. In the process of requesting the item bank from Gemini, the document containing the educational model of Asociación Grupo Ceiba [1] was provided as part of the prompt. This bank resulted in 316 possible items to include in the questionnaire.

Phase 4: Instrument assembly. From the bank generated in Phase 3, the final items were randomly selected, respecting the proportionality indicated in the specifications table of the previous step (Haladyna, 2006). However, the Grupo Ceiba team that validated the instrument suggested, including only 44 items as three were considered to be redundant. The table shows the total number of items. The instrument is structured using a four-level frequency scale that allows for the assessment of facilitator performance, ranging from "never does it" (1) to "always does it" (4), with intermediate levels of "does it occasionally" (2) and "does it frequently" (3). The final instrument consists of 44 items organized into six job responsibilities (theoretical dimensions), which were directly derived from the key responsibilities identified during the DACUM workshop and further in the table of specification (Table 1).

Phase 5: Piloting the instrument. To strengthen objectivity and mitigate observational bias, a multi-informant evaluation scheme (triangulation) was adopted while piloting the final instrument: (a) the regional coordinator, (b) a student with at least one year of experience, and (c) the facilitator themselves through self-evaluation. The instrument was configured for direct evaluation by the coordinators, based

on their frequent visits to the sites. The facilitators responded based on a self-evaluation, and the students based on their experience as students of the facilitator for at least one year.

2.3 Data Analysis

The psychometric quality of the instrument was analyzed under the following criteria:

2.3.1 Item Analysis

An initial exploration was conducted using the frequency distribution of the scale options: "never does it" (1), "does it occasionally" (2), "does it frequently" (3), "always does it" (4) . Subsequently, internal consistency was estimated using Cronbach's alpha coefficient, with the psych package in the R statistical environment.

2.3.2 Internal Structure

To assess construct validity, an exploratory factor analysis (EFA) was performed using the psych package in the R statistical environment. The purpose of this analysis was to verify that the empirical structure of the tasks corresponded to the theoretical dimensions of facilitator responsibilities as defined in the Dacum Workshop and further in the table of specifications (Table 1).

2.3.3 Implementation Fidelity Exploration

Finally, the facilitators' overall scores were estimated, disaggregated by the three profiles of actors participating in the study, to compare the reported implementation levels.

3. Results of the Instrument Validation

3.1 Item Analysis

Analysis of the response frequencies reveals a marked tendency towards the higher categories on the scale: **"I always do it" (4)** and **"I do it frequently" (3).** The category **"I do it occasionally" (2)** has a significantly lower frequency, while the option **"I never do it" (1)** is selected marginally.
This distribution suggests that, while the four-level scale effectively discriminates the degree of implementation among those already applying the model, it has a limited capacity to identify those who have not implemented it at all (ceiling effect). Consequently, calculating the implementation fidelity score is the proportion of frequency of implementation over complete implementation of the task.

Table 2. Average proportion of selection of each point on the scale

	Number of items	I never do it	I do it occasionally	I do it frequently	I always do it
Pedagogical agreement	14		4.6363	44.7357	47.8429
Administration	8	1.9	5.6857	37.5222	54.0889
Assessment	7		3.04	45.2857	48.7857
Monitoring	7	6.3	7.5571	47.9857	38
Maintenance	1		1.9	20.8	73.6
Divulgation	6	1.9	6.9333	39.3	49.6667

The 44-item scale exhibits excellent internal consistency, with an overall Cronbach's alpha coefficient of 0.96 [0.95, 0.96]. Item homogeneity is adequate, with an average inter-item correlation of 0.33. The reliability analysis if one item is removed (Reliability if an item es The deleted items demonstrate that excluding any item would not significantly increase the overall coefficient, suggesting that all items contribute positively to the consistency of the construct. Furthermore, all corrected item-total correlations exceed 0.40, confirming the strong discriminatory power of each item within the scale.

3.2 Factor Analysis

Exploratory factor analysis confirms the existence of a robust general implementation factor underlying the entire instrument (MR1). However, specific dimensions are identified that group teachers' practices around pedagogical agreements and administrative practices (MR3); items from sections A (A_2_12_D, 0.648) and B (B_4_32_D, 0.551) load here. Monitoring and administrative tasks (MR4) are also included; items from section D, such as D_2_11_D (0.658) and B_1_6_D (0.624), load heavily here. Finally, evaluation (MR2) is defined by items C_1_6_D (0.600) and C_3_24_D (0.501). The presence of cross-loadings suggests that the Grupo Ceiba educational model functions as an integrated system where the components mutually reinforce each other. This finding is consistent with the literature on the dynamic complexity of work tasks.

Table 3. Factor Loads

FACTORIAL DIMENSION	LOAD	DESCRIPTION OF (MR)
MR1: GENERAL IMPLEMENTATION	Dominant	Robust factor that underlies the entire instrument.
MR3: PEDAGOGICAL AGREEMENT	0.648	Pedagogical agreement and administrative tasks.
MR4: MONITORING	0.658	Monitoring and administrative tasks.
MR2: EVALUATION	0.600	Evaluation tasks.

3.3 Implementation Fidelity

To estimate the implementation fidelity results, fidelity of implementation of the facilitators scores as evaluated by three people were obtained: 1) the coordinator (immediate supervisor), 2) their students, and 3) themselves in a self-evaluation format.

With 95% confidence, the implementation fidelity according to the facilitators' self-assessment falls between CI (0.83, 0.88). With the same confidence level, the students find a slightly higher implementation fidelity CI (0.88, 0.92). Finally, the coordinators find a level of implementation fidelity very close to the facilitators' self-assessment CI (0.81, 0.87). The graph shows that the coordinators' evaluations of the facilitators vary more than the self-assessments and the students' evaluations. Presumably, this is because the coordinators can compare the work of several facilitators under their supervision. In all three cases, implementation of fidelity exceeds 80%.

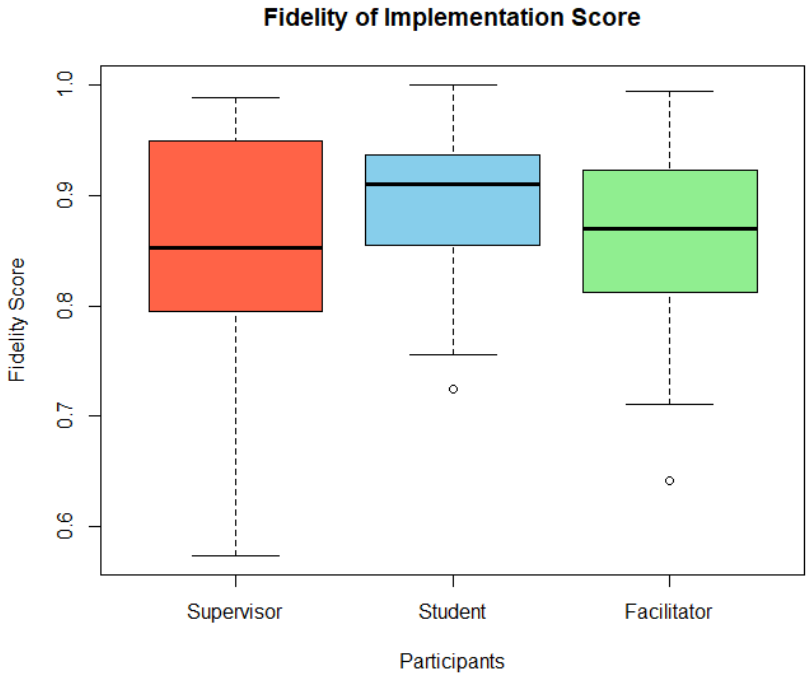

Fig. 1. Average score per group of participants

4. Conclusions

The validation process for a monitoring instrument, initially based on task analysis using the DACUM methodology, ensures that the measurement will focus on the specific operational aspects of the intervention. In this sense, designing tools with a focus on faithful implementation is essential for project sustainability, as it enables informed decision-making and continuous, evidence-based improvement.
Under this rigorous methodology, the analyses performed confirm that the resulting monitoring instrument is reliable and valid, meeting the necessary psychometric properties to ensure that the fidelity of its implementation is based on precise measurements. In the item construction phase, the use of Artificial Intelligence emerges as a valuable tool for generating a comprehensive item bank; however, its application must be strictly subject to the model's normative documents and undergo qualitative validation with the intervention's leadership to ensure its relevance.
Finally, the results of this study suggest that, discriminating against response frequency in certain categories, it is essential to preserve a scale that includes at least three levels of performance: one that documents the absence of implementation and two that allow discriminating the gradation of the model's presence in the work context.

Global Learners, Global Leaders: Building the Knowledge, Empathy, and Skills to Lead in an Interconnected World

Bettina Staudt

Chesterfield County Public Schools, Virginia Dual Language Educator Network, Executive Board, United Nations Association National Council, United States

Abstract

Global Learners, Global Leaders is an elementary-level program designed to cultivate globally competent students through an integrated approach that combines language learning, cultural exploration, and engagement with the United Nations Sustainable Development Goals (SDGs). As globalization increasingly shapes social, environmental, and economic systems, education must equip young learners with the knowledge, skills, and dispositions necessary to understand diverse perspectives and address complex global challenges. Global competence involves the ability to examine issues of local and global significance, communicate across cultures, and take informed action toward sustainable and inclusive societies (Organisation for Economic Co-operation and Development [OECD], 2018). Today's students are tomorrow's problem-solvers. This program encourages elementary learners to explore the world with curiosity, empathy, and a sense of shared responsibility. Through age-appropriate, interdisciplinary units, students develop foundational language skills that support cross-cultural communication and appreciation for linguistic diversity. Research indicates that early bilingual and multilingual education can strengthen executive functioning, cognitive flexibility, and problem-solving abilities in young learners, contributing to broader cognitive and academic development (Alabi, 2024; Barbu et al., 2024). Students also explore diverse cultures and perspectives to understand the value of inclusion, collaboration, and respect for cultural differences. Through inquiry-based and project-based learning experiences, learners investigate global challenges—including climate change, access to clean water, and social equality—through the framework of the SDGs. By emphasizing critical thinking, intercultural understanding, and ethical decision-making, Global Learners, Global Leaders prepares students to thrive in an interconnected world and contribute as informed, responsible global citizens.

Keywords: *Global competence, intercultural education, sustainable development, dual immersion, elementary education*

Introduction

In an increasingly interconnected world, education must extend beyond the acquisition of academic knowledge to include the development of skills necessary for navigating complex global systems. Students are required not only to understand content but also to engage with diverse perspectives, communicate across cultural boundaries, and contribute meaningfully to addressing global challenges. Global competence has therefore emerged as a critical educational priority. Global Learners, Global Leaders is an elementary-level framework designed to cultivate globally competent students through language learning, cultural exploration, and engagement with the United Nations Sustainable Development Goals (SDGs). As globalization increasingly shapes social, environmental, and economic systems, education must equip learners with the knowledge, skills, and dispositions necessary to understand diverse perspectives and address complex global challenges. Through interdisciplinary learning experiences, inquiry, and opportunities for action, students develop communication skills, intercultural understanding, critical thinking, and civic responsibility. The Organization for Economic Co-operation and Development (OECD, 2018) defines global competence as the capacity to examine issues of local and global significance, understand and appreciate multiple perspectives, engage in intercultural interactions, and to take action for collective well-being. The *Global Learners, Global Leaders* framework responds to this need by embedding global competence into elementary education through interdisciplinary, language-rich, and sustainability-focused instruction. Rather than treating global education as an isolated subject, this framework integrates it into daily teaching and learning, positioning students as future changemakers capable of contributing to a more just and interconnected world.

Theoretical Framework

The foundation of this work is grounded in global competence and education for sustainable development. The OECD (2018) framework identifies four core dimensions of global competence: investigating the world, recognizing perspectives, communicating ideas, and taking action. These dimensions align closely with Fernando Reimers' vision of education as a moral imperative, in which students are empowered to improve the world through knowledge, empathy, and purposeful action. In parallel, UNESCO (2017) emphasizes that education must equip learners with the knowledge, values, and skills necessary to achieve the Sustainable Development Goals (SDGs). The SDGs provide a meaningful framework for connecting classroom learning to real-world challenges, including climate change, inequality, and access to education. Additionally, research on bilingual and multilingual education underscores the cognitive benefits of early language learning. Studies demonstrate that students engaged in immersion programs exhibit enhanced executive functioning, cognitive flexibility, and problem-solving skills (Alabi, 2024; Barbu et al., 2024). These findings support the integration of language learning as a central component of global competence development. Together these foundations support an integrated model that develops knowledge, empathy, communication skills, and civic engagement.

Program Design and Implementation

The *Global Learners, Global Leaders* framework provides a comprehensive K–5 instructional model that integrates global competence into everyday teaching practices. It is guided by a vision of empowering learners to become curious, compassionate, and capable global leaders through language, inquiry, and purposeful action. This vision is supported by six guiding principles, including interconnectedness, multilingualism, critical thinking, collaboration, agency, and inclusive curriculum, which collectively ensure that global learning is embedded within core instructional practices rather than treated as an add-on. A key feature of the framework is its developmentally aligned structure, which organizes learning around grade-level themes connected to the Sustainable Development Goals. Younger learners begin by developing empathy and understanding of their immediate environment, while older students engage with more complex issues such as sustainability, equity, and global partnerships. This progression allows students to build knowledge and skills in ways that are both age-appropriate and increasingly sophisticated. Instruction within the framework is grounded in inquiry-based and project-based learning approaches. Students explore essential questions related to global issues, engage in perspective-taking, and collaborate with peers to develop solutions. Creative expression through art, storytelling, and multimedia further supports students in making connections between their learning and the world around them. The model is flexible enough to be implemented in dual language immersion programs, world language programs, and general education classrooms. Learning experiences may be delivered through interdisciplinary units, capstone projects, service-learning opportunities, and classroom investigations. Students explore topics such as environmental sustainability, cultural diversity, health and well-being, access to education, and community development. These themes provide meaningful opportunities to connect local experiences with global issues. Language learning is integrated throughout, enabling students to develop communication skills and an appreciation for linguistic diversity, which provides students the opportunity to strengthen their ability to communicate across cultures and engage with diverse communities.

Impact on Student Learning

The implementation of the *Global Learners, Global Leaders* framework supports multiple dimensions of student development. From a cognitive perspective, participation in bilingual and globally focused learning experiences enhances executive functioning, memory, and problem-solving abilities (Alabi, 2024; Barbu et al., 2024). Equally important are the social-emotional and intercultural outcomes. Students develop empathy and the ability to understand diverse perspectives through exposure to global cultures and issues. These experiences foster respect, inclusion, and a deeper appreciation for diversity. Engagement is also significantly enhanced when learning is connected to real-world challenges. Inquiry-based instruction encourages curiosity and student ownership, while project-based learning provides opportunities for meaningful application. As students explore SDG-aligned topics, they begin to see themselves as agents of change, developing a sense of civic responsibility and ethical awareness (UNESCO, 2017).

Assessment and Evidence of Learning

Assessment within this framework is designed to be authentic, reflective, and formative, emphasizing growth in global competence rather than solely content mastery. Students demonstrate their learning through a variety of modalities, including reflection journals, presentations, creative projects, and portfolios that document their evolving understanding of global issues. Evaluation criteria focus on students' ability to understand global challenges, consider multiple perspectives, collaborate effectively, communicate ideas, and take informed action. This approach aligns assessment practices with the broader goals of global competence and sustainability education, ensuring that students are evaluated on both knowledge and dispositions.

Discussion

The integration of global competence and sustainability education within elementary classrooms represents a significant shift in educational practice. Rather than positioning global education as an additional component, the *Global Learners, Global Leaders* framework embeds it within the core curriculum, making it accessible and relevant to all learners. This approach highlights the importance of early exposure to global learning. Elementary education provides a critical foundation for developing the knowledge, skills, and dispositions necessary for navigating a complex and interconnected world. By introducing global concepts at a young age, educators can foster long-term engagement and prepare students for future academic and professional success. Furthermore, the educational model demonstrates the importance of aligning curriculum, instruction, and assessment with global goals. It also underscores the need for professional development and collaboration among educators to support effective implementation. The framework also aligns with major educational priorities, including the OECD Global Competence Framework, the United Nations Sustainable Development Goals, ACTFL World-Readiness Standards, and the Virginia Profile of a Graduate. This alignment demonstrates that global learning is not an additional initiative but rather a powerful approach for achieving existing educational goals while preparing students for future success.

Conclusion

The *Global Learners, Global Leaders* framework illustrates the transformative potential of integrating global competence, language learning, and sustainability education in elementary settings. By providing students with opportunities to explore global issues, engage with diverse perspectives, and take meaningful action, this model prepares learners to thrive in an interconnected world. As global challenges continue to evolve, education systems must prioritize approaches that foster critical thinking, empathy, and collaboration. This framework offers a practical and scalable model for cultivating the next generation of global learners and leaders, ensuring that students are equipped not only to understand the world, but also to improve it.

Enhancing Employability and Workplace Readiness through the International Career Coaching Programme (ICCP) in South African TVET Colleges

Abstract

South Africa's TVET sector faces persistent challenges in preparing graduates with transferable skills for a volatile labour market. The International Career Coaching Programme (ICCP), developed through international collaboration and accredited by the UK CPD Certification Service, was designed to address this gap by embedding career coaching within vocational education. This study examines participant`s perceived outcomes of the ICCP in terms of employability, workplace readiness, and professional development among TVET students and lecturers. A mixed-methods approach was employed, combining pre- and post-programme questionnaires with thematic analysis of open-ended responses. Quantitative data were analysed using SPSS. Findings indicate broadly positive self-reported improvements in communication, problem-solving, teamwork, and workplace readiness, with entrepreneurial confidence emerging as a particularly salient perceived outcome. The programme's CPD-accredited international framing contributed to participant`s perceived global career awareness and professional legitimacy. Differential completion rates between students and lecturers are treated as analytically significant, reflecting structural inequalities in programme access rather than motivational deficiency. The study contributes to debates on career coaching in vocational education and argues that the ICCP provides a model for integrating structured coaching into TVET curricula, provided that implementation is accompanied by structural investment in digital access, workload accommodation, and institutional support.

Keywords: *TVET; employability; career coaching; workplace readiness; skills development; South Africa; CPD.*

1. Introduction

South Africa's TVET sector occupies a formally strategic position in national responses to unemployment, yet the gap between its policy mandate and its structural realities has proven difficult to close. With youth unemployment consistently above 50 per cent and the formal economy unable to absorb available labour at the scale required, the question of how vocational institutions prepare graduates for labour market entry carries social urgency beyond its educational dimensions [1,2]. TVET colleges are expected to produce technically capable, employment-ready graduates while simultaneously developing entrepreneurial capacity, digital fluency, and the transferable competencies that contemporary workplaces demand. The empirical record suggests they frequently fall short on all counts, not because of institutional failure alone but because of systemic under resourcing, curriculum misalignment, and a persistent mismatch between what colleges teach and what employers require [3,4]. Career coaching has attracted increasing attention as one intervention capable of bridging this gap. Unlike generic employability skills training, structured coaching is oriented towards developing goal clarity, professional self-efficacy, and the adaptability to navigate career transitions in contexts of uncertainty [5,6]. Evidence from higher education contexts suggests that coaching programmes can contribute meaningfully to students' employability competence development, particularly when they are sustained over time and incorporate reflection and goal-directed action [8,5]. Evidence from TVET specific contexts is considerably thinner, particularly in the African setting, where career guidance services remain underdeveloped and the structural barriers to graduate employment extend well beyond individual competence gaps [9,10,8].

The ICCP, developed through international collaboration and accredited by the UK CPD Certification Service, represents a structured attempt to integrate professional career coaching into the TVET environment. Delivered across multiple South African TVET colleges, the programme targets both

students and lecturers, aiming to develop employability competencies, entrepreneurial orientation, and workplace readiness while simultaneously building lecturer coaching capacity. Its international accreditation framework is a deliberate design feature, intended to confer professional legitimacy on participant credentials and to orient participants towards global as well as domestic career possibilities. This article examines participant`s perceived outcomes of the ICCP across the pre- and post-programme period, drawing on mixed-methods survey data from 160 pre-programme and 68 post-programme respondents. It does not make causal claims about programme effectiveness; the data are self-reported and cross-sectional, and are treated accordingly. The study's contribution is threefold, (1) it provides empirically grounded evidence on participant perceptions of career coaching in a South African TVET context, (2) it examines the role of international CPD accreditation in shaping participant-perceived professional legitimacy and career aspiration and, (3) it treats differential programme completion as a structural finding rather than a measurement inconvenience. The research questions are: (1) How did ICCP participants perceive the programme's contribution to their employability, workplace readiness, and professional development? (2) What role did the programme's international accreditation framing play in shaping participant perceptions of career possibility? (3) What do patterns of participation and completion reveal about the structural conditions for career coaching delivery in South African TVET colleges? By answering the research questions, the study aims to examine participant`s perceived outcomes of the ICCP in terms of employability, workplace readiness, and professional development among TVET students and lecturers. The next section will cover literature review.

2. Review of Related Literature

2.1 Theoretical Framework

A robust theoretical framework for this study draws on Human Capital Theory and Career Construction Theory to explain how structured career coaching interventions can strengthen employability and workplace readiness among students in South African TVET colleges. Human Capital Theory suggests that investment in knowledge, skills, and competencies enhances individual productivity and labour market competitiveness, positioning the ICCP as a mechanism for developing transferable skills such as communication, teamwork, adaptability, and entrepreneurial capacity [11]. Complementing this perspective, Career Construction Theory emphasises career adaptability, self-awareness, and proactive career planning as essential capabilities for navigating dynamic and uncertain labour markets [11]. Together, these theories provide a comprehensive lens for understanding the ICCP as an intervention that not only builds employability skills but also promotes career identity development and long-term professional readiness in an increasingly complex employment environment [12].

2.2 Employability and Workplace Readiness in TVET

Graduate employability in the South African TVET context is shaped by intersecting structural conditions: curriculum-industry misalignment, credential undervaluation relative to university qualifications, weak work-integrated learning infrastructure, and the socio-economic circumstances of the student population [3,13]. Research consistently identifies a gap between the competencies TVET graduates possess on completion and those that employers require, a gap that is simultaneously a curriculum problem, a pedagogy problem, and a structural labour market problem [4,14]. Soft skills, defined broadly as communication, teamwork, problem-solving, and adaptability, feature prominently in employer accounts of what TVET graduates lack, a finding with direct implications for programme design (15,16].

The concept of workplace readiness extends the employability frame: it refers to the combination of practical competence, professional orientation, and psychosocial preparedness that enables graduates to function effectively from the point of labour market entry [16,17]. Research on workplace readiness among South African TVET students identifies career self-efficacy, career exploration, and self-perceived employability as significant predictors, suggesting that affective and psychological dimensions of preparation matter alongside technical skill development [16]. Programmes that address these dimensions alongside hard skills may contribute to a more durable form of graduate readiness than those focused exclusively on technical competencies.

2.3 Career Coaching and Career Guidance in Vocational Education

Career coaching in educational contexts is characterised by a facilitative, goal-oriented process aimed at developing self-clarity, career goal clarity, and the confidence to act on professional aspirations [6,5]. According to [6] career resources model identifies self-clarity and career-goal clarity as foundational prerequisites for career optimism and career security, outcomes with direct relevance to TVET graduates navigating constrained opportunity structures. [5], in a multi-institutional study of career coaching in higher education in the Netherlands and Belgium, found that autonomy-supportive coaching was positively associated with employability competence development, with trial-and-error encouragement and reflective practice as key facilitative mechanisms.
In the African TVET context specifically, career guidance and counselling services are poorly developed, and the majority of graduates navigate career decision-making without structured institutional support [8,9]. According to [9] and [10] have documented the career barriers facing marginalised South African youth and the significance of contextually grounded interventions in supporting career adaptability among disadvantaged populations. [18] identifies self-knowledge and career exploration as foundational to sound career decision-making across international contexts, a framework that aligns with the ICCP's coaching design. The scarcity of structured career coaching provision in South African TVET colleges positions the ICCP as a rare institutional attempt to address this gap at scale.

2.4 CPD Accreditation, International Frameworks, and Professional Legitimacy

Professional accreditation in continuing professional development (CPD) serves multiple functions in vocational education: it provides quality assurance signals to participants, employers, and institutional partners; it confers credential recognition that individual college certificates may not command; and it positions programme participants within professional networks and discourses that extend beyond the national context [18,19]. For TVET participants in a context where vocational credentials are frequently undervalued relative to university qualifications, international CPD accreditation carries a specific legitimising function: it reframes the participant's learning within a credentialled professional identity that is recognised beyond the domestic South African system.

The aspiration to international career exposure and global professional participation is documented among TVET students in sub-Saharan African contexts as simultaneously rational, given domestic opportunity constraints, and aspirationally significant, in expanding the range of professional futures participants are willing to contemplate [10,20]. Programmes that explicitly engage this aspiration, by exposing participants to international professional standards, accredited credentials, and global network possibilities, may contribute to what has been described as a 'cosmopolitan capability': the professional orientation and confidence to engage with global as well as local career environments. Whether this translates into concrete mobility or international employment is a question beyond the reach of the present data; but the aspiration activation itself is analytically significant as an employability-relevant outcome.

2.5 Lecturer Professional Development and Coaching Capacity in TVET

TVET lecturer professional development is a documented weak point in the South African sector. [21] and [22] have documented the effects of professional competence deficiencies on lecturer confidence, self-efficacy, and institutional effectiveness, identifying inadequate training and development as a primary structural driver. Programmes that develop coaching capacity among lecturers carry implications beyond individual professional development: lecturers who acquire coaching skills and apply them in their institutional contexts function as multipliers, extending programme benefit to students and colleagues who did not participate directly [23]. This multiplier logic is central to the ICCP's institutional design, which targets lecturers alongside students in the expectation that lecturer development will generate downstream institutional benefit.

3. Research Methodology

3.1 Research Design

The study employs a cross-sectional mixed-methods design integrating both quantitative and qualitative approaches to provide a comprehensive understanding of participant experiences. Quantitative data

obtained from Likert-scale items in pre- and post-programme instruments are analysed descriptively using frequencies, means, standard deviations, and distributional comparisons, while qualitative responses from open-ended items are examined through thematic analysis using inductive coding procedures [24,25]. The two data streams are treated as complementary, where quantitative findings establish patterns and trends, and qualitative insights provide depth, context, and meaning. Given the exploratory nature of the study, no inferential statistical analyses are conducted, as the focus is on interpretation and participant perceptions rather than causal relationships or validated labour market outcomes.

3.2 Participants

Pre-programme data were collected from 160 participants across three TVET colleges: Majuba (n = 122; 76.3%), Vhembe (n = 30; 18.8%), and Central Johannesburg College (n = 5; 3.1%). The sample comprised 127 students (79.4%) and 33 lecturers (20.6%). The age distribution was weighted towards 25 to 34 years (43.9%), with substantial representation in the 18 to 24 bracket (33.1%). Most participants were affiliated with Business Studies programmes (65.6%), with the NCV and NATED levels near-equally represented. Post-programme data were returned by 68 participants (41 students; 27 lecturers), representing 42.5 per cent of the pre-programme cohort. Lecturer completion was approximately 81.8 per cent of the pre-programme lecturer group; student completion was approximately 32.3 per cent. This differential is treated analytically as a structural feature of the programme's interaction with participants' different institutional and socio-economic circumstances, and conditions all post-programme findings reported below.

Table 1. provides a summary profiles

Table 1: Participants profiles summary

Variable	Category	Pre-programme (N=160)	Post-programme (N=68)
Role	Student	127 (79.4%)	41 (60.3%)
	Lecturer	33 (20.6%)	27 (39.7%)
College	Majuba	122 (76.3%)	34 (50.7%)
	Vhembe	30 (18.8%)	23 (34.3%)
	CJC / Other	8 (5.0%)	11 (16.2%)
Programme Level	NCV	75 (46.9%)	21 (30.9%)
	NATED	78 (48.8%)	41 (60.3%)
Field	Business Studies	105 (65.6%)	55 (84.6%)
	Engineering / Other	55 (34.4%)	13 (19.1%)

Source: Authors own compilation

3.3 Instruments and Analytic Procedure

The pre-programme instrument addressed participant demographics, self-assessed confidence across five employability competency domains on a five-point Likert scale (1 = Not Confident; 5 = Very Confident), and open-ended items on career goals, motivations, and expected programme benefits. The post-programme instrument addressed overall programme experience, content relevance, satisfaction with delivery, self-reported improvement across the same five domains (1 = No improvement; 5 = Significant improvement), and open-ended items on career aspiration change, skills application, entrepreneurial orientation, institutional value, and challenges. Qualitative responses were coded inductively, with thematic categories reviewed through the conceptual lenses described in the literature review.

3.4 Limitations

The study is subject to four substantive constraints. First, all data are self-reported; perceived improvement cannot be equated with verified skill development or labour market outcome. Second, the substantial attrition between pre- and post-programme samples introduces completion bias: findings from the post-programme instrument represent participants who completed the programme and are not representative of the full initial cohort. Third, the unmatched design of the pre- and post-programme samples precludes direct individual-level comparison. Fourth, the open-ended framing of some items, particularly on institutional benefits, may have primed responses using programme language. These limitations are acknowledged throughout and condition the scope of all claims made.

4. Results

4.1 Baseline Competency Confidence and Career Orientation

Pre-programme Likert responses indicated high overall confidence, with notable variation across domains. Teamwork and collaboration returned the highest mean (M = 4.74, SD = 0.53), followed by workplace readiness (M = 4.58, SD = 0.74), communication skills (M = 4.54, SD = 0.65), and problem-solving (M = 4.45, SD = 0.68). Entrepreneurial skill was the exception: lower mean (M = 4.17), wider standard deviation (SD = 0.93), and modal and median values of 4 rather than 5. Table 2 presents the full profile. Perceived job market readiness was similarly high overall (M = 4.44, SD = 0.83), though approximately one in three respondents rated themselves at level 4 rather than the highest level, indicating that confident but not fully settled self-assessment was common. Table 2. Provides a baseline self-assessed competency confidence (pre-programme; scale 1–5).

Table 2. Baseline Competence full profile

Competency Domain	Valid (n)	Mean	Median	SD
Communication skills	142	4.54	5.0	0.65
Problem-solving skills	140	4.45	5.0	0.68
Teamwork and collaboration	151	4.74	5.0	0.53
Entrepreneurial skills	135	4.17	4.0	0.93
Workplace readiness	142	4.58	5.0	0.74

Source: Authors own compilation

Pre-programme open-ended responses revealed differentiated aspirational orientations across the two participant groups. Student career goals centred on labour market entry, further qualification, and entrepreneurial aspiration, with a recurrent motif of international career exposure: multiple students described aspirations to work overseas or access globally recognised credentials. Lecturer goals were oriented around pedagogical leadership, curriculum innovation, and institutional contribution. These divergent orientations at baseline are analytically significant: they establish that students and lecturers entered the programme with structurally different frames of reference, a differentiation that shapes how post-programme perceptions should be read.

4.2 Post-Programme Experience and Self-Reported Skill Development

Post-programme ratings were strongly positive. Overall experience had a mean of 4.53 (SD = 0.70), with 64.7 per cent at the highest level and no respondent below 3. Content relevance to career goals returned a mean of 4.49 (SD = 0.74). Satisfaction with trainers and coaches was highest (M = 4.59, SD = 0.74), with accessibility also highly rated (M = 4.47, SD = 0.80). Programme materials were comparatively lower (M = 4.29 to 4.31), suggesting a relative gap in resource quality relative to human delivery quality. Self-reported improvement across competency domains was broadly high, as shown in Table 3. Communication skills returned the highest improvement mean (M = 4.58, SD = 0.63), with problem-solving (M = 4.49), workplace readiness (M = 4.40), entrepreneurial skills (M = 4.35), and teamwork (M = 4.32) following. Across all domains, no respondent reported no improvement; minimum

reported improvement was level 2 for teamwork and level 3 for all others. **Table 3** below presents self-reported competency improvement following ICCP participation (post-programme; scale 1–5).

Table 3. Post-program competency

Competency Domain	Valid (n)	Mean	SD	% at 4 or 5
Communication skills	67	4.58	0.63	92.5
Problem-solving skills	68	4.49	0.68	89.7
Teamwork and collaboration	68	4.32	0.84	82.4
Entrepreneurial skills	68	4.35	0.82	84.0
Workplace readiness	68	4.40	0.76	83.8

Source: Authors own compilation

The entrepreneurial skills domain warrants attention: the post-programme improvement means (M = 4.35) exceeded the pre-programme confidence baseline for the same domain (M = 4.17), and the standard deviation narrowed (from 0.93 to 0.82). This pattern suggests that participants who reported lower confidence at baseline described comparatively larger perceived gains in this domain. The pre- and post-programme samples are not matched, and the shift may partly reflect selection; what can be said is that entrepreneurial confidence was the domain where the distributional contrast between baseline and post-programme self-assessment was most pronounced.

4.3 Employability, Workplace Readiness, and Global Career Orientation

Qualitative post-programme responses on employability and workplace readiness centred on three patterns: perceived gains in professional communication and self-presentation; an enhanced capacity to engage with formal workplace norms; and a perceived broadening of career horizon from local to international. Students described the programme as having addressed a gap between their college learning and workplace competency expectations, a gap consistent with documented curriculum-industry misalignment in the South African TVET sector [3,4]. Multiple participants described reorienting their job search frame to include global possibilities, with accounts of advising fellow students not to limit themselves to the South African market.

The international accreditation dimension of the programme appeared to contribute to this reorientation. Several participants described the UK CPD Certification Service accreditation as having conferred a form of professional legitimacy that distinguished their participation from ordinary college activity. One participant described the certificate as evidence that their training met an internationally recognised standard, while another described using the accreditation to position themselves in job applications beyond South Africa. These accounts suggest that the programme's international framing contributed to participant-perceived credential value and global career orientation, consistent with the aspirational function of international accreditation described in the literature.

4.4 Perceived Entrepreneurial Confidence and Orientation

Entrepreneurial orientation was among the most generative themes in the post-programme qualitative data. Two patterns were present. The first, which might be called perceived confidence activation, involved accounts of a shift in participants' willingness to contemplate entrepreneurial activity: descriptions of no longer feeling that entrepreneurship was inaccessible, of becoming aware of available funding ecosystems, and of beginning to take initial steps, including forming teams, conducting sector research, and applying for grants. The second pattern involved accounts of concrete initial activity: participants described having started a small business or side venture during or immediately following the programme. Both patterns should be read carefully. The data support claims about perceived entrepreneurial orientation and reported initial steps, not about verified venture creation or sustained entrepreneurial activity. In the South African context, structural barriers to entrepreneurship, including limited access to finance, weak business support infrastructure, and constrained market access, are well documented and are not resolved by a coaching intervention alone [9,16]. The significance of the entrepreneurial confidence finding lies in the perceived orientation shift: participants reported a changed

sense of possibility rather than a guaranteed business outcome, which is a meaningful intermediate outcome in itself.

4.5 Career Coaching Outcome Pathway in the ICCP

Figure 1 presents a synthesising model of the perceived outcome pathway in the ICCP, organising the empirical findings from Sections 4.2 to 4.4. The model foregrounds the differentiated nature of outcomes across student and lecturer groups and notes the participation-conditional character of the pathway: structural barriers shape who reaches each stage of the outcome sequence. Figure 1. Below present the participant`s perceived career coaching outcome pathway in the ICCP (based on pre- and post-programme survey data).

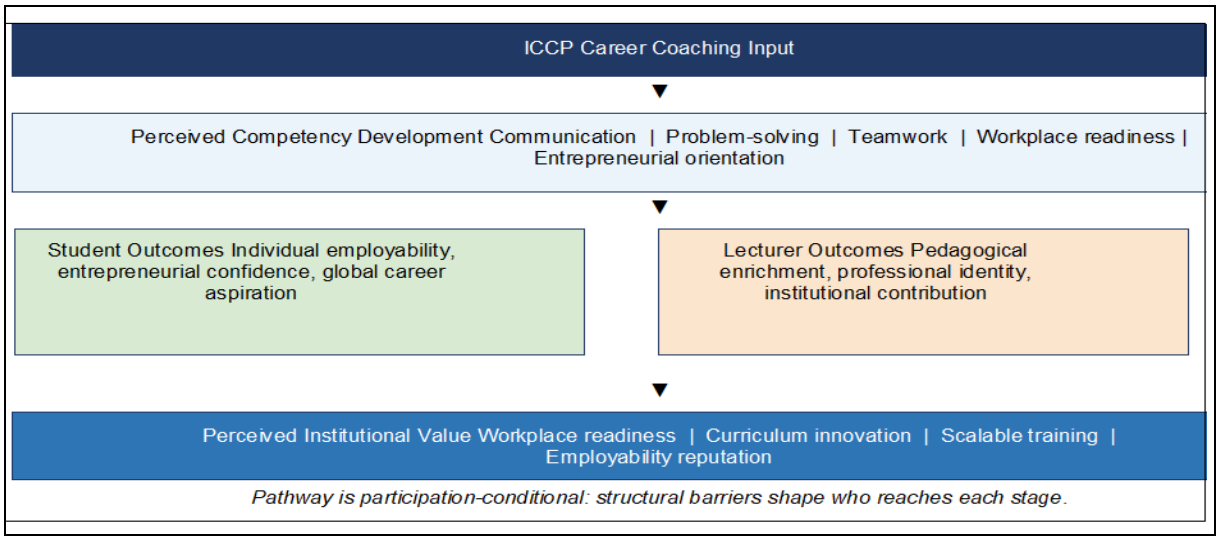

Fig. 1. ICCP Career Coaching Pathway
Source: Authors own compilation

4.6 Differential Patterns: Students and Lecturers

As documented in the companion articles in this series, students and lecturers engaged with the programme from structurally different positions and attributed different forms of value to their participation. Students oriented perceived benefit around personal employability, entrepreneurial aspiration, and global career possibility. Lecturers framed benefit through professional identity, pedagogical enrichment, and institutional contribution, with multiple accounts of sharing programme learning with students and colleagues.

4.7 Implementation Challenges and the Attrition Finding

Post-programme open-ended responses identified a consistent cluster of implementation barriers: workload and time pressure, digital connectivity constraints, platform navigation difficulties (particularly regarding LinkedIn), and variable mentorship quality. These findings are documented in detail in Article 2 of this series. For the purposes of the present analysis, the critical finding is the differential completion rate: approximately 81.8 per cent of pre-programme lecturers completed the post-programme evaluation, compared with approximately 32.3 per cent of students. This differential is not incidental; it reflects the structural incompatibility between the programme's demands and the time, resource, and digital access circumstances of TVET students under South African conditions. The post-programme findings described above should therefore be understood as representing the experience of programme completers: disproportionately lecturers, and among students, those for whom structural barriers were insufficiently severe to prevent completion. [25] have documented the multidimensional causes of student attrition in South African TVET colleges; the attrition pattern in the ICCP data is consistent with those causes and should be read structurally rather than individually.

5. Discussion

The findings suggest that the ICCP positively influenced employability, workplace readiness, and career development among programme completers by strengthening competencies frequently identified in TVET literature as important for graduate preparedness, including professional communication, career adaptability, self-efficacy, and career aspirations. Entrepreneurial confidence emerged as a particularly important outcome, indicating improved perceptions of participants' ability to identify opportunities and pursue diverse career pathways. The programme's mentored coaching structure appears to have supported this development by enhancing confidence, facilitating career goal formation, and encouraging entrepreneurial thinking beyond immediate employment outcomes. International CPD accreditation also emerged as a significant programme component, with participants perceiving accredited certification as enhancing the legitimacy and credibility of their qualifications while strengthening their professional identity and confidence regarding broader career opportunities. However, high levels of participant attrition highlighted structural challenges such as limited digital access, workload pressures, and competing responsibilities, suggesting that programme effectiveness may be influenced by contextual factors beyond the intervention itself. These findings indicate that while the ICCP demonstrates potential as a scalable career development intervention within TVET education, stronger institutional support, resource provision, and inclusive implementation strategies are necessary to improve participation and sustained engagement.

6. Recommendations for Policy and Institutional Practice

The findings of this study suggest several implications for policy and institutional practice within the South African TVET sector. First, career coaching interventions such as the ICCP should be integrated more systematically into TVET curricula rather than implemented as stand-alone extracurricular initiatives. Embedding structured coaching within existing academic programmes may improve accessibility, participation, and long-term sustainability. Second, institutions should strengthen digital support systems to address barriers related to connectivity, platform access, and digital literacy. The high level of student attrition observed in this study indicates that unequal access to technological resources continues to shape participation outcomes within coaching and professional development programmes. Third, workload-sensitive programme design is necessary, particularly for students balancing academic, financial, and personal responsibilities. Flexible scheduling, blended learning approaches, and extended completion timelines may improve programme retention and participation equity. Fourth, TVET colleges should invest in lecturer coaching capacity development, as lecturers who acquire coaching and mentoring competencies may serve as institutional multipliers by extending employability support to wider student populations. Finally, future programme implementation should incorporate longitudinal graduate tracking systems to evaluate long-term employability outcomes, entrepreneurial activity, and workplace integration beyond self-reported participant perceptions. Such evidence would strengthen the empirical basis for scaling career coaching interventions across the TVET sector.

7. Conclusion

This study examined participants perceived outcomes of the ICCP within South African TVET colleges, focusing on employability, workplace readiness, entrepreneurial confidence, and the role of international CPD accreditation in shaping professional identity and career aspirations. The findings revealed positive self-reported development across key competency areas among programme completers, with entrepreneurial confidence demonstrating the most substantial improvement. The accreditation component further contributed to perceptions of enhanced professional legitimacy and increased confidence regarding broader career opportunities. The study contributes to the TVET employability and career coaching literature by providing evidence of participant experiences within an internationally accredited intervention in the South African context and by highlighting that programme completion patterns may reflect structural and contextual barriers rather than individual limitations. Future research should adopt longitudinal approaches to assess the sustainability of programme outcomes and explore barriers experienced by non-completers to strengthen understanding of long-term impacts and support more equitable participation in similar initiatives.

Whose Design Knowledge? Adapting the Culturally Responsive Curriculum Scorecard for Graphic Design Higher Education

Marion Schaberl

University of Melbourne, Faculty of Fine Arts and Music, Australia

Abstract

Despite increasing calls to decolonise design education, most curricula have not been systematically examined. Formal curriculum documents, such as assessment briefs, lecture slides, visual references and prescribed readings, carry cultural assumptions about which designers matter, which design histories are legitimate and which design aesthetics are valued. This article makes these patterns visible by using the Culturally Responsive Curriculum Score Card (CRCS), a tool that was originally developed for high-school English language curricula. The CRCS was adapted to fit within Graphic Design higher education and was applied to a graphic design unit of study in Australia. Syllabus documents, design briefs, assessment rubrics, workshops, prescribed readings and seminar slides were examined across the scorecard's three domains: Representation, Social Justice Orientation and Teacher's Materials. The unit scored both Culturally Insufficient for Representation and Social Justice, and Emerging Awareness for Teacher's Materials. The analysis made 5 structural patterns visible: geographic concentration of exemplars, monolingual typographic normativity, assessment criteria rooted in unmarked cultural norms, cultural content present but unframed, and assumed rather than designed inclusivity. These patterns highlight how dominance is reproduced through omission rather than deliberate exclusion. The adapted CRCS can be transferred to other practice-based disciplines where canonical knowledge operates through visual and material systems.

Keywords: *culturally responsive teaching, graphic design education, curriculum analysis, scorecard, representation, higher education*

1. Introduction

Australian higher education classrooms are characterised by their cultural and linguistic diversity. Recent data shows that approximately a third (30.7%) of Australians were born overseas (Australian Bureau of Statistics 2023), and international student enrolments exceeded 840,000 (Department of Education 2024). Additionally, over 300 ethnic groups are represented, and about 21% of the population speaks a language other than English at home (Australian Bureau of Statistics 2023). Many of these students bring design knowledge shaped by non-European histories, non-Latin typographic traditions and diverse aesthetic conventions to the graphic design classroom. This trend is not only observable in Australia but is a global phenomenon. Similar demographic shifts are also occurring in other OECD countries (OECD 2025). However, the recruitment of culturally diverse students has often served as an internationalisation strategy, with the curriculum itself not being adapted or examined accordingly (Brewer and Leask 2012).

Graphic design education has been predominantly shaped by Bauhaus-derived pedagogical frameworks rooted in European design traditions (Holmes Miller 2023; Noel et al. 2023), operating within what Noel et al. (2023) consider a hegemonic frame of reference. This is consistent with further criticisms of the internationalisation of the curriculum, which point to the dominance of Western perspectives in the structuring and teaching of knowledge in higher education (Brewer and Leask 2012). This results in a discrepancy between who is in the classroom and what the curriculum recognises as valid knowledge (Apple 2012). Students whose design traditions, language, and visual systems are not acknowledged within the curriculum receive an implicit message that their expertise falls outside the disciplinary norm. This exclusion is often implicit rather than explicit, created through omission (Giroux 2020).

There is an increasing call within design scholarship for the decolonisation of design curricula (Abdulla, 2019; Tunstall, 2023; Holmes Miller, 2023; Pater, 2021). However, these discussions have mainly focused on teaching practice and/or pedagogical intent (Davis 2017; McCoy 2022). A more systematic analysis of the curriculum documents and artefacts, such as syllabi, briefs, seminar materials, reading lists and assessment rubrics, has received less attention (Sales 2023; Noel et al. 2023). These documents determine what content students encounter and what knowledge is legitimised before

teaching takes place (Apple 2012; Darder 2012). The curriculum, thus, carries an implicit message of which designers matter, which histories are legitimate and which visual traditions are foregrounded. When these structures are not being questioned, even a well-intentioned curriculum can reproduce dominance through omission.
Bryan-Gooden, Hester and Peoples (2019) developed a systematic approach, the Culturally Responsive Curriculum Scorecard (CRCS), to make these embedded messages visible. This tool was originally developed for the K–9 English Language Arts curriculum. This article reports on an application of the adapted CRCS to one unit of study at one Australian institution. It presents findings across three domains, identifies five structural patterns as diagnostic indicators for curriculum review, and examines the implications of these patterns for student belonging and for curriculum design practice.

2. Theoretical Framing

The study draws on Culturally Responsive Teaching and Critical Pedagogy as an analytical lens to examine how knowledge is constructed, legitimised and reproduced within the education setting. Apple (2012) argues that curriculum decisions are not technical but ideological in nature and reflect social and political interests which determine whose knowledge is selected, valued and taught. Giroux (2020) expands this with the concept of the hidden curriculum, which describes how educational institutions implicitly convey values, norms and assumptions through what knowledge is included and what is omitted. These omissions are not accidental but function as a power mechanism that privileges certain traditions and renders others invisible.
Darder (2012) claims that the curriculum is a site of cultural reproduction where dominant ideologies are transmitted through materials, structures and pedagogical assumptions. This perspective is supported by hooks (1994), who argues that education can operate as a site of dominance, particularly when one cultural perspective is placed at the centre as universal, it silences marginalised communities.
Culturally responsive teaching (Gay 2018) offers a pedagogical response to these structural conditions. Gay (2018) argues that teaching becomes culturally responsive when it acknowledges the cultural knowledge that students bring with them and incorporates it into curriculum content, teaching practice, and assessment. Ladson-Billings (1995) also understands cultural relevance as a pedagogical principle that places students' experiences at the centre rather than treating them as secondary.
When curriculum structures exclude students' cultural knowledge, the effects extend beyond content learning. Walton and Cohen (2007) argue that students of socially stigmatised groups experience *belonging uncertainty* in academic contexts: uncertainty about the quality of their social bonds and heightened sensitivity to issues of social belonging. Gopalan and Brady (2020) confirm that minoritised students report lower belonging, which predicts persistence, engagement and mental health.
Understanding how curriculum documents create these conditions requires a systematic examination of what they include and exclude. The Culturally Responsive Curriculum Scorecard (Bryan-Gooden, Hester, and Peoples 2019) provides a method for making visible what Apple (2012) describes as ideological curriculum decisions and what Giroux (2020) identifies as the hidden curriculum. Developed within a CRT framework, the CRCS interrogates the extent to which these documents reflect or exclude diverse perspectives. This study adapts this instrument for higher education in graphic design, applying it to curriculum documents that have not previously been subjected to such analysis.

3. Method

This study uses document analysis as its primary qualitative method. Bowen (2009) describes document analysis as an iterative process that combines elements of content and thematic analysis and involves skimming, in-depth reading, and interpreting institutional documents. Documents are not to be treated as complete records of facts but rather interrogated in terms of their meaning and contribution to the research questions (Bowen 2009). In this study, curriculum documents, including syllabi, design briefs, seminar materials, and required reading, are treated as artifacts that convey institutional values and disciplinary norms even before teaching takes place. The analytical tool applied to these documents is the CRCS (Bryan-Gooden, Hester, and Peoples 2019), which examines the curriculum in three key areas: representation, social justice, and teacher's materials. Since the tool was developed for an English Language Curriculum, the original statements focused on narrative, texts, character portrayals, and primary/secondary literature context, which required an adaptation to fit within graphic design higher education.
Each statement was examined for its transferability across the three domains. Within Representation, character-based language was replaced with designers, case studies, typographic systems, and cultural

frames of reference. In the area of Social justice, the statements were adapted to determine whether the curriculum situates design as embedded within power structure, whether multiple cultural frames of reference are recognised as equally valid, and whether design practice is linked to real-world social contexts. Statements within Teacher's Materials were shifted from teachers in school settings and literacy-related curricula to design educators and studio-based teaching materials.
In this study, the researcher examined whether the documents provided guidance for teachers on cultural positioning, bias in critique, and the recognition of students' prior cultural knowledge. Items were classified as non-transferable if their content was specifically geared toward narrative fiction or character-based literacy instruction and lacked a functional equivalent in studio-based design education. Items were classified as transferable if the underlying principle (e.g. whether diverse knowledge systems are positioned as equivalent) could be meaningfully assessed within curriculum documents in graphic design, even if the specific wording required adaptation (Table 1). Statements that were determined redundant or not transferrable were removed. Those that remained applicable were retained unchanged.

Table 1. Examples of adaptation

Adapted	Adapted statement	Original source items	Adaptation rationale
RE1	Case studies and examples used in class draw from culturally and geographically diverse contexts, and avoid homogenising or ambiguous representations.	1. The curriculum features visually diverse characters, and the characters of color do not all look alike. / 3. Diverse ethnicities and nationalities are portrayed – not all Asian families are Chinese, not all Latinx families are Mexican, etc. / 13. Diverse characters are rooted in their own cultures and are not ambiguous.	Reframed from fictional characters to design case studies and exemplars. The concern with characters not all looking alike (item 1) and diverse nationalities (item 3) became a requirement for geographic and cultural diversity in design examples. The anti-ambiguity requirement from item 13 was retained directly.
SJ6	The curriculum encourages students to design strategies that are inclusive of diverse cultural perspectives and lived experiences.	19. The curriculum presents different points of view on the same event or experience, especially points of view from marginalized people/communities.	Reframed from presenting multiple perspectives on events to designing inclusive strategies. The design-specific application replaces the narrative framing.
TM1	Teaching materials and curricular artefacts reflect contributions from staff of diverse identities, acknowledging how representation in authorship shapes classroom culture.	22. The authors of the teachers' materials are people of diverse identities (race/ethnicity, gender, other identities if possible).	Retained and expanded. "Authors" became "staff" to reflect the higher education context. The clause about representation shaping classroom culture makes explicit a concern implicit in the original.

Each item was examined through two rounds of scoring using the scorecard's rubric bands, with a written justification for each score. The CRCS uses a four-point scoring system ranging from +2 (Very Satisfied: clear evidence of intentional CRT design) through +1 (Satisfied: some CRT elements present) and –1 (Unclear: minimal or ambiguous evidence) to –2 (Not Satisfied: little or no consideration of CRT principles). Scores were then aggregated across items for each domain to generate domain-level scores. When an item was ambiguous during scoring, the decision was based on whether the curriculum document contained explicit, structural evidence rather than whether it could theoretically be met through individual teaching practice. This was a necessary distinction, since the scorecard captures what the curriculum conveys as a written artifact, not what might occur in classroom practice. It should also be noted that the researcher is a lecturer of the unit under investigation, which allowed for detailed familiarity with the curriculum materials and their application context; however, it also carries the risk of normalising existing structures. To counteract this, the scoring was solely based on the rubric criteria and not the researcher's own teaching experience or intent. All justifications were documented to allow for external review.

4. Findings

The examined curriculum scored in the following ranges:

Table 2. Scores across the three domains of the adapted CRCS.

Domain	Score / Classification
Representation	–6 / Culturally Insufficient
Social Justice	–7 / Culturally Insufficient
Teacher Materials	+1 / Emerging Awareness

Representation and Social Justice both scored within the Culturally Insufficient range, which indicates limited structural alignment with culturally responsive teaching principles. The Teaching Materials domain, in contrast, achieved a score within the Emerging Awareness range. Place-based tasks and flexible design outcomes provided a certain foundation; however, there was limited guidance on positioning, cultural differences, critical analysis and teacher positionality. Beyond the numerical scores, the curriculum analysis generated five structural patterns that appeared across all three domains. The following patterns are not only presented as case-specific findings but also as diagnostic indicators that curriculum designers and program coordinators in practice-based disciplines can use to examine their own curriculum documents.

4.1 Pattern 1: Geographic Concentration of Exemplars

Diagnostic question: *Do the case studies, visual references, and historical content in your curriculum draw from more than one geographic and cultural tradition?*
The curriculum under investigation drew heavily on examples from European, North American and Australian designers, with a recurring focus on modernism, Bauhaus and Swiss International Style principles. The analysis revealed a focus on culturally dominant design references, with a scarcity of representation of Indigenous, migrant, queer or working-class communities. Instead, target audiences were mainly framed as English-speaking, urban and middle-class. Designers of colour, women, and gender-diverse designers were almost entirely absent from core teaching materials and only appeared sporadically in supplementary resources. Designers from Africa, South America, South Asia, East Asia and Indigenous cultures were not represented. The dominance of canonical white male designers reduced students' opportunities to encounter other design perspectives that align with their own identities or cultural backgrounds. Historical content followed a Euro-American trajectory and neglected alternative design histories and Indigenous or diasporic traditions. This geographical narrowing was not only evident within Representation but also within Social Justice, where non-dominant populations were not represented through a strengths-based perspective, and opportunities to make cultural expertise or community-specific knowledge visible were minimal. Where a curriculum draws its exemplars predominantly from a singular geographical perspective or cultural cluster, it becomes the primary frame of reference for design learning regardless of the diversity of its student cohort.

4.2 Pattern 2: Monolingual Typographic Normativity

Diagnostic question: *Does your curriculum engage with non-Latin scripts and multilingual design practice as structured content, or only incidentally?*
Visual reference in seminar slides and case studies predominantly focused on modernist and minimalist typographic traditions in English and Latin scripts. Non-Latin writing systems such as Arabic, Devanagari, Hangul or Kanji were only mentioned in passing, without any structural introduction to multi-lingual or culturally specific typographic systems. Therefore, bi-scriptural design practices were not addressed. This pattern was visible across all three CRSC domains. There was no guidance for teachers or students on how to address and work with non-dominant typographic systems. Indigenous language systems were completely absent from the curriculum. Given that students bring multilingual competencies and knowledge of diverse typographic traditions, the exclusive focus on Latin typography conveyed a normative stance on which languages are recognised as a valid source of design knowledge.

4.3 Pattern 3: Assessment Criteria Rooted in Unmarked Cultural Norms

Diagnostic question: *Do your assessment criteria and evaluative language name the cultural and aesthetic tradition they derive from?*
Assessment rubrics and criteria defined quality through terms such as "professional", "polished", or "grid-aligned" without addressing that these terms reflect a specific cultural tradition. These design criteria and norms, which are based within a culturally dominant framework, function as an unmarked quality standard. Thereby, student work that uses a culturally dominant or culturally diverse design tradition is measured against a single tradition. This is exacerbated by a lack of guidance for teachers on addressing their own bias and assumptions in assessments and critiques, or on questioning whose quality standards are applied and whose are denied. This leads to critique protocols based on "professional standards" that fail to consider how dominant aesthetics disadvantage underrepresented students who design outside the dominant cultural norm. Without naming the cultural origin of evaluative language, students from other aesthetic traditions encounter criteria that appear neutral but have a normative effect.

4.4 Pattern 4: Cultural Content Present but Unframed

Diagnostic question: *Where cultural engagement opportunities exist, are they explicitly framed as cultural content and linked to learning outcomes?*
Whereas the curriculum allowed for cultural engagement and expression there was no framing or guidance on what cultural frameworks were being engaged. Several assignments allowed students to draw on their own cultural backgrounds and choose target audiences and contexts that align with their own cultural backgrounds. However, this was not linked to formal learning outcomes and was not reinforced through prompts, analytical tools, or examples. This meant the potential for cultural integration relied on students' own initiative rather than being supported by formal curricular documents that could have helped to link cultural meaning to design decisions. Individual reading activities, such as a reading on design ethics, encouraged reflection on industry norms. However, these instances were not woven throughout the course materials and remained isolated learning experiences. This pattern continued into the teaching materials, where isolated prompts invited reflections on personal experiences but were not embedded more systematically. Without explicit frameworks, culturally relevant content cannot be systematically developed, and student learning cannot be assessed or linked to outcomes. Identifying cultural content as such is a prerequisite for pedagogical effectiveness.

4.5 Pattern 5: Assumed Rather than Designed Inclusivity

Diagnostic question: *Does your curriculum explicitly design conditions for cultural responsiveness, or does it assume that task flexibility will produce inclusive outcomes?*
The curriculum design supported place-based learning and task flexibility. Some assessment tasks were linked to local contexts with flexible deliverables. These options were outlined within the assessment structure; however, it was not addressed how culturally specific methods could be integrated within assessment tasks, nor how they could be recognised as a formal outcome. The analysed unit of study did not provide any guidance for teachers on how to address cultural sensitivity or reflect on cultural assumptions. Culturally responsive teaching was possible within the curriculum structure but required teachers to enact these principles independently, as the written curriculum did not consistently provide the necessary conditions. Therefore, responsiveness functioned as an individual responsibility, not as an institutional design decision.

5. Implications for Teaching and Student Learning

The five patterns identified in this study are not attributed to individual bias. Instead, they are embedded in curricular documents, which exist independently of individual teaching decisions. The scorecard made these conditions visible, not because they are hidden, but because they are default assumptions within the curriculum as a designed artifact.

5.1 Implications for Students

The scores for Representation (–6) and Social Justice (–7), both classified as Culturally Insufficient, indicate that the curriculum does not create conditions for what Gay (2018) defines as culturally

responsive teaching: teaching that acknowledges the cultural knowledge students bring and incorporates it into curriculum content, practice and assessment. When the curriculum excludes students' cultural knowledge (Gay 2018), it signals whose knowledge is valid within the discipline. Walton and Cohen (2007) argue that students from minority groups perceive such exclusion as uncertainty about their place, questioning whether "people like me belong here" (p. 83). Gopalan and Brady (2020) empirically confirm that underrepresented minority and first-generation students at four-year institutions report a lower sense of belonging. In graphic design education, such signals of belonging are enacted through studio-based critique, visual references and assessment criteria, even before teaching takes place.

Geographic concentration of exemplars (Pattern 1) and monolingual typographic normativity (Pattern 2) signal whose design traditions are treated as disciplinary knowledge. Assessment criteria rooted in unmarked cultural norms (Pattern 3) position students working from non-Eurocentric visual traditions against a standard that does not name the tradition from which it originates. Their work is not read as an alternative approach but rather measured as deficient. Where cultural content exists but is unframed and unlinked to learning outcomes (Pattern 4), students from non-dominant traditions must do additional, unrecognised work to locate themselves within the curriculum. Thomas and Quinlan (2023) demonstrate that minoritised students in higher education perceive their curriculum as less culturally sensitive than their majority peers, and this perception accounts for lower teacher interactions and interest. Kahu and Nelson (2018) identify belonging as one of four psychosocial mechanisms that mediate student engagement. If belonging is undermined by the curriculum itself, the effects extend to self-efficacy and academic outcomes.

In a multicultural country like Australia, not only international but also local students bring diverse design knowledge from non-European histories and non-Latin typographic traditions to the classroom. Universities recruit this diversity as part of their internationalisation strategy (Brewer and Leask 2012). They then place these students in a curriculum consisting of teaching artifacts that do not acknowledge the design traditions and knowledge that diversity represents. Prior research has identified the tension between pedagogical intent and teaching practices (Abdulla 2019; Tunstall 2023; Noel et al. 2023); however, the contribution of this study lies in the empirical evidence for how this tension is embedded in curriculum documents themselves. The results of the scorecard demonstrate that the signals students receive are not necessarily produced by individual teaching decisions but are embedded within the curriculum itself.

5.2 Implications for Curriculum Design and Delivery

Each pattern identifies a condition that constrains teaching practice and requires action at the level of curriculum design and institutional resource allocation. Design educators typically enter teaching from professional practice rather than through formal pedagogical training (Davis 2017; Cezzar 2020). The written curriculum, therefore, functions as their primary pedagogical framework. When that framework has not been examined for its cultural positioning, the teacher inherits its assumptions.

Pattern 5 (assumed rather than designed inclusivity) directly frames this limitation. The Teacher's Materials domain scored +1 (Emerging Awareness), indicating that while some structural foundations existed, the curriculum offered no guidance on cultural positioning, bias in critique, or recognition of students' prior cultural knowledge. Culturally responsive teaching was possible within the curricular structure but was not systematically supported. This could lead to inconsistency across a teaching team and make students' access to culturally responsive teaching contingent on which instructor they are assigned to.

The remaining patterns specify what structural support would be needed. Geographic concentration of exemplars (Pattern 1) requires investment in sourcing and curating materials from a broader range of traditions. Furthermore, attention must be paid to the composition of curriculum development teams, as a culturally homogeneous team tends to reproduce the same frame of reference. Monolingual typographic normativity (Pattern 2) requires expertise in non-Latin typographic systems, which may not exist within the current teaching team. This necessitates either staffing investment or targeted professional development. Assessment criteria rooted in unmarked norms (Pattern 3) require programme-wide revision of rubrics and learning outcomes. Such a change cannot be made unilaterally by an individual teacher.

Unframed cultural content (Pattern 4) requires curriculum documents to identify cultural material as such and connect it to learning outcomes. The CRCS provides a systematic evaluation of existing curriculum documents, while Thomas and Quinlan (2024) developed an educator self-reflection tool that supports individual educators in recognising and addressing cultural assumptions in their own teaching materials.

Used in conjunction, these instruments could support curriculum review at both programmatic and individual levels. However, their effectiveness depends on institutional commitment to embedding them in curriculum review processes.

These conditions cannot be addressed through a single revision. Leask (2015) argues that internationalisation of the curriculum requires sustained institutional commitment, disciplinary expertise, and continuous engagement with changing contexts. Marantz-Gal and Leask (2020) reinforce this, arguing that constant shifts in institutional and disciplinary contexts mean that regular review and reconstitution of the curriculum should be a priority. However, such commitment presupposes empirical documentation of the structural conditions embedded in curriculum documents themselves. Existing calls for the decolonisation of design curricula have focused on what should change (Abdulla 2019; Tunstall 2023; Holmes Miller 2023). This study contributes a documented account of what specific structural conditions need to change, at what level, and with what resource implications. The five patterns, derived from a systematic analysis of curriculum documents rather than from pedagogical intent, provide an empirical basis for curriculum review in graphic design and potentially in other practice-based disciplines where disciplinary norms are transmitted through canonical examples, material traditions and studio-based assessment.

The adapted CRCS makes the question “Whose design knowledge?” empirically answerable. While existing calls for decolonisation identify what should change, this study documents what currently exists in curriculum documents and the structural conditions that maintain it. The five patterns provide evidence of what Apple (2012) describes as ideological curriculum decisions: decisions that determine whose knowledge is taught, whose traditions are centred, and whose design expertise is positioned as disciplinary norm.

6. Limitations

Document analysis captures the curriculum as a written, fixed structure and not its implementation in teaching practice. Actual teaching practice may exceed or fall short of what the curriculum prescribes. Likewise, culturally responsive practices may occur in the classroom without being explicitly stated in the written materials. The scorecard results thus reflect the structural conditions created by the curriculum, not the full spectrum of student experience.

This study examined a single course at one institution, and the scoring was conducted by a single researcher. The adapted tool has not yet been tested in different contexts or by multiple assessors. Further research is needed to test the instrument in other design programs, at other institutions, and in other practice-based disciplines, and to determine whether multiple assessors produce consistent results.

Understanding Student Preference for Universities Over TVET Colleges: A Conceptual Analysis of Perceptions and Institutional Factors

Malebo Suzan Mulaudzi[1], Rachel Tholakele Khoza[2]

[1,2]University of Johannesburg, Johannesburg Business School, South Africa

Abstract

The persistent preference of students for universities over Technical and Vocational Education and Training (TVET) colleges in South Africa remains a critical concern, particularly in the context of youth unemployment and ongoing skills shortages. Despite the strategic role of TVET institutions in providing practical, industry-relevant skills, enrolment patterns continue to favour traditional university pathways. This conceptual study examines the determinants of students' preference for universities over TVET colleges, with a specific focus on perceptions of digital readiness. Drawing on Human Capital Theory, Social Influence Theory and Institutional Theory, the study integrates traditional factors awareness, employability expectations, curriculum relevance and institutional credibility with contemporary digital transformation perspectives. A conceptual research design is adopted, grounded in a narrative and critical review of recent literature, through which key constructs and relationships are synthesised into an integrated framework. The synthesis indicates that limited awareness of TVET opportunities, negative societal perceptions, perceived differences in employability outcomes and institutional factors such as infrastructure and reputation shape student preferences. Perceptions of digital readiness play a significant role in shaping student choice, with universities generally perceived as more digitally advanced and better aligned with the Fourth Industrial Revolution, while TVET colleges are often viewed as less digitally equipped. The study contributes a digitally grounded conceptual perspective on student preference and provides practical insights for policymakers and institutions seeking to enhance the relevance, competitiveness and attractiveness of vocational education in South Africa. Although developed in the South African context, the framework is positioned as transferable to comparable developing country systems, offering a shared analytical basis for transnational cooperation on vocational education reform and a structure that is amenable to empirical testing.

Keywords: *Student preference; TVET colleges; universities; digital readiness; digital transformation; higher education choice; South Africa*

1. Introduction

South Africa's Technical and Vocational Education and Training (TVET) colleges were redesigned after 1994 to produce the artisans and technicians on whom the country's industrial base depends, with an explicit mandate to bridge mass post-school enrolment and a labour market starved of intermediate skills [1, 2]. Three decades on, school-leavers continue to choose universities first. TVET enrolment lags, public esteem stays low, throughput rates are weak and graduate unemployment persists in ways that contradict the sector's developmental promise [3, 4]. The Fourth Industrial Revolution (4IR) has sharpened the puzzle: employers now expect graduates to combine technical competence with digital fluency and adaptability [5, 6], and the COVID-19 pandemic exposed the digital fragility of many vocational institutions, widening the perceived distance between universities and TVET colleges [1, 7, 8].

Why, then, do students continue to prefer universities over TVET colleges? How do awareness, social influence, employability expectations and institutional characteristics interact to produce this preference, and how do digital readiness perceptions reshape an already lopsided choice in a 4IR economy? Although scholarship on TVET, on student career choice and on digital readiness has grown rapidly, these strands have run in parallel rather than in dialogue. This paper bridges them, drawing on Human Capital Theory, Social Influence Theory and Institutional Theory to develop an integrated conceptual framework of student preference in South African post-school education one that places digital readiness perceptions at its centre rather than at its margins. South Africa's TVET sector confronts a paradox of persistent under-utilisation. Vocational education is consistently identified as critical to

addressing youth unemployment and skills shortages, yet students continue to favour universities at the expense of strategic alignment with labour market need [3, 6]. Negative public perceptions, weak articulation between TVET qualifications and further study, and limited awareness of vocational career pathways entrench the pattern [2, 9]. The challenge has taken on new dimensions in the digital era. As employers increasingly expect digital competencies, perceptions of how well institutions prepare students for digitally mediated work have become consequential to higher education choice [5, 10]. Universities are routinely positioned as more digitally advanced and 4IR-aligned, while TVET colleges are often perceived as digitally underdeveloped [7, 11]. Existing scholarship, however, treats these phenomena in isolation. Studies of career choice focus on socio-economic and peer influences but rarely engage with digital perceptions; work on digital readiness focuses on infrastructural deficits but rarely connects to the moment of student choice. There is no coherent conceptual account that integrates traditional determinants of higher education choice with the digital readiness perceptions now refracting them. This study addresses that gap. The study aims to develop a conceptual framework that explains the determinants of student preference for universities over TVET colleges in South Africa, with particular attention to perceptions of digital readiness. It seeks to synthesise traditional determinants of higher education choice with contemporary digital readiness considerations, advancing scholarly understanding of student preference patterns and providing an integrated basis for policy and institutional response within South Africa's 4IR agenda. Although anchored in the South African case, the perceptual undervaluation of vocational education relative to university study that the framework describes recurs across many developing and transitional economies, positioning the framework as a basis for comparative analysis and transnational cooperation on TVET repositioning. The primary research question is: What factors shape student preference for universities over TVET colleges in South Africa, and how do perceptions of digital readiness contribute to this preference? Three secondary questions extend the inquiry: How do awareness, societal perceptions and employability expectations influence student choice between universities and TVET colleges? What institutional factors infrastructure, reputation, curriculum relevance shape student preferences? And how can existing theoretical perspectives be integrated into a conceptual framework that explains student preference for universities over TVET colleges in a 4IR context? In addressing the research questions, the study pursues four objectives: to examine the role of awareness, societal perceptions and employability expectations in shaping student preferences; to analyse institutional factors influencing higher education choice; to explore the influence of digital readiness perceptions on student decision-making in the South African post-school context; and to synthesise these elements into an integrated conceptual framework that explains student preference for universities over TVET colleges.

The remainder of the paper is structured as follows. Section 2 reviews the related literature across five thematic clusters. Section 3 details the research methodology. Section 4 develops the theoretical foundation drawing on Human Capital Theory, Social Influence Theory and Institutional Theory. Section 5 presents the findings across six interrelated themes. Section 6 proposes the integrated conceptual framework. Section 7 sets out the implications for policy and practice, and Section 8 concludes the paper.

2. Review of Related Literature

The relevant scholarship is reviewed across five thematic clusters that surface the constructs the framework will integrate.

2.1 TVET in South Africa

The South African TVET sector inherits a difficult institutional history. The apartheid legacy shaped vocational education as a racially stratified, under-resourced system [2]. Post-1994 reforms sought to reposition TVET as an 'institution of choice', yet low public esteem, underfunding, weak articulation with universities and poor graduate outcomes continue to constrain the sector [1, 3]. [4] show how structural and attitudinal barriers compound for students with disabilities in Gauteng TVET colleges, while [3] demonstrates that misalignments between National Certificate (Vocational) qualifications and both employer expectations and university entry requirements restrict graduate progression.

2.2 Student Perceptions and Career Choice

Career choice in vocational education is shaped by personal interest, parental guidance, perceived employability and peer influence [12, 13, 14, 15]. Within South African TVET, [9] shows that limited

understanding of career pathways contributes to disengagement and poor completion, while [16] report that perceptions of TVET attractiveness vary along demographic lines unrelated to programme quality. [17] and [18] identify information asymmetry and perceived employability as the dominant determinants of TVET institutional choice in East African contexts. That information asymmetry and perceived employability recur as dominant determinants across East African and Southeast Asian settings [16, 17, 18] points to a cross-national pattern, suggesting that the drivers of vocational education choice are not uniquely South African but shared across developing systems, and are therefore amenable to transnational comparison and cooperation.

2.3 Digital Readiness and E-Learning

Digital readiness has expanded rapidly as an object of TVET research post-pandemic. [11] find that South African TVET engineering lecturers hold positive attitudes towards technology-assisted teaching but report significant digital skills deficits. [7] report inconsistent e-learning integration at a Free State TVET college, while [19] documents foundational digital competency gaps among first-year students. [8] trace these gaps upstream to under-resourced secondary schools, [20] and [21] identify lecturer competence and institutional support as critical determinants.

2.4 Institutional Reputation and Employability

Institutional reputation and graduate employability are tightly coupled in higher education choice. [17] and [15] identify reputation and infrastructure as primary drivers of TVET selection, findings corroborated for South Africa by [2]. On employability, Mbambo and du Plessis [6] establish a significant relationship between TVET students' digital skills deficits and poor throughput, [22] document a substantial divergence between students' self-perceived work readiness and employer expectations, [10] show that perceived digital-era work readiness predicts employability competency, and [23] attributes weak job-entry preparedness to limited industry exposure.

2.5 4IR and Digital Transformation in TVET

4IR discourse has reshaped expectations of South African post-school education. [1] argues that the pandemic exposed a substantial distance between policy aspirations and TVET institutional capacity. [5] treats 4IR preparedness as a stakeholder construction constitutive of institutional legitimacy, while [6] link student digital skills directly to throughput, framing 4IR competence as a precondition for vocational success. 4IR readiness now operates as a foundational expectation rather than an optional modernisation agenda.

3. Research Methodology

The study is conceptual, based exclusively on secondary data, employing a narrative and critical literature review with thematic synthesis. No human participants were recruited and no primary data were collected. Methodological choices follow [24] for conceptual research design, [25] for narrative review and [26] for thematic analysis trustworthiness. Searches were conducted across six databases Scopus, Google Scholar, Web of Science, ScienceDirect, JSTOR and EBSCOhost combining key co nstructs through Boolean operators ('TVET South Africa', 'university preference', 'digital readiness TVET', '4IR TVET', 'employability TVET', 'higher education choice South Africa'), supplemented by snowballing from reference lists. Sources were included where published in English between 2011 and 2025 and focused on TVET, higher education choice, digital readiness or career readiness in South African or comparable developing country contexts; foundational theoretical works prior to 2011 were retained where conceptually indispensable. Thematic synthesis followed the six phases set out by [26]: familiarisation, initial coding, searching for themes, reviewing themes, defining and naming themes, and producing the report. Trustworthiness was supported through the four criteria credibility (triangulating evidence across sources), transferability (rich contextual description of the South African TVET environment), dependability (documenting analytical decisions) and confirmability (maintaining a traceable trail from coded passages to themes). The six themes were then mapped to the three theoretical lenses and synthesised into the conceptual framework in Section 6, with each directional pathway supported by at least two sources from the reviewed literature.

4. Theoretical Foundation

Three theoretical lenses inform the framework. Human Capital Theory conceptualises education as an investment in productive capacity yielding future returns in employability and earnings; students rationally compare expected returns on competing pathways [10, 13, 22], and digital competencies are increasingly central to perceived returns [5, 6]. Social Influence Theory addresses how attitudes and decisions are shaped by parents, peers, teachers and reference groups, operating through informational and normative channels; African scholarship consistently shows career choice mediated by these influences [9, 12, 13, 14, 15]. Institutional Theory examines how legitimacy, conferred by reputation, accreditation and visible markers of quality, conditions individual choice [2, 17]; South Africa's differentiated post-school system has established universities as the most legitimate destination, with TVET colleges positioned as less prestigious [1, 3], and digital readiness now contributes to institutional legitimacy by signalling alignment with contemporary 4IR expectations [5, 11].

5. Findings

Six interrelated themes emerge from the synthesis, each engaged critically and linked explicitly to student preference.

Theme 1: Societal Perceptions of TVET

Societal stigma is a powerful constraint on TVET attractiveness, but scholars account for it differently. [3] treats stigma as an outcome of structural articulation failures; [4] locate it at the intersection of disability and vocational identity; [2] trace it to the historical-symbolic ordering of South Africa's differentiated post-school system. These accounts capture different facets of a layered phenomenon-structural, intersectional and historical. Scholars further disagree on whether perceptions are malleable through targeted intervention [16] or sedimented in the political economy of unemployment [9, 23]; the evidence supports a middle position where perception shifts most reliably when narrative work and substantive institutional change move together. For student preference, prospective students rarely encounter empirical employment data; they encounter narratives transmitted through family, peers and media that position TVET as second-best, driving university choice by social default. Under Social Influence Theory, the channels that transmit stigma must also become those through which TVET's repositioning is propagated.

Theme 2: Perceived Employability Differences

[6], [22] and [10] converge on the digital framing of TVET employability but diverge on its locus; [6] place it on the supply side (graduates lack digital competencies), [22] in self-perception (students underestimate readiness), and [23] in curriculum design and limited industry exposure. The three readings triangulate three reinforcing weaknesses, implying complementary interventions. For student preference, prospective students lack disaggregated labour market data on TVET versus university outcomes; what they have is a generalised perception, now travelling through a digital register, that university graduates fare better. Read through Human Capital Theory in 4IR terms, expected returns to a TVET investment depend on perceived digital readiness as much as on perceived technical training, so university preference partly tracks a digitally inflected employability calculation that disadvantages TVET.

Theme 3: Digital Readiness and Technology Infrastructure

South African TVET literature documents real digital readiness deficits infrastructural constraints, lecturer skills gaps and student competency gaps [6, 7, 11, 19] that [8] trace upstream to under-resourced secondary schools. Scholars locate the deficit at different system levels (lecturer capability, platform usability, school-level digital inequality), amounting to a system-level diagnosis that requires whole-of-system responses. For student preference, digital readiness has two faces: the institutional-real and the perceptual. Under Institutional Theory, what shapes preference is the visible markers of digital readiness, not the underlying capability. Improvements in digital infrastructure must therefore be accompanied by deliberate communication; otherwise the perception lag persists and prospective students continue to choose universities on perceptual grounds.

Theme 4: Institutional Reputation and Credibility

Two competing accounts of reputation run through the scholarship. The first treats it as a reflection of underlying institutional quality; the second, drawn from Institutional Theory, treats legitimacy as its own resource, partially decoupled from underlying performance. [17] shows that perceptions of credibility persist even when programmes improve, while [8] and [7] show students basing judgements on visible markers devices, connectivity, modern facilities that can be improved relatively quickly. The implication is a dual-track logic in which substantive quality improvement is necessary but not sufficient, requiring deliberate reputation management alongside quality work. For student preference, university choice is reinforced by reputational asymmetries that predate the moment of decision; universities benefit from longer histories of investment and the structural privileging of academic over vocational qualifications, leaving TVET colleges to encounter a credibility ceiling that depresses enrolment even where programme quality is sound.

Theme 5: Awareness and Understanding of TVET Pathways

Where prospective students do not understand what TVET qualifications offer or what careers they lead to, the choice between TVET and university is not a genuine comparison but a default to the more familiar option [9, 16, 17]. [12], [13] and [14] underscore the role of parental and peer guidance, suggesting that awareness work must engage the wider social environment rather than the prospective student alone. For student preference, university choice partly tracks the unequal visibility of options rather than considered comparison. Awareness intersects with digital readiness perceptions: students who learn about TVET through outdated websites or thin digital outreach infer that TVET institutions themselves are digitally underdeveloped, so the communicative infrastructure of TVET becomes part of how its institutional substance is perceived.

Theme 6: 4IR Preparedness and Future Employability

The sixth theme draws the other five together. 4IR readiness has become central to how students, families and employers evaluate post-school institutions [5, 6, 10]. [5] treats 4IR preparedness as a stakeholder construction; [6] connect it to throughput and labour market outcomes; [10] link it to individual employability competency. These contributions disagree on what 4IR preparedness requires a skills agenda, an institutional reorientation agenda, or a self-efficacy agenda implying complementary investments rather than mutually exclusive ones. For student preference, perceptions of 4IR preparedness operate as a perceptual lens through which the other five themes are now refracted, shaping awareness, societal perceptions, employability expectations, institutional reputation and perceived digital readiness. Where TVET is seen to lag the 4IR, every other determinant tilts further towards university choice. Repositioning TVET requires reframing the meaning of vocational education in a digitally mediated society, not just upgrading digital infrastructure.

6. Proposed Conceptual Framework

The themes synthesised in Section 5 imply a system of directional relationships among eight constructs: awareness of TVET opportunities, social influence, 4IR preparedness, digital readiness, institutional reputation, employability expectations, student perceptions and student preference decisions. The framework organises these into four layers: an antecedent layer (awareness, social influence, 4IR preparedness) carrying the contextual forces in which choice is made; a mediating institutional layer (digital readiness, reputation, employability expectations) carrying the institutional-level evaluations students form; a synthesising perceptual layer (student perceptions) through which the other layers translate into preference; and an outcome layer (student preference decisions).
Eleven directional relationships connect these constructs (Table 1). Each pathway is anchored in a theoretical lens and supported by at least two sources from the reviewed literature, ensuring that the framework rests on a demonstrable evidential base rather than conceptual assertion alone.

Table 1. Directional Relationships in the Proposed Conceptual Framework

Path	Relationship (Source → Target)	Theoretical Anchor	Justification and Literature Support
R1	Awareness → Student perceptions	Social Influence (informational)	Limited or inaccurate information about TVET produces weaker perceptions of attractiveness [9, 16, 17].
R2	Social influence → Student perceptions	Social Influence (normative)	Parents, peers, teachers and media shape evaluation of post-school options [9, 12, 13].
R3	Social influence → Awareness	Social Influence (mediating)	Information about TVET reaches students through social channels, so the social environment moderates the awareness signal [13, 17].
R4	4IR preparedness → Digital readiness	Institutional Theory	4IR discourse sets the benchmark against which institutional digital readiness is now assessed [1, 5, 6].
R5	4IR preparedness → Employability expectations	Human Capital (4IR-inflected)	4IR-relevant skills increasingly shape employer evaluation of graduates [5, 10, 22].
R6	4IR preparedness → Institutional reputation	Institutional Theory	Legitimacy is now partly conferred by visible alignment with 4IR expectations [1, 5, 8].
R7	Digital readiness → Institutional reputation	Institutional Theory	Visible markers of digital readiness feed institutional credibility [7, 8, 11].
R8	Digital readiness → Employability expectations	Human Capital Theory	Perceptions of digital capability shape beliefs about graduate employability [6, 19, 22].
R9	Institutional reputation → Student perceptions	Institutional Theory	Reputation and prestige shape how students evaluate enrolment desirability [2, 15, 17].
R10	Employability expectations → Student perceptions	Human Capital Theory	Perceived employability is a consistent driver of post-school preference [10, 13, 22].
R11	Student perceptions → Student preference decisions	Integrated theoretical scaffolding	The composite of antecedent and mediating constructs, refracted through digital readiness and 4IR perceptions, manifests as the observable choice between universities and TVET colleges.

Source: Authors own compilation

Three integrating mechanisms produce the framework's analytical force. First, 4IR preparedness operates as a cross-cutting force feeding digital readiness (R4), employability expectations (R5) and institutional reputation (R6); three of the four mediating pathways into student perceptions are therefore conditioned by 4IR perceptions, so that where TVET is perceived to lag the 4IR every mediator tilts further against it. Second, social influence operates through two pathways simultaneously directly on perceptions (R2) and indirectly via the awareness signal (R3) so that perceptions of TVET are doubly mediated by the social environment. Third, the mediating institutional layer is internally interconnected: digital readiness shapes both reputation and employability, each of which then shapes perceptions, so improvements in perceived digital readiness exert compounded rather than additive effects on student preference. Institutional choice is, fundamentally, perceptual. Students do not directly observe infrastructure, lecturer capability or graduate employment outcomes; they observe perceptions of these things, transmitted through social, informational and digital channels. R11 is therefore the binding pathway of the entire framework: every other relationship feeds into perceptions, and perceptions drive choice. The three theoretical anchors converge on this point Human Capital Theory holds that students choose on perceived rather than actual returns; Social Influence Theory holds that perceptions are socially mediated; Institutional Theory holds that legitimacy is conferred by perceptions of relevant audiences. In South Africa, universities benefit from advantages on all three dimensions while TVET colleges face a triple disadvantage on the perceptual register, intensified by 4IR perceptions. The framework yields four testable propositions: (P1) preference is shaped by an interacting system of antecedent, mediating, perceptual and outcome layers rather than by any single determinant; (P2) 4IR

preparedness perceptions condition the influence of digital readiness, reputation and employability expectations on student perceptions; (P3) social influence operates through both direct and information-mediating pathways, doubling its effect on perceptions of TVET; and (P4) shifting student preference requires engaging capability and perception simultaneously, because perceptions are the binding pathway through which institutional capacity translates into choice.

The framework is deliberately constructed to be empirically testable. Each construct is amenable to measurement: awareness and social influence through survey scales adapted from career choice research, digital readiness and 4IR preparedness perceptions through validated perception instruments, institutional reputation through established legitimacy and image scales, and student preference through stated and revealed choice measures. The eleven directional relationships (R1 to R11) can be estimated using structural equation modelling on cross-sectional survey data from prospective and enrolled students, while the mediating and moderating roles specified in P1 to P4 lend themselves to mediation and moderated mediation analysis. Multi-group testing across provinces, and across comparable developing country systems, would establish the framework's boundary conditions and its transnational generalisability, converting the conceptual scaffolding into a verifiable model.

7. Implications for Policy and Practice

Single-lever interventions are unlikely to succeed. A coordinated, multi-pronged response is required in which substantive improvements in institutional capacity move together with deliberate work on the perceptual environment in which TVET is evaluated. For policymakers and institutional leaders, this means combining investment in TVET digital infrastructure, lecturer professional development and curriculum modernisation with targeted communication campaigns to reshape public perceptions. The Department of Higher Education and Training, working with employer associations, student support organisations and community structures, has a particular role in reframing TVET as a credible and aspirational 4IR pathway [1, 5], while articulation between TVET and university qualifications requires policy attention so that students are not penalised for choosing the vocational route [2, 3]. At the institutional level, visible markers of digital readiness modern learning management systems, lecturer digital fluency, student-facing digital experiences communicate institutional readiness directly to prospective students, families and employers [11, 20]. For curriculum practice, 4IR-relevant competencies need to be embedded across vocational programmes rather than treated as bolt-on modules, with industry exposure and work-integrated learning closing the gap between TVET training and employer expectations [10, 22, 23]. To make the framework directly actionable, institutions can translate its constructs into monitorable indicators, for example prospective-student awareness levels, the currency and reach of digital outreach, learning-management-system adoption, lecturer digital-fluency benchmarks and graduate-destination tracking, and then sequence interventions so that visible markers of digital readiness and reputation are communicated to prospective students, families and employers as substantive capacity is built. This gives institutional leaders a staged and measurable basis for applying the framework rather than a purely conceptual account.

Beyond the national level, the convergence of vocational education challenges across developing systems creates clear scope for transnational cooperation. Regional bodies and cross-border partnerships, for instance within the Southern African Development Community and through wider South-to-South knowledge exchange, can pool scarce resources for digital infrastructure, share curriculum frameworks for 4IR-relevant competencies, and coordinate the reputational repositioning of vocational education. The comparable patterns reported in East African and Southeast Asian studies [16, 17, 18] indicate that this is a shared rather than a purely South African problem, and that instruments, interventions and lessons are mutually transferable across systems facing similar perceptual and structural constraints. Embedding the framework within such cooperative arrangements would strengthen both its evidentiary base, through coordinated comparative testing, and its practical reach, directly connecting the analysis to the transnational cooperation agenda in post-school education.

8. Conclusion

This paper has examined the persistent preference of South African students for universities over TVET colleges in a labour market that increasingly requires the skills TVET is designed to deliver, and has proposed a conceptual framework to explain this enrolment pattern. Drawing on Human Capital Theory, Social Influence Theory and Institutional Theory and synthesising literature predominantly from the 2021–2025 period, the framework identifies six determinants of preference and positions perceptions of digital readiness and 4IR preparedness as a cross-cutting perceptual layer that conditions every

determinant. The four research objectives are addressed: the role of awareness, societal perceptions and employability expectations is analysed in Themes 1, 2 and 5 of Section 5; institutional factors are analysed in Theme 4; the influence of digital readiness perceptions is analysed in Themes 3 and 6; and the integrated framework is presented in Section 6. The substantive conclusion is that university preference cannot be adequately explained by any single determinant. It is the product of layered interactions among economic calculation, social influence, institutional legitimacy and digital perceptions, with 4IR-related perceptions intensifying every layer of disadvantage TVET faces. Repositioning TVET within South Africa's post-school education system is therefore a core component of the country's 4IR response. As a conceptual study, this paper does not generate primary empirical data; its four propositions await testing through quantitative modelling, qualitative inquiry into perception formation and comparative work across provinces and other developing country contexts. In particular, the eleven pathways and four propositions can be operationalised and tested through structural equation modelling and comparative, transnational designs that examine whether the same perceptual mechanisms operate across developing country TVET systems, providing an evidentiary basis for cooperative regional responses and stronger evidence of the framework's practical applicability. The contribution is the conceptual scaffolding on which such empirical work can build.

Higher Education in Morocco: Promoting Innovation through Human Capital Development

Sanae EL MELLOUKI

Mohammed V University- Faculty of Sciences Rabat (FSR), Morocco

Abstract

In the context of accelerating global competitiveness and structural reform, innovation has emerged as a central organizing principle of higher education policy worldwide. In Morocco, universities are increasingly positioned as engines of economic growth and employability enhancement. However, prevailing reform discourses tend to equate innovation with technological modernization, institutional restructuring, and entrepreneurial performance, thereby narrowing its pedagogical and developmental dimensions.

This paper advances a reconceptualization of innovation in Moroccan higher education through a human capital development framework that integrates cognitive, socio-behavioral, and ethical competencies alongside disciplinary expertise. Drawing on innovation systems theory and human capital scholarship, the study argues that sustainable innovation requires more than institutional reform; it necessitates the cultivation of transferable skills that enable adaptive, collaborative, and socially responsible graduates. Using English for Specific Purposes (ESP) as a strategic pedagogical locus, the paper proposes a competence-oriented approach that repositions language education as a site of integrated skill formation rather than merely disciplinary specialization. By situating ESP within broader innovation and human capital debates, the study highlights its potential contribution to socially embedded and development-oriented innovation in Morocco. The paper concludes that aligning innovation policy with holistic human capital formation is essential for achieving both economic competitiveness and sustainable societal transformation.

Keywords: *Human capital development, ESP, sustainable innovation, Moroccan higher education reform.*

1. Introduction: The Innovation Imperative in Moroccan Higher Education

Innovation has emerged as a defining paradigm shaping contemporary higher education systems operating within increasingly competitive and knowledge-driven economies. Globally, universities are no longer conceived solely as sites of knowledge transmission but as strategic actors within national innovation systems, expected to contribute directly to economic growth, technological advancement, and workforce competitiveness. Within this policy landscape, innovation functions both as an institutional survival strategy and as a developmental imperative.

Moroccan public universities are deeply embedded in this global reform dynamic. Confronted with economic restructuring, demographic pressures, globalization, and labor-market volatility, they are increasingly called upon to produce graduates equipped not only with disciplinary knowledge but also with adaptive and transferable competencies. Recent reform initiatives—including the restructuring of degree architecture toward a bachelor-based model and the reinforcement of multilingual education policies—reflect an explicit commitment to modernization and employability enhancement. These reforms signal Morocco's alignment with broader international trends linking higher education performance to innovation capacity.

Yet a critical question persists: **What conception of innovation should guide Moroccan higher education reform?**

While policy discourse often equates innovation with structural reorganization, technological upgrading, or entrepreneurial output, such interpretations risk reducing innovation to an economic performance indicator. When framed narrowly, innovation becomes a rhetorical instrument legitimizing reform without necessarily transforming pedagogical practices or student development processes. The result is a reform agenda focused on institutional adjustment rather than human capability formation.

This paper argues that innovation in Moroccan higher education must be reconceptualized through a human capital development framework that integrates cognitive, socio-behavioral, and ethical competencies alongside disciplinary expertise. Drawing on innovation systems theory and human capital scholarship, the study contends that sustainable innovation cannot be achieved through

structural reform alone; it requires the deliberate cultivation of transferable skills, adaptive expertise, and socially responsible agency. By repositioning innovation as a multidimensional developmental process rather than a purely economic objective, Moroccan higher education can move beyond modernization rhetoric toward meaningful institutional and pedagogical transformation.

2. Conceptualising Innovation: Beyond Reform & Change

Innovation is frequently conflated with reform, modernization, or institutional change. Yet the literature draws important distinctions between these concepts. Reform may introduce structural adjustments, policy modifications, or administrative reorganization without fundamentally transforming institutional practices or outcomes. Innovation, by contrast, is generally conceptualized as a multi-stage process involving the generation, implementation, diffusion, and evaluation of novel ideas that produce demonstrable value or impact (Baregheh, Rowley, & Sambrook, 2009; Tierney & Lanford, 2016).

In this sense, innovation cannot be reduced to the mere introduction of new structures or policies. It entails at least four interrelated dimensions: **novelty**, understood as the introduction of new approaches or practices; **implementation**, referring to the effective operationalization of those ideas; **evaluation**, involving systematic assessment of outcomes; and **measurable impact**, which indicates tangible improvement in performance, quality, or societal contribution. Without these elements, institutional initiatives risk remaining symbolic gestures rather than substantive transformation.

Within higher education, innovation may manifest in multiple domains, including curriculum redesign, pedagogical experimentation, digital integration, research collaboration models, or governance restructuring. However, the presence of novelty alone does not guarantee innovation. As innovation systems scholarship emphasizes, successful innovation depends on coherence between institutional culture, incentive structures, leadership vision, and pedagogical practice. When innovative ambitions are not embedded within supportive organizational ecosystems, reforms often result in fragmented or superficial adoption.

The Moroccan higher education system currently confronts this structural tension. Over recent decades, expansion policies have increased access and diversified institutional offerings. Yet quantitative growth has not always been accompanied by corresponding qualitative transformation in learning outcomes, graduate adaptability, or knowledge transfer capacity. This disjunction highlights the limits of reform understood primarily as structural adjustment.

Accordingly, innovation in Moroccan higher education must be reconceptualized not as incremental modification but as purpose-driven educational redesign. Such redesign requires alignment between policy objectives, pedagogical strategies, and human capital development goals. Only through this integrative approach can innovation transcend rhetorical invocation and become a driver of sustainable institutional and societal advancement.

3. Reclaiming Impact: Economic and Social Dimensions

Contemporary innovation discourse in higher education is frequently framed in economic terms. Institutional success is often measured through graduate employability rates, alignment with labor-market demands, entrepreneurial output, and contribution to national competitiveness. While these indicators remain significant—particularly within developing and emerging economies—a purely utilitarian interpretation of innovation risks narrowing the normative mission of the university.

Reducing innovation to economic productivity alone overlooks the broader civic and developmental responsibilities historically associated with higher education. Universities are not merely engines of workforce preparation; they are also sites of intellectual formation, ethical reflection, and social transformation. A more comprehensive understanding of impact must therefore extend beyond employability to encompass civic engagement, ethical awareness, personal growth, and social responsibility.

From this broader perspective, innovation involves cultivating individuals capable not only of adapting to existing economic systems but also of critically evaluating and reshaping them. Graduates should possess the reflective capacity to interrogate social challenges, the ethical grounding to act responsibly, and the communicative competence to participate meaningfully in public discourse. Innovation, in this sense, becomes as much about social contribution and institutional trust as it is about market performance.

1. This dual orientation challenges the dominance of market-centered models of higher education and calls for a hybrid framework in which instrumental and intrinsic purposes coexist. The following diagram clearly demonstrates that Economic competitiveness and social development should not be positioned

as mutually exclusive objectives; rather, they must be understood as interdependent dimensions of sustainable innovation.

"An educational system that prioritizes only short-term employability may undermine the long-term adaptive capacity and civic resilience required for enduring national progress."

Fig. 1. Dual-Dimension Model of Innovation Impact in Higher Education

The above Dual-Dimension Model illustrates that sustainable innovation in higher education cannot be achieved by optimizing either economic or social objectives in isolation. The **left circle** represents *Economic Vitality and Competitiveness*—encompassing graduate employability, entrepreneurial output, and labor-market alignment. The **right circle** captures *Social Responsibility and Ethical Advancement*—encompassing civic engagement, ethical reflection, and social transformation. The intersection—**Sustainable Innovation Capacity**—is the zone where both dimensions converge, and where transformative innovation becomes possible.

2. For Moroccan higher education, reclaiming this broader conception of impact is particularly urgent. As institutions navigate reform pressures and global benchmarking regimes, innovation must be anchored in a balanced human capital strategy—one that integrates economic vitality with ethical and societal advancement. Only through such equilibrium can innovation move beyond performance metrics to become a transformative force within both the university and society at large.

4. Human Capital Development as a Lever for Innovation

Innovation is fundamentally human-driven. Its sustainability does not reside in policies, technologies, or institutional restructuring alone, but in the competencies, dispositions, and cognitive capacities of individuals. Educational transformation, therefore, cannot occur without parallel human capital development.

Human Capital Theory, as articulated by Schultz (1961) and later developed by Becker (1964), conceptualizes education as an investment that enhances productivity and economic growth. Within this framework, skills acquisition is primarily justified by its contribution to labor-market efficiency and national competitiveness. While this economic rationale remains influential—particularly in policy discourse—it has been widely critiqued for reducing individuals to instruments of economic output and for overlooking broader developmental and social dimensions of education.

In response to these limitations, contemporary perspectives such as Strategic Human Resource Management (SHRM) and knowledge-based organizational theory reconceptualize individuals not as passive labor-market inputs but as active agents of innovation. From this standpoint, competitive advantage emerges not merely from technical expertise, but from higher-order competencies that

enable adaptability, creativity, and collaborative problem-solving (Wright & McMahan, 1992; Teece, 2007). Innovation capacity becomes embedded in people rather than structures alone.
Applied to higher education, this shift necessitates a reorientation from narrow employability metrics toward the cultivation of transferable and transformative competencies. These include critical thinking, creativity, adaptability, communication proficiency, ethical judgment, and lifelong learning dispositions. Such capacities allow graduates not only to integrate into existing professional environments but also to reshape them. Innovation thus becomes generative rather than reactive.
For Moroccan higher education, adopting this developmental lens is particularly significant. In a context marked by rapid socio-economic transformation and evolving labor-market demands, graduates must be equipped not simply to access employment but to navigate uncertainty, initiate change, and contribute to institutional and societal renewal. Innovation, therefore, should be conceptualized as a byproduct of empowered human capital—individuals capable of synthesizing knowledge, exercising judgment, and acting responsibly within complex systems.
Shifting toward this transformative model does not negate the importance of employability. Rather, it reframes employability as an outcome of deeper intellectual and personal development. When higher education prioritizes transferable competencies and reflective capacity, it strengthens both economic resilience and social sustainability.

5. English for Specific Purposes (ESP) as a Strategic Site of Innovation

Within Moroccan universities, English for Specific Purposes (ESP) was initially introduced to enhance students' disciplinary communication competence and facilitate access to global academic and professional communities. Its expansion reflects broader multilingual and modernization policies seeking to strengthen graduate competitiveness. However, despite its strategic positioning within reform agendas, ESP has not consistently fulfilled its transformative potential. Structural and pedagogical constraints—including large and heterogeneous classes, grammar-centered teaching practices, limited disciplinary collaboration, and insufficient curricular coherence—have often reduced ESP to a supplementary language requirement rather than a developmental platform.
Moreover, traditional ESP frameworks have tended to remain narrowly disciplinary, emphasizing terminology acquisition and field-specific communicative conventions. While such objectives are essential, this orientation alone does not sufficiently address the broader human capital demands associated with sustainable innovation. As argued in the preceding sections, innovation capacity depends not only on technical expertise but also on transferable cognitive and socio-behavioral competencies. When ESP is confined to lexical specialization, it risks underutilizing its inherently interactive and communicative pedagogical structure.
Repositioned within a human capital development framework, ESP emerges as a uniquely strategic site for cultivating innovation-oriented competencies. Its dialogic format, reliance on problem-based tasks, emphasis on negotiation of meaning, and engagement with professional scenarios create fertile conditions for developing critical reasoning, leadership capacity, collaborative problem-solving, interpersonal communication, and self-awareness. These competencies align closely with the multidimensional skill architecture required for innovation in contemporary knowledge economies.
A reformed ESP framework, therefore, should move beyond disciplinary language transmission toward an integrated, skill-based innovation model. Such a model would explicitly bridge language learning with societal and labor-market realities, embedding authentic professional challenges within communicative tasks. Soft skills would be systematically integrated into project-based learning and reflective activities rather than treated as incidental by-products of language instruction. Interdisciplinary collaboration between language instructors and subject specialists would enhance contextual relevance, while research-informed pedagogical experimentation would ensure continuous evaluation and adaptation.
In this configuration, ESP occupies a strategic intersection between personal development, professional readiness, and social responsibility. It becomes not a remedial or peripheral course, but a structured environment for cultivating adaptive expertise and reflective agency across disciplines. By aligning communicative competence with transferable skill formation, ESP can function as a micro-level pedagogical lever within broader institutional innovation strategies.
For Moroccan higher education, such repositioning holds particular significance. As universities seek to reconcile economic competitiveness with social transformation, ESP provides a scalable and cross-disciplinary mechanism through which innovation-oriented human capital can be systematically nurtured. The challenge, therefore, is not merely to reform ESP structurally, but to reconceptualize its epistemological purpose within the innovation agenda.

6. Conclusion: Toward Transformative Innovation in Moroccan Higher Education

Innovation has become an unavoidable imperative within contemporary higher education reform. In Morocco, as in many emerging knowledge economies, universities are increasingly expected to align with global competitiveness standards and respond to labor-market demands. Yet, as this paper has argued, equating innovation solely with structural reform, technological modernization, or employability metrics risks narrowing its transformative potential.

Reconceptualizing innovation through a human capital development lens allows for a more comprehensive and sustainable framework. Innovation must be understood not merely as institutional adaptation but as the cultivation of multidimensional competencies that enable individuals to think critically, act ethically, collaborate effectively, and navigate complexity. Economic vitality and social responsibility are not competing objectives; they are interdependent dimensions of durable national progress.

Within this integrative framework, pedagogical spaces that foster communicative interaction, reflective engagement, and interdisciplinary problem-solving acquire strategic importance. Repositioning such spaces as structured environments for transferable skill formation offers a practical pathway through which innovation-oriented human capital can be systematically developed across disciplines.

Future research should therefore move beyond conceptual reframing toward the design and empirical evaluation of pedagogical models capable of operationalizing this human-centered innovation agenda. The challenge ahead lies not in redefining innovation rhetorically, but in embedding it coherently within curricular architectures that translate policy ambition into developmental practice.

Only through such alignment can Moroccan higher education transition from reform discourse to transformative and sustainable innovation.

STEM-Based Learning Leadership in Elementary Schools

Sri Utaminingsih[1], Ahmad Hariyadi[2]

[1,2]University Muria Kudus, Indonesia

Abstract

Indonesian learning, the Science, Technology, Engineering, and Mathematics (STEM) approach is recommended as a strategy to improve the quality of education towards a Golden Indonesia, but its implementation is still not optimal. This study aims to develop a STEM-based learning leadership design in elementary schools. The research method uses the ADDIE development design. At the need analysis stage with 120 elementary school principals as subjects, it showed that 67% experienced difficulties in leading STEM integration in learning. The STEM-based learning leadership design consists of 5 aspects, namely leadership in developing a STEM learning environment with local phenomena and establishing a STEM center in schools; leading the planning and implementation of STEM-based learning by applying a project-based learning model; leading reflection on improving the quality of learning; leading the involvement of parents as mentors and STEM learning resources. The results of the model design test from the expert and practitioner groups were in the very feasible category with an average feasibility percentage of 85.68%. At the implementation stage, the response of the principal as a user to the model design was 84.97% in the very satisfied category.

Keywords: *Innovation; Learning Leadership; Deep Learning; STEAM; Elementary Schools*

Introduction

In the pursuit of Indonesian Golden 2045, Indonesia is projected to have a population of more than 320 million people, predominantly within the productive age group, as a result of the demographic dividend. This demographic advantage provides a substantial opportunity to accelerate national development. Nevertheless, the demographic dividend can only be transformed into a sustainable competitive advantage if the Indonesian workforce is equipped with essential 21st-century competencies, particularly the 4C skills of **critical thinking, creativity, communication, and collaboration.** Consequently, the education system must foster learning environments that develop these competencies, enabling students to effectively respond to the complex challenges of the 21st century [1], [2].

Indonesia's education system is currently facing a serious challenge known as *learning loss*. This phenomenon is characterized by a decline in students' learning motivation, comprehension of subject matter, and academic performance. If not addressed effectively, learning loss may hinder the development of essential competencies and negatively affect students' long-term educational outcomes. [3]. The consequences of this condition are evident not only in students' declining academic performance but also in the insufficient development of critical thinking skills, one of the key competencies required in the 21st century. Consequently, there is a need for innovative learning leadership that facilitates the implementation of *deep learning* and the STEAM (*Science, Technology, Engineering, Arts, and Mathematics*) approach. These approaches enable students to actively participate in meaningful learning experiences, address authentic problems, and continuously enhance their critical thinking abilities, preparing them to meet the demands of an increasingly complex and dynamic world.

On the other hand, Indonesia is facing a rapid educational transformation driven by technological advancement, globalization, and the changing demands of the 21st century. This situation requires immediate responses from educational leaders, particularly in ensuring the provision of high-quality learning services. Educational leaders play a crucial role in preparing learning processes that equip students with the knowledge, skills, and competencies needed to remain competitive in the future. However, the results of the 2022 Programme for International Student Assessment (PISA) placed Indonesia below the OECD average in reading, mathematics, and science performance. These international comparative findings highlight persistent challenges in the quality of learning and the development of higher-order thinking skills among Indonesian students. Therefore, strategic innovations in learning leadership are essential to improve educational quality and prepare students to thrive in an

increasingly complex global environment [4].

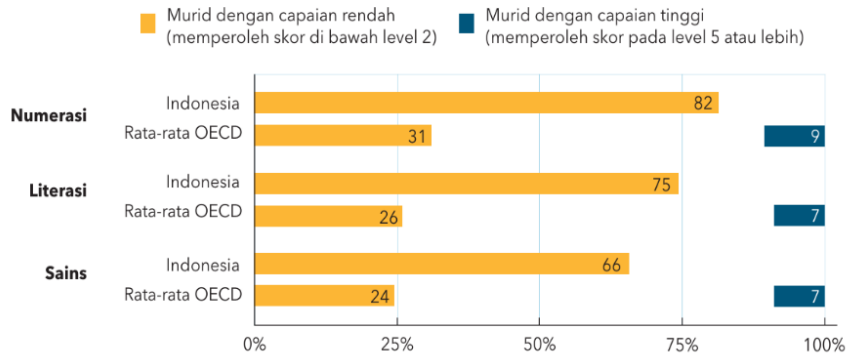

Fig. 1. Percentage of Students Reaching the Minimum Proficiency Level (Level 2 and Above) in PISA 2022 (Source: OECD, 2023)

Figure 1 illustrates the percentage of students achieving proficiency Level 2 or above in PISA 2022. Indonesia's performance remains below the OECD average, indicating persistent challenges in learning quality and the development of higher-order thinking skills. These findings underscore the importance of implementing innovative learning leadership and student-centered instructional approaches to improve educational outcomes. The PISA 2022 assessment revealed a substantial gap in Higher-Order Thinking Skills (HOTS) among Indonesian students. Only 18% of students attained at least Level 2 proficiency in mathematics, compared to 25% in reading and 34% in science. These results suggest that many students have not yet developed the minimum competencies required to effectively analyse information, reason critically, and solve authentic problems. Similarly, students' performance in creative thinking was relatively low, indicating challenges in generating innovative ideas and solutions. Such findings underscore the necessity of strengthening learning practices that promote critical and creative thinking as essential competencies for the 21st century [4]. These findings indicate that learning practices in elementary schools have not yet adequately fostered Higher-Order Thinking Skills (HOTS), which are crucial for success in the 21st century. Consequently, there is a pressing need for innovative educational approaches that provide meaningful learning experiences and encourage active student participation. Learning should move beyond the transmission of knowledge toward engaging students in authentic problem-solving, inquiry, collaboration, and reflection. In this regard, the integration of *deep learning* and the STEAM approach offers a promising framework for cultivating critical thinking, creativity, and lifelong learning skills among elementary school students.

In 2022, Indonesia introduced the *Merdeka Curriculum* as part of its educational reform efforts to enhance learning quality and student competencies. Subsequently, in 2025, the curriculum was strengthened through the adoption of a *deep learning* approach. This approach emphasizes meaningful, contextual, and participatory learning experiences aimed at developing Higher-Order Thinking Skills (HOTS) from an early age. Through deep learning, students are encouraged not only to acquire knowledge but also to analyse, evaluate, and apply their understanding in authentic contexts, thereby fostering critical thinking, problem-solving, creativity, and lifelong learning competencies [5]. These objectives can be achieved through the use of open-ended questions, meaningful discussions, and the exploration of authentic real-world problems. Such learning activities encourage students to actively construct knowledge, reflect on their understanding, and apply concepts in relevant contexts, thereby fostering critical thinking and deeper learning.

In 2025, the Indonesian government recommended the Science, Technology, Engineering, and Mathematics (STEM) approach as a strategic framework for improving educational quality in support of the Golden Indonesia 2045 vision. Furthermore, STEAM (Science, Technology, Engineering, Arts, and Mathematics) learning integrated with interactive media is widely regarded as an effective strategy for fostering critical thinking, creativity, and innovation from an early age. By combining interdisciplinary knowledge with engaging learning experiences, the STEAM approach encourages students to explore, create, solve problems, and develop the competencies needed to thrive in the 21st century [6], [7]. The integration of Arts into the STEM framework has led to the emergence of STEAM (Science, Technology, Engineering, Arts, and Mathematics), a more comprehensive approach that not only enhances logical thinking and problem-solving skills but also promotes creativity, innovation, and design thinking.

Consequently, STEAM is regarded as a more effective approach for fostering the holistic development of twenty-first-century competencies.
Contemporary challenges in Indonesian primary and secondary education extend beyond improving school management quality to ensuring the effective implementation of student-centered learning. Consequently, school principals are required to move beyond traditional administrative and managerial roles and adopt *learning leadership* practices that guide, support, and improve instructional quality. Research has demonstrated that effective learning leadership positively influences student achievement and facilitates the development of key 21st-century competencies, such as critical thinking, creativity, communication, and collaboration. Therefore, strengthening learning leadership is essential for creating meaningful learning experiences and enhancing students' readiness to face future educational and societal challenges [8], [9]. Hattie emphasized that meaningful and student-centered learning has a significant impact on students' academic achievement and the long-term development of learning capabilities. Such learning experiences enable students to actively engage in the construction of knowledge, deepen their understanding of concepts, and develop the cognitive skills necessary for lifelong learning. [10]. Furthermore, Hoskins and Fredriksson argued that the development of higher-order thinking skills should begin in primary education, as this stage represents a critical period for cultivating reflective thinking, problem-solving abilities, and deep learning. These competencies serve as essential foundations for students' future academic success and their ability to adapt to increasingly complex learning environments. [11]. Previous studies have demonstrated that learning leadership, deep learning approaches, and STEAM-based learning, when implemented separately, can improve the quality of learning and students' competencies. However, studies integrating learning leadership, deep learning principles, and the STEAM approach into a comprehensive model for elementary schools remain limited. Furthermore, few studies have developed a learning leadership model specifically designed to enhance elementary school students' critical thinking skills through the integration of deep learning and STEAM.
The novelty of this study lies in the development of a STEAM-based learning leadership model that integrates the principles of deep learning, namely meaningful, mindful, and joyful learning, into learning planning, implementation, reflection, evaluation, and the development of student-centered learning environments to improve elementary school students' critical thinking skills. This study is expected to contribute both theoretically and practically. Theoretically, it enriches the literature on STEAM-based learning leadership and deep learning. Practically, the proposed model can serve as a guideline for school principals and teachers in managing learning processes that are oriented toward the development of students' critical thinking skills. **This study aims to:** (1) analyse the need for STEM-based learning leadership in elementary schools; (2) develop a STEM-based learning leadership model for elementary schools; and (3) evaluate the practicality and effectiveness of the developed STEM-based learning leadership model in enhancing students' critical thinking skills.

Method

This study employed a **Research and Development (R&D)** approach using the ADDIE model [12], [13]. The research was conducted in accredited A-level public and private elementary schools in Kudus Regency, Indonesia. The data sources included school principals, teachers, and students. Data were collected through classroom observations, interviews, and questionnaires. The development process involved two learning experts and two STEM experts from Pendidikan Indonesia University as expert validators. Data were analyse using both quantitative and qualitative approaches.
The product developed in this study was a STEM-based learning leadership model for elementary schools. The ADDIE model proposed by Dick and Carey consists of five development stages: Analysis, Design, Development, Implementation, and Evaluation. During the analysis stage, needs and challenges related to STEM-based learning leadership were identified. The design stage focused on developing the components and framework of the model. The development stage involved expert validation and model revision. Subsequently, the implementation stage tested the model in selected schools, while the evaluation stage assessed the practicality, feasibility, and effectiveness of the model. The research procedure is illustrated in Figure 2.

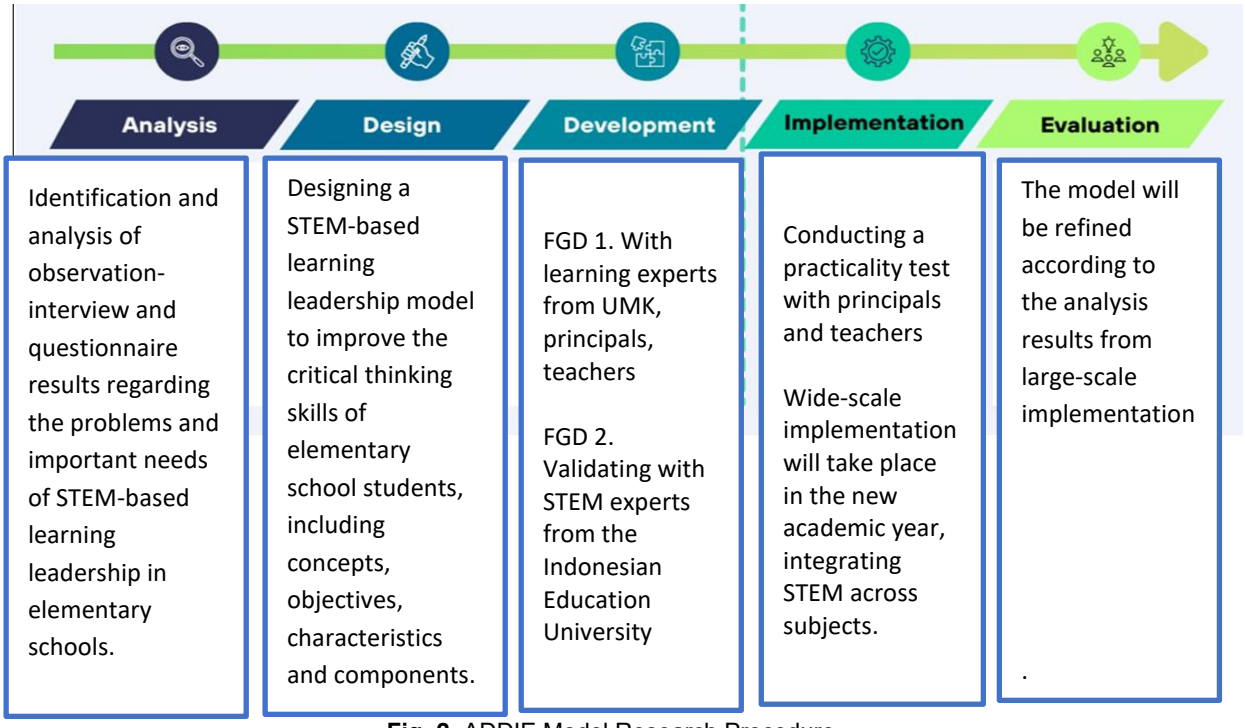

Fig. 2. ADDIE Model Research Procedure

Results

Analysis

Field observations indicate that many teachers have implemented the STEM approach but lack understanding. Interviews with teachers revealed that they are happy to implement the STEM approach, but it requires considerable preparation, infrastructure, and time. Furthermore, teachers must complete the material. A needs analysis involving 120 elementary school principals found that 67% experienced difficulties leading STEM integration in learning. Observation and interviews revealed that 72% of teachers had difficulty integrating STEM into deep learning.

The integration of Arts into the STEM framework has led to the emergence of STEAM (Science, Technology, Engineering, Arts, and Mathematics), which offers a more comprehensive and holistic learning experience [14]. The STEAM approach not only focuses on developing logical thinking, technological literacy, engineering design, and mathematical problem-solving skills, but also fosters creativity, imagination, aesthetics, and design thinking [15]. The inclusion of Arts enables students to connect knowledge across disciplines, generate innovative solutions, and express ideas in more meaningful ways. Previous studies have shown that STEAM-based learning can enhance critical thinking, creativity, collaboration, and problem-solving skills, which are essential competencies for the twenty-first century [16]. Furthermore, STEAM encourages students to engage in authentic, contextual, and interdisciplinary learning experiences, thereby supporting balanced cognitive, affective, and psychomotor development [17]. Therefore, STEAM is considered a more appropriate approach for fostering twenty-first-century competencies in a holistic manner and preparing students to face increasingly complex, dynamic, and technology-driven global challenges [18]. However, the successful implementation of STEAM in schools depends not only on teachers' competencies but also on the ability of school principals to exercise effective learning leadership that guides the planning, implementation, reflection, and evaluation of learning processes on an ongoing basis. Therefore, a STEAM-based learning leadership model is needed to support the implementation of deep learning and enhance elementary school students' critical thinking skills. Previous studies have shown that the integration of technology in learning supported by a sustainable pedagogical framework can enhance student engagement and improve the quality of the learning process [19]. The effective learning management through the use of interactive digital worksheets has been proven to significantly improve students' critical thinking skills and learning outcomes [20]. These findings indicate that innovative learning management and instructional leadership play an important role in creating meaningful learning experiences and fostering students' higher-order thinking skills.

Desain:

- A learning leadership model was developed by integrating the STEM approach.
- Learning leadership applies the management functions of planning, implementation, and evaluation.
- STEM-Based Learning Leadership integrates the principles of deep learning and STEM learning.
- Component 1. Leading the Development of a Student-Oriented Learning Environment.
- Component 2. Leading learning planning, starting with Identifying Problems and Potential, analysing Learning Outcomes (CP) and STEM integration across subjects, establishing STEM projects, and developing learning designs (learning objectives, assessments, activities, environment, and partnerships).
- Component 3. Leading learning implementation by applying the principles of deep learning: Meaningful, Joyful, and Mindful. The learning steps are: 1) Problem and potential analysis; 2) Investigation: designing a design or solution; 3) Testing and shared understanding; 4) Formative and summative assessment
- Component 4. Leading learning evaluation and reflection to determine the achievement of learning objectives and obstacles.
- Component 5, Leading STEM center as part of a learning community for professional development and improving the quality of student learning

Development. The model design was developed collaboratively with experts and practitioners through focus group discussions. Input was obtained for the following components:

1. Leading the development of the learning environment is initially included in the planning phase. It is best to lead efforts to develop a safe and comfortable environment for students before planning.
2. Management functions were removed.
3. Local phenomena should be given more attention to identifying problems and potential.
4. Implementation of STEM-based learning by implementing a project-based learning model elaborated on STEM learning principles.
5. Additionally, leading parent involvement as mentors and resources for STEM learning.

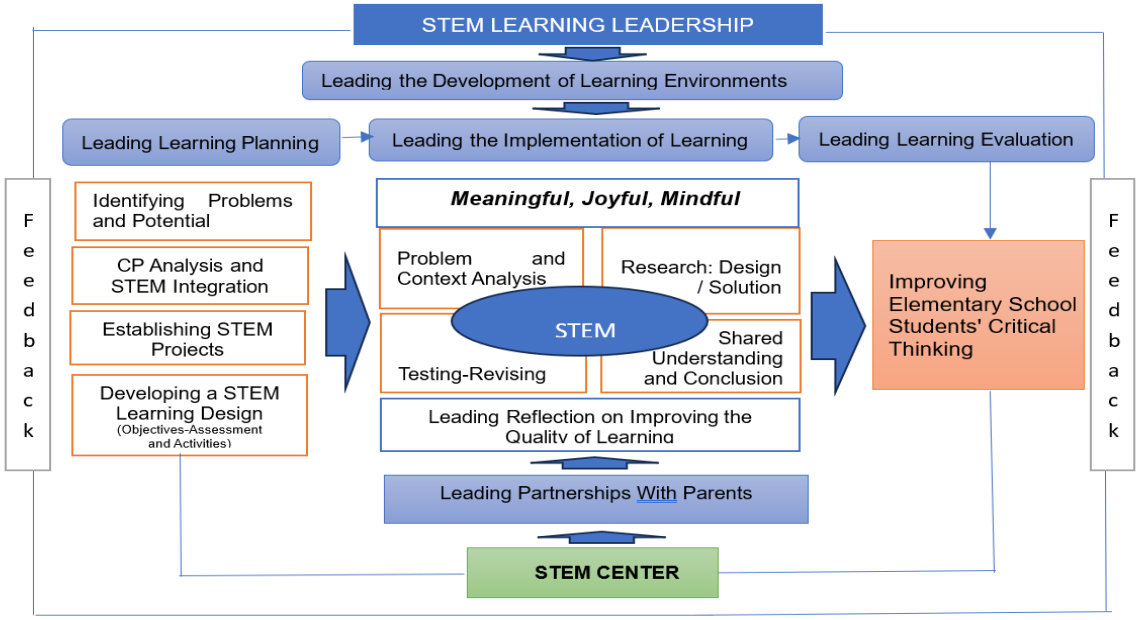

Fig. 3. Model Kepemimpinan Pembelajaran Berbasis STEM

The STEM-Based Learning Leadership Model developed in this study underwent several revisions based on expert validation and practitioner feedback. The final model consists of the following components and aspects:

1. Leading the Development of a Student-Centered Learning Environment
   School leaders are responsible for creating and fostering a learning environment that places students at the center of the learning process, encouraging active engagement, collaboration, and meaningful learning experiences.
2. Leading Learning Planning, which includes:
   a) Identifying School Characteristics, Problems, and Potentials. These three aspects provide a comprehensive understanding of the school context. The results of the identification process are analyzed and prioritized to determine the key challenges and potentials that need to be addressed and developed.
   b) Analyzing Learning Outcomes and Integrating STEM Components into Subject Content. This process ensures alignment between curriculum objectives, STEM components, and subject matter.
   c) Determining STEM Project Topics. Project topics are selected based on the results of the identification process and the analysis of learning outcomes.
   d) Designing STEM Learning. This stage involves establishing learning objectives, assessment strategies, and instructional procedures while incorporating scientific and engineering practices. Learning objectives are derived from the analysis of learning outcomes and selected projects. Assessment strategies are aligned with the intended learning objectives. The instructional design consists of four learning stages.
3. Leading Learning Implementation
   The implementation process integrates the principles of Deep Learning *Meaningful, Joyful, and Mindful Learning* with the core principles of STEM education, namely problem-solving, scientific and engineering practices, and interdisciplinary integration. Learning activities emphasize responsible and conscious problem-solving, focusing on authentic issues that are relevant and beneficial to the community in which students live. Scientific and engineering practices are conducted in a meaningful and enjoyable manner, enabling students to develop self-regulation and recognize the relevance of what they learn to everyday life. The learning process follows four stages:
   a) Analysis of problems and potentials
   b) Investigation and solution design
   c) Testing and revision; and
   d) Shared understanding and conclusion
4. Leading Reflection to Improve Learning Quality
   School leaders facilitate reflective practices among teachers and students to continuously improve the quality of teaching and learning processes.
5. Leading Parent Partnerships
   Parents are encouraged to participate directly as learning resources and mentors or indirectly by providing support for students' learning activities.
6. Leading the Evaluation of STEM Learning Programs
   School leaders evaluate STEM learning programs to determine their effectiveness in improving elementary school students' critical thinking skills. This evaluation can be conducted through the analysis of students' summative assessment results and other relevant performance indicators.
7. Establishing a School STEM Center
   A STEM Center is established within the school as a professional learning community that supports teacher professional development, collaboration, innovation, and the continuous improvement of student learning quality.

The developed STEM-Based Instructional Leadership Model is strengthened by six main, interrelated components. First, student-centered learning positions students as active agents in constructing their knowledge and learning experiences [21]. Second, the principle of deep learning comprising meaningful, mindful, and joyful learning aims to foster deep conceptual understanding that is reflective and meaningful [21]. Third, STEM learning characteristics emphasize problem-solving, scientific and engineering practices, and interdisciplinary integration to develop students' critical thinking and creativity skills [22]. Fourth, learning leadership plays a role in directing, facilitating, monitoring, and continuously evaluating the learning process to improve student learning quality [23]. Fifth, parental partnership provides support for the learning process both as a learning resource and as a companion in project-based activities, making learning more contextual. Sixth, the establishment of a STEM Center serves as a professional learning community that supports teacher collaboration, competency development, and the sustainability of instructional innovation in schools [24]. The integration of all these components forms a learning ecosystem that supports the implementation of STEM based on deep learning to enhance the critical thinking skills of elementary school students.

Implementation and Evaluation. The practicality test conducted by a panel of experts and practitioners indicated that the STEM-Based Learning Leadership Model was categorized as highly feasible, achieving an average feasibility score of 85.68%. This result suggests that the developed model possesses a high level of practicality, making it easy to understand and implement within elementary school settings. According to Nieveen, the quality of an educational model is determined by three main criteria: validity, practicality, and effectiveness [25]. During the implementation phase, the response from school principals as the primary users of the model reached 84.97%, which was categorized as very satisfactory. This high level of user satisfaction indicates that the model provides clear guidance for implementing STEM-based learning leadership practices. User acceptance is considered one of the key indicators of the successful implementation of an educational innovation [26]. The implementation results also revealed that learning leadership plays a significant role in improving the quality of the teaching and learning process. Effective learning leadership focuses on developing an academic vision, supporting teachers, and continuously monitoring instructional practices [27]. Within the developed model, school principal function as facilitators who support the implementation of STEM learning, thereby fostering a more innovative and student-center learning environment. The integration of STEM learning within the model supports the development of twenty-first-century skills, including critical thinking, creativity, collaboration, and problem-solving. Integrated STEM learning enables students to connect concepts from multiple disciplines to address real-world problems effectively [28]. Therefore, the developed model contributes not only to improving the quality of instruction but also to enhancing students' competencies required for future challenges. However, the model can still be further refined through strengthening teachers' STEM-related competencies, optimizing the role of the STEM Center, and enhancing partnerships with parents and the broader community. Continuous improvement is essential to ensure that educational innovations remain relevant to evolving school needs and societal changes[29].

Conclusion

A STEM-based learning leadership model is urgently needed in elementary schools. This model serves as a guide for leading learning management, adhering to the principles of deep learning and STEM learning. The STEM-based learning leadership model consists of seven components: Component 1) Leading the Development of a Student-Oriented Learning Environment; 2) Leading learning planning; 3) Leading learning implementation; 4) Leading reflection to improve the quality of learning; 5) Leading partnerships with parents; 6) Leading evaluation of STEM learning; 7) Leading STEM centers as part of a learning community for professional development and improving the quality of student learning. Each component has its own aspects.

Recommendation: The model can be implemented by principals or teachers and can be further developed for further research by integrating digital media such as robotics and AI.

Who Gets to Generate Knowledge: Co-creation of an "Open Educational Resources" Textbook

Yaprak Dalat Ward

Fort Hays State University, United States

Abstract

Open Educational Resources (OER) have become indispensable in higher education as mechanisms for improving access, availability concerns, rising costs, inequities embedded in commercial textbooks. While significant literature has documented OER adoption/adaptation as cost saving, less attention has been given to faculty-driven knowledge creation, underlying open textbook development. This case study documented the collaborative process of five faculty engaged in developing an OER textbook for graduate-level educational research students. Based on Nonaka and Takeuchi's SECI model of knowledge creation, the process involved faculty moving from shared tacit knowledge to explicit knowledge, creating an openly licensed textbook, through socialization, externalization, combination, and internalization. Multiple data sources included shared planning documents, draft chapters, and reflective notes generated throughout the process, and prolonged engagement. The initial data analysis yielded four interrelated themes: 1) shared dissatisfaction with commercial textbooks as an agent for collaboration; 2) negotiation of disciplinary and pedagogical assumptions; 3) emergence of collective pedagogical ownership; and 4) conceptualization of the open textbook as a living, revisable product of knowledge. The subsequent data analysis revealed the alignment of four themes with the SECI model of knowledge creation, demonstrating how faculty engaged in a sustained sense-making process and professional learning rather than discrete content production. To conclude, apart from providing students with a freely accessible open textbook, the study was consistent with the OER literature in that the process promoted curricular coherence, strengthened collective pedagogical ownership, and supported sustainable engagement with open pedagogy. The study suggests that OER development provides a scalable, low-risk entry point for faculty participation in open knowledge practices while cultivating institutional cultures of collaboration and equity.

Keywords: *Collaborative process; explicit knowledge; Open Educational Resources; tacit knowledge; SECI model*

1. Introduction

Rising commercial textbook costs continue to pose a significant barrier to student access and success in higher education, particularly for students from historically marginalized and economically vulnerable populations [1,2]. Open Educational Resources (OER), defined as teaching, learning, and research materials which reside in the public domain or are released under an open license, have emerged as a promising alternative addressing both cost and access concerns [3,4]. Research consistently demonstrates that OER adoption reduces financial barriers without diminishing learning outcomes [5–7]. Beyond cost savings, scholars argue that OER challenge traditional models of knowledge ownership by repositioning faculty and learners as contributors to shared knowledge ecosystems [8,9]. Despite this potential, most OER research emphasizes adoption/adaptation outcomes rather than the collaborative processes through which open educational content is created. Less attention has been given to the internal processes through which faculty collaboratively create open textbooks and how such processes shape professional learning, curriculum design, and shared ownership of knowledge. Addressing this gap was essential for understanding how OER initiatives could be sustained as scholarly and pedagogical practices rather than one-time reductions in cost.

The aim of this study was to deepen understanding of the collaborative process of open textbook development and to confirm previous findings. The collaboration focused on the social, relational, and epistemological dimensions of OER development which involved five faculty, situated within a graduate program in college of education. The vision was to respond to the gaps in learning objectives and pedagogical needs as well as release students from a financial burden. The research question which guided the study was: How do faculty collaboratively create an open textbook, and how can this process be understood through the SECI model of knowledge creation?

2. Literature Review

Open Educational Resources are described as educational materials that are freely accessible and openly licensed, permitting use, adaptation, and redistribution with limited restrictions [3]. Open licensing, most commonly through *Creative Commons*, enables what Wiley [4] describes as the 5R permissions: *retain*, *reuse*, *revise*, *remix*, and *redistribute*. These permissions distinguish OER from merely *free* resources by granting legal authority to adapt content for local contexts. A substantial body of literature documents the impact of OER on affordability and access. OER adoption has been associated with comparable or improved learning outcomes while easing the financial burden [5-7]. Studies show that high textbook costs influence enrollment decisions, persistence, and academic performance [1,10]. In addition, OER have been framed as a social justice intervention. Equity-oriented outcomes depend on who creates OER and how knowledge is negotiated during development. Lambert argues that openness must be understood not only in economic terms but also as a mechanism for redistributing *epistemic power* and *representation* [11]. Open pedagogy extends OER principles into teaching practices that emphasize collaboration, transparency, and participatory knowledge creation [12,13]. Practices such as renewable assignments and open publishing position faculty and students as co-creators rather than consumers of content [14].
While student co-creation has received significant attention, faculty-to-faculty collaborative knowledge creation remains underexamined. Although faculty awareness of OER is increasing, participation in OER creation remains limited due to time constraints, lack of incentives, and uncertainty around quality and sustainability [15,16]. Research which examines faculty-created OER highlights professional learning, shared ownership, and curricular coherence as key outcomes [17,18]. However, few studies offer a theoretical explanation of *how* faculty knowledge based on personal experience is transformed into shared, open curricular resources.

2.1 Theoretical Framework: SECI Model of Knowledge Creation

Nonaka and Takeuchi's SECI model of knowledge creation became the foundation of the OER co-creation as the process involved shared knowledge building and collaboration. The model illustrated the dynamic interaction between tacit and explicit knowledge by means of four iterative processes: **S**ocialization, **E**xternalization, **C**ombination, and **I**nternalization [19, 20]. The model has been applied widely in organizational learning and professional development contexts to explain how individual expertise becomes shared knowledge [20]. Recent research has extended the SECI model into educational settings, including collaborative curriculum design and creativity-focused learning environments [21,22]. The alignment between SECI and open pedagogy lies in their shared emphasis on interaction, reflection, and collective meaning-making. In this study, the SECI model served as an analytic lens for understanding the collaboration of creating an OER. Faculty's *tacit knowledge*, personal experience, observations, intuition, became the starting point of the collaborative process, and the end result was *explicit knowledge* which was documented, stored and shared knowledge. [19, 20].
The following diagram (Fig. 1.) illustrates the conceptual relationship among: Open Educational Resources; Open Pedagogy; and the SECI Model of Knowledge Creation.

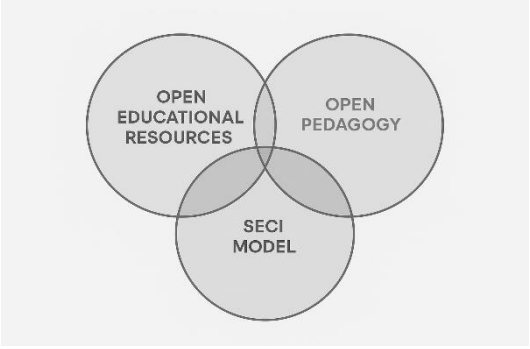

Fig. 1. Conceptual relationship among Open Educational Resources, Open Pedagogy, SECI Model

According to the conceptual relationship, the circle entitled *Open Educational Resources* represents the material and licensing foundation of openness which is the 5R permissions (retain, reuse, revise, remix, redistribute); and access, adaptability, and sustainability [4] which depends on OER adoption or OER creation. The *Open Pedagogy* circle represents the teaching and learning practices enabled by OER

which is collaborative knowledge and production; faculty and possibly, students as co-creators; renewable and participatory assignments. The SECI Model [19, 20], the third circle, demonstrates the theoretical framework, representing the knowledge creation process which explains how openness works in practice and is illustrated as four iterative processes: 1) *Socialization* (faculty sharing tacit knowledge); 2) *Externalization* (articulating ideas into chapters and outcomes); 3) *Combination* (integrating content into a coherent textbook); and 4) *Internalization* (using, teaching with, and revising the OER). Moreover, regarding the conceptual relationship, the center overlap represents the intersection of all three constructs symbolizing faculty-driven open textbook development as a knowledge-creation activity; a form of open pedagogical practice; and structural and legal OER permissions.

Building on OER, open pedagogy, and knowledge creation literature, this study aimed to contribute to a theoretically grounded examination of faculty-driven open textbook development. By applying the SECI model of knowledge creation [19, 20] to a collaborative OER project, the study focused on the social and epistemic dimensions of open knowledge production. In addition, the study demonstrated the understanding of how faculty collectively generate, structure, and internalize OER.

3. Methodology

Employing a case study design, the study explored a collaboration process within a bounded institutional context [23, 24]. The research question which guided the study was: How do faculty collaboratively create an open textbook, and how can this process be understood through the SECI model of knowledge creation? The collaboration process focused on the social, relational, and epistemological dimensions of OER development and involved five faculty members teaching graduate-level educational research courses. One of the faculty members, also the author, collected and analyzed the textual data related to the phenomenon which included shared planning documents, draft chapters, and reflective notes generated throughout the project and prolonged engagement. The linguistics and research background of the author allowed the completion of the thematic analysis. The *analytic memos* [25] kept during the analyses also helped further to strengthen the findings. The data were analyzed in two phases. The initial phase yielded four interrelated themes, consistent with OER research. The subsequent analysis involved interpreting the findings through the four phases of the SECI model to further understand the collaborative process. Findings were verified by *member checking.* Trustworthiness of the study was enhanced by *triangulation* based on multiple data sources [26, 27].

3.1 Data Analysis: Two Phases

The first phase of the data analysis, the initial analytic phase, employed an iterative thematic approach [28] by means of the *Key-word-in-context (KWIC) method* [29] to inductively identify related words/phrases across collected data which included shared planning documents, draft chapters, and reflective notes to remain grounded in faculty language and experiences. Following the identification of the related key words/phrases in the texts, the author manually coded the recurring concerns, points of negotiation, and moments of shared decision-making during the prolonged engagement of faculty collaboration and pedagogical sense-making. *Values coding* was selected since the data included the *interplay between/among thoughts, feelings and action* and made it possible to interpret the faculty *values, attitudes and beliefs* during the process [25]. *Analytic memos* [25] generated by the author throughout the analytic phases, further documented emerging interpretations, tensions, and shifts in understanding the themes [29]. Through constant comparison, codes were clustered into categories leading to broader themes which reflected patterns of collaboration. As a result, the open textbook development revealed four interrelated themes characterizing: 1) shared dissatisfaction with commercial textbooks as an agent for collaboration; 2) negotiation of disciplinary and pedagogical assumptions; 3) emergence of collective pedagogical ownership; and 4) conceptualization of the open textbook as a living, revisable knowledge artifact.

Following the initial analytic phase, the subsequent analytic phase involved contextualizing the four themes within the process of the SECI model of knowledge creation in order to examine how faculty moved between tacit and explicit knowledge during this open textbook development. A*nalytic memos* also helped link each theme to the corresponding SECI phase. This process was also completed manually by juxtaposing the key words in the themes to the description of the SECI model phases including socialization, externalization, combination, and internalization.

4. Findings

The development of an open textbook functioned as a collaborative knowledge-creation process rather than a linear authorship task. The five-faculty engaged in a collaborative process to transform tacit pedagogical expertise into explicit, openly licensed curricular knowledge through sustained interaction. The group did not simply divide writing tasks; rather, engaged in collective sense-making as they showed their tacit instructional knowledge, articulated shared assumptions about educational research, and iteratively refined their perspectives through dialogue and co-authorship. Consistent with the SECI model of knowledge creation, this process involved dynamic movement between tacit and explicit knowledge as faculty socialized professional experiences, externalized implicit understandings into curricular structures, combined individual contributions into a coherent open textbook, and internalized the resulting resource through classroom use and revision [21].

The codes and categories leading to the four interrelated themes emerged prior to mapping the SECI phases and were characterized as follows: 1) The first insight was that *faculty frustration* functioned as *productive tension* that initiated the collaboration. The *shared dissatisfaction* of faculty emerged from codes such as thoughts and feelings of *frustration*, *textbook misalignment*, *cost concerns*, *student confusion*, *teaching around the commercial textbook*. These codes led to theme one: *shared dissatisfaction as an agent for faculty collaboration*. 2) The second insight was that knowledge creation required surfacing of *implicit epistemological commitments*. Codes included *what counts as research*, *student needs*, *values of learning, methods hierarchy*, *curriculum disagreements.* These codes led to theme two: *Negotiation of disciplinary and pedagogical assumptions*. 3) The third insight was that authorship shifted from individual contribution to collective responsibility. Codes included key phrases such as *we language, shared outcomes, alignment across sections, and editing each other's work.* These codes led to theme three: *Emergence of collective pedagogical ownership*. 4) The fourth insight was that the textbook was understood as a process, not a finished product. Codes included: *future revisions, classroom feedback, adaptability, open licensing affordances, living materials*. These codes led to theme four: *Open textbook as a living, revisable knowledge artifact*.

To further explicate how these themes functioned as knowledge creation, the initial four findings were interpreted using the SECI model as part of the subsequent data analytics. The SECI framework provided an explanatory structure for understanding how the identified themes unfolded through cycles of *socialization*, *externalization*, *combination*, and *internalization*. This process highlighted how faculty collaboration process functioned as the primary mechanism through which open knowledge was generated, legitimized, and sustained [19]. The four themes aligned closely with the SECI model, and reflected how faculty engaged in sustained sense-making and professional learning rather than discrete content production as follows: 1) *Socialization: Sharing Tacit Pedagogical Knowledge*. The inductive theme, *shared dissatisfaction*, was visible during this phase. Faculty shared experiential knowledge regarding teaching challenges and disciplinary assumptions through dialogue and reflection. The project began with faculty conversations centered on *shared dissatisfaction* with the existing commercial textbooks. Through dialogue, participants exchanged tacit knowledge regarding individual teaching philosophies, recurring student difficulties, and implicit assumptions about graduate level educational research. These conversations established a shared problem space and created conditions for mutual trust and intellectual risk-taking. While the creation of content was a shared responsibility, the division of labor included a designated lead author/editor responsible for process monitoring. The lead editor acted as the *metacognitive anchor*, ensuring that individual chapters/sections remained aligned with the overarching learning objectives and the final synthesis met rigorous graduate-level standards. Moreover, during this phase, the group selected a user-friendly platform, *Pressbooks,* to create their digital book which allowed simultaneous editing and version control [30, 31]. 2) *Externalization: Articulating Implicit Understandings.* The *negotiations of assumptions* theme was visible in the *externalization* phase. Implicit understandings were articulated into learning outcomes, chapter structures, and pedagogical features through collaborative planning [20]. As discussions progressed, faculty began externalizing tacit insights into explicit forms, including learning objectives, organizing frameworks, and pedagogical features. Negotiating shared language required making underlying epistemological assumptions visible, thereby transforming personal teaching knowledge into collectively owned conceptual structures. 3) *Combination: Systematizing Explicit Knowledge*. The *collective ownership* theme was visible in this phase. Individual contributions were integrated into a coherent textbook structure aligned with program outcomes and supported by open publishing infrastructure [30]. Explicit contributions were integrated into a coherent textbook structure aligned with program outcomes. Following the draft textbook completion, faculty collaboratively refined chapter organization, standardized terminology, and incorporated reflective and applied learning features to support iterative

authorship, accessibility, open licensing. Finalized textbook was peer-reviewed by two external faculty. Once the textbook was approved and passed the review phase, it was added to the university scholarship repository to be accessed freely by students. 4) *Internalization: Teaching, Using, and Revising*. The *living textbook* theme was visible in this phase for faculty internalized the shared knowledge through classroom implementation, revision, and ongoing use [19]. The textbook also became freely available in the *Open Textbook Library* repository for adoption or adaptation by other institutions. Classroom use prompted further reflection and revision, allowing explicit knowledge embedded in the textbook to be reinternalized through instructional practice. This ongoing cycle reinforced shared pedagogical commitments and positioned the textbook as a living curricular resource rather than a static product.

5. Conclusion and Implications

This study examined faculty-driven OER textbook development through the lens of the SECI model of knowledge creation, foregrounding collaboration as the central mechanism through which open knowledge was generated. Rather than conceptualizing open textbook creation as a linear authorship task, the findings demonstrated that the process functioned as a dynamic cycle of collective inquiry in which faculty socialized tacit pedagogical expertise, externalized shared assumptions, combined explicit contributions into a coherent curricular resource, and internalized the resulting knowledge through teaching and iterative revision. These findings extend the existing OER literature by shifting analytic focus from adoption outcomes and cost savings to the *epistemic labor* of open textbook creation. While prior research has emphasized the economic and access-related benefits of OER [6-9], this study demonstrated that faculty-created OER textbooks also operate as sites of professional learning, curricular alignment, and shared meaning-making [30, 32]. In this sense, open textbook development aligns closely with principles of open pedagogy, not merely because of open licensing but because of the collaborative processes through which knowledge is negotiated and legitimized [12–15]. Applying the SECI model provides an explanatory framework for understanding how faculty expertise becomes institutional knowledge. The iterative movement between tacit and explicit knowledge observed in this study reflects findings from organizational learning research while extending them into the domain of higher education curriculum design [17-22]. Importantly, the SECI framework highlights that openness alone does not produce knowledge; rather, it is the structured interaction among participants that enables transformation of individual insight into shared, sustainable resources.

5.1 Implications for Students

Faculty-created open textbooks based on empiricism can eliminate certain barriers present for students which come with commercial textbooks. These freely available resources can provide access to materials, eliminate restricted availability, address rising textbook costs, and improve inequities. Eliminating such barriers can also affect retention, and serve as a marketing tool for recruitment.

5.2 Implications for Faculty, Researchers and Institutions

The findings also suggest that open textbook development can serve as a meaningful form of scholarly and pedagogical engagement. Collaborative OER creation offers opportunities for reflective practice, disciplinary dialogue, and alignment across multi-section courses; outcomes that are often difficult to achieve through isolated course design. Framing open textbook work as collective inquiry rather than content production may also lower perceived barriers to participation by emphasizing learning and shared ownership over technical expertise [22].
To conclude, faculty-created open textbooks [30, 32] represent more than alternatives to commercial content; these digital sources embody a reconfiguration of how academic knowledge is generated, shared, and sustained. By framing open textbook development through the SECI model, this study demonstrates that collaborative knowledge creation lies at the heart of open education practice. Supporting such processes may enable institutions to move beyond adoption toward more equitable, participatory, and sustainable cultures of openness in higher education.

6. Limitations and Future Directions

While this study focused on a single case within one institutional context, its purpose was analytic rather than generalizable in a statistical sense.

Future research could extend this work through comparative studies, longitudinal designs, or mixed-methods approaches examining learning outcomes alongside faculty experiences. Additional inquiry is also needed to explore how power, positionality, and institutional reward structures shape participation in open knowledge creation. Furthermore, future research might examine how SECI-informed collaboration unfolds across disciplinary contexts, includes students as knowledge co-creators, or evolves over multiple revision cycles of open textbooks.

From Engagement Trajectories to Targeted Support: An Intervention-Oriented Framework for Reducing Learning Gaps in MOOCs

Stefania Zourlidou[1], Rekha Agali Virupaksha[2]

[1,2]University of Koblenz, Institute for Web Science and Technologies (WeST), Germany

Abstract

Massive Open Online Courses (MOOCs) expand access to learning, but instructors and platforms often struggle to translate noisy and sparse engagement traces into timely support that is both pedagogically meaningful and feasible to deliver at scale. This paper proposes a three-stage, workload-aware intervention framework that bridges early-warning evidence in learner traces and course-level decision making. Stage 1 derives interpretable signals from engagement trajectories and assessment participation (e.g., inactivity accumulation, engagement variability, and assessment-to-content imbalance). Stage 2 maps these signals into risk archetypes using transparent, educator-auditable rules that resolve conflicting evidence and prioritize actionable explanations (e.g., early disengagers, deadline-driven cramming, irregular persistence, and assessment-dominant strategies). Stage 3 operationalizes archetypes under capacity constraints by selecting intervention policies that explicitly balance anticipated instructional value against available instructional resources, enabling graduated support (universal low-intensity supports plus budgeted, targeted higher-intensity supports when risk persists). We use the public HarvardX–MITx Person–Course Academic Year 2013 dataset as a motivating context and describe a filtered working sample of 338,223 person-course records from that release to illustrate the scale and structural sparsity of MOOC learner data, motivating budgeted, stage-specific interventions rather than blanket "at-risk" labeling. The contribution is a practitioner-oriented blueprint for designing interventions that remain faithful to evidence in learner traces while acknowledging the operational realities of large-scale online education.

Keywords: *MOOCs, learning gaps, engagement trajectories, targeted support, capacity-aware interventions*

1. Introduction

MOOCs have enabled wide participation in higher education and professional upskilling, but high dropout rates and persistent learning gaps remain common. In this paper, we use learning gaps broadly to mean emerging differences in learners' ability to sustain participation, access core course activities, and progress toward successful completion. Foundational MOOC studies documented substantial heterogeneity in how learners engage with course content and assessments, including early disengagement and irregular participation patterns [1,2]. More recent work has emphasized that early-course behavior can be predictive of later success or dropout risk [3,4]. In parallel, the learning analytics community has produced a rich set of methods for profiling learners and predicting outcomes using platform traces [5,6]. Despite these advances, the practical adoption barrier often lies in the step after prediction: translating analytics into timely, feasible, and pedagogically meaningful actions. Instructors and course teams need to decide (i) which engagement signals should trigger a response, (ii) what kind of support is appropriate for a given behavioral pattern, and (iii) how to prioritize interventions under limited capacity. To address this gap, we reframe early warning as an intervention design problem and contribute an intervention-oriented framework that converts interpretable engagement-trajectory signals into actionable support policies. The framework builds on our prior empirical work, which identified these signals through hybrid-weighted clustering and anomaly analysis on the same MOOC release. This paper does not evaluate predictive accuracy or intervention effects. Instead, it presents a rule-based framework for translating learner-trace evidence into feasible support decisions.

The paper makes three contributions: (1) a compact set of trajectory signals intended for intervention triggering (Table 1), (2) an interpretable set of risk archetypes and a corresponding intervention playbook (Table 3), and (3) a workload-aware evaluation perspective that accounts for the number of learners targeted each week (Table 4). Figure 1 summarises the overall pipeline. The intended audience is course teams and platform operators who already have access to learning analytics dashboards but

lack a structured way of converting their outputs into bounded, repeatable instructional actions. We therefore prioritise interpretability, low implementation cost, and the ability for an instructor to inspect why a particular learner was flagged. Throughout the paper, the HarvardX-MITx Person-Course dataset serves as descriptive context for the scale and sparsity challenges of MOOC support. It is not used as an evaluation benchmark, because our contribution is a design framework, not a predictive model.

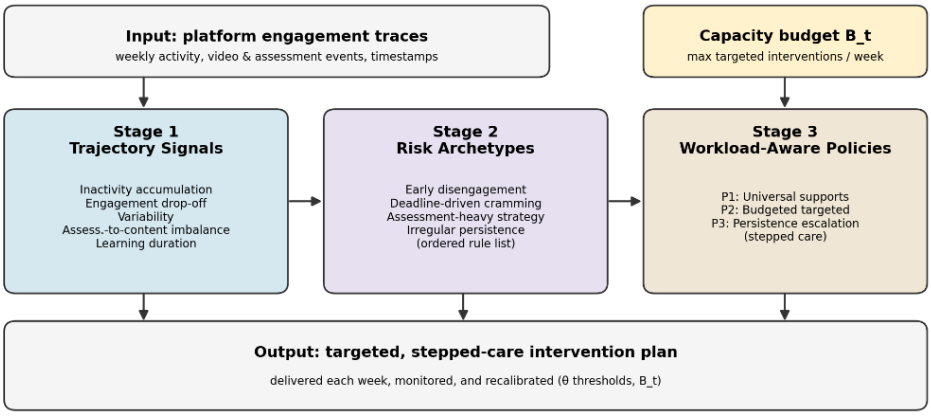

Fig. 1. Three-stage intervention-oriented framework. Engagement traces feed Stage 1 signal extraction, Stage 2 maps signals to interpretable risk archetypes, Stage 3 selects graduated-support policies under a weekly capacity budget B_t.

2. Related Work

Early MOOC research highlighted engagement diversity and the need to interpret learner behavior beyond completion rates [1,2]. Broader reviews of MOOC research also show that engagement, retention, learner motivation, and course design remain recurring concerns across the field [7]. Work on engagement subpopulations introduced typologies that distinguish disengaged, auditing, and completing behaviors [2], while dropout prediction studies established that early-week traces can provide useful signals for risk detection [4,8]. Beyond dropout, performance prediction and certification prediction have been explored using prior knowledge, activity traces, temporal features, and interpretable feature sets [3,9]. However, there is a well-known gap between analytics outputs and actionable instructional decisions. Surveys of educational data mining and learning analytics emphasize the importance of aligning models with educational objectives and interpretability requirements [5,6]. Recent systematic reviews also summarize the multi-factor nature of MOOC engagement and dropout, pointing to the importance of contextual and motivational explanations [10]. Motivations and challenges reported by learners and instructors further suggest that interventions should support pacing and reduce friction during critical attrition windows [11].

This paper builds on that line of work by organizing engagement-trajectory evidence into a framework that is explicitly optimized for intervention decisions. Our emphasis is on (i) interpretability of signals and (ii) operational feasibility of responses at MOOC scale. It also builds directly on our prior empirical work on MOOC learning-gap detection [12]. That work examined hybrid-weighted K-Means, OPTICS, and Local Outlier Factor on the HarvardX-MITx Person-Course release, identified engagement signals, such as quiz-to-video ratio, inactive weeks, engagement variability, and engagement slope, that separate learners into clusters with distinct underperformance rates, and analysed clustering failure modes that produce technically valid but outcome-flat partitions. The present paper extends that empirical line of work by translating the previously identified engagement signals into an educator-auditable, workload-aware intervention framework. It serves as the design-and-deployment counterpart to the earlier learner-segmentation analysis.

3. An Intervention-Oriented Framework

The framework proceeds in three stages: (1) compute interpretable trajectory signals, (2) map signal combinations to intervention-ready risk archetypes, and (3) select interventions using workload-aware policies. The framework is designed so that each stage can be implemented by course teams without specialized machine learning infrastructure.

3.1 Stage 1: Trajectory Signal Extraction

Instead of relying solely on aggregate activity counts, we focus on trajectory signals that capture engagement shape over time. Temporal analyses of MOOC study patterns have shown that the timing and regularity of activity can differentiate meaningful behaviors even when total engagement volume is similar [13]. Table 1 lists the proposed signal set.

Table 1. Intervention-oriented engagement trajectory signals.

Signal	Operational definition (example)	Intervention rationale
Inactivity accumulation	Count of course weeks with no recorded events up to week t	Directly indicates disengagement windows, commonly predictive early in a course [4,8].
Engagement drop-off	Ratio of mean engagement in recent weeks vs. initial weeks (e.g., weeks 1-2)	Detects loss of momentum after initial onboarding, supports timely re-engagement prompts [2,11].
Engagement variability	Dispersion of weekly engagement (e.g., standard deviation over weeks 1..t)	High variability can indicate unstable study routines or deadline-driven activity, requiring pacing scaffolds [13,14].
Assessment-to-content imbalance	Smoothed quiz-to-video ratio or related proxy of assessment-first strategies	Flags potentially shallow strategies and test-taking behavior, suggests adaptive review or concept-check follow-up [9,15].
Learning duration	Time span between first and last recorded activity (within the course window)	Supports distinguishing early dropouts from late disengagers, informs when interventions may still help [1,10].

3.2 Stage 2: Risk Archetypes

Stage 2 translates the signal set from Stage 1 into a small number of intervention-ready risk archetypes. The aim is not to discover clusters, but to produce labels that are (i) interpretable, (ii) stable enough for operational use, and (iii) directly connected to a plausible instructional response. Each archetype specifies: (1) a signal pattern (expressed as simple conditions on Table 1 signals), (2) a likely barrier or learning-gap mechanism, and (3) a recommended first-line action from the intervention playbook (Table 3). Archetypes are therefore designed as interpretable support categories rather than statistical groupings.

Rule template. Let S(t) be the vector of signals from Table 1 computed up to week t for a learner. An archetype a is defined by a Boolean rule f_a(S(t)) that returns TRUE when the observed early trajectory matches the archetype pattern. If no rule fires, the learner remains unassigned and receives only universal low-intensity supports (Stage 3, Policy P1).

Conflict resolution and decision order. Multiple rules may fire simultaneously (e.g., a learner can be both highly variable and also show a strong drop-off). To ensure a single actionable label, we apply an ordered decision list that prioritizes conditions that suggest imminent disengagement and require earlier intervention. A practical default order is: (1) Early Disengagement, (2) Deadline-Driven Cramming, (3) Assessment-Dominant Strategy, and (4) Irregular Persistence.

Example ordered rules (course-calibrated thresholds θ are set from early-course distributions): (1) Early Disengagement if inactivity accumulation ≥ θ_inactive OR drop-off ratio ≤ θ_drop, (2) Deadline-Driven Cramming if engagement variability ≥ θ_var AND a late surge indicator is TRUE, (3) Assessment-Dominant Strategy if assessment-to-content imbalance ≥ θ_imbalance (assessment-dominant), (4) Irregular Persistence if engagement variability ≥ θ_var but without sustained decline, otherwise Unassigned.

These archetypes are intentionally coarse. Their purpose is to provide educators with an auditable explanation and a clear first step, not a definitive diagnosis. In deployment, thresholds and rule order can be tuned to course context, and archetype definitions can be validated by monitoring whether the corresponding interventions reduce subsequent risk signals.

3.3 Stage 3: Workload-Aware Intervention Policies

Stage 3 turns archetype labels into workload-aware intervention decisions. The key inputs are (i) the set of learners flagged at week t, (ii) the intensity and timing of available interventions, and (iii) an explicit capacity budget B_t, defined as the maximum number of targeted interventions that can be delivered in that week without overwhelming learners or staff. Budgeting is central in large-scale courses because even low-cost actions can scale to thousands of messages, and excessive targeting can reduce trust and increase opt-outs. We therefore recommend a graduated-support approach that starts with universal, low-intensity supports and escalates to higher-intensity, targeted supports only when risk persists and budget allows.

Policy families. We recommend three deployable policy types: (P1) Universal supports (e.g., pacing reminders and 'start-here' prompts) delivered to all learners, (P2) Budgeted targeted supports delivered only to the top-ranked flagged learners up to B_t (e.g., structured catch-up pathways, adaptive review prompts, or tailored remediation links matched to the archetype), and (P3) Persistence-based escalation, where learners flagged for consecutive weeks move to a higher-intensity targeted tier while one-time flags receive only P1 or light P2.

Prioritization within a budget can be implemented with a simple priority score derived from Table 1 signals (e.g., combining inactivity, drop-off ratio, and variability) and selecting the highest-scoring learners until the weekly budget is exhausted. A lightweight monitoring loop (delivery counts, opt-outs, and subsequent engagement shifts) supports recalibration of θ thresholds and B_t over time.

3.4 Deployment Considerations

The framework is intentionally designed to be implemented on top of an existing learning analytics dashboard, not as a standalone system. A minimal deployment requires three artefacts: (i) a weekly batch job that computes the Table 1 signals from platform logs, (ii) a small rule file expressing the ordered Stage 2 archetype list and the current threshold values θ, and (iii) a delivery layer that can dispatch templated messages or surface in-course banners under the Stage 3 policies P1-P3. None of these components requires model training, GPU infrastructure, or feature engineering beyond the aggregates that most MOOC platforms already expose.

In practice we recommend that course teams begin with a pilot deployment without learner-facing messages, in which signals and archetype labels are computed and logged each week. After two to three weeks of pilot data, instructors can inspect the distribution of triggered archetypes, sanity-check a small random sample of flagged learner trajectories, and tune θ and B_t before activating P1 supports. This staged roll-out is also the natural time to confirm that the rule order in Stage 2 reflects the course's pedagogical priorities, since the same signal pattern can plausibly justify more than one first-line action depending on the discipline.

4. Data Context and Implementation Requirements

We use the public HarvardX-MITx Person-Course Academic Year 2013 dataset, a de-identified dataset of learner-course records from HarvardX and MITx offerings on edX, covering Fall 2012 to Summer 2013 across 16 courses [16]. Prior analyses using this de-identified release report 641,138 person-course observations from 476,532 unique learners after aggregation [17]. For the descriptive scale-and-sparsity context used in this paper, we draw on a 338,223-record analytic subset derived from this release in our prior work [12], restricted to five selected MOOCs (CS50x, CB22x, ER22x, PH207x, and PH278x) and obtained after the study's preprocessing pipeline (exclusion of internally inconsistent records flagged in the release, zero-imputation of structural non-engagement, and removal of records not meeting the analytic inclusion criteria). Within that subset, temporal trajectory analyses focused on a single 21-week course to avoid cross-course differences in calendar length, pacing, assessment cadence, and instructional design. Because the public file contains aggregate counts and does not provide per-event timestamps, weekly activity was approximated by distributing each learner's total events across their active weeks, and computationally expensive analyses, such as DBSCAN with DTW distances, were applied to a subsample [12]. The subset is used here only as descriptive context for the scale and sparsity challenges of MOOC support design, not as a benchmark for evaluating predictive performance or intervention effects.

Initial inspection of the working sample highlights substantial structural sparsity: in our prior analysis of this subset, 90.16% of learners exhibited no recorded video interactions and 62.04% showed no activity in key course events such as problem sets and chapter interactions [12]. This matters operationally

because trace-based support rules can only act on learners for whom some behavioural evidence is available.

Table 2. Dataset context and descriptive indicators used to motivate workload-aware intervention budgeting.

Characteristic	Value	Notes
Dataset	HarvardX–MITx Person–Course Academic Year 2013	Public de-identified person–course release
Public release	641,138	Person-course observations across 476,532 learners, Fall 2012-Summer 2013
Working sample	338,223	Filtered subset used for the descriptive budgeting context in this paper
Video interactions	Substantial sparsity in video-event traces (90.16% of learners with no video interactions in prior analysis [12])	Illustrates uneven content-view traces in large MOOC data
Assessed components	Substantial sparsity in assessed-component traces (62.04% of learners with no activity in key course events [12])	Early assessed-event traces may be absent for many learners

The signals in Table 1 require timestamped or week-level platform logs in deployment (e.g., weekly activity counts, video and assessment events, and timestamps of first/last activity). The public person–course release is therefore used here to contextualize scale and structural sparsity, not to estimate all week-level trajectory features directly. These descriptive indicators are not used as performance results as they provide operational motivation for Stage 3 budgeting by quantifying how many learners may lack actionable trace evidence early in a course.

5. Intervention Playbook

Table 3 presents a practical playbook that maps archetypes to scalable interventions. The interventions are designed to be platform-feasible and to support learners during known attrition windows, particularly the early weeks of a MOOC [4,11].

Table 3. Risk archetypes and a scalable intervention playbook.

Archetype	Signal pattern (example)	Likely barrier	Scalable intervention
Early disengagement	Inactivity accumulation rises by week 2-3, engagement drop-off < 1	Onboarding friction, low self-efficacy, unclear expectations	Week-2 re-engagement nudge, ‘start-here’ guide, short diagnostic quiz with feedback, optional catch-up path
Deadline-driven cramming	High engagement variability with late spikes, drop-off after deadlines	Time management issues, reliance on last-minute study	Pacing scaffold: weekly plan and reminders, chunked deadlines, ‘two-step’ practice (preview then quiz)
Assessment-dominant strategy	High assessment-to-content imbalance (quiz-to-video ratio high)	Superficial engagement, test-taking without conceptual grounding	Adaptive review prompts after each quiz, short concept-check quizzes, concept-check items with explanations

Archetype	Signal pattern (example)	Likely barrier	Scalable intervention
Irregular persistence	Moderate engagement but high variability without sustained decline	Competing commitments, unstable routines	Routine-building nudges, flexible pacing options, goal-setting prompts, social participation suggestions

6. Workload-Aware Targeting and Evaluation

A common failure mode in practice is to deploy an early-warning rule that flags an impractically large fraction of learners, leading to interventions that are too diffuse to be meaningful. We propose evaluating intervention policies along three dimensions (Table 4): (i) lead time, (ii) targeting quality, and (iii) intervention workload.

Table 4. Workload-aware evaluation dimensions for intervention policies.

Evaluation dimension	What to measure	Why to measure
Lead time	Earliest week where a stable signal triggers (e.g., week 2 vs. week 5)	Earlier targeting enables low-cost supports before disengagement hardens [4,8].
Targeting quality	Association between triggers and later underperformance or disengagement	Ensures interventions focus on learners likely to benefit, aligning analytics with educational objectives [6,9].
Intervention workload	Proportion and count of learners triggered per week, intervention type cost	Supports feasible deployment, avoids overwhelming staff or learners, enables capacity planning.

Instructors can implement workload-aware targeting using simple budget rules (e.g., intervene on the top 10% highest-risk eligible learners each week) or graduated-support strategies (e.g., universal low-cost nudges plus targeted higher-cost supports). To make the budget intuition concrete, consider an illustrative course scenario with 30,000 enrollees. If 10% of enrollees (3,000 learners) generate sufficient early-week traces to be eligible for trajectory-based flagging, then a P2 budget of 5% of this eligible subset corresponds to 150 targeted contacts in a given week.

As a further illustration, suppose $\theta_inactive$ is calibrated so that the Early Disengagement rule fires on the top quartile of this eligible subset. Roughly 750 learners would then be candidates for P2 supports in week 2. Setting $B_t = 150$ would therefore force an explicit prioritisation step, with the remaining candidates routed to P1 universal messaging until the following week, when persistence-based escalation is re-evaluated. This kind of simple calculation is intended as a planning illustration, not an empirical performance result, and shows how analytics outputs can be translated into a delivery plan that an instructional team can execute.

7. Discussion

The framework reframes learner analytics outputs as intervention inputs. The approach supports educator trust and practical deployment by emphasizing trajectory shape signals and interpretable archetypes. The archetypes align with established observations of MOOC engagement patterns, including early disengagers and irregular participants [2,13]. Compared with prior work, our contribution is prescriptive and not descriptive. Earlier MOOC typologies [2] characterise how learners behave but stop short of mapping behaviours to instructional responses, while dropout-prediction models [4,8] estimate risk but rarely specify what to do once a learner is flagged. Our framework occupies the intermediate layer: it converts interpretable signals into a small set of support categories, each carrying a default action, constrained by an explicit workload budget so that the prescription is both pedagogically reasonable and operationally deliverable.

A deployment trial should track the three dimensions in Table 4 across at least one full course offering, examining whether the framework yields (i) earlier P1 universal supports than baseline instructor-driven interventions, (ii) improved or stable week-over-week engagement among learners receiving escalated P2/P3 support relative to a matched comparison group, and (iii) a weekly intervention workload within

the configured B_t budget. Degradation on any dimension should trigger threshold and rule-order recalibration rather than abandonment of the framework.
From a 'future of education' perspective, the primary value lies in scalable personalization: capacity-aware evaluation helps institutions plan support offerings across large cohorts and the same signal-archetype-policy pipeline can be transferred to university LMS courses, bootcamps, and corporate training where instructional capacity similarly constrains support delivery. A further implication concerns the role of the instructor. By exposing thresholds, rule order, and budgets as explicit operational parameters, the framework deliberately keeps a human in the loop: instructors can override archetype assignments, change priority order, or suspend Stage 3 escalation around exam weeks. We see this transparency as a precondition for responsible adoption in publicly funded courses, where learners and regulators may legitimately ask why a particular support was offered.

8. Limitations And Ethical Considerations

Several limitations should be considered before deployment. First, engagement traces are imperfect proxies for learning and may miss off-platform study, peer discussion, or use of external materials. Archetype labels should therefore be treated as conversation starters with learners, not as diagnoses. Second, signal thresholds θ are course-dependent and assume that early-course distributions are stable enough to calibrate against. In courses with very small early enrolment or highly skewed cohorts, calibration may be unreliable, and instructor review is essential before rule activation. Third, the framework itself has not yet been validated experimentally. We propose archetypes and a playbook on the basis of prior literature and dataset descriptive evidence, but we do not show that the resulting interventions improve learning outcomes. A field trial measuring learning gains, retention, and learner experience under different intervention budgets is the natural next step. Fourth, interventions can have unintended consequences. Excessive nudging may produce notification fatigue, opt-outs, or stigma effects, particularly when learners infer that they have been singled out as 'at risk'. Graduated-support escalation and explicit learner-facing explanations are intended to mitigate these effects but do not eliminate them. Fifth, the public HarvardX-MITx Person-Course release reflects MOOC behaviour from the 2012-2013 academic year. Modern platforms (current Coursera, edX, FutureLearn) differ in structure, mobile-first interaction, and learner demographics, so transferability of specific thresholds should not be assumed without recalibration. Sixth, privacy and transparency are essential when learner data drive personalised messaging. Deployments should follow responsible data practices [18], including clear opt-out mechanisms and learner-facing explanations of why support was offered. Relatedly, although prior empirical work [12] included demographic variables (e.g. age, gender, education) for explanatory analysis, the intervention rules proposed here should rely on behavioural engagement signals rather than protected or sensitive learner attributes unless their use is explicitly justified, audited, and ethically approved.

9. Conclusion and Future Work

This paper presented an intervention-oriented framework that maps interpretable engagement-trajectory signals into actionable, scalable support strategies for MOOCs. By combining a compact signal set (Table 1), intervention-ready archetypes (Table 3), and workload-aware evaluation (Table 4), the framework offers a practical bridge between learning analytics and course design decisions. The framework is intended as a design and implementation aid, not as an intervention-effectiveness study, and its next step is empirical validation through field deployment.
Several extensions follow naturally. The most important is empirical validation through a controlled or quasi-experimental field study in which Stage 3 policies are activated in one course offering and compared against an instructor-driven baseline along the dimensions in Table 4. A second extension is to broaden the rule library beyond the four archetypes described here for project-based, group-assessed, or self-paced certification tracks where engagement rhythms differ from cohort-based MOOCs. A third is to integrate the framework with adaptive content systems so Stage 3 actions can include lightweight content adjustments such as alternate pathways or scaffolded retrieval-practice items. On the methodological side, future work should investigate principled ways of setting and updating the thresholds θ and the weekly budget B_t, for example by treating threshold calibration as a constrained optimisation problem where the objective is week-level intervention precision under a hard cap on instructional cost. Rule order may also need to shift across the course timeline, and learner-facing transparency mechanisms should be designed and tested as part of the intervention bundle from the start, instead of being added only after deployment.

AI-Powered Chatbot Assessments in Online Anatomy & Physiology: An Exploratory Mixed-Methods Pilot Study

Jaime Cantú

Austin Community College, United States

Abstract

As online health sciences education expands, concerns continue regarding whether traditional exam-based assessments adequately capture applied understanding, communication skills, and clinical reasoning. This exploratory mixed-methods pilot study examined the use of AI-powered chatbot assessments as an alternative to traditional high-stakes exams in two fully online Anatomy and Physiology I course sections at a community college. The sections followed identical learning objectives and instructional designs but differed in lecture assessment format: one used traditional proctored exams, while the other used structured, proctored AI chatbot conversations simulating virtual patient interactions. Quantitative survey data collected at multiple points examined student confidence, perceived learning, fairness, and assessment-related anxiety, while qualitative open-ended responses explored students' experiences with explanation, application, communication, and engagement. Because survey-response counts were small and unequal and responses were not longitudinally matched, quantitative findings were treated only as descriptive context. Qualitative responses from the AI-supported section emphasized explaining concepts in students' own words, applying anatomical and physiological knowledge, communicating in patient-friendly language, and, for some respondents, experiencing the format as less anxiety-provoking. Students also described challenges associated with learning how to interact effectively with the chatbot. These themes are consistent with constructivist learning theory and cognitive load theory and suggest that conversational AI assessments warrant further investigation as a way to capture forms of applied understanding not easily measured through traditional exams. The findings are preliminary and hypothesis-generating rather than evidence of comparative effectiveness. This study contributes preliminary classroom-based evidence to ongoing discussions about the ethical, equitable, and pedagogically sound integration of AI into online assessments.

Keywords: *artificial intelligence, assessment, anatomy and physiology, online learning, mixed methods*

Introduction

Assessment practices in higher education, particularly in foundational and gateway health science courses, have continued to rely heavily on traditional measures of student learning even as instructional delivery models and student demographics have shifted significantly [1,2,3]. Traditional assessments, such as multiple-choice and essay-based exams, have been criticized for prioritizing memorization over application and for inadequately measuring clinical reasoning and communication skills [4,5]. These limitations are especially noticeable in Anatomy and Physiology (A&P), a foundational course for many health science pathways where student success is connected to later academic and clinical preparation [6]. In A&P, students must not only understand complex biological systems but also explain and apply that knowledge in patient-centered contexts.

Recent advances in generative artificial intelligence (AI) offer new opportunities to rethink assessment design. AI-powered chatbot assessments allow students to engage in structured dialogue, justify reasoning, and translate technical language into accessible explanations. Prior research has shown that AI-driven learning environments can enhance engagement, personalize instruction, and improve knowledge retention [7,8]. In medical education specifically, AI-supported tools have been identified as having the potential to support clinical reasoning, diagnostic decision-making, intelligent tutoring, and feedback in physician training [9]. However, empirical research examining AI as a **direct assessment mechanism**, rather than as tutoring or practice, remains limited, particularly in introductory A&P courses.

This article presents an exploratory mixed-methods pilot study examining the feasibility and perceived value of AI-powered chatbot assessments as an alternative assessment format in a fully online A&P I course.

Course Context and Assessment Design

The study was conducted across two fully online BIOL 2401 sections taught by the same instructor at Austin Community College in Austin, Texas, USA. Both sections followed identical learning objectives, pacing, laboratory experiences, grading thresholds, and academic integrity measures. Students completed weekly laboratory assignments, chapter-based quizzes, and extensive student-created video presentations requiring explanation, synthesis, and analogy-based reasoning.
The primary difference between sections was the **lecture assessment format**. In the traditional section, students completed proctored, time-restricted midterm and final exams. In the AI section, these exams were replaced with structured, proctored, time-restricted AI chatbot conversations. During these conversations, students led a dialogue with a virtual patient, explained anatomical and physiological concepts using correct terminology, and then reframed their explanations in patient-friendly language. The chatbot prompted clarification and elaboration but did not provide answers, aligning assessment with applied competency rather than recall.
This design reflects prior research emphasizing explanation-centered assessment, adaptive feedback, and instructional approaches intended to manage extraneous cognitive load and support deeper learning [10,11,12].

Methodology

An exploratory convergent mixed-methods pilot design was used, integrating quantitative survey data with qualitative open-ended responses. Participants were drawn from a convenience sample of students enrolled in two existing sections of Anatomy and Physiology. Students were not randomly assigned to the AI-supported or traditional assessment section; rather, they registered for sections through the institution's normal enrollment process. The AI-supported section was identified in the course schedule as using AI as a main assessment tool, while the traditional section included the same general online course expectations but did not include that AI assessment statement.
Each section began with 24 enrolled students. By the end of the semester, enrollment was 16 students in the AI-supported section and 19 students in the traditional section.
The study was reviewed and approved by the Austin Community College Institutional Research Review Committee in August 2025. Participation in the research component was voluntary and separate from completion of required course assessments. Electronic informed consent was obtained before research data were collected. A designated faculty liaison who was not affiliated with the course managed the consent process and withdrawal requests, and the instructor-researcher remained blinded to participant identities until final course grades had been submitted. Only de-identified data from students who provided consent were included in the analysis.
Four surveys were administered:

- Pre-assessment survey (combined sections; $n = 15$)
- End-of-course survey, AI section ($n = 8$)
- End-of-course survey, traditional section ($n = 4$)
- Post-assessment survey (combined sections; $n = 11$)

Quantitative items used Likert-scale measures to assess confidence, anxiety, perceived fairness, and alignment between assessments and learning. Qualitative items invited students to reflect on what they found easy or difficult and how assessments influenced their understanding.
Because the course was intensive in pace and workload, student participation varied across the semester. Some students completed surveys at the beginning and end of the course but did not participate at every data-collection point, while others completed only selected instruments. Consequently, response counts differed across surveys. Each survey instrument was analyzed separately, and the samples were not treated as longitudinally matched. No claims of individual change over time were made from comparisons among the surveys.

Data Analysis

Quantitative Likert-scale items were summarized descriptively at the survey-instrument level. Item means were retained to provide a transparent summary of the observed responses, but no inferential tests, effect estimates, or statistical comparisons were conducted. Because Likert items are ordinal and the response counts were small, unequal, and not longitudinally matched, the reported means were treated only as secondary contextual information. They were not interpreted as evidence of individual growth, population-level effects, or comparative effectiveness between assessment formats.

Open-ended responses were analyzed using an inductive qualitative content-analysis approach. The instructor-researcher read the de-identified responses multiple times and assigned initial descriptive codes to statements concerning memorization, explanation, application, assessment anxiety, communication, and interaction with AI. Related codes were then grouped into broader categories and reviewed against the original responses. These categories were refined into recurring themes that organized the qualitative findings. Representative quotations were selected because they clearly illustrated each theme rather than because they were assumed to represent all participants. Because the analysis was conducted by one researcher, no interrater reliability statistic was calculated, and the possibility of researcher interpretation bias is acknowledged as a limitation. Accordingly, the qualitative findings serve as the primary basis for interpretation, while the quantitative results provide limited descriptive context.

Results

Appendix Tables 1–3 provide a structured overview of the four survey instruments used in this study, including each instrument's timing, participant group, sample size, analytic purpose, selected qualitative excerpts, and descriptive quantitative findings. Because the surveys were administered at different points in the course and were not identical across all instruments, the tables are used to organize the findings rather than to suggest direct statistical comparison across groups. Table 1 outlines the purpose of each survey, Table 2 presents representative de-identified student responses, and Table 3 summarizes selected Likert-scale means related to confidence, explanation, application, anxiety or stress, and assessment fairness. The following sections discuss the quantitative and qualitative findings separately while drawing on these appendix tables as supporting evidence. Table 3 is retained to transparently report the observed Likert-scale responses but is not intended to support longitudinal or between-section statistical comparisons.

Quantitative Findings

Pre-assessment responses suggested that participants entered BIOL 2401 with moderate confidence in their ability to succeed but lower confidence in applying and explaining A&P concepts, alongside moderate-to-high assessment anxiety, a concern previously documented in health science education [13]. Most respondents also agreed that assessments should help them apply learning to real-life situations and that explaining concepts in their own words supported their learning. These responses provide baseline context regarding participants' expectations and concerns but cannot be linked to later responses at the individual level.

Across the end-of-course and post-assessment surveys, descriptive ratings generally fell within the Agree to Strongly Agree range for items related to confidence, application, communication, fairness, and perceived learning value. In the post-assessment survey, item means ranged from approximately 4.18 to 4.36 on a five-point scale for application- and communication-related items, while perceived assessment fairness had a mean of 4.27. AI-section respondents also reported favorable perceptions of explanation and real-life application. These means are retained to transparently summarize the observed survey responses, but they are not used to test differences, estimate effects, or demonstrate change over time.

These findings must be interpreted cautiously. Survey participation varied across instruments, responses were not longitudinally matched, and the end-of-course response counts were small and unequal, particularly in the traditional section, which included four respondents. The values therefore cannot demonstrate individual growth over time or support meaningful statistical comparisons between assessment formats. Quantitative findings are presented only as preliminary descriptive indicators of participant perceptions and should be interpreted alongside the qualitative findings rather than as evidence of comparative effectiveness.

Qualitative Findings

Four recurring themes were identified across the open-ended responses: moving beyond memorization through explanation, conversational assessment and perceived pressure, communication and applied reasoning, and challenges associated with interacting with AI. Given the small number of respondents, these themes describe patterns within the collected responses and should not be interpreted as representing the experiences of all students enrolled in either section.

Theme 1: Moving Beyond Memorization Through Explanation

Pre-assessment open-ended responses showed that several students distinguished memorization from meaningful understanding. One student explained that previous science exams often required them to "memorize and then regurgitate the information," making it difficult to remember the material later. Another student noted that explaining information in their own words helped them learn more effectively. These responses provide important baseline context, as students entered the course already aware that traditional study and testing practices did not always support long-term understanding.

AI-section respondents similarly emphasized explanation as a learning mechanism. One student stated, "It pushed me to actually understand the material because I had to explain it in my own words." This perception aligns with constructivist learning theory [14,15]. Related anatomy education research has also examined how adaptive learning approaches may support student engagement and flexible learning [16].

Theme 2: Conversational Assessment and Perceived Pressure

Some AI-section respondents described the assessment format as feeling more conversational and less like a conventional test. One student explained, 'It felt more like a conversation than a test.' A respondent in the combined post-assessment survey also reported that their motivation was higher and their stress had decreased. These statements reflect students' perceptions of the assessment experience rather than objective evidence that the format reduced anxiety. Nevertheless, the pattern is consistent with prior research suggesting that assessment structures can influence test-related stress [5,17].

Theme 3: Communication and Applied Reasoning

AI-section respondents described opportunities to explain their thought processes and communicate their knowledge more fully. One student stated that the assessments allowed them to "talk through my thought processes of the material learned," while another reported, "I was really able to display what I know, which is not something you typically get to do in a multiple-choice standard exam." These responses suggest that students perceived the chatbot format as emphasizing explanation, application, and communication rather than answer selection alone. Students in the traditional section valued the predictability of conventional exams but also acknowledged limitations. One respondent explained, "I can use process of elimination to get an answer if I don't necessarily know the question." Another described difficulty recalling every element required by short-answer prompts. Responses across both sections reflected awareness of the distinction between memorization and meaningful understanding, an outcome emphasized in competency-based medical education literature [4,9].

Theme 4: Challenges Associated with Interacting With AI

The AI-supported assessment was not perceived as uniformly easy or beneficial. One respondent noted, "The AI could be difficult to steer in the right direction or avoid being redundant." This response suggests that interacting with the chatbot introduced an additional technological and communication demand. Students were required not only to understand A&P content but also to learn how to communicate effectively with the AI. This theme highlights the importance of providing practice opportunities, clear expectations, and guidance before students complete AI-supported assessments. It also reinforces concerns raised in the literature regarding differences in students' familiarity with emerging technologies and the need for intentional AI-literacy scaffolding [18,19].

Discussion

Taken together, the preliminary qualitative themes and descriptive survey responses suggest that assessment format may be associated with how students approach explanation, application, and communication. AI-section respondents more frequently emphasized opportunities to explain their reasoning, communicate their understanding, and apply course concepts in a conversational context. Traditional-section respondents emphasized the predictability of conventional exams but also described limitations associated with recall and test-taking strategies. Because the sections were not randomly assigned and the response counts were small and unequal, these patterns should not be interpreted as evidence that one assessment format caused better learning outcomes.

These findings are consistent with prior research suggesting that AI-driven and adaptive learning systems may influence extraneous cognitive load, engagement, and opportunities for applied learning [8,12,20]. They also reinforce concerns raised in the literature regarding equity and access. Some students noted that learning how to interact effectively with the AI was itself part of the challenge, underscoring the need for AI-literacy scaffolding, clear expectations, and opportunities to practice with the technology [18,19].

Limitations

This exploratory pilot study is limited by its small convenience sample, unequal survey-response counts, lack of random assignment, and implementation within one course at a single institution. Because the AI-supported section was identified in the course schedule as using AI as a primary assessment tool, students may have self-selected into the section based on their prior interest in, comfort with, or attitudes toward AI. This self-selection limits the ability to attribute differences in student responses to the assessment format itself. Survey participation also varied across instruments and sections. The traditional-section end-of-course survey included only four respondents, compared with eight respondents from the AI-supported section. Students who elected to complete the surveys may have held stronger, more favorable, or otherwise different views from students who did not participate, creating the possibility of nonresponse bias. Anonymous responses were not matched longitudinally; therefore, apparent differences between beginning- and end-of-course responses cannot be interpreted as individual change.

The study relied primarily on self-reported perceptions and did not include objective measures of content mastery, long-term retention, standardized laboratory performance, or performance in subsequent clinical coursework. The qualitative analysis was conducted by one researcher, and no second coder or inter-rater reliability analysis was used. The instructor's dual role as course instructor and researcher may also have influenced interpretation. Although the consent and withdrawal process was managed by an independent faculty liaison and the instructor-researcher remained blinded to participant identities until final grades were submitted, the possibility of researcher interpretation bias cannot be eliminated. Findings should therefore be interpreted as preliminary and hypothesis-generating rather than as evidence of comparative effectiveness.

Conclusion and Implications

This article provides preliminary insight into students' experiences with AI-powered chatbot assessments as an alternative to traditional exams in fully online Anatomy and Physiology courses. AI-section respondents described the assessments as providing opportunities to explain concepts in their own words, articulate their reasoning, apply knowledge to patient-centered situations, and communicate complex information in accessible language. Some respondents also described the format as less anxiety-provoking than conventional testing. These statements represent students' perceptions and do not establish that the assessment format objectively improved understanding or reduced anxiety. Nevertheless, the findings suggest that AI-supported assessment may create opportunities for students to demonstrate forms of applied understanding that are not easily captured through answer-selection formats.

One important implication of this work is that assessment format may shape what students are asked to demonstrate. Later-course survey responses in both sections reflected generally favorable perceptions of confidence and understanding. However, because the surveys were anonymous and were not matched longitudinally, these responses cannot be interpreted as evidence that individual students' confidence increased over time. The AI-supported assessment required students to verbalize their reasoning, respond to follow-up prompts, and explain concepts in both technical and accessible language. These characteristics may be particularly relevant in A&P because many students are preparing for healthcare-related fields where success depends not only on content knowledge but also on communication, clinical reasoning, and the ability to translate complex information for patients. Larger studies using objective performance measures are needed to determine whether AI-supported assessments more effectively capture these forms of applied thinking.

At the same time, this study does not suggest that AI-based assessments should fully replace traditional exams. Traditional exams still provide value in measuring foundational knowledge, content recall, and readiness under structured conditions. However, they often fail to capture whether students can explain, apply, and communicate what they know. AI-based assessments may be most useful as a complementary assessment model that expands what counts as evidence of learning. When carefully designed, these assessments may help instructors evaluate dimensions of student understanding that are often difficult to measure through multiple-choice or short-answer exams alone.

The findings also point to the importance of intentional course design. AI assessment cannot simply be added to a course without preparation. Students need clear expectations, practice opportunities, rubrics, and guidance on how to interact with AI in ways that support learning rather than replace it. In this study, the AI chatbot did not provide answers; instead, it prompted students to clarify, elaborate, and explain their reasoning. This design choice is important because it positions AI as an assessment environment

rather than a shortcut. For AI-supported assessments to be equitable and effective, instructors must also consider students' varying levels of comfort with technology and provide scaffolding for AI literacy. For online A&P courses specifically, AI-powered chatbot assessments may help address a persistent challenge: how to create meaningful, rigorous, and authentic assessments in an asynchronous environment. Fully online courses often rely heavily on proctored exams to protect academic integrity, but those exams may not always reflect the depth of student learning. A structured chatbot assessment offers another possibility. It allows students to demonstrate knowledge through explanation while still working within time limits, proctoring expectations, and instructor-designed prompts. This creates a more applied assessment experience without removing academic accountability.

Future research should build on this exploratory study through larger sample sizes, more diverse institutional contexts, and longitudinal designs that examine whether AI-supported assessment influences student performance in later coursework, clinical programs, or professional communication tasks. Additional research should also compare student performance across different assessment types, including traditional exams, oral exams, written case studies, and AI chatbot conversations. Performance-based outcome measures would strengthen the evidence base and help determine whether students who complete AI-supported assessments demonstrate stronger long-term retention, application, or communication skills.

Overall, this study suggests that AI-powered chatbot assessments have the potential to reframe assessment in Anatomy and Physiology from a process focused primarily on recall to one that values reasoning, explanation, and communication. If students are being prepared for careers where they must think critically, communicate clearly, and apply biological knowledge to real human situations, then assessment practices should reflect those goals. AI-supported assessment, when designed with rigor, transparency, and equity in mind, offers one promising pathway toward that broader vision of learning.

Appendix.

Table 1. Survey Instruments and Analytic Purpose

Survey instrument	Timing	Group	Number of Participants (n)	Main Purpose
Pre-assessment survey	Beginning of course	Combined sections	15	Establish baseline student confidence, anxiety, and expectations before major assessments.
Post-assessment survey	Post-assessment	Combined sections	11	Capture overall reflection on how assessments supported understanding, application, confidence, engagement, and stress.
End-of-course survey: AI section	End of course	AI-supported assessment section	8	Capture student perceptions after completing structured AI chatbot assessments.
End-of-course survey: Traditional section	End of course	Traditional assessment section	4	Capture student perceptions after completing conventional exams.

Table 2. Qualitative Findings by Survey Instrument

Survey instrument	Group	Number of Participants (n)	De-identified quotation(s)
Pre-assessment survey	Combined sections	15	"All I'm trying to do when it comes to exams is memorize and then regurgitate the information to get a good grade." "Explaining concepts in my own words and teaching others has helped me understand the material the most."
Post-assessment survey	Combined sections	11	"I feel as though I am not just trying to regurgitate memorized information." "I was able to talk more conceptually about the topic instead of just answering." "My motivation has been higher and my stress has lowered."
End-of-course survey: AI section	AI-supported assessment	8	"These exams were very helpful because they allowed me to talk through my thought processes of the material learned." "I was really able to display what I know, which is not something you typically get to do in a multiple-choice standard exam." "The AI could be difficult to steer in the right direction or avoid being redundant."
End-of-course survey: Traditional section	Traditional assessment	4	"I can use process of elimination to get an answer if I don't necessarily know the question." "The short essays have always been a little challenging; sometimes it seems like I can't remember every single thing on the prompt." "The presentation part… helped me recall the information well during the exams."

Table 3. Selected Descriptive Likert-Scale Results by Survey Instrument

Survey instrument	n	Confidence/ understanding	Explanation/ communication	Application	Anxiety/ stress	Assessment fairness
Pre-assessment survey	15	A&P confidence M = 3.87	Explain scientific ideas M = 4.07	Apply learning to real-life situations M = 4.20	Usually anxious before exams M = 4.33	Prepared for assessment format M = 3.73
Post-assessment survey	11	Helped understand A&P M = 4.27	Confident explaining concepts M = 4.09; Express clearly M = 4.36	Apply rather than memorize M = 4.18	Less anxious as course progressed M = 4.00	Fair M = 4.27
End-of-course survey: AI section	8	A&P confidence M = 4.38	Explain scientific ideas M = 4.25	Real-life application M = 4.38	Usually anxious before exams M = 3.50	Comfort with new formats M = 4.38; Prepared M = 4.00
End-of-course survey: Traditional section	4	A&P confidence M = 4.25	Explain scientific ideas M = 4.00	Real-life application M = 4.50	Usually anxious before exams M = 4.25	Prepared M = 4.25

Abstract

Artificial intelligence (AI) is rapidly transforming higher education, including fields that combine technology and healthcare. This paper reports on experiences integrating AI-supported learning tools into a UX Design course in an eHealth master's program. Using Google NotebookLM as a structured self-study environment, students prepared independently for practical usability and accessibility evaluations conducted in face-to-face sessions. The course follows a blended learning format with four in-person sessions: the first introduces the course framework and a first display is developed by students; the second focuses on usability testing and individual oral examination; and the third covers accessibility evaluation and oral assessment. A final element, the fourth session, introduces external tools for remote usability testing. Between sessions, students engage in self-directed preparation guided by curated materials and structured question sets within Google NotebookLM. Assessment was conducted exclusively in face-to-face formats to ensure independent understanding. Student performance was strong, with a high pass rate and positive course evaluations. Qualitative feedback highlighted the value of structured AI-supported preparation and the practical relevance of the exercises. The experience suggests that AI tools can effectively scaffold learning in applied technology and health contexts when paired with clearly defined assignments, curated resources, and controlled assessment.

Keywords: *AI in education, UX design, eHealth systems, learning objectives, assessment integrity, workforce transformation*

1. Introduction

Artificial intelligence is rapidly reshaping higher education, opening new possibilities for supporting student learning, structuring self-directed study, and fostering engagement with complex subject matter [1], [2]. These developments are particularly salient in interdisciplinary fields such as eHealth, where students must integrate technical expertise with a nuanced understanding of human-centered design principles [3]. As a result, the meaningful integration of AI tools into teaching - while preserving academic integrity and maintaining rigorous assessment standards - has emerged as a central challenge for educators.

At the same time, AI is transforming entry-level work in software engineering and related domains. Recent analyses indicate that routine tasks traditionally assigned to junior professionals are increasingly being automated, leading to a shift in task profiles and elevated expectations for graduates. Rather than a decline in junior roles, the evidence suggests a reconfiguration of entry-level work, with growing emphasis on analytical, evaluative, and integrative competencies [7] - [9]. This shift disrupts traditional pathways of skill acquisition, as early-career professionals have fewer opportunities to develop expertise through routine tasks.

This paper presents the integration of Google NotebookLM as an AI-supported learning environment within a UX Design course in a master's program in eHealth at the University of Applied Sciences JOANNEUM Graz, Austria. The course focuses on usability and accessibility evaluation of digital health applications, combining structured theoretical preparation with practice-oriented exercises. To ensure the validity of learning outcomes, all assessment is conducted through face-to-face oral examinations, thereby isolating demonstrated competencies from AI-assisted preparation.

The paper details the course design, including the role of AI-supported self-study, the structure of in-person sessions, and the assessment approach. It further analyses the outcomes observed in the most recent cohort and discusses the conditions under which AI tools can effectively support learning in applied, practice-oriented educational settings.

Beyond reporting a course implementation, this work contributes to the emerging discourse on AI-enhanced education by demonstrating how structured AI-supported self-study, combined with curated content, guided tasks, and controlled assessment formats, can systematically foster higher-order competencies while maintaining academic integrity. The findings provide empirical and conceptual insights into how educational designs can respond to the transformation of entry-level roles and increasing competency demands in AI-augmented professional contexts.

2. Educational Context

The course “UX Design in eHealth” is embedded in a master's program that prepares students for professional roles in the development, evaluation and management of digital health technologies. The program draws students from diverse disciplinary backgrounds, including computer science, healthcare informatics, and health professionals. Students typically work part-time in industry or healthcare sector alongside their studies, bringing practical experience that shapes their engagement with course content.
Within the curriculum, the UX Design course sits at the intersection of interaction design, usability engineering and health informatics. Students learn to apply established evaluation methods - such as usability testing with think-aloud protocols and accessibility evaluation based on WCAG criteria - to digital health applications and displays. The course emphasizes the practical relevance of these methods for regulatory compliance and patient safety in eHealth contexts.
A central pedagogical challenge in this context is the need to develop both methodological knowledge and applied skills within a limited number of contact hours. The course addresses this challenge through a blended learning format that combines structured self-study supported by AI tools with practice-oriented in-person sessions and controlled individual assessment.
The European Union's Artificial Intelligence Act introduces requirements related to transparency, human oversight, and AI literacy. However, these obligations are not uniformly applied to all educational institutions. Instead, they depend on the role of an organization as a provider or deployer of AI systems. In particular, systems used for high-stakes decisions, such as student assessment or access to education, may fall under the high-risk category, whereas supportive learning tools typically do not [10].

3. Teaching Approach and Course Structure

The course is organized into four in-person sessions, between which students engage in self-directed preparation using Google NotebookLM. This structure reflects a flipped classroom approach: theoretical content and methodological foundations are acquired independently before the in-person sessions, which then focus on practical application and assessment.
The course design explicitly addresses the shift in competency requirements by focusing on higher-order cognitive skills, including problem framing, critical evaluation of AI-generated outputs, and methodological reasoning.
The integration of AI into this course follows a deliberate design principle: AI is positioned as a cognitive scaffold rather than a content substitute or autonomous tutor. This distinction matters. Where AI-as-tutor implies a conversational, adaptive relationship in which the system guides the learner dynamically, and AI-as-content-aggregator reduces AI to a search interface, AI-as-scaffold structures the learner’s own cognitive effort without replacing it. In practice, this means that Google NotebookLM was not used to generate answers for students, but to frame the intellectual territory they were expected to navigate independently. The curated question sets, structured answer outlines, and defined task boundaries ensure that AI amplifies active knowledge construction rather than enabling passive consumption. This design choice reflects established principles of generative learning and retrieval practice, which consistently show that effortful processing — not exposure to correct answers — drives durable understanding [4].
The course is designed for 20 – 30 students and comprises 30 teaching units of 45 minutes each, corresponding to a total of 2,5 ECTS credits. This structure allows for approximately 20 hours of self-directed study in addition to in-class instruction and assessment activities.

Table 1. Workload Breakdown

Component	Calculation	Hours
Total workload	2,5 ECTS	62,5
Lectures (in-person sessions)	30 × 0.75 hours	22.5
Exam preparation and assessment	—	20
Self-directed study	approx.	20

3.1 First In-Person Session: Course Introduction and Design of a Display

The first session introduces students to the course framework, learning objectives, examination modalities, and the general requirements of UX evaluation. A central element of this session is the assignment of a shared reference object for practical exercises: display systems used in public transportation.

Students work in groups of five and are assigned one of seven variants, ranging from urban tram displays to high-speed train information systems. This diversity of contexts enables comparative analysis while maintaining a consistent methodological approach across groups. An important advantage of this setting is that students are typically familiar with such systems as everyday users, allowing them to draw on prior knowledge of user needs and expectations.

During the session, students receive a structured introduction to the design rationale of their assigned system, including typical user groups, usage contexts, and relevant usability and accessibility considerations. The selected display systems serve as concrete and professionally relevant artefacts that form the basis for all subsequent evaluation exercises.

Following the first session, students begin their independent preparation for usability testing using Google NotebookLM. The AI-supported environment is based on curated course materials, including relevant sections of the course textbook, structured question sets, and detailed task descriptions for the practical exercises. Students work through approximately one hundred guiding questions, supported by concise answer outlines that help structure their preparation and consolidate their understanding of usability testing principles and methods.

3.2 Second In-Person Session: Usability Testing and Oral Examination

The second session focuses on the practical application of usability testing methods. Students conduct structured usability tests on the eHealth display introduced in the first session, working in small groups. They define test tasks, moderate sessions using the think-aloud method, take on observer roles, and systematically document identified usability issues. The results are compiled into short test reports and presented to the group, including recommendations for interface improvements.

Individual assessment takes place during this session in the form of face-to-face oral examination questions. Each student is assessed individually on their understanding of the usability testing methods applied. This controlled assessment format ensures that the results reflect independent understanding rather than group performance or AI-assisted preparation. The oral questions cover the theoretical foundations of usability testing, the specific methods applied, and the interpretation of findings.

After the second session, students complete a further phase of self-directed preparation, this time focused on accessibility evaluation. Using Google NotebookLM, they work through curated materials on WCAG criteria, automated and manual accessibility testing methods, and the relevance of accessibility in regulated eHealth environments. Structured question sets guide their preparation and help them build a methodologically sound understanding of accessibility evaluation.

3.3 Third In-Person Session: Accessibility Evaluation, Oral Examination

The third session opens with structured accessibility evaluations of selected websites. Students work in groups and choose a website from a predefined list; own proposals are also permitted. They apply WCAG-based criteria, use automated accessibility testing tools, and conduct manual checks, including keyboard navigation and screen reader testing. Identified accessibility barriers are documented and prioritized according to their severity and potential impact on target user groups. Each group presents its findings, answers follow-up questions, and demonstrates its understanding of WCAG principles.

As in the second session, individual oral examination questions are posed during the accessibility evaluation phase. Students are assessed on their understanding of WCAG criteria, the tools used, and

the interpretation of their findings. This format maintains the integrity of individual assessment within a group-based practical exercise.

3.4 Fourth In-Person Session: Remote Usability Testing Tools

The fourth session introduces students to external platforms and services for remote usability testing. This segment surveys current commercial and open-source tools for conducting unmoderated and moderated remote usability studies, highlighting their relevance for professional eHealth development contexts. Following this introduction, practical demonstrations and explanations are provided by an additional external specialist who is actively working in this field. Students discuss the methodological trade-offs between in-person and remote evaluation formats and explore how remote testing tools can complement laboratory-based approaches in practice.

4. Results

From the instructor's perspective, the examination results and student presentations were assessed as highly positive. An objective comparison with previous cohorts is not possible, as the course was newly designed in this format and no directly comparable baseline exists. Nevertheless, the instructor's subjective assessment is that students performed noticeably better than in conventionally delivered courses. While this observation is inherently subjective, it may be considered an indicative signal of the effectiveness of the applied teaching approach.

The official course evaluation was conducted using the evasys system. Of 23 eligible students, 5 participated in the evaluation, corresponding to a response rate of 21.7%. Despite the small sample size, the results were consistently positive across all dimensions. Overall course quality was rated “very good” by 4 out of 5 students, with one student giving the second-best rating. Organisational conditions, including the length of the in-person blocks and room equipment, received similarly high ratings. All five students confirmed that the workload corresponded appropriately to the assigned ECTS credit points.

The evaluation results indicate a consistently structured approach and a high level of methodological correctness. These findings suggest effective learning outcomes; however, they should be interpreted with caution given the limited sample size of the evaluation data.

The course was also enriched by one guest lecturer, which 4 out of 5 evaluating students confirmed as a clear added value for the course. Students noted that the guest contribution provided valuable insight into professional practice and was well integrated into the course flow. Preparation for the English-language guest lecture was highlighted as particularly helpful, enabling students with varying levels of English proficiency to follow and engage with the content effectively.

Ratings for the instructor dimensions were also very positive. The working climate in the course was rated “very good” by all five students. The connection between theory and practice received the highest possible rating from all respondents. Didactic methods and the quality of course materials received strong ratings. Accessibility of the instructor was rated positively by all students. Four out of five students confirmed that the assessment scheme, including grading criteria and examination modalities, was clearly understandable.

Qualitative feedback collected through open-response questions reinforced the quantitative findings. Students particularly valued the open and practice-oriented teaching style, noting that attendance alone provided substantial learning gains. The joint discussion and improvement of real-world examples of good and poor UX implementation was highlighted as especially valuable. Students also appreciated the opportunity to work through examination topics themselves, which they found deepened their understanding and enabled direct application during the in-person sessions. Representative feedback included comments such as: keep everything as it is, and please continue teaching in this open and practice-relevant way.

5. Discussion

The results of the course evaluation provide consistent evidence for the effectiveness of the proposed teaching design. In particular, the strong alignment between theoretical instruction and applied, practice-oriented exercises indicates that the course successfully operationalizes a key requirement of contemporary software engineering education: the integration of methodological rigor with real-world relevance. This is especially significant in a master's program context, where students are typically working professionals and expect immediate applicability of acquired competencies.

The qualitative feedback further supports the contribution of the approach by highlighting the value of example-based, comparative learning using real-world UX cases. Students consistently emphasized that the structured combination of self-study and in-person application enabled deeper engagement with complex problems. This finding suggests that the blended learning design, supported by AI-based preparation, effectively shifts classroom time from content delivery to higher-order cognitive activities, thereby increasing learning efficiency and depth [2].

A central contribution of this work lies in demonstrating how structured AI-supported self-study can enhance active knowledge construction. Students reported that independently working through examination-relevant content significantly improved their understanding and ability to apply methods in practice. This aligns with established principles of retrieval practice and self-explanation and indicates that AI tools, when embedded in a guided and curated framework, can support generative learning processes rather than superficial knowledge acquisition [4].

It is important to acknowledge the limitations of AI-supported self-study as implemented in this course. Google NotebookLM operates within the boundaries of curated source materials and cannot dynamically adapt to individual students' misconceptions or knowledge gaps in real time. Students who engage superficially with the guided question sets — reading answer outlines without actively constructing their own responses — risk acquiring a surface-level familiarity that does not translate into transferable competence. The oral examination format is precisely designed to surface this distinction: students who have genuinely engaged with the material can explain, justify, and apply concepts under questioning, while those who have not are identifiable through the conversation. This underscores a broader design principle: the effectiveness of AI-supported learning depends not on the sophistication of the AI tool, but on the quality of the surrounding pedagogical structure — including the tasks, the curation, and above all, the assessment format that makes genuine understanding non-optional.

The integration of external expert input through guest lectures provides additional evidence for the scalability and practical relevance of the approach. The successful preparation of students for an English-language guest lecture across varying levels of language proficiency illustrates how structured scaffolding can make advanced and potentially demanding learning experiences accessible. This highlights the broader applicability of the concept in heterogeneous learning environments and supports its transferability to other domains [6].

While the evaluation results should be interpreted with appropriate methodological caution, it should be noted that the response rate of 21.7% (5 out of 23 students) is within the range commonly reported for voluntary course evaluations in higher education, where response rates between approximately 20% and 40% are frequently observed [11], [12]. This reflects a broader structural challenge rather than a limitation specific to this course. Within this context, the consistently positive pattern across both quantitative and qualitative feedback still provides meaningful indications of the effectiveness of the design.

A particularly relevant contribution concerns the design of the assessment approach. By conducting all individual assessment through face-to-face oral examinations, the course ensures that demonstrated competencies reflect genuine individual understanding, despite extensive use of AI tools during preparation. This explicit separation between AI-supported learning and human-controlled assessment represents a robust design principle for maintaining academic integrity in AI-enhanced educational settings [3]. The results indicate that students are able to translate AI-supported preparation into authentic, independently demonstrated competencies.

6. Conclusion

This paper has reported on the design and outcomes of an AI-enhanced UX Design course in an eHealth master's program, in which Google NotebookLM served as a structured self-study environment embedded within a blended learning format assessed exclusively through face-to-face oral examination. The official course evaluation, conducted via the institutional evasys system, returned consistently positive ratings across all dimensions, including overall quality, working climate, the connection between theory and practice, and didactic methods. All five responding students confirmed that the workload corresponded to the assigned ECTS credit points. Qualitative feedback emphasized the value of the open and practice-oriented teaching style, the joint analysis of real-world UX examples, and the structured self-directed preparation of examination topics. The guest lecture component was rated as a clear added value by all students who experienced it.

The experience suggests that AI-supported learning environments can effectively scaffold student preparation in applied technology and health contexts, particularly when paired with curated resources, clearly defined assignments, a concrete shared reference object such as a purpose-built eHealth

display, and assessment formats that ensure individual accountability. The combination of AI-supported self-study, practice-oriented in-person sessions, and face-to-face oral examination appears to support both learning depth and assessment integrity.
Future development of this teaching approach will focus on increasing student participation in course evaluations to enable more robust conclusions, expanding the range of eHealth interface types used in the practical exercises, and exploring the integration of remote usability testing platforms directly into the course assignments.
The approach also reflects emerging labor market requirements, where graduates must demonstrate the ability to critically evaluate AI-generated outputs and integrate them into complex problem-solving contexts.
In addition to evaluating the effectiveness of the teaching approach, it is important to situate the course design within the broader transformation of software engineering education driven by artificial intelligence. In particular, three questions arise: how such a concept prepares students for changing entry-level roles, how it enables the development of higher competence levels in both foundational knowledge and AI-supported work, and how it contributes to increasing AI literacy among instructors. The following paragraphs address these aspects in relation to the presented course design.

6.1 Preparation for Changing Entry-Level Roles

The course design responds directly to the reconfiguration of entry-level roles in software engineering and related technology fields. As routine analytical and testing tasks are increasingly automated, graduates entering the workforce are expected to operate at higher cognitive levels from the outset — framing problems, critically evaluating tool outputs, and exercising methodological judgment rather than executing predefined procedures. The course addresses this shift by deliberately foregrounding higher-order competencies: students do not simply learn to run a usability test, but to select appropriate methods, interpret ambiguous findings, prioritize issues by severity and context, and communicate conclusions to professional audiences. Critically, they are expected to demonstrate these competencies independently, under examination conditions that exclude AI assistance. This prepares graduates not only to work alongside AI tools in professional practice, but to exercise the kind of evaluative and contextual judgment that AI cannot yet replicate — precisely the competencies that define the reconfigured entry-level role [7]–[9]. Through the blended learning approach with AI tools, students learn very early on how to increase the productivity and quality of their own products or services. This will help them when entering the job market.

6.2 Achieving Higher Competence Levels (Fundamentals and AI Use)

This paper contributes evidence that higher competence levels can be achieved through the deliberate integration of foundational knowledge and structured AI usage. The combination of curated materials, guided question sets, and clearly defined tasks ensures that AI functions as a cognitive scaffold rather than a substitute for understanding. The results indicate that this design supports deep learning, critical evaluation, and effective transfer to applied contexts, while controlled, AI-free assessment safeguards the validity of demonstrated competencies.

6.3 Increasing AI Literacy Among Instructors

The findings further contribute to the understanding of how AI literacy among instructors can be developed through practice-oriented course design. By actively engaging in the curation of AI-supported learning environments, structuring interactions with AI tools, and maintaining human oversight in assessment, instructors acquire a grounded and reflective understanding of AI capabilities and limitations. This suggests that AI literacy is most effectively developed as an embedded, experiential competence within teaching practice rather than through isolated training measures.

Operationalizing the Metaverse in South African Higher Education: A Readiness Assessment and Strategic Framework

Rachel Tholakele Khoza

University of Johannesburg, Johannesburg Business School, South Africa

Abstract

The metaverse has emerged as a transformative digital innovation with the potential to reshape higher education and Technical and Vocational Education and Training (TVET) through immersive, interactive, and experiential learning environments. Building on the foundational work of [1], which identified the metaverse as a potential solution to study space shortages in South African higher education institutions, this study investigates institutional readiness, stakeholder perceptions, and strategic pathways for operationalising metaverse technologies within South African Higher Educational Institutions (HEIs), especially TVET colleges. The study is situated within the broader national agenda to expand post-school education and training, particularly the goal of increasing TVET enrolments to approximately 2.5 million students by 2030 [2, 3]. Given growing enrolments, infrastructure constraints, and the need for innovative approaches to skills development, the metaverse presents opportunities to enhance access, experiential learning, and vocational training while reducing pressure on physical facilities. A qualitative research design was employed, with data collected through semi-structured interviews involving academic leaders, digital transformation specialists, educators, and policy advisors. Data were analysed using [4] thematic analysis framework. Five key themes emerged: institutional infrastructure readiness, digital competencies and capacity building, policy and governance readiness, implementation challenges and risks, and opportunities associated with metaverse adoption. The findings reveal growing institutional interest in immersive technologies and evidence of emerging digital readiness; however, significant challenges remain, including infrastructure disparities, inadequate digital competencies, limited policy frameworks, funding constraints, cybersecurity concerns, and persistent inequalities across institutions. Participants nevertheless highlighted the metaverse's potential to enhance experiential learning, simulation-based training, student engagement, and access to vocational education. In response to these findings, the study proposes a Metaverse Readiness and Implementation Framework (MRIF) to guide institutions through readiness assessment, governance development, stakeholder engagement, capacity building, phased implementation, and continuous evaluation. The framework provides a contextually relevant roadmap for supporting sustainable, inclusive, and strategically governed metaverse adoption within South African higher education especially TVET colleges.

Keywords: *Metaverse, Virtual Study Spaces, Higher Education, TVET colleges, Digital Learning, Virtual Reality, Education Technology*

1. Introduction

The global higher education sector is experiencing significant transformation as institutions respond to the rapid technological changes associated with the Fourth Industrial Revolution (4IR). Emerging digital technologies such as artificial intelligence (AI), virtual reality (VR), augmented reality (AR), blockchain, and extended reality (XR) are reshaping teaching, learning, research, and institutional operations [5, 6]. Within this evolving digital ecosystem, the metaverse has emerged as a transformative innovation with the potential to redefine educational delivery and student engagement in higher education. The metaverse refers to a persistent, immersive, and interconnected virtual environment in which users interact through digital avatars in real time using advanced immersive technologies [7, 8]. In educational contexts, the metaverse enables experiential, collaborative, and interactive learning beyond the limitations of physical classrooms. Through virtual laboratories, simulations, digital campuses, and immersive collaborative spaces, the metaverse offers opportunities to enhance student engagement, improve accessibility, and support innovative pedagogical practices aligned with constructivist and connectivist approaches to learning [9].

Globally, universities are increasingly exploring metaverse applications to support flexible and technologically enhanced learning environments. Institutions in developed countries have begun

implementing immersive learning platforms for disciplines such as engineering, medicine, architecture, and teacher education, where simulation-based learning can improve practical competence and student participation [6]. The metaverse is further viewed as an important component of digital transformation strategies aimed at improving institutional competitiveness, innovation, and global collaboration in higher education. The need for innovative approaches to educational delivery is further amplified by South Africa's national skills development agenda. The National Development Plan (NDP) 2030 and the White Paper for Post-School Education and Training position TVET colleges as critical institutions for addressing unemployment, poverty, and economic growth through skills development [2, 3]. To achieve these objectives, government has set ambitious enrolment expansion targets for the TVET sector, with long-term plans aimed at accommodating approximately 2.5 million students. However, expanding enrolments at this scale presents significant challenges relating to infrastructure, equipment, workshop space, and lecturer capacity. Emerging technologies such as the metaverse may provide innovative opportunities to support expanded access and quality vocational training through immersive and scalable learning environments. Existing studies suggest that the metaverse may provide innovative solutions to challenges such as overcrowded campuses, limited physical infrastructure, and restricted access to practical learning environments [1].

Despite these opportunities, the adoption of metaverse technologies remains uneven across different socio-economic and institutional contexts. In developing countries such as South Africa, higher education institutions continue to face structural and systemic barriers that hinder advanced digital transformation initiatives. These challenges include inadequate digital infrastructure, unstable internet connectivity, electricity disruptions, limited financial resources, insufficient technical expertise, and persistent inequalities between historically advantaged and disadvantaged institutions [10, 11]. Such disparities significantly affect institutional capacity to adopt sophisticated immersive technologies and may deepen existing educational inequalities if not adequately addressed. The COVID-19 pandemic further exposed the vulnerability of South African higher education institutions especially TVET colleges regarding digital readiness and technology integration. Although some institutions successfully transitioned to online and blended learning models, many institutions experienced significant challenges related to infrastructure limitations, staff preparedness, student access to digital devices, and affordability of internet connectivity [12, 13]. The pandemic highlighted the persistent digital divide within South African higher education especially TVET colleges, particularly among students from rural and economically disadvantaged communities, thereby raising concerns about equitable access to emerging technologies such as the metaverse [14].

Furthermore, despite the increasing global interest in metaverse technologies as transformative tools for education, there is limited empirical evidence regarding the readiness of South African post-school institutions, particularly TVET colleges, to adopt and implement immersive learning environments. TVET colleges face unique challenges associated with infrastructure constraints, unequal access to digital technologies, lecturer digital competencies, and the need to deliver practice-oriented learning experiences that mirror real workplace environments. Although immersive technologies may offer innovative solutions for vocational training through virtual simulations, laboratories, and workplace-based learning experiences, little is known about the institutional, technological, and human-capacity requirements necessary for successful implementation. Consequently, the absence of context-specific readiness frameworks creates uncertainty regarding the feasibility, sustainability, and equity implications of metaverse adoption within South African TVET colleges and the broader higher education sector. The study aims to investigate institutional readiness, stakeholder perceptions, and strategic pathways for operationalising metaverse technologies within South African HEIs, especially TVET colleges.

2. Review of Related Literature

2.1 Theoretical and Conceptual Foundations

The integration of metaverse technologies in higher education is grounded in several technology adoption and digital learning frameworks. Diffusion of Innovation Theory posits that technological adoption depends on perceived usefulness, compatibility, complexity, and institutional support [15]. Similarly, the Technology Acceptance Model (TAM) emphasizes that perceived usefulness and ease of use directly determine user willingness to adopt new tools [16]. In the metaverse context, educators and students embrace immersive platforms when they perceive them as catalysts for teaching effectiveness and enhanced learning. Pedagogically, constructivist and connectivist learning theories support this immersion. Constructivism states that learners actively build knowledge through interactive experiences,

while connectivism emphasizes digital networking and collaborative learning [17]. The metaverse merges these views by offering highly interactive, experiential, and collaborative virtual environments.

2.2 Digital Transformation in Higher Education

Digital transformation is a global strategic priority driven by the Fourth Industrial Revolution (4IR), which has integrated artificial intelligence, cloud computing, virtual reality, and learning management systems into universities to improve access and quality [5]. This shift demands deep organizational change, pedagogical innovation, and process restructuring [18]. In South Africa, the COVID-19 pandemic forced a rapid transition to online and blended models [12], but exposed severe institutional inequalities in digital readiness, infrastructure, and staff preparedness between historically advantaged and disadvantaged universities [19]. Today, local digital transformation remains constrained by inadequate funding, unstable internet access, rolling power outages, and limited digital competencies among students and academics [10], barriers that heavily impede metaverse adoption.

2.3 Metaverse and Immersive Learning

The metaverse is an interconnected, real-time virtual ecosystem where users interact via avatars through a blend of virtual/augmented reality, artificial intelligence, and blockchain [7, 8]. Educationally, it facilitates boundaryless, simulation-based learning through virtual laboratories and collaborative projects [6]. These immersive environments boost student engagement, motivation, and knowledge retention via active participation [9]. Furthermore, virtual campuses can help institutions bypass physical infrastructure limits and overcrowding, expanding access to practical, lab-based disciplines [1]. However, scholars note that deployment is hindered by high financial costs, cybersecurity threats, privacy issues, and complex ethical governance [20].

2.4 Metaverse Applications in TVET Education

Technology-enhanced learning is critical for the South African Technical and Vocational Education and Training (TVET) sector, where curricula demand hands-on, occupational competencies. The metaverse offers virtual workshops and industry environments where students can practice technical skills safely and repeatedly, overcoming physical workshop limitations. This immersive framework directly fosters the technical and employability skills required for Industry 4.0 [6, 8]. The National Development Plan (NDP) 2030 positions TVET colleges as central to tackling youth unemployment, while the White Paper for Post-School Education and Training targets massive growth to 2.5 million [2, 3]. Expanding via brick-and-mortar infrastructure is financially impossible. Metaverse technologies offer a viable alternative pathway to scale training capacity, reach remote learners, and offer flexible delivery models [1]. This potential, however, depends heavily on whether institutions possess the necessary infrastructure, policy frameworks, and human capacity.

2.5 Institutional Readiness for Technology Integration

Institutional readiness is the baseline technological, financial, human, and organizational capacity required to successfully implement innovation. It encompasses digital infrastructure, clear policy frameworks, leadership commitment, staff competencies, and supportive organizational culture [21]). Institutions with strong leadership and robust digital policies deploy emerging technologies effectively [22]. Conversely, low readiness sparks user resistance and widens educational inequalities. In South Africa, readiness remains highly uneven; rural and historically disadvantaged institutions face persistent bandwidth limitations, infrastructure deficits, and severe funding gaps [11].

2.6 Challenges of Digital Transformation in South African Higher Education

Digital transformation in South African universities is severely impeded by systemic socio-economic and technical barriers. Chief among these is the persistent digital divide, which restricts equitable access to devices, reliable internet, and online learning platforms for students from low-income or rural backgrounds [14]. Operational hurdles include rolling power outages (load shedding), deficient broadband infrastructure, legacy technological hardware, and under-resourced ICT support desks ([23]. Furthermore, widespread institutional financial constraints restrict high-end investments in immersive tech and academic training. These infrastructural issues are compounded by human barriers, notably

academic resistance to change, gaps in digital literacy, and missing institutional policy frameworks [24]. Consequently, adopting advanced systems like the metaverse demands comprehensive institutional restructuring rather than simple technological procurement.

2.7 Opportunities and Risks of Immersive Technologies

Immersive platforms offer powerful avenues to elevate higher education by hosting experiential, simulation-driven learning that sharpens 21st-century competencies like creative problem-solving and deep digital literacy [25]. Conversely, deploying these systems introduces profound ethical, operational, and psychological risks. Key vulnerabilities include data privacy breaches, cybersecurity threats, and psychological strain from extended virtual immersion [20]. Furthermore, the steep capital required for advanced hardware, software licensing, and specialized staff training presents a major barrier for budget-constrained universities. If unmitigated, these costs risk deepening student exclusion. Successful metaverse integration therefore hinges on rigorous strategic planning, ethical policy frameworks, stakeholder alignment, and proactive equity strategies.

3. Research Methodology

This study employed a qualitative research approach grounded in the interpretivist paradigm to explore institutional readiness for metaverse integration in South African higher education institutions [26]. An exploratory case study design was adopted to gain in-depth insights into stakeholders' perceptions, experiences, and preparedness regarding immersive technologies in teaching and learning [26].

3.1 Participant Selection

A purposive sampling technique was used to select 8 participants with relevant knowledge and experience in digital transformation and educational technology integration. Using purposive sampling enabled the researcher to obtain rich and contextually relevant data from participants directly involved in institutional technology adoption processes [26]. The selected participants included academic staff, ICT personnel, institutional managers, and e-learning coordinators involved in digital transformation initiatives within HEIs.

3.2 Profiles of Participants

The eight participants were purposively sampled to provide a comprehensive, multi-level overview of the post-school education and training sector, spanning national policy, institutional management, and frontline execution.
National Policy Level: Mr Sello Sethusha (DHET Director of Lecturer Development and Support) and Dr Moyo Mtheto (DHET Acting Director of International Scholarships) were selected to provide critical insights into national capacity-building frameworks, international education partnerships, and the broader policy landscape governing metaverse adoption. Institutional Leadership & eLearning Strategy: Ms Zandile Nkabinde (Deputy Principal, Majuba TVET College) was chosen to offer a strategic perspective on institutional management, focusing on resource allocation, operational infrastructure constraints, and staff readiness. Complementing this, Ms Phumzile Mthiyane (Deputy Chief Education Specialist, eLearning Directorate) was selected for her specialized expertise in designing and integrating digital learning policies. Frontline Classroom Execution: Four TVET college lecturers; Ms Khathu Mangaladzi (CJC TVET College), Mr Dlamini (Majuba TVET College), Ms Precious, and Ms T.G. Ndou (both Vhembe TVET College), were selected to capture the practical realities of daily teaching, user-level experiences with digital tools, and the pedagogical shifts needed for immersive learning.

3.3 Data Collection

Data was collected through semi-structured interviews conducted either face-to-face or via online platforms such as Microsoft Teams and Zoom. The interviews focused on institutional infrastructure, digital competencies, policy readiness, implementation challenges, and opportunities associated with metaverse adoption.

3.4 Data Analysis

Data was analysed using thematic analysis following the six-phase framework developed by [4], enabling the identification and interpretation of recurring themes and patterns within the data. The process included familiarization with data, generating initial codes, generating initial themes reviewing potential themes, defining and naming themes, and producing the report. To ensure trustworthiness, the study applied the principles of credibility, dependability, confirmability, and transferability as proposed by [27]. Ethical considerations, including informed consent, confidentiality, anonymity, and voluntary participation, were observed throughout the study.

4. Findings

Using [4] six-phase thematic analysis framework, five overarching themes emerged from the interview data: (1) Institutional Infrastructure Readiness, (2) Digital Competencies and Capacity Building, (3) Policy and Governance Readiness, (4) Implementation Challenges and Risks, and (5) Opportunities and Future Potential of the Metaverse. These themes provide insights into the readiness of South African higher education institutions and TVET colleges to adopt metaverse technologies and inform the development of a strategic framework for implementation.

4.1 Institutional Infrastructure Readiness

Participants acknowledged significant progress in digital transformation, particularly following the COVID-19 pandemic, through the adoption of Learning Management Systems (LMSs), online learning platforms, and blended learning approaches. However, readiness was found to be uneven across institutions, with disparities in infrastructure, connectivity, and access to digital resources remaining a major concern.

One participant highlighted both the progress made and the existing challenges:

“TVET colleges have made massive progress by adopting LMSs and online teaching platforms, but there are still limitations because of inadequate bandwidth, outdated computers, insufficient software licences and shortages of modern devices.”

Similarly, a senior DHET official emphasised the inequalities that continue to characterise the higher education landscape:

“We have urban universities, rural universities, historically white universities and historically black universities… some rural universities did not have the basic equipment, basic internet connection and basic computers.”

4.2 Digital Competencies and Capacity Building

The second theme focused on the digital competencies required for successful metaverse implementation. Participants consistently emphasised educator training, technical support, and continuous professional development as critical enablers of adoption.

As one participant explained:

“The educators would require hands-on technical training, instructional design support, continuous professional development, mentoring and communities of practice, technical support services and clearly defined policies.”

Participants also recognised that students may adapt more quickly to immersive technologies than educators due to greater familiarity with digital environments:

“Students may embrace immersive technologies because it aligns with their experiences… but some educators have cyberphobia and fear of technology.”

4.3 Policy and Governance Readiness

Policy and governance readiness emerged as one of the weakest dimensions of institutional preparedness. Although institutions have increasingly embraced digital technologies, participants reported the absence of comprehensive policies to guide the implementation and governance of immersive technologies.

One participant stated:

“I don’t think we have policies in our institutions that guide us about how to utilise technology and how to manage technology.”

Another participant highlighted the broader governance responsibilities associated with metaverse adoption:
“The issue is what support must policymakers provide to universities. That is funding… and also issues of ethics as well because embedded in the metaverse are issues of AI.”
Participants argued that policy frameworks should address ethical governance, cybersecurity, accessibility, artificial intelligence, and sustainable funding.

4.4 Implementation Challenges and Risks

Participants identified several challenges that could hinder the adoption of metaverse technologies, including financial constraints, inadequate infrastructure, digital inequality, cybersecurity concerns, and resistance to change.
One participant summarised these concerns succinctly:
“Financial constraints, inadequate digital infrastructure, inequality in access to devices, cybersecurity and data privacy concerns, lack of policies and resistance to change.”
Participants were particularly concerned about the potential for metaverse implementation to exacerbate existing inequalities within the higher education sector:
“The institutions should be very careful that they don’t widen the existing inequalities… equity should be embedded into every stage of implementation. Nobody should be left behind.”
Without targeted interventions, metaverse adoption may reinforce existing inequalities rather than address them.

4.5 Opportunities and Future Potential of the Metaverse

Despite these challenges, participants overwhelmingly viewed the metaverse as a transformative educational innovation capable of enhancing experiential learning, improving access, and supporting practical skills development.
A tourism lecturer illustrated the educational possibilities offered by immersive technologies:
“I can take my students to Table Mountain while I’m in Johannesburg… students are going to be provided with simulated environments and engage with experiential learning.”
Another participant highlighted the value of simulations for practical learning:
“Visual simulations will provide students with realistic learning experiences that may otherwise be expensive or inaccessible.”
Participants viewed the metaverse as particularly beneficial for engineering, tourism, hospitality, logistics, aviation, and vocational education programmes that require practical and experiential learning opportunities.

5. Discussion

The findings demonstrate that institutional readiness for immersive technology in a developing country context cannot be viewed as a purely technological phenomenon. Instead, it is a complex sociotechnical ecosystem where infrastructure, digital literacies, institutional governance, and socio-economic history collide.
A critical finding of this study is the persistent unevenness of institutional infrastructure readiness, which is starkly divided along historical lines (urban vs. rural and historically white vs. historically black institutions). While the post-COVID-19 era accelerated the baseline adoption of Learning Management Systems (LMSs) and blended modalities across South Africa, this study shows that transitioning to the metaverse requires an entirely different order of technological capital. The presence of basic internet and outdated hardware does not equate to metaverse readiness, which demands massive bandwidth, low-latency connectivity, high-end graphic processing power, and specialized peripheral hardware (e.g., VR headsets).
This infrastructure disparity strongly echoes the warnings of [11] and [10], who argue that blanket digital transformation policies frequently fail because they ignore underlying institutional inequalities. Within the broader South African discourse, these results add an immersive-technology layer to the structural digital divide documented by [14]. If South African higher education blindly deploys metaverse spaces without targeted capitalization, it risks cementing a two-tier educational system: a technologically enriched immersive experience for well-resourced urban universities, and a text-based, resource-constrained experience for rural and TVET campuses. Therefore, infrastructure readiness must be

conceptualized not just as "having technology," but as achieving equity of access to specialized technical architectures.

The findings indicate that technological infrastructure is entirely inert without a corresponding upgrade in human capability. The data revealed a stark contrast between a highly digitally fluent student body and an instructional workforce constrained by technical limitations and, in some cases, "cyberphobia." This dynamic can be directly interpreted through the lens of [16] Technology Acceptance Model (TAM). According to TAM, a user's intention to adopt a system is driven by its Perceived Usefulness (PU) and Perceived Ease of Use (PEOU). While the educational utility (PU) of the metaverse is widely acknowledged, its perceived ease of use among educators remains low due to a lack of instructional design support and hands-on technical training.

Furthermore, this human capital gap illustrates the structural bottlenecks predicted by [15] Diffusion of Innovations Theory. For an innovation to diffuse successfully through an organization, the social system must provide clear compatibility and observability. The findings highlight that South African institutions currently lack the organizational support systems needed to transition educators from "laggards" or "late majorities" into active adopters. This underscores that human capital development cannot be an afterthought; continuous professional development must run parallel to any hardware procurement.

Perhaps the most vulnerable dimension of readiness identified is the systemic absence of policy and governance frameworks tailored to immersive environments. While institutional policies have slowly adapted to traditional online learning, they are completely unequipped to handle the unique ethical, legal, and operational complexities of the metaverse. This policy vacuum aligns with observations by [21] and [22], who assert that institutional leadership and agile governance are the primary gatekeepers of sustainable digital transformation. Implementing the metaverse without predefined regulatory guardrails poses catastrophic risks regarding student safety, identity theft, and institutional liability. Furthermore, because the metaverse blurs geographical and physical boundaries, it creates complex questions around digital rights management and algorithmic bias. The findings imply that state bodies, such as the Department of Higher Education and Training (DHET), alongside institutional councils, must proactively move away from reactive policymaking and instead co-design proactive, ethically grounded governance frameworks that explicitly address immersive spaces.

When evaluating the data holistically, a profound paradox emerges between the identified risks (Theme 4) and the perceived opportunities (Theme 5) of the metaverse. On one hand, the metaverse introduces extreme financial strains onto already burdened public budgets and risks worsening the digital divide [24]. On the other hand, it offers unprecedented pedagogical opportunities for experiential, simulated, and collaborative learning that could democratize access to expensive physical training.

This pedagogical potential is highly consistent with constructivist and connectivist learning theories [17], which position learning as an active, networked process of generating meaning through experience. In disciplines that require expensive or high-risk physical infrastructure the metaverse offers an elegant solution to resource scarcity. As argued by [8], [9], and [6], high-fidelity virtual simulations allow students to bridge the gap between theory and practice safely and iteratively. The core implication is that the metaverse should not be pursued as a novelty or a generic replacement for traditional lectures; rather, its implementation must be highly strategic, targeting specific spatial, practical, and experiential learning modules where virtual simulation provides a clear, cost-effective educational advantage over physical infrastructure.

6. Proposed Framework

The Proposed Strategic Framework for Operationalising the Metaverse in South African Higher Education and TVET Colleges in **Figure 1** below provides a structured roadmap for institutions to assess readiness, implement immersive technologies, and sustain innovation in teaching and learning. Grounded in Constructivism, Connectivism, the Technology Acceptance Model, and Diffusion of Innovation Theory, the framework integrates six sequential phases which are institutional readiness and policy development to stakeholder engagement, pilot implementation, scaling, and sustainability. Each phase aligns technological adoption with human capacity, governance, pedagogy, and strategic vision, ensuring that metaverse integration advances equity, inclusivity, and digital transformation. Ultimately, the framework empowers universities and TVET colleges to transition toward experiential, data-driven, and future-ready education ecosystems.

Source: Researchers Own Compilation

7. Conclusion

This study found that South African higher education institutions and TVET colleges demonstrate emerging readiness for metaverse adoption, evidenced by the increasing use of digital learning platforms, blended learning approaches, and collaborative initiatives aimed at enhancing teaching and learning. However, institutional readiness remains uneven due to infrastructure disparities, limited digital competencies, inadequate policy and governance frameworks, funding constraints, and persistent inequalities across the sector. While participants expressed strong optimism regarding the potential of immersive technologies to enhance experiential learning, student engagement, practical skills development, and access to education, they also highlighted significant challenges related to digital inclusion, cybersecurity, change management, and sustainability. The findings suggest that successful metaverse integration requires a holistic and coordinated approach that aligns technological infrastructure, human capacity development, governance mechanisms, stakeholder engagement, and equitable access strategies. In response to these findings, the study developed the Metaverse Readiness and Implementation Framework (MRIF), which provides a context-specific roadmap to guide institutions through the stages of readiness assessment, policy development, capacity building, implementation, scaling, and continuous evaluation. The study therefore concludes that metaverse adoption is both feasible and desirable within the South African higher education and TVET sectors, provided it is implemented through a phased, inclusive, and strategically governed process that promotes sustainability, innovation, and educational equity.

Course-Specific AI TAs: A Platform Comparison for Higher Education

Joon S. Park

School of Information Studies, Syracuse University, Syracuse, NY, United States

Abstract

As generative AI tools increasingly spread across higher education and become more widely available, educators are confronted with a substantial decision: Which AI platform best facilitates the implementation of course-specific AI teaching assistants (AI TAs) in their courses? This study seeks to compare available options as of today by designing and evaluating three distinct course-specific AI TAs: OpenAI Custom GPT, Anthropic Claude Projects, and Google Gemini Gems, all implemented within the same college-level cybersecurity course. Each AI TA was meticulously configured with course-specific instructional objectives, lecture materials, a course syllabus, an academic schedule, and course-related resources. We assessed the following governance-relevant criteria: customization depth, ease of setup, course resource integration, interface & accessibility, multimodal capabilities, privacy & ethics controls, institutional cost, and pedagogical impact. At the time of this writing, our comparative analysis finds that Custom GPT stands out as the most fully featured no-code platform for a deeply customizable, tightly governed, shareable, course-specific AI TA deployment. Claude Project has closed the gap, particularly with the addition of Skills, though it remains more constrained in Project sharing across organizations/institutions and dynamic usage. Gemini Gems offers the strongest multimodal and Google-native integration but remains limited by upload, storage, and context-window constraints. Overall, this study offers guidance to instructors and institutions on deploying AI TAs that enhance learning experiences and outcomes while safeguarding academic integrity and promoting accessibility.

Keywords: *Course-specific AI Teaching Assistant (TA), AI-augmented Higher Education*

1. Introduction

Artificial intelligence (AI) is reshaping higher education by expanding the ways students seek explanations, practice skills, and receive feedback. Students now encounter general-purpose conversational systems as everyday academic tools, yet those systems are not designed primarily for course-grounded instruction, institutional governance, or academic integrity [1], [2]. For instructors, then, the central question is no longer whether an AI system can answer student questions. The more consequential question is whether it can function as a course-specific assistant that remains grounded in the syllabus, lecture content, and course policies; supports learning without producing graded solutions; and operates in ways that are consistent with institutional expectations for privacy, access, and oversight. These concerns have become more pressing as AI-supported tools move into mission-critical and educational settings, where system failures, hallucinations, and misuse can have consequences that extend well beyond convenience or productivity [3], [4], [5]. In higher education, the value of such tools depends not only on what they can produce, but also on whether they can be integrated into teaching in ways that are pedagogically sound, ethically defensible, and practically sustainable [6], [7], [8].

This paper examines those challenges by building and comparing three no-code, course-specific AI teaching assistants (TAs) for the same college course: OpenAI Custom GPTs, Anthropic Claude Projects with Skills, and Google Gemini Gems. All three platforms now allow instructors to define custom instructions and attach course-related materials, but they differ in meaningful ways with respect to persistence of course knowledge, sharing and access, multimodal support, and administrative controls. Our purpose is not to identify a single universal winner. Rather, we seek to clarify which trade-offs matter most when instructors and institutions select a platform for a course-specific AI TA.

This study builds directly on our earlier work on course-specific AI TAs and AI-augmented teaching [9], [10], [11]. In prior research, we developed and evaluated a course-grounded AI TA based on Custom GPT, with particular attention to implementation choices and effects on student learning [9]. Related work also examined broader pathways toward AI-augmented teaching in higher education and the practical design choices required for responsible instructional use [10]. More recently, the same design

logic has been extended to other educational contexts, including medical education, suggesting that course-specific AI TAs can be adapted across disciplinary settings while retaining the same underlying concerns about grounding, pedagogy, and governance [11]. The present study builds on that line of work by moving from a single platform case to a comparative, cross-platform analysis.

Observations from practice motivate this comparison. The educational value of an AI TA depends on grounding in the course-specific context. A helpful course assistant should begin with the course's own materials, including the syllabus, lecture slides, lab guides, research projects, and other related academic resources, before relying on external resources. Furthermore, academic integrity cannot be simply assumed. Default assistants may be helpful yet still permissive, which means support patterns and coaching strategies must be deliberately designed and implemented in line with the instructor's teaching plan and philosophy. Additionally, institutional constraints, such as licensing, device configuration, privacy protections, ethical issues, and instructor oversight, shape whether an apparently useful system can be adopted fairly and responsibly across a course or program. Therefore, the evaluation focuses on several criteria that, in our judgment, best predict classroom usefulness and institutional adoptability: knowledge capacity and persistence; internal grounding and citation fidelity; external scholarly retrieval and citation completeness; academic integrity and ethics; mobility across devices; multimodal utility; and cost and usability within the institutional setting. We intentionally do not foreground timing comparisons or decontextualized accuracy leaderboards. In this course setting, those measures were less informative than the broader question of whether a platform could function as a dependable instructional assistant under realistic teaching constraints.

This study makes three contributions. First, it provides a replicable approach to evaluating course-specific AI teaching assistants under realistic instructional constraints. Second, it offers a platform-aware analysis that links observed behavior to governance choices, including what can be achieved through no-code configuration alone and when institutions may need to migrate toward SDK or LMS-based deployments for retrieval augmentation, logging, and learning analytics. Third, it offers practical guidance for instructors and institutions by identifying the conditions under which each platform is most useful and the trade-offs that accompany those choices. In this sense, the study moves the discussion from generic chat toward governed assistance: systems that begin with the course's own voice and values, support learning without requiring completion of graded work, and fit within the institutional fabric of higher education.

2. Background and Related Work

Prior work has established the promise of AI in higher education, while also warning that pedagogical value depends on context, governance, integrity safeguards, and institutional readiness [12], [15]. More recent studies and policy analyses suggest that institutions are moving away from blanket prohibition and toward more explicit guidance on acceptable use, attribution, course-level expectations, and AI literacy [16], [19]. Within that landscape, course-specific AI TAs have emerged as a particularly useful model because they can be anchored to local materials, shaped by instructor intent, and evaluated against concrete pedagogical goals rather than generic chatbot performance [9], [10], [11]. In this study, we examine three widely used AI platforms by configuring each with the same course materials and integrity policies and then comparing their pedagogically relevant trade-offs through hands-on experiments.

OpenAI's Custom GPT feature provides one of the widely recognized no-code pathways for building a course-specific assistant. Instructors can define persistent instructions, upload course materials as knowledge, and enable additional capabilities such as web search, data analysis, and connected tools. As of today, a GPT can include up to 20 uploaded knowledge files, with each file limited to 512 MB, making the platform attractive for courses that rely on extensive lecture decks, policies, lab guides, and reference materials. A major strength of Custom GPTs is controllability. The platform allows instructors to shape tone, refusal behavior, prompting logic, and task boundaries with relatively fine granularity, which is especially useful in courses where academic integrity expectations must be explicit. Custom GPT also offers broader sharing options than the other no-code platforms examined here, including direct link sharing and managed workspace distribution.

Anthropic's Claude Projects allows instructors to define project-level instructions and upload persistent files so that students remain inside a bounded course context rather than using a general chatbot with no local grounding. Furthermore, Skills now add reusable task behavior and can be shared or provisioned in some plan contexts, which materially strengthens customization beyond simple prompt writing. However, as of today, sharing is more constrained than in ChatGPT. Claude Projects can be shared organization-wide or invitation-based within the same organization, rather than openly

distributable through a general-public-style URL. Therefore, if the instructor and students are not affiliated with the same university, they cannot share Claude Projects for AI TAs. Usage limits are also dynamic and depend on factors such as load, conversation length, model use, and attachments. Even with those constraints, Claude remains a compelling option when instructors want a fast setup, a strong integrity posture, and course-grounded behavior without extensive prompt hardening.

Google's Gemini Gems lets instructors define a reusable assistant with custom instructions and attached materials, and Gemini is particularly effective when students need help interpreting screenshots, diagrams, figures, or mixed-media inputs. Gemini's practical constraints are different from those of ChatGPT and Claude. Google's current documentation emphasizes file and storage upload limits, as well as rolling usage limits, rather than presenting Gems as an unrestricted, persistent knowledge environment. Gemini Apps support file-backed interaction, but large or numerous uploads can exceed context windows or reduce response quality, and the platform explicitly warns that oversized uploads may cause missed details or weaker cross-document connections. Gemini also supports sharing, including viewer and editor roles, but attached files become visible to users with access, which raises governance questions when instructors work with copyrighted, licensed, or sensitive course materials. A further limitation for this use case is that Gems cannot currently be used with Gemini Live, so voice-based interaction does not extend to the custom course Gems. As with the other no-code platforms, built-in instructor-side logs are limited.

At the time of writing, several other popular AI platforms are relevant to higher education, including Grok (xAI), Microsoft Copilot, Mata AI, and others, but none currently offer the same combination of usability, course-specific grounding, and instructor-ready no-code deployment as Custom GPTs, Claude Projects, and Gemini Gems. We therefore exclude them from the comparative analysis in this study.

3. Building Course-Specific AI TAs (Same Knowledge, Different Platforms)

We built three course-specific AI TAs intended to serve the same instructional purpose across different platforms. The goal was not to optimize each platform separately, but to hold the teaching intent constant and evaluate the capabilities and constraints across Custom GPT, Claude Projects, and Gemini Gems. Our priorities were straightforward: make the setup replicable, keep the instructions clear, and avoid design choices that would create uneven access for students.

3.1 Study Setup and Key Constraint

We developed three course-specific AI TAs for the same course using the same course description, custom instructions, syllabus, lecture materials, and related resources. However, there is a critical platform-level constraint in one of the AI platforms. During our study period, the Gemini configuration we used limited the number of uploaded files in persistent use to 10, whereas Claude Projects and Custom GPTs could accommodate the full set of 21 course materials. As a result, the Gemini TA included only the syllabus and core lecture decks, whereas the Claude and Custom GPT versions also included lab manuals, external course resources, relevant research articles, and other academic resources. This directly affected how fully each TA could stay grounded in the course. In our setting, that difference became one of the most important practical limitations of Gemini.

3.2 Pedagogical Goals

The three TAs were built around the same instructional goals. First, they were expected to clarify concepts from lectures and labs. Second, they were expected to support problem-solving without giving away graded answers. Third, they were expected to direct students back to the relevant course materials rather than providing generic advice. Fourth, the TA was intended to function more like a guided study partner than a simple answer provider. That distinction has become increasingly important in recent work on generative AI in higher education, especially in discussions of student agency, tutoring, and ethical use [19], [20].

3.3 Standardized Instruction Block

Across all three platforms, the AI TAs were given the same operating logic. Accuracy was prioritized over speed. If a prompt was unclear, the AI TA was instructed to ask clarifying questions before answering. It was instructed to search the persistent course knowledge first, including the syllabus, lecture slides, lab materials, and related course materials, before producing a response. If that

knowledge was insufficient, it was instructed to request the missing information from external sources and cite them clearly. When students attached PDFs or images, the AI TA was expected to interpret them and explain what they showed. It was also encouraged to ask reflective follow-up questions, recommend credible external resources when appropriate, and defer questions about policy, schedule, and requirements to the syllabus and other course materials.

3.4 Optional SDK / External Tools

This study focuses on no-code classroom feasibility: how quickly an instructor can launch a usable AI TA, how much integrity support appears by default, and how much can be done without development support. Once an API layer is added, results begin to depend on engineering choices such as retrieval design, chunking strategy, tool orchestration, interface design, logging architecture, and caching. They can easily overshadow the out-of-the-box differences between platforms. For that reason, including SDK-based implementations in the present study would have made the findings harder to interpret. It would also have introduced additional data governance and research complexities, including decisions about storage, consent, retention, deletion, and institutional review. Therefore, we consider SDK and external tools as an important future path rather than part of the baseline comparison in this study.

4. Results and Comparative Analysis

Following the development of AI TAs for the same cybersecurity course across the three AI platforms described in the previous sections, we conducted a systematic evaluation and comparative analysis. This analysis examined multiple critical dimensions, including Customization Depth, Ease of Use, Course Resource Integration, Interface and Accessibility, Multimodal Capabilities, Privacy and Ethical Controls, Institutional Cost, and Pedagogical Impact. The results of this comparative evaluation are summarized in Table 1.

Table 1. Comparative Analysis of AI TA Platforms

Criteria	ChatGPT (Custom GPTs)	Claude (Projects + Skills)	Google (Gemini Gems)
Customization Depth	Very High — Persistent instructions, knowledge files, optional actions/apps, and version history.	High — Persistent project instructions/files; Skills extend customization but add governance and security caveats.	Moderate — Instructions, file-backed context, previewing, and sharing, but fewer explicit control layers.
Ease of Setup	Moderate — Streamlined builder, but strong performance still depends on careful prompt design and testing.	High — Simple workflow: create project, upload files, add instructions, and use persistently.	High — Fast setup, simple previewing, and optional AI-assisted instruction rewriting.
Course Resource Integration	Strong — Knowledge files are designed for persistent reference during conversation across common file types.	Strong, with format caveats — Supports multiple file types, but PDFs are best when visual elements matter; non-PDF documents are treated mainly as text.	Moderate — File-backed knowledge works well, but storage, upload, and large-file caveats are more prominent.
Interface & Accessibility	Strong — Private, link-based, workspace, and broader sharing options depending on plan and admin settings.	Moderate — Project sharing is mainly organization-wide or invite-only; Projects do not offer the same general link-sharing model as ChatGPT GPTs.	Strong — Available on the Web, mobile, and Workspace side panel; supports private, organization, link, or public sharing depending on account settings.
Multimodal Capabilities	Strong — Supports documents, spreadsheets, images, code, Web search, image generation, voice chat, and data analysis options.	Moderate — Good document/image support; visual interpretation is strongest in PDFs, weaker in non-PDF documents with embedded images.	Very Strong — Broad support for documents, spreadsheets, images, videos, code repositories, and data visualization.
Privacy & Ethics Controls	Strong — Workspace restrictions, compliance availability, and analytics in managed deployments.	Strong — Clear organizational boundaries for Projects and collaboration controls, but Skills introduce	Moderate — Admin controls and enterprise protections exist, but shared Gems expose instructions and

		prompt-injection and data-exfiltration risks.	uploaded files to authorized users.
Institutional Cost	Variable — Paid access and institutional governance options exist, but institutional licensing and entitlements must be verified locally.	Variable — Plan access is clear, but institutional licensing and entitlements must be verified locally.	Variable — Feature access depends heavily on Workspace and Google AI licensing; Institutional licensing and entitlements must be verified locally.
Pedagogical Impact	High — Best fit for tightly guided course assistants that require strong behavioral guardrails and durable reference to course materials.	High — Particularly strong for writing-intensive, discussion-based, and reflective learning support.	Moderate — Especially useful when multimodal course materials or Google Workspace integration are central.

As of April 2026 (at the time of this writing), our comparative analysis finds that Custom GPT stands out as the most fully featured no-code platform for a deeply customizable, tightly governed, shareable, course-specific AI TA deployment. Claude Project has closed the gap, particularly with the addition of Skills, though it remains more constrained in Project sharing across organizations/institutions and dynamic usage. Gemini Gems offers the strongest multimodal and Google-native integration but remains limited by upload, storage, and context-window constraints.

5. Recommendations: When to Choose Which Platform (Decision Matrix)

Selecting among Custom GPTs, Claude Projects, and Gemini Gems depends less on which platform is "best" in the abstract than on which platform best fits the instructional scenario, course-specific support, governance requirements, and interaction mode of a given course. Accordingly, Table 2 presents scenario-based recommendations drawn from our comparative analysis and current vendor documentation. Rather than designating a universal winner, we align each platform with the use cases for which its documented capabilities are presently the best fit.

Table 2. Decision Matrix for Selecting a Course-Specific AI TA Platform

Instructional Scenario	Primary Choice	Notes
Fast, low-friction no-code launch with strong governance controls	Claude Projects	Claude Projects provide a simple no-code workflow: create a project, upload files, add project instructions, and keep chats scoped to that project. Skills can extend functionality, but they are optional and may require admin enablement or added security review.
Large, persistent course knowledge base (labs, policies, articles, slide decks)	Custom GPTs or Claude Projects	ChatGPT Custom GPTs support persistent knowledge files and no-code configuration. Claude Projects also provide a persistent project knowledge base and document automatic RAG (Retrieval-Augmented Generation) scaling for large project knowledge.
Heavy visual, screenshot, figure, and diagram workflows	Gemini Gems	Gemini is the strongest fit when course interaction depends heavily on multimodal inputs such as images, charts, screenshots, videos, spreadsheets, or code repositories.
Voice conversations with the TA	Custom GPTs	OpenAI explicitly documents voice conversations with GPTs. Claude also supports full voice conversations. Gemini Gems are not currently usable with Gemini Live.
Current-information retrieval, external links, and source-grounded answers	Custom GPTs or Claude Projects	ChatGPT Custom GPTs can enable Web search as a built-in capability. Claude documents live web search with citations and direct URL fetching when web search is enabled.
Auditability, analytics, and institutional oversight	Custom GPTs	OpenAI currently documents the clearest GPT-specific managed-workspace governance stack, including RBAC (Role-based Access Control), sharing controls, action-domain restrictions, compliance visibility, and GPT-level workspace analytics. Claude also now documents meaningful Team/Enterprise analytics and exports, but the GPT-specific governance model is most explicit in OpenAI's Enterprise/EDU documentation.

Broad student-facing sharing by link or public discovery	Custom GPTs or Gemini Gems	ChatGPT supports private, workspace, link-based, and GPT Store/public sharing depending on plan and admin settings. Gemini supports private, organization, anyone-with-link, or public sharing depending on account type and admin controls. Claude Projects are primarily organization-visible or invite-based rather than generally public project links.
Instructor/TA collaboration inside an organization-scoped workspace	Claude Projects	Claude Projects are especially well suited when instructors and TAs need a shared, persistent workspace with project knowledge, project instructions, and organization-scoped visibility settings. Gemini Gems supports collaboration via the extended Google ecosystem.
Cost and usability under campus provisioning	Locally dependent; verify before recommending	This category remains institution specific. Platform availability, sharing permissions, model access, and governance features depend heavily on local licensing, admin settings, and procurement terms.

Taken together, the scenario matrix summarized in Table 2 suggests that no single AI platform can be regarded as uniformly optimal across instructional scenarios. Rather, each appears to support a distinct area of comparative advantages and is constrained by pedagogical purpose, interaction design, and governance requirements. In contexts where persistent course-specific materials, flexible student-facing availability, voice interaction, and the possibility of later migration to a more formally managed institutional environment are central, the OpenAI ecosystem appears especially well aligned. By contrast, Anthropic's project-based workflow is particularly well suited to cases in which instructors prioritize rapid no-code setup, organization-scoped collaboration, and relatively bounded instructional use, although these advantages should be considered alongside its more limited sharing model and the additional governance considerations associated with enabling Skills. Google's offering, in turn, is most compelling where instructional activity depends heavily on multimodal interaction, such as screenshots, figures, diagrams, charts, video, or other visually rich course materials, especially when those workflows are already embedded in Google's ecosystem. More broadly, the matrix indicates that platform selection is most productively understood not as a simple comparison of model quality, but as a consideration of instructional and institutional fit. Accordingly, the relevant evaluative standard is less about which system performs best in the abstract than which one most appropriately matches the course's knowledge structure, sharing requirements, interaction mode, and oversight context.

As a result, the matrix suggests three practical conclusions. First, Custom GPT is the strongest choice when the instructional priority is a tightly governed, shareable, knowledge-grounded course assistant that may later require stronger institutional oversight or analytics. Second, Claude Projects is particularly appropriate when instructors prioritize setup speed, rapid no-code deployment, and conservative instructional behavior, provided that its more limited Project-sharing model and dynamic usage constraints are acceptable within the same institution. Third, Gemini Gems is best understood not as the most general platform, but as the strongest option when the course design depends heavily on multimodal interaction, visual explanation, or Google Workspace alignment. Therefore, we emphasize that the selection of the AI platform should be treated as a pedagogical and governance decision based on the course objectives and related learning activities rather than merely a model performance.

6. Conclusions and Future Work

In this study, we compared three no-code AI platforms for course-specific AI TAs, using OpenAI Custom GPTs, Anthropic Claude Projects with Skills, and Google Gemini Gems for the same cybersecurity college-level course, and we evaluated them against the pedagogical and governance criteria. While the findings show that no single platform is uniformly superior across educational scenarios, each AI platform reflects distinct trade-offs and is effective in specific instructional conditions. Overall, as of today, Custom GPT offers the greatest behavioral management, customization details, accessibility, and the clearest path toward institutional oversight, making it the most suitable choice when governance and shareability are primary concerns. Claude Projects may provide the rapid no-code deployment and the strongest collaboration features, while its more restricted sharing model limits cross-institutional teaching, especially when the instructor and students are not within the same institution supported by the Claude service. Gemini Gems is the most capable platform for multimodal interaction, especially within the Google ecosystem, but its upload constraints (e.g., limited course knowledge space) and the exclusion of Gems from voice interaction hinder its usefulness as a general-purpose course-grounded assistant. More broadly, these findings reinforce a conclusion from our earlier work on course-specific

AI TAs [9], [10], [11]: AI platform selection is not merely a matter of model performance. It is a pedagogical and governance decision, and instructors are best served by anchoring it in the actual knowledge structure, interaction patterns, course-specific learning activities (e.g., labs, research projects, discussions, etc.), and oversight requirements of their course.

This study directly leads to several directions in future work. First, the accuracy and reliability of each AI platform's knowledge retrieval (i.e., response to queries) need to be formally evaluated. Future work should benchmark each platform against course-specific ground-truth queries to identify where retrieval quality degrades, where hallucinations occur, and how error rates differ across platforms. In a mission-critical educational context such as medicine and cybersecurity, this evaluation is critical. Second, scalability across AI platforms remains a challenge. As AI platforms update their capabilities, tools, storage limits, underlying models, and pricing structures, the trade-offs summarized in Tables 1 and 2 will shift, and the framework developed here should be re-evaluated at regular intervals to remain current. Third, instructor monitoring and auditability represent persistent gaps across all available no-code platforms. For instance, without access to query-response logs, instructors cannot verify if the AI TA behaved appropriately, identify boundary failures, or detect misuse. Therefore, future work should examine SDK-integrated deployments that enable logging, audit trails, and instructor-facing dashboards, building on the governance considerations we have identified here. Finally, extending the cross-platform comparison to additional disciplines, including medicine, law, arts, and engineering, would test whether the trade-offs observed in a cybersecurity context hold across domains with different precision requirements, content structures, and student interaction patterns, building on the cross-disciplinary AI TA framework.

Can AI Learning Systems Build the DeepTech Workforce? A Model for Aligning Education, Labor Markets, and Industry Demands

Waqas Halim

International Edtech Lab, AI4Edu Lab, Canada

Abstract

The arrival of AI is influencing major changes in global economies, yet the talent development ecosystem leveraging AI systems has lagged behind. Consequently, significant gaps in productivity gains persist owing to the failure of the talent development ecosystem to keep pace. This paper argues for a strategic, structured and systematic approach to transform outdated, inflexible and largely inaccessible learning and training models that dominate contemporary workforce development systems. To bridge this scholarly lacuna, the researcher uses a sociotechnical systems perspective and investigates whether AI-supported learning systems can be instrumental as workforce infrastructure. The major discussions in the paper center on workforce development related to deeptech technologies including quantum computing, Internet of Things, nuclear fusion, genetics, and advanced manufacturing. The study adopts a conceptual synthesis, which is informed by workforce development policy literature. The literature review provides insights into structural bottlenecks in education to employment channels and enhances understanding of effectiveness and limitations of learning pathways. The paper evaluates modes such as adaptive learning platforms, skill and competence-based frameworks, and micro-credential ecosystem architecture. Moreover, the analysis underscores how each mode works and differs in facilitating deep-tech skills acquisition. In the final part of the paper, insights enable development of a model for AI-enabled learning systems. The proposed framework is developed through the integration of three core components. First, an intelligence layer maps deep technology competencies based on labor market data. Second, an adaptive learning engine recommends learning pathways. It considers different factors such as learners' backgrounds and changing industry needs. Third, a micro-credentialing system verifies and stores credentials that can be recognized by both employers and educational institutions. Another layer is based on overarching themes like ethics, human factors, data privacy, facilitator's role, equity and governance in the model. This research provides insights to policymakers and other stakeholders to leverage AI not as a system of content delivery but as a learning system and workforce development infrastructure.

Keywords: *Artificial Intelligence in Education; DeepTech Workforce Development; Adaptive Learning Systems; Micro-Credentials; Education–Labor Market Alignment*

1. Introduction and Context

This paper synthesizes and analyzes the emergence of two significant contemporary trends: the growing use of artificial intelligence (AI) in education and workforce development, and the rapid expansion of the deep-tech sector.

Deep Technologies (Deeptech) are defined as breakthrough technological discoveries or engineering/scientific innovations. Their main features are technological uncertainty and long development cycles. These technologies have the potential to reshape economic structures, industries and societies [1].

However, the current system of educational institutions, training providers, and skill assessment frequently remain disconnected from rapidly evolving labor market demands, despite major technological progress. This problem leads to skill shortages in the deeptech sectors despite significant financial focus from the policy-makers and private sector on education and training [2], [3].

These technologies include AI, quantum computing, advanced manufacturing, biotechnology, nuclear fusion, robotics, clean energy, and the Internet of Things (IoT). These technologies are disruptive and knowledge-intensive by structure. As a result, they depend on a highly skilled workforce. Also, for these sectors adapting and responding to the fast-changing technological environments is essential. These challenges arise from inefficiencies and coordination problems in the ecosystem. The accumulation of

these problems makes the integration of learning frameworks with changing industry needs challenging. Several reasons can explain as to why these problems exist.
Based on my analysis, three distinct factors are integrated to address the afore-mentioned problems. They form the basis of the framework:

1. Labor market intelligence, however, it tends to be fragmented and generally lacks any structured approach to directly and consistently inform curricular development.
2. Learning journeys, but the challenge with them is that they tend to be too standardized and rigid despite the fact that career paths have evolved to be diversified.
3. Credentialing mechanisms, but they face major interoperability problems and it is difficult to convert or transfer recognition of skills across sectors and geographies.

The paper highlights the effective use of AI as a workforce infrastructure and not only as educational technologies. The conceptual model is based on socio-technical systems theory and the framework brings three main factors together into a unified workforce development ecosystem, namely; labor market intelligence, adaptive learning, and credential verification.
The key question addressed in the paper is how can AI-based learning systems operate as workforce infrastructure for deep-tech talent development?

2. Literature Review

Governments around the world have pursued different approaches and initiatives to support deeptech workforce development. Policies in the United States have emphasized industry-led workforce initiatives and public-private partnerships to build talent. The European Union has focused on providing broader digital skills. It also relies on lifelong learning strategies. It launched initiatives such as the Digital Education Action Plan in this regard [4]. The SkillsFuture program from Singapore is another important national initiative. But it is more integrated and links the factors like labor market forecasting, credentialing, and continuous workforce development [5]. Although there are institutional and structural variations among these countries, they share a common challenge. Their educational systems, and credentialing systems in particular, are unable to keep pace with fast-changing technological dynamics. OECD shows similar trends in their reports. Their findings identify gaps between labor market requirements and workforce readiness in the developed countries [6], [7]. Overall, the takeaways from these reports indicate that successful workforce development depends less on isolated interventions but more on continuous and systematic coordination between various stakeholders such as educational institutions, employers, policymakers, and credentialing organizations.
Policy reports mention talent shortages as a major challenge in the deep-tech sector. The World Economic Forum [8] projected an increase in job demands in deeptech fields like artificial intelligence, data analytics, cybersecurity, robotics, and advanced technologies. However, it also flagged a shortage of qualified talent in these fields as a major challenge. OECD skills assessments and the National Academies' analysis of AI and the future of work [9] reports have also raised similar concerns.
There are different approaches to workforce development. Each has its own advantages and limitations. For example, adaptive learning systems provide personalization through learner profiling, competency mapping, skills-gap identification, and individualized recommendations [10]. However, their effectiveness depends on the quality of data and the governance involved. On the other hand, skills or competence-focused frameworks lead to better alignment between instructional outcomes and labor market demands. But the biggest challenge facing them is standardization. Likewise, micro-credential ecosystems have the clear advantage of flexible and lifelong learning pathways but fragmentation and limited interoperability across institutions prove to be major obstacles to their efficacy [11]. Collectively, it can be deduced from these findings that deep-tech talent shortages are a systematic coordination problem involving interconnected dimensions.
The literature provides strong insights on major themes connected in this study namely: AI-supported learning systems, workforce development, labor market intelligence, and skills-based credentialing. Most studies on AI-supported learning have illustrated the instructional effectiveness and enhanced learning outcomes [10], [12]. Likewise, workforce development literature on use of AI focuses on its instrumental role in labor market transformation and emerging skill demands [2], [3], [7]. The scholarship on micro-credentials underscores alternative credentialing pathways and lifelong learning opportunities [11]. However, these domains largely remain independently studied. There is limited attention devoted to analysis of gaps in the overall workforce development - particularly using the factors such as labor market intelligence, adaptive learning systems, and credential ecosystems. This paper addresses this gap and introduces an integrated approach for deep-tech talent development rooted in sociotechnical systems theory.

2.1 Sociotechnical Systems Theory

I derive the theoretical foundations of the framework from Sociotechnical Systems (STS) theory. Advanced by Trist and Bamforth [13], the theory is relevant to the thesis as it asserts that the combined impact of social and technical systems enhanced organizational effectiveness. It dispels the false assumption that technological innovation alone can generate sustainable transformation. It has to be complemented by various social dimensions of evolution such as governance structures, institutional arrangements, and human practices.
I apply this model to the workforce development. It is a pertinent model because of its explanatory power of learning systems. And it argues that technological systems cannot be conceived solely as educational technologies for workforce development. More important is the fact that they are embedded within broader ecosystems and involve various stakeholders such as learners, educators, employers, policymakers, credentialing organizations, and technological infrastructures.
An emerging body of scholarship tends to advance the STS theory to digital transformation and AI-supported systems [14]. These studies confirm that efficacy of AI systems is fully achieved when they are complemented by the organizational and institutional processes and policies. Operating them in isolation and viewing them as solely technical interventions do not yield the same level of effectiveness.

2.2 Deep-Tech Workforce Development

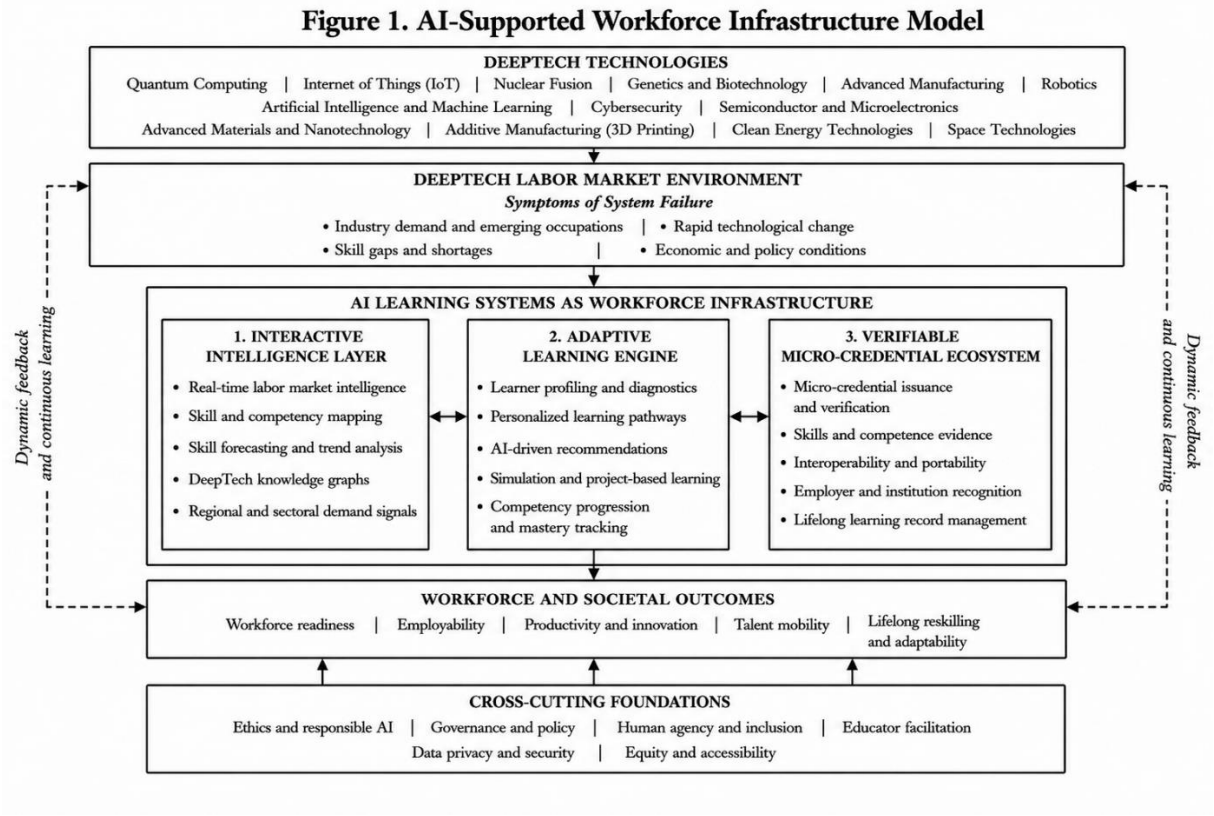
Because deeptech industries are driven by scientific discovery and engineering innovation, they are different from traditional technology sectors. These industries generally face talent shortages due to fast-changing skills requirements and limited educational capacity [8], [6].
Research highlights an increasing demand for competencies related to data analytics, quantum information science, biotechnology, advanced robotics, and cybersecurity [15]. However, educational institutions generally are not able to update curricula as fast as these technologies evolve. As a result, the learners may acquire basic knowledge but lack the market-ready competencies [6]. Nowadays, the emphasis on adopting flexible and responsive mechanisms to workforce development is strengthening. Some of the emerging domains in this area include competence-based recruitment, micro-credentials, and lifelong learning models.

2.3 AI-Supported Learning Systems

Learning systems supported by AI have emerged as a useful educational innovation. Personalized and adaptive learning platforms as well as other platforms operating in the adjacent space such as intelligent tutoring systems and learning analytics tools rely on learner data to personalize the learning experience and provide individual assessment, feedback and even tailor the content according to needs and choices. Applications of AI in education have been documented in domains such as adaptive learning, intelligent tutoring, profiling and predictive analytics, assessment and evaluation, as well as for individualized learning support [16].
Research shows that adaptive systems improve learning outcomes. It is particularly true for structured learning environments. Competence mapping is easier and skill levels can be monitored in these environments [12]. However, the existing literature is limited on workforce and talent development outcomes. Consequently, a research gap exists on learning efficiency of how AI-supported systems in their support for workforce development objectives.

2.4 Skills-Based Credentialing

Micro-credentials and competency-based systems have become common in recent years. They are alternatives to traditional degrees and diploma-based qualifications. They provide evidence of the competencies that learners have gained through focused and short-term learning. Also, they facilitate learners' lifelong educational trajectories.
In spite of these benefits, several challenges remain related to these recognition and assessment systems. One of the main concerns is that they are often fragmented and there is no standardization. Employer recognition structures are also inconsistent. Limited interoperability between institutions and regions is also a major issue [11].



3. Methodology

I use conceptual synthesis as a methodology in this paper. Through this approach, I integrate different dimensions identified in workforce development literature and policy documents. These sources were selected based on their focus on AI-supported learning, talent development, and credentialing systems. Following this, I performed a thematic synthesis to identify recurring patterns, key bottlenecks, as well as implications. The findings led to the development of the framework.
Based on my analysis and synthesis, three different themes emerged: mismatch between educational provision and labor market demand, increasing variations in learner pathways and skill development needs, and fragmentation across credentialing systems. These observations point towards a missing integrated workforce infrastructure that can address these three concerns.

4. Framework Development

The main contribution of my work in the paper is the development of the AI-Supported Workforce Infrastructure Model. This unified framework illustrates workforce readiness in deep-tech sectors. It also builds the framework through the factors that were identified in the research: effective functioning of labor market intelligence, adaptive learning pathways, and interoperability of credential ecosystems.
There is another layer in the framework, which is based on crosscutting dimensions such as ethics and responsible AI, governance and policy, human agency and inclusion, educator facilitation, data privacy and security and equity and accessibility. The framework also adds dynamic feedback and continuous learning as important features between deeptech labour market environment and workforce as well as social outcomes. The process of the AI-supported workforce development mechanisms will be incomplete without these factors. In fact, there can be adversarial outcomes if these dimensions are overlooked and not focused properly.

Figure 1. AI-Supported Workforce Infrastructure Model

Based on its emphasis on the Sociotechnical Systems Theory, the paper argues that AI-supported workforce development cannot be analyzed in isolation. It should not be considered simply as an educational, technological, or labor market issue. Instead, most talent shortage challenges arise from dynamic interaction of institutions, technological infrastructures, policy milieu, labor market requirements and pressures, credentialing systems, and educational ecosystems. Therefore, the paper contends that deeptech talent shortages are systematic failures. And AI has the potential to operate as infrastructure

for repairing those failures. Access to advanced technologies or educational opportunities are important. But the extent to which these interconnected dimensions interact as an integrated whole is more important. This perspective frames the issue differently as a systems problem. It suggests that systematic alignment is a pre-condition for addressing deep-tech talent shortages. This alignment should involve all stakeholders including educational providers, employers, policymakers, and AI-enabled learning infrastructures.

5. Implications for Policy and Practice

The model presents clear guidelines on the importance of prioritizing real-time intelligence capabilities in the deeptech labor market. It also offers recommendations on standardization of digital credentialing. It can be inferred from the discussion that the policymakers must enable conditions for collaboration between education systems and training providers, employers, technology companies, and policy actors. The model also provides practical recommendations to educational institutions. It shifts the focus away from rigid curricular structures towards more flexible architectures. By doing so, it presents a systematic path for educational institutions to adapt to the demands of industries with AI prevalence.
For technological companies and other related employers, the model provides a tool to better communicate emerging competency requirements. As a result, they play a more proactive role in the process of workforce development. It is important to note that the framework does not frame AI as a replacement of educators. It, in fact, re-centers the discussion on the role of educators as facilitators and mentors in talent development.
This framework is conceptual in nature in its present form. Future research can explore its application throughout different deep-tech sectors. It can also be analyzed in different geographical contexts and educational systems. One dimension can be the empirical validation of the framework. Other areas can be on assessment of role of human agency, governance challenges, data privacy considerations, and equity implications.

6. Conclusion

The fast adoption and deployment of AI systems reveals various limitations in the contemporary workforce development systems. The major problem is that current educational structures along with the credentialing systems are not equipped and prepared to keep pace with the changing market realities. Consequently, the economies worldwide face serious skill shortages and underutilization of human talent. This paper calls for rethinking AI-supported learning systems as educational technologies and workforce infrastructure engines at the same time. The AI-Supported Workforce Infrastructure Model is based on insights from the Sociotechnical Systems Theory. The framework brings together labor market intelligence, personalized learning pathways, and credential systems. The work is valuable for the emerging scholarship on the topic of deeptech workforce. It shifts attention from AI, which is conceived as a content delivery mechanism. The discussion in the paper reconceptualizes it as an infrastructure for integrating learning, credential systems, and employment dynamics. Future research should empirically examine the hypothesis in different deep-tech sectors and national contexts. Moreover, special attention should be laid on equity, governance, and sustainable workforce development. As deep-tech industries are expanding, the key problem in the future is not whether AI can facilitate workforce development. Based on the proposed model, it will be how institutions can strategically optimize and manage AI-enabled systems for better adaptation and inclusiveness of talent development ecosystems.

AI Use Declaration

All research, conceptualization, analysis and synthesis are author’s own intellectual contribution. AI is used exclusively for editing and diagram construction. The author takes full responsibility for the content and declares that all materials including text and image content and citations are thoroughly verified.

Reclaiming Pedagogical Agency: The EDEH AI Squad's Main Drivers Framework for Responsible AI Adoption in European Education

Fabrice Serodes

European Digital Education Hub, Belgium

Abstract

In response to the unregulated adoption of artificial intelligence (AI) in European schools, and to address the region's lag behind global technology leaders, the European Commission established the European Digital Education Hub (EDEH) as part of the Digital Education Action Plan (DEAP, 2021–2027). Between October 2025 and January 2026, the EDEH AI Squad — a group of 45 experts selected from across Europe — met online and in person to develop a Main Drivers Framework for the responsible adoption of AI in education. The framework identifies four interconnected drivers: Teacher Training in the Age of AI; Teachers as Co-Designers of AI; Public-Private Partnerships; and Data Literacy in the Age of AI. Drawing on current scholarship and UNESCO guidance, it emphasises a human-centred rather than technocentric approach to AI integration, and is designed as a modular toolkit allowing stakeholders to use each driver independently or in combination. This paper presents the framework's architecture, details the sub-group work on conditions for designing AI courses, analyses the structural tensions inherent in AI adoption across European education systems, and formulates actionable recommendations for policymakers, institutions, and educators.
This paper reflects the views of the author and the EDEH AI Squad. It does not represent the official position of the European Commission.

Keywords: *Artificial intelligence in education; responsible AI adoption; teacher agency; data literacy; public-private partnerships; European Digital Education Action Plan*

1. Introduction

The integration of artificial intelligence (AI) into educational systems has emerged as one of the defining policy challenges of the current decade. European governments and supranational institutions are confronted with two interrelated challenges. Firstly, they must address the persistent structural technological lag relative to global leaders. Secondly, they are tasked with the management of the unregulated use of AI tools by students and teachers across member states. The issue is further compounded by the fact that a significant proportion of AI tools currently employed in educational settings were not originally developed for pedagogical purposes. Instead, these tools have been adapted or repurposed for learning purposes, frequently without the incorporation of appropriate pedagogical safeguards or alignment with the objectives of the curriculum [1].
It is within this policy context that the European Commission established the Digital Education Action Plan (DEAP) 2021–2027, a comprehensive framework providing networking opportunities and institutional instruments for the responsible adoption of digital technologies in education. The European Digital Education Hub (EDEH) was established by the Commission as part of the DEAP. This collaborative platform now comprises more than 7,000 members drawn from across the educational ecosystem. The EDEH is responsible for the organisation of thematic working groups, which are referred to as *squads*. The remit of these squads is to examine specific dimensions of the future of digital education.
In response to an open call launched in September 2025, the EDEH AI Squad was formed and worked from October 2025 to January 2026. Comprising 45 selected members from across Europe spanning education and training, policy, research, learning design, EdTech, and related fields, the squad collaborated primarily online through twice-monthly plenary meetings, complemented by regular working sessions in four sub-groups. A face-to-face workshop was held in Brussels in November 2025. The output of this collaborative process is the Main Drivers Framework, which identifies four interconnected drivers: Teacher Training in the Age of AI; Teachers as Co-Designers of AI; Public-Private Partnerships; and Data Literacy in the Age of AI. The framework was explicitly designed to prioritise a human-centred

approach in keeping with current scholarship [1] and UNESCO guidance [2]. It is intended as a modular toolkit: each driver corresponds to a toolset that can be used independently or combined with others depending on the stakeholder's role, priorities, and starting point.
The paper sets out to explore how the proposed framework's architecture and rationale can address the conditions for designing AI courses while accounting for the structural tensions inherent in European educational systems. It also seeks to identify actionable recommendations for policymakers, institutions, and educators.

2. The Main Drivers Framework: Architecture and Rationale

The integration of responsible artificial intelligence in education can be considered analogous to the construction of a temple resting upon complementary foundations. In order to facilitate the successful integration of artificial intelligence in this field, there is a requirement for distinct but complementary structural supports that are able to reinforce one another. The Main Drivers Framework identifies four such supports. Of particular note is the non-exclusive nature of the drivers' hierarchy: Data Literacy in the Age of AI functions as a transversal thread that connects and underpinns the other three, since data underpins how AI systems function and how their impacts are understood and governed.

2.1 Closing the Professional Development Gap

Teacher professional development in AI has consistently lagged behind the deployment of AI tools in classrooms. To address this, the squad's first driver aims to equip educators with the skills, confidence, and critical awareness needed to understand both the potential and the risks of AI tools before adopting them for classroom use [3]. The driver is built around four pillars: Pedagogical Integration and Learning Design; Foundations, Policy and AI Literacy; Accessibility, Sustainability and Professional Development; and Classroom Practice, Tools and Implementation.
Concretely, the driver produced an advisory report for the European Commission's annual State of AI in Education assessment, a set of guidelines for building AI courses for teachers, and an example course on pedagogical integration and learning design [4]. These outputs are designed to be actionable and replicable across different national educational systems.

2.2 Repositioning Teachers as Co-Creators

AI tools designed without teacher input tend to fail in real classrooms or cause unintended harm, reproducing misalignments between technological capability and classroom reality [5]. Addressing this, the squad produced a coherent four-part mini-pack: a needs analysis explaining why teacher co-design is essential; case studies and a journey map showing what meaningful co-design looks like in practice; a quick partnership checklist structuring collaboration before, during, and after the co-design cycle; and a teacher competency map clarifying what capacities are needed for effective co-design. These instruments reposition educators from end-users to co-creators of AI tools, ensuring that pedagogy, inclusion, ethics, and safety are embedded from the outset [6].

2.3 Governing the Market: Public-Private Partnerships

Pedagogically principled AI integration cannot be sustained without restructuring the relationship between public educational systems and private EdTech providers. To this end, the squad developed Power, Priorities & Pitfalls, a card-based simulation game that enables educators, school leaders, SME owners/developers, and policymakers to explore the real trade-offs in AI-powered public–private partnerships. The game addresses four critical themes — Trust and Quality Assurance, Funding and Sustainable Investment, Governance and Regulation, and Market Fragmentation — through four distinct stakeholder perspectives. It can be deployed in policy labs, conference workshops, system strategy meetings, and training programmes.

2.4 Establishing a Shared Conceptual Vocabulary

Data literacy serves as the pivotal connecting element among all three drivers: it makes teacher training more meaningful, co-design more reliable, and partnerships more balanced. The fourth driver produced two complementary sets of resources: guides for teachers supporting them in learning foundational data and AI concepts, and teaching scenarios and activities for different age groups (8–12, 12–16, 15–19,

and across levels) providing ready-to-use classroom materials. Among the concrete outputs are a practical glossary on data and AI, a traffic-light classification system for classroom data practices (DO / ONLY IF / DON'T), and an AI-assisted guide to data literacy lesson planning.

3. Sub-Group Work: Conditions for Designing AI Courses

Operating within the first driver, the sub-group on teacher training examined the pedagogical, institutional, and ethical conditions under which AI courses can effectively empower educators. Its work was motivated by three structural deficits identified in the literature (Fig.1): knowledge asymmetry, whereby teachers and students frequently lack awareness of ethical and open-source alternatives to dominant commercial platforms; pedagogical misalignment, whereby AI is grafted onto existing curricula without contextual adaptation; and a governance vacuum that exposes schools to vendor lock-in and data exploitation [1][2].

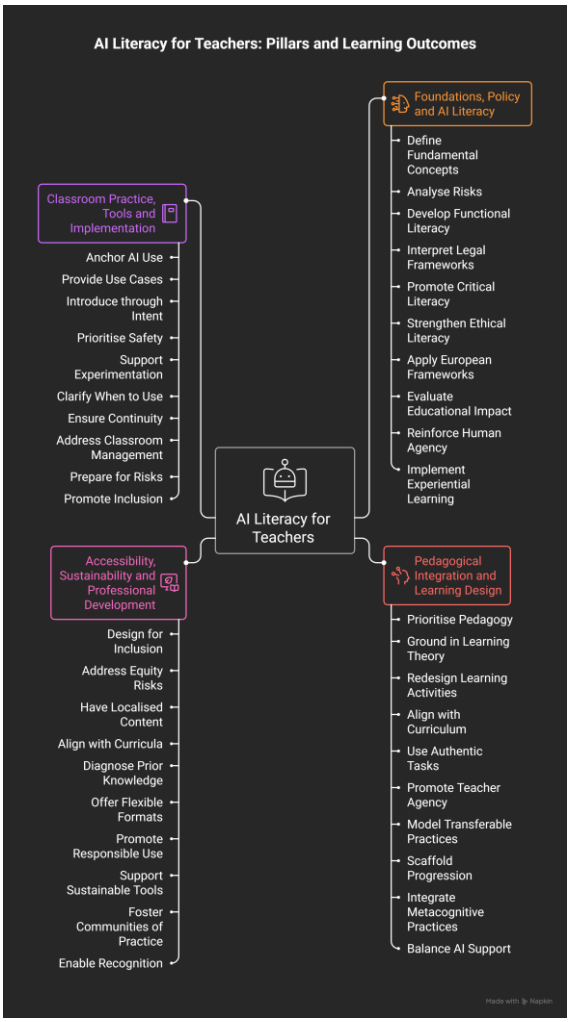

Fig.1. AI Literacy for Teachers: Pillars and Learning Outcomes

3.1 Student Competency Objectives

Responsible AI courses must develop competencies enabling critical, informed interaction with AI systems: digital literacy, computational thinking, ethical awareness, and practical application. At present, the predominance of self-directed learning as the de facto mode of AI skills acquisition produces structurally incoherent learning pathways that may inadvertently reinforce misconceptions [1]. The framework insists that structured curricular provision is not a supplementary option but a governance imperative.

3.2 Teacher Agency and Professional Risks

AI integration reshapes the professional role of teachers in ways that are simultaneously enabling and threatening [7]. Three risks require institutional attention: deskilling, whereby progressive automation of pedagogical tasks erodes professional expertise; loss of agency, whereby teachers risk being reduced to executors of algorithmically generated content; and psychological resistance arising from anxiety about professional identity dissolution [8][9]. These risks are not hypothetical; they are documented in empirical research across national contexts.
The framework's response is threefold: teacher-centred design of AI courses and tools; targeted deployment limited to clearly identified pedagogical challenges; and institutional provision of psychological support to facilitate a productive and sustainable relationship between educators and AI systems.

4. Structural Tensions in AI Adoption

Three structural tensions characterise AI adoption in European education. They are constitutive features of a genuinely complex sociotechnical transition, and the framework articulates principled responses to each.

4.1 Efficiency Versus Pedagogical Autonomy

AI systems are engineered for computational efficiency, optimisation, and scalability; education is fundamentally a relational, contextual, and intrinsically human enterprise [1]. Unmediated, this incommensurability produces a drift towards automation that progressively displaces pedagogical judgement. The framework's response is the principle of augmentation over automation: AI tools must extend what teachers can do rather than perform what teachers should do [10]. This is a categorical normative constraint, not a preference.

4.2 Ethical Compliance Versus Functional Performance

Ethically certified, European-hosted tools offer superior data sovereignty and GDPR compliance but may underperform commercially dominant tools operating outside European regulatory frameworks [2]. Rather than treating this as a binary choice, the framework advocates a stratified strategy: certified tools as the default institutional choice; structured negotiation with commercial providers for contractual safeguards on data use and pedagogical autonomy; and clearly delimited use of commercial tools with explicit constraints on data access and automated decision-making.

4.3 Standardisation Versus Curricular Diversity

The fragmentation of European educational systems — across languages, national curricula, pedagogical traditions, and regulatory frameworks — renders rigid standardisation both practically impractical and normatively undesirable [1]. The framework's response is the concept of flexible standardisation: common frameworks provide structural coherence while systematic local adaptation, peer learning communities, and multi-directional knowledge exchange preserve institutional autonomy and contextual relevance.

5. Recommendations

At the policy level, governments and European institutions should substantially increase investment in AI-specific teacher professional development programmes, introduce legally binding standards for public-private partnerships in education technology, and prioritise public funding for European AI tools designed specifically for educational contexts.
At the institutional level, educational establishments should adopt ethical procurement frameworks for AI tools, involve teachers actively in tool selection and evaluation, and establish communities of practice for sharing AI course design experiences across disciplines and national contexts.
At the level of individual educators, a stance of informed criticality towards AI tools, active engagement in co-design processes, and an incremental implementation strategy allowing for evidence-based adjustment of practice over time are the conditions under which responsible adoption can be sustained [2].

6. Discussion and Limitations

As an EDEH working document, the Main Drivers Framework has not been subject to formal peer review or large-scale empirical validation, and several recommendations retain a prospective and normative character. Its European scope may limit applicability to contexts operating under different regulatory regimes and institutional traditions. The pace of AI development also means that specific tool recommendations risk rapid obsolescence — a vulnerability the framework mitigates by anchoring guidance in durable pedagogical principles rather than in the capabilities of particular tools.
AI adoption in European education carries genuine risks alongside real opportunities. The risks — loss of professional autonomy, overreliance on AI, data exploitation, reinforced inequities, commercialisation of education, linguistic and cultural hegemony, spread of misinformation and bias, and environmental impact [11] — fall disproportionately on educators in less well-resourced systems. A framework that insists on teacher agency as both the means and the end of responsible AI adoption is therefore also, implicitly, a framework for educational equity.

7. Conclusion

Responsible AI adoption in European education requires more than technical guidance: it requires a governance architecture that places pedagogical agency, ethical grounding, and systemic sustainability at its centre. The EDEH AI Squad's Main Drivers Framework offers such an architecture — modular, human-centred, and attentive to the structural tensions that any serious engagement with AI in education must navigate. The four drivers — teacher training, co-design, public-private partnerships, and data literacy — are designed to function as a coherent yet flexible toolkit, not a prescriptive hierarchy.
Future research should prioritise empirical validation across diverse European educational contexts, and the development of evaluation instruments capable of measuring the impact of human-centred AI adoption on both learning outcomes and teacher professional wellbeing.

Digital Transformation and Student Engagement in Higher Education: An ICT and E-Learning Perspective

Malebo Suzan Mulaudzi

University of Johannesburg, Johannesburg Business School, South Africa

Abstract

The digital transformation of higher education has reshaped pedagogical practice and the conditions under which students engage with academic content. Despite substantial institutional investment in Information and Communication Technologies (ICT) and e-learning platforms, the literature has yet to produce a coherent account of how such investment translates into meaningful student engagement. This paper synthesises peer-reviewed scholarship on digital transformation, ICT adoption and e-learning quality to develop an integrated conceptual framework grounded in the Technology Acceptance Model (TAM), Constructivist Learning Theory (CLT) and the Student Engagement Framework (SEF). Drawing on a narrative and critical review of literature published between 2013 and 2026, the analysis examines how perceived usefulness, instructional design and institutional support converge to shape the behavioural, cognitive and emotional dimensions of engagement. The synthesis demonstrates that digital transformation enhances engagement only when ICT tools are accessible, pedagogically aligned and supported by digital readiness, leadership and inclusive design. Conversely, infrastructural deficits, weak instructional design, low digital literacy and persistent digital divides constrain engagement, particularly in South African and developing-country contexts. The framework positions student engagement as the central outcome of an enabled, mediated and pedagogically grounded transformation process. It offers theoretical, practical and policy guidance for advancing engagement-centred digital strategies in resource-constrained higher education settings.

Keywords: *Digital transformation; student engagement; ICT in education; e-learning quality; technology acceptance; South African higher education*

1. Introduction

Over the past decade, the integration of digital technologies into higher education has accelerated, repositioning ICT and e-learning platforms from peripheral instructional aids to central pillars of teaching, research and student services [1, 2, 3]. The COVID-19 pandemic acted as a forced accelerant of this trajectory, exposing both the latent capabilities and the structural fragilities of institutional digital infrastructures [4, 5]. Despite considerable investment, however, the relationship between digital transformation and student engagement remains insufficiently understood [6, 7]. Engagement, conceptualised across behavioural, cognitive and emotional dimensions, is widely regarded as a primary determinant of academic success [8, 9]. However, much of the existing scholarship examines transformation and engagement in isolation, focusing on specific tools or modalities without producing an integrated theoretical account [10, 11]. These limitations are amplified in the South African and broader developing-country context, where transformation imperatives intersect with persistent digital inequality, infrastructural constraints and the Fourth Industrial Revolution agenda [12, 13].

The existing literature exhibits three interrelated weaknesses. First, it remains fragmented: perceived usefulness, system quality, digital readiness and instructional design are typically examined in isolation rather than as a coherent multi-level account of how transformation reaches students [6]. Second, the behavioural, cognitive and emotional dimensions of engagement are seldom addressed simultaneously, with observable participation privileged in empirical work while deeper cognitive investment and emotional connection remain under-theorised [9, 17]. Third, much scholarship rests on infrastructural and cultural assumptions that do not transfer cleanly to South African and developing-country settings, where digital divides and infrastructural gaps remain constitutive of the transformation process [12, 18].

Against this backdrop, this study synthesises secondary literature to develop an integrated conceptual framework grounded in TAM, CLT and SEF, designed both to clarify how digital transformation shapes engagement and to extend the theoretical repertoire for analysing transformation in resource-constrained settings. Three objectives guide the analysis: to synthesise published scholarship on digital transformation, ICT adoption, and e-learning quality in higher education; to examine how ICT tools and

e-learning quality shape the behavioural, cognitive, and emotional dimensions of student engagement; and to integrate TAM, CLT, and SEF into a unified conceptual model. The remainder of the paper presents the literature review (Section 2), the research methodology (Section 3), the findings (Section 4), the proposed conceptual framework (Section 5), the discussion (Section 6), the study's contribution (Section 7), and the conclusion (Section 8).

2. Review of Related Literature

The literature review is organised thematically to support the conceptual framework presented in Section 5. Three thematic clusters are examined: digital transformation in higher education, ICT adoption and e-learning quality, and the dimensions of student engagement, each interrogated for the patterns on which the literature converges, the contradictions it sustains and the gaps it leaves unresolved. A concluding subsection integrates the three theoretical resources whose convergence yields the framework.

2.1 Digital Transformation in Higher Education

Recent scholarship reframes digital transformation away from tool deployment and towards a comprehensive reconfiguration of teaching, learning, research, and administrative practice [6, 19]. [14] argues that present concerns centre on organisational change, leadership, faculty experience, and inclusive strategy rather than on technology procurement alone, with digital leadership recurring as a particularly consequential capability that mediates resource allocation, faculty support, and digital culture [20, 22]. The literature remains divided, however, on the experiential consequences of transformation. One stream emphasises its productive and emancipatory potential [3, 4]; another foregrounds its costs, administrative burden, digital fatigue, faculty resistance and inequities in competence and access [23, 24]. The contradiction is one of emphasis rather than fact: the same processes generate both effects, with the relative weighting determined by the institutional substrate in which they unfold. A persistent gap persists: frameworks developed in well-resourced settings transfer poorly to South African and other developing-country contexts unless they explicitly address structural deficits in connectivity, devices, and digital literacy [13, 18]. This body of work motivates Tier 1 of the proposed framework, in which institutional digital transformation is captured as a strategic, infrastructural and cultural reconfiguration.

2.2 ICT Adoption and E-Learning Quality

If institutional transformation establishes the strategic backdrop, ICT adoption and e-learning quality constitute the technical-pedagogical mechanism through which transformation reaches students. A consistent pattern in the adoption literature identifies perceived usefulness, perceived ease of use, institutional support, infrastructural reliability and content quality as core determinants [26]. E-learning quality, operationalised through usability, content relevance, interactivity, and technical reliability, has likewise been identified as a critical determinant of satisfaction and learning outcomes [16, 27, 28], with the pattern holding across institutional types, national settings, and the most recent generation of adaptive, AI-driven, and immersive systems [29]. The literature presents a sharp contradiction, however, over whether technical quality is, in itself, sufficient. Tool-specific findings frequently fail to generalise, and a substantial body of evidence demonstrates that ICT-mediated pedagogy produces engagement gains only when integrated with disciplined teaching practice [32]. Chaturvedi et al. [34] show that effective deployment, rather than infrastructure alone, distinguishes outcomes, a finding at odds with tool-deployment narratives that treat platform quality as the dominant variable. The conceptual bridge between adoption decisions and learning engagement remains thinly developed: TAM-style accounts explain user perceptions but not how adoption translates into pedagogical conditions [35], while constructivist accounts specify those conditions but offer little guidance on adoption antecedents. This literature motivates Tier 2 of the framework, perceived usefulness, ease of use, usability, interactivity and content quality, and justifies the claim that Tier 2 is necessary but not sufficient and must be coupled with Tier 3 mediating factors.

2.3 Student Engagement Dimensions

The tripartite conceptualisation of engagement, behavioural, cognitive and emotional, has achieved near-universal adoption in the digital learning literature [8, 37]. Behavioural engagement encompasses

participation, task completion and observable interaction; cognitive engagement refers to depth of intellectual investment, metacognitive strategy use and active knowledge construction; emotional engagement captures motivation, interest and a sense of belonging. The construct's analytic robustness is substantiated by Bond et al.'s [8] systematic mapping of 243 studies. The literature, however, sustains a sharp contradiction over the relationship among the three dimensions. One stream treats engagement as additive, assuming that interventions targeting any single dimension contribute to overall engagement [38, 39]. A second demonstrates that the dimensions are configurational rather than additive: tools driving behavioural participation may simultaneously displace the cognitive depth they were intended to enable [15], and behavioural metrics frequently fail to predict learning achievement, which depends on the configurational pattern of cognitive and emotional engagement [40]. [8] further show that behavioural engagement is the most frequently observed dimension and cognitive engagement the least often theorised, skewing the empirical base toward easily measured rather than consequential variables. Recent work maps differential responsiveness: emotional engagement is tied to inclusive design, social presence and culturally responsive pedagogy [43]; cognitive engagement is most sensitive to instructional design and constructivist alignment [37]; and behavioural engagement responds most directly to access and ease of use [42]. This literature motivates Tier 4 of the framework.

2.4 Theoretical Integration

Three theoretical resources jointly yield the framework. TAM, refined in recent applications to augmented reality and emotion-augmented engagement, explains the perceptual antecedents of adoption at Tier 2 [35, 36]. Constructivist Learning Theory, applied by [44] through socio-constructivist and ecological lenses, specifies the pedagogical conditions under which adoption deepens into cognitive engagement at Tier 4. The Student Engagement Framework provides the analytic taxonomy through which Tier 4 outcomes are observed [9]. TAM accounts for perception-level antecedents, CLT for pedagogical conditions and SEF for outcome taxonomy; the mediating layer at Tier 3 is where these resources jointly do their explanatory work.

3. Research Methodology

This study employs a conceptual research design grounded in a narrative and critical review of secondary literature. The design is appropriate to the study's objective of developing a framework rather than testing a priori model against new empirical data. The narrative–critical review tradition is well established in higher education research as a vehicle for theoretical integration across heterogeneous empirical contexts. No primary data were collected, and no human participants were involved. Sources comprised peer-reviewed journal articles, edited book chapters and conference proceedings published between 2013 and 2026, retrieved from five databases: Scopus, Web of Science, EBSCOhost, ScienceDirect and Google Scholar. The 2013–2026 window captures contemporary digital transformation literature, including pre- and post-pandemic discourse on online and blended learning. Search terms combined three conceptual clusters digital transformation ('digital transformation higher education', 'digitalisation higher education', 'ICT in higher education'); adoption and quality ('technology acceptance model higher education', 'e-learning system quality'); and engagement ('student engagement digital learning', 'behavioural cognitive emotional engagement') with contextual terms such as 'South Africa', 'developing country' and 'digital divide higher education' to surface scholarship relevant to the study's regional focus. Inclusion criteria specified English-language peer-reviewed sources within the date range with a substantive focus on digital transformation, ICT adoption, e-learning quality, student engagement or technology acceptance in higher education; sources were retained where they addressed one of the three theoretical lenses or contributed empirical evidence on enabling and constraining factors. Editorials, blog posts, non-peer-reviewed grey literature, sources focused exclusively on school-level or corporate training contexts and duplicate records were excluded. The final corpus comprised 48 sources.

Analysis proceeded in three stages. The first was thematic coding: each source was coded against the three thematic clusters, and recurring patterns, theoretical claims and contradictions were identified [7, 14]. The second was theoretical mapping: each thematic cluster was related to TAM, CLT, and SEF to identify which lens did the explanatory work at each point. Convergences and divergences were used to specify the conditions under which competing claims hold, rather than to reconcile them artificially. The third was framework construction: the theoretical mapping was integrated with structural patterns from the thematic coding to produce a multi-tier framework. The framework was validated through three internal checks consistency with each theoretical lens, capacity to accommodate empirical patterns and

contradictions, and applicability to South African and developing-country contexts. Three design limitations should be acknowledged: the framework is constructed from secondary literature rather than tested against primary data; the English-language inclusion criterion may have excluded relevant Francophone and Lusophone African scholarship; and the privileging of peer-reviewed sources may underrepresent practitioner knowledge.

4. Findings

The secondary data synthesis identified four interrelated themes between digital transformation and student engagement.

Theme 1: Digital transformation is multi-dimensional, and its experiential consequences are contested

Across the corpus, digital transformation is consistently reframed as a comprehensive reconfiguration of teaching, learning, research and administrative practice rather than a tool-deployment exercise [1, 6, 19]. The literature, however, is divided over the experiential consequences of that reconfiguration. One stream documents its productive and emancipatory potential [3, 4]; another documents its costs, administrative burden, digital fatigue, faculty resistance and inequities in competence and access [23, 24]. The two streams are not factually inconsistent: the same processes generate productive and costly effects simultaneously, with the institutional substrate (strategy, leadership, infrastructure and culture) determining which effect dominates in a given setting. Two propositions follow. First, accounts presenting transformation as uniformly progressive overstate the evidence. Second, the institutional and cultural conditions under which transformation is implemented are themselves part of the explanation for engagement outcomes, not preconditions to be assumed.

Theme 2: ICT adoption and e-learning quality are necessary but not sufficient for engagement

The adoption literature consistently identifies a core set of determinants shaping ICT uptake and e-learning quality: perceived usefulness, perceived ease of use, institutional support, infrastructural reliability, content quality, usability and interactivity [4, 25–28, 32]. The pattern holds across institutional types, national settings and the most recent generation of adaptive, AI-driven and immersive systems [29–31]. The same literature equally consistently demonstrates that the presence of these determinants is necessary but not sufficient. [34] show that effective pedagogical deployment, rather than infrastructure alone, distinguishes outcomes; [33] shows interactive tools yield stronger results when they enable active rather than passive engagement; [26] shows ICT-mediated pedagogy produces engagement gains only when integrated with disciplined teaching practice. Technical and adoption-level conditions establish the possibility of engagement but do not produce it; translation depends on the pedagogical and institutional mediating layer linking Tier 2 to Tier 4.

Theme 3: Student engagement is configurational rather than additive across its three dimensions

The tripartite conceptualisation of engagement [8, 9, 37] is near-universally adopted, but the relationships among the three dimensions are contested. One stream treats engagement as additive, assuming interventions targeting any single dimension contribute to overall engagement [38, 39]. A second stream demonstrates that the dimensions are configurational rather than additive: tools driving behavioural participation may displace the cognitive depth they were intended to enable [15, 17], and behavioural metrics frequently fail to predict learning achievement, which depends on the configurational pattern of cognitive and emotional engagement [40]. [8] show that behavioural engagement is the most frequently observed dimension and cognitive engagement the least theorised, skewing the empirical base toward easily measured rather than consequential variables. Differential responsiveness is therefore both empirically warranted and analytically necessary: behavioural engagement responds most directly to access and ease of use; cognitive engagement is most sensitive to instructional design and constructivist alignment; emotional engagement is most responsive to inclusive design, social presence and culturally responsive pedagogy [37, 41, 42, 43].

Theme 4: Constraining factors are systematically more salient in South African and developing-country contexts

The mediating layer of enablers and constraints behaves asymmetrically across contexts. In well-resourced settings, enabling factors such as digital readiness, instructional design quality, institutional support, digital leadership, faculty digital competence and inclusive design dominate analytical attention [20, 22, 44]. In South African and developing-country settings, constraining factors, such as digital divides, infrastructural deficits, low digital literacy, faculty resistance, weak strategic alignment and gendered patterns of access, are systematically more salient and persistently shape engagement outcomes [12, 13, 18, 46]. Enablers are not absent in such settings; rather, the gradient of constraint is steeper, and frameworks developed in well-resourced contexts cannot be transposed unmodified without distorting empirical reality. This asymmetry is the empirical basis for the framework's decision to treat constraining factors as constitutive of Tier 3 rather than as residual noise.

5. The Proposed Conceptual Framework

Drawing on the four findings, this section presents the integrated conceptual framework, the study's principal output. The framework positions student engagement as the central outcome of a multi-level, theoretically integrated digital transformation process comprising four interrelated tiers: institutional digital transformation as the strategic driver (Tier 1); ICT adoption and e-learning quality as the technical-pedagogical mechanism (Tier 2); mediating, enabling and constraining factors (Tier 3); and student engagement in its behavioural, cognitive and emotional forms as the principal outcome (Tier 4).

Tier 1 captures the strategic, infrastructural, and cultural reconfiguration through which institutions pursue digitally enabled missions, invest in infrastructure, formulate a digital strategy, establish digital leadership, and embed digital culture [1, 2, 20]. Without institutional-level commitment, lower-level investments remain disconnected from a coherent architecture and fail to produce systemic change.

Tier 2 operationalises the mechanism through which transformation reaches students: ICT adoption depends on the central TAM variables of perceived usefulness, perceived ease of use and institutional support, while e-learning quality captures usability, content relevance, interactivity and pedagogical alignment with constructivist principles [28, 32, 35]. Tier 3 captures the mediating layer through which adoption translates into engagement. Enabling factors include digital readiness, instructional design quality, institutional support, digital leadership, faculty digital competence and inclusive design [22, 41, 44]; constraining factors include digital divides, infrastructural deficits, low digital literacy, faculty resistance and weak strategic alignment [14, 18, 23]. In the South African and developing-country context, constraining factors are systematically more salient and demand explicit institutional and policy response [12, 13]. Tier 4 operationalises the outcome through the tripartite framework of behavioural, cognitive and emotional engagement, with each dimension differentially activated: behavioural engagement by access, ease of use and infrastructural reliability; cognitive engagement by instructional design quality and constructivist alignment; and emotional engagement by inclusive design, social presence and culturally responsive pedagogy [8, 36]. Relationships among the tiers are recursive rather than unidirectional: strong engagement outcomes feed back into institutional commitment, while weak outcomes erode it [8, 23]. Through this recursive dynamic, transformation and engagement co-evolve over time.

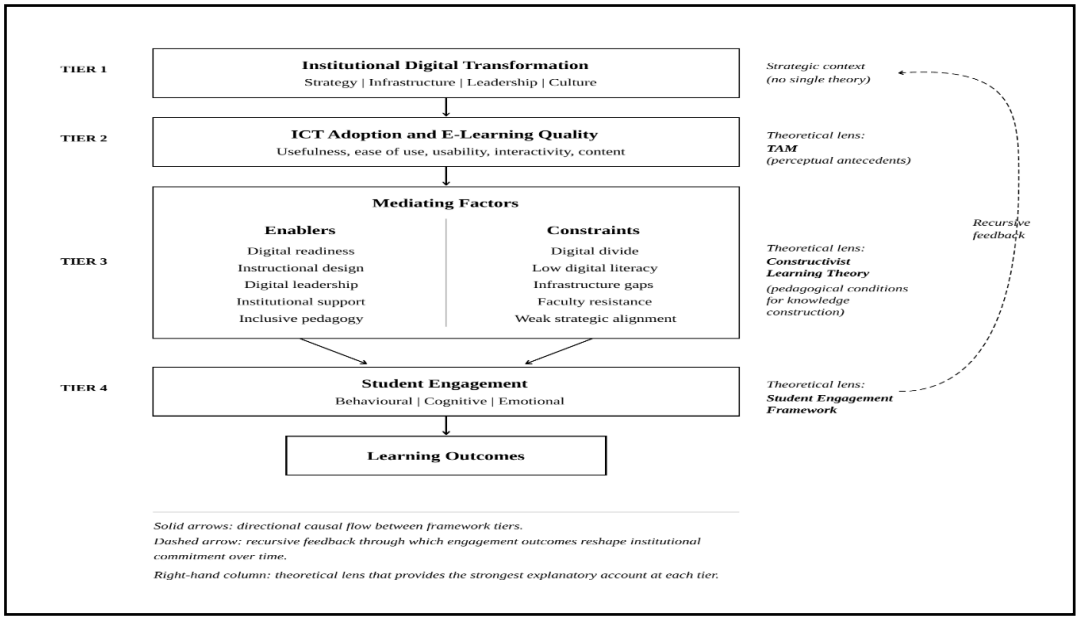

Fig. 1. illustrate the proposed conceptual framework for digital transformation and student engagement in higher education.
Source: Researcher's own Compilation

Figure 1 presents the framework as a four-tier vertical cascade together with the theoretical mapping that underwrites it. The right-hand column identifies the lens that does explanatory work at each tier: the Technology Acceptance Model accounts for the perceptual antecedents of adoption at Tier 2; Constructivist Learning Theory accounts for the pedagogical conditions at Tier 3 under which adoption deepens into knowledge construction; and the Student Engagement Framework accounts for the tripartite engagement outcomes at Tier 4. No single theory governs tier 1 but provides the strategic context within which the lower tiers operate. Three structural features warrant emphasis. The first is the partitioning of the mediating layer into enablers and constraints, which signals that institutions cannot pursue one without managing the other; in resource-constrained settings, this symmetry is particularly consequential. The second is the convergence of two arrows from the mediating layer onto Tier 4, which encodes the analytical claim that engagement is the joint product of supportive and constraining conditions rather than the linear output of supply-side investment alone. The third is the dashed recursive feedback arrow from Tier 4 to Tier 1, which converts the framework from a static taxonomy into a dynamic system: engagement outcomes do not merely register the effects of transformation but, over time, reshape the institutional commitment, leadership choices, and digital culture that drive subsequent transformation cycles. The figure thereby visualises the central theoretical contribution of the study: the consolidation of three previously parallel literatures into a single, integrated, multi-level account of how digital transformation produces, or fails to produce, student engagement in higher education.

6. Discussion

The four findings and the framework carry implications that extend beyond the analytical claims themselves. Four interpretive moves are made. First, the dominant policy logic of digital transformation globally and in South Africa treats infrastructure investment and platform adoption as the principal levers for lifting engagement [2, 14]. Finding 2 directly contests this logic: technical conditions establish possibility but not outcome. Recent work [15] argues that supporting engagement in technology-enhanced learning requires attending to pedagogical, relational and institutional conditions. The framework's mediating layer is the analytical correction. Institutional and policy interventions that bypass Tier 3 instructional design, digital readiness, faculty competence and inclusive design should be expected to underperform regardless of the scale of Tier 1 and Tier 2 investments. Second, the configurational character of engagement has implications for institutional evaluation practice. If the three engagement dimensions are differentially activated and may move in opposition, the prevailing reliance on behavioural metrics, such as login frequency, time on platform, post counts, and completion rates, produces an evaluation system biased toward the most easily measured but least consequential

dimension. [17] and [40] provide direct empirical support for this concern. Institutions evaluating digital transformation strategies on engagement grounds will need instruments that capture cognitive depth and emotional connection alongside observable participation, with policy-level monitoring expanded commensurately.

Third, the salience of constraining factors in South African and developing-country settings is more than additional difficulty within a shared theoretical landscape. The asymmetry calls into question the implicit universalism of much global digital transformation literature, which has been disproportionately produced in well-resourced settings [2, 44]. The framework's treatment of constraining factors as constitutive of Tier 3 rather than residual noise is therefore both an empirical accommodation and a theoretical claim: structural conditions are part of the explanation of engagement, not an external scope condition. This has direct implications for how comparative higher education research is designed and how policy borrowing across contexts is justified. Fourth, the rapidly evolving technological frontier introduces new tensions. [30] and [31] demonstrate gains in engagement from AI-integrated platforms, yet [47] caution that over-reliance on AI may diminish critical thinking and authentic engagement. Within the framework, these technologies sit at Tier 2 but alter the conditions of the Tier 3 mediating layer: adaptive platforms partially substitute for instructional design effort, intelligent tutoring for instructor presence, and immersive environments potentially reshape the constructivist conditions of knowledge construction. The framework anticipates that the evaluative challenge identified in Theme 3, the asymmetric measurement of the three engagement dimensions, will intensify rather than diminish as these technologies mature, since AI-driven systems generate behavioural signals at unprecedented volume while leaving cognitive and emotional substrates harder to access.

7. Contribution of the Study

The study's primary theoretical contribution lies in developing an integrated framework that synthesises TAM, CLT and SEF into a coherent account of the relationship between digital transformation and student engagement. The framework addresses the fragmentation of the existing literature, in which these three resources have typically been deployed in isolation, and extends prior conceptualisations by incorporating mediating factors and treating the relationship as recursive rather than unidirectional. By foregrounding the South African and developing-country context, it also responds to recent calls to move beyond global-North paradigms in higher education research [2, 44]. For institutions, curriculum developers and e-learning designers, the framework provides evidence-based guidance for structuring digital learning environments that genuinely enhance engagement. It identifies the enabling conditions of digital readiness, instructional design quality, institutional support, accessible infrastructure, digital leadership and inclusive pedagogy that must be present for transformation to translate into engagement gains, alongside the constraining conditions that must be actively managed. Strategically, transformation should be planned as a coordinated programme integrating infrastructure, pedagogy, leadership development and inclusion; evaluatively, institutions should monitor engagement across all three dimensions rather than relying solely on participation metrics. For policymakers in the South African higher education sector, the framework supports three directions: investment in the mediating layers of digital readiness, instructional design, faculty development, digital leadership and inclusive pedagogy alongside infrastructure; embedding inclusive design as a foundational policy requirement given the structural inequalities and constitutional equity commitments that distinguish the South African context; and expanding policy-level monitoring beyond access and adoption metrics to capture engagement outcomes across the behavioural, cognitive and emotional dimensions [45].

8. Conclusion

This study has synthesised secondary literature on digital transformation, ICT adoption, and e-learning quality, and developed an integrated conceptual framework grounded in TAM, CLT, and SEF. The framework positions student engagement, in its behavioural, cognitive and emotional dimensions, as the central outcome of a multi-level transformation process mediated by enabling and constraining factors that are particularly salient in South African and developing-country contexts. Three principal conclusions follow. First, digital transformation enhances engagement only when ICT tools are accessible, pedagogically aligned and supported by institutional readiness, leadership and inclusive design. Second, the dimensions of engagement are differentially responsive to elements of the transformation process and therefore require coordinated intervention across infrastructural, pedagogical and cultural levels rather than concentration at a single point. Third, the South African context calls for strategies that simultaneously expand access, address infrastructural inequality, build

digital literacy and embed inclusion as a foundational rather than peripheral concern. Future empirical work should validate the framework in South African higher education settings, extend it to comparable developing-country contexts and examine the consequences of emerging AI-driven, immersive and adaptive technologies for engagement.

Agent EDDIE – A Model-Agnostic AI Agent for Cross-LMS Content Migration, OER Integration and Didactic Quality Assurance

Dominik Giel[1], Sebastian Moser[1], Marcia Håkansson Lindqvist[2], Peter Mozelius[2]

[1]Offenburg University of Applied Sciences, Germany
[2]Mittuniversitetet, Sweden

Abstract

The integration of Artificial Intelligence in Higher Education is often limited to standalone tools, neglecting the structural complexity of Learning Management Systems (LMS). This paper introduces "Agent EDDIE" (Educational Didactic Digital Interchange Engine), a collaborative project between Mid Sweden University and Offenburg University of Applied Sciences. EDDIE is designed as an AI-agnostic agent capable of bridging the gap between LMS environments like Moodle and Canvas. Unlike provider-specific solutions, our architecture ensures strategic independence by decoupling the agent's logic from any specific Large Language Model (LLM). At the current stage of development, the agent has successfully demonstrated core functionalities: it autonomously authenticates within Moodle, validates course accessibility via unique IDs, generates a comprehensive inventory of student-visible elements, and utilizes LLM APIs to synthesize rudimentary course descriptions. However, the primary focus of this contribution is the strategic roadmap of the project. We outline the planned evolution of EDDIE through four critical milestones: first, the activity-by-activity technical transfer between Moodle and Canvas; second, the integration of automated linguistic translation; third, the integration of Open Educational Resources (OER) from external repositories to enhance existing courses, and finally, the implementation of a didactic audit tool. This tool will evaluate courses against abstract "studyability" rubrics, providing instructors with feedback based on pedagogical best practices. By presenting this work-in-progress, we aim to discuss the challenges of maintaining identical usability across systems and the importance of academic sovereignty in the age of AI.

Keywords: *AI-Ed, OER, LMS Migration, Digital Sovereignty, Moodle, Canvas*

1. Introduction

In the contemporary discussions on the challenges and opportunities of Artificial intelligence (AI) in education (AIED), the focus has often been on the importance of teacher training [1] [2], and how to address students AI cheating [3] [4]. Less has been published on the opportunities of using AI techniques to facilitate course management and assess the quality of course content. As pointed out by Zawacki-Richter et al. [5] AIED has been around for about more than 30 years, but it is still unclear how educators could make a pedagogical advantage of AI techniques on a broader scale, and how to achieve a meaningful actual impact on teaching and learning in higher education.

The integration of AI in Higher Education is often limited to standalone tools, neglecting the structural complexity of Learning Management Systems (LMS). Moreover, the concept of open educational resources (OER) has become prominent in technology enhanced learning [6]. At the same time, there have been research reporting on the need of quality assurance of both OER [7] [8], and entire courses in LMS environments [9] [10]. As argued in [11], the course quality can be further divided into factors such as course content quality, course relevance, course instructor quality, and course design quality.

To improve the quality of different existing LMS this paper suggests the design and development of Agent EDDIE (Educational Didactic Digital Interchange Engine). Agent Eddie is a model-agnostic AI agent who can assess the quality of LMS-courses according to variable definitions which is up to the user. Moreover, EDDIE should be able to suggest and implement improvements in different types of LMS.

Course review has long been a source of inspiration for producing new courses and developing and advancing existing courses. For teachers in higher education, the course reviews are sometimes conducted through peer review [13]. Faculty peer review of courses and course design can lead to improved and developed teaching practice, stronger teaching cultures, pedagogical exchange, as well as serving as additional information along with student evaluations [15], [16], [18]. Challenges include lack of time, faculty anxiety, unclear purposes, variable feedback quality, and lack of training for

reviewers [13], [15]. This course review process can be compared to the peer review process in publications, where there are similar challenges. Although peer review is seen as important, it can be biased, opaque, slow and harsh, with research calling for fairness, transparency, recognition, and training more open models in peer review [17]. The use of AI, or a hybrid solution, may offer alleviations to these challenges and provide new possibilities [14]. As in the publication process, teachers in higher education may appreciate the possibilities of AI course review as a faster, objective and transparent review than a review done by a colleague.

2. Method and Materials

This paper should be seen as the first part of a Design science research project comprising the five-folded process outlined by Johannesson and Perjons [20]. As presented and discussed in Humble and Mozelius [19], small scale studies, or parts of larger studies in academia can be carried out with selected parts of the full five-folded process. The first iteration of the initial phases described in this paper involves the three first phases of the process depicted below in Figure 1. below. Initially, the problem presented in this paper was identified and formulated by brainstorming and discussions among the authors during a staff training week. Later the problem explication, the defining of requirements and the beginning of the design phase have been conducted individually and with e-mail discussions among the authors. The focus has been on the first two phases, but also involves a first proof-of-concept of the design (prototype EDDIE V0.9, section 4).

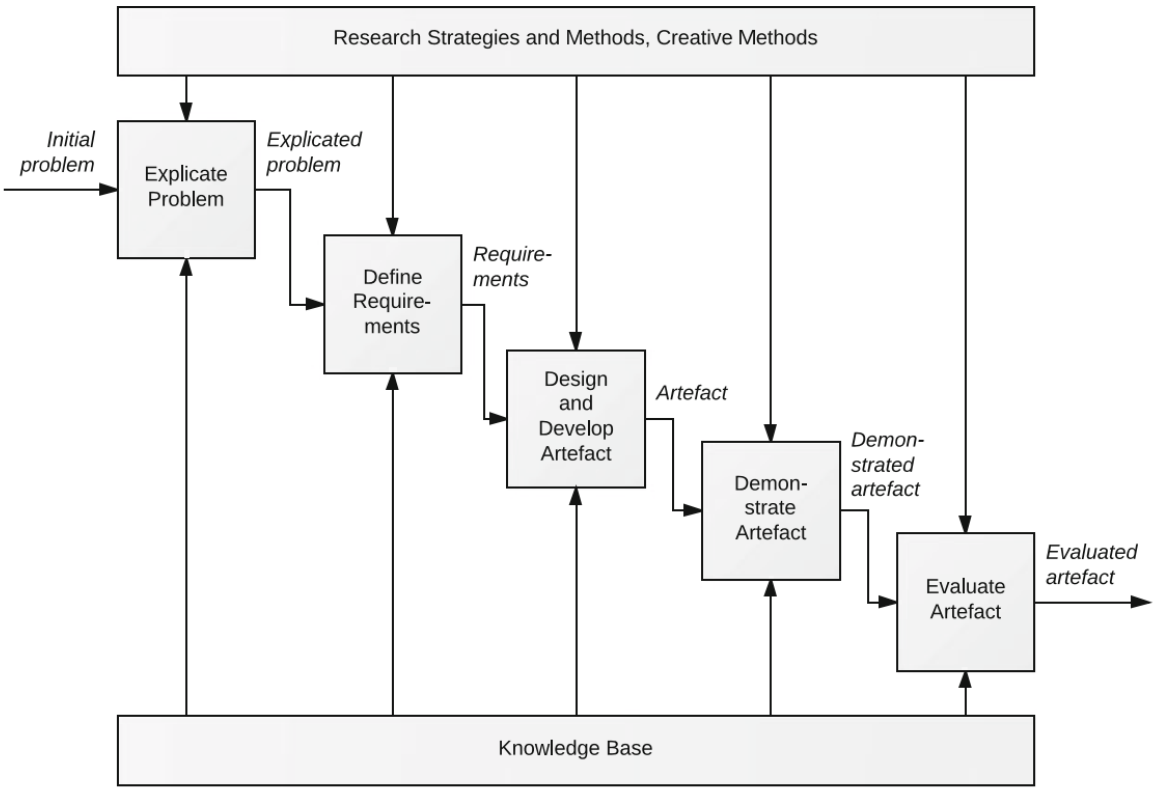

Fig. 1. The design science process as outlined by Johannesson and Perjons [12], p. 82

2.1 Current Situation of AI in Higher Education

Current research into the integration of AIED has been established for over 30 years, yet it remains primarily focused on profiling and prediction, adaptive systems, or intelligent tutoring systems [5]. While systematic reviews identify a vast array of potential applications, there is a noted lack of critical reflection on pedagogical implications and a "trust gap" regarding the delegation of course management to automated systems. The evaluation of didactical content through AI-mediated rubrics is an emerging pattern in the literature, though currently limited to sub-course granularity. Recent studies [26] have demonstrated the use of Natural Language Processing (NLP) to score classroom discussion transcripts

against instructional quality rubrics. Similarly, projects have utilized GPT-4 to compare human-crafted learning objectives against AI-generated ones based on criteria such as "SMART" alignment and course goal consistency. A systematic surveys of LLM Agents for Education [27] reports no existing project that combines course-activity-level rubrics with automated AI evaluation.

3. Concept

Faculty trust for granting access to a live LMS must be earned at the level of the agent's operating envelope, not at the level of its outputs alone. To help building trust to the concept, we have stated basic principles (P1-P5) for EDDIE:

3.1 Non-delete (P1)

EDDIE's first commitment is that no API call ever deletes, overwrites, or unpublishes existing material on the host LMS. Every action of the agent produces a new item, for example: an additional course, section, activity, or file whose existence is independent of the source course it derives from. EDDIE targets two platforms whose API surfaces and instructional models differ. On either of them, the design intent is the classical principle of least privilege of [21] applied to the agent's webservice token. On Moodle the token's scope is restricted to the `core_course_create` family and `core_files_upload`. On Canvas the equivalent OAuth scope is `manage_courses_add`. The corresponding delete and update functions against source-course resource handles are absent from the agent's token profile and therefore unreachable. The most defensive case of additive-only is no writes at all: The prototype (section 4) implements this case and grounds the principle in deployed code.

3.2 Invisible by Default (P2)

Every course that EDDIE creates begins in a non-discoverable state. On Moodle this is the `visible=0` in conjunction with `visibleold=0` flag-pair. On Canvas it is the equivalent `workflow_state="unpublished"` at course creation. The flag is set in the create call itself, not in a follow-up update. This is a deliberate choice that closes the otherwise small but real window in which the course exists in the public catalogue before being hidden, and is a residual risk addressed explicitly in the summary below. The LMS's own access-control layer enforces non-discoverability for invisible courses independently of any agent-side discipline.

3.3 Explicit Promotion (P3)

Switching the visible course pointer from a source course to its EDDIE-improved variant is a deliberate human action, never an agent action. A structured file (uploaded by the agent into the agent-produced course as an ordinary file resource) lists every change since the source: per activity, the agent records the source identifier, the agent-produced identifier, the type of semantic delta and a provenance bundle with the LLM provider identity, the system-prompt class, the timestamp, and the place where the instructor's acknowledgement signature is to be recorded. The manifest serves as the explanation surface aligned with the user-control guidelines and stands in analogy to the learning-to-defer framework of [22], where a learned classifier hands the decision to a human expert rather than committing to its own answer; in EDDIE the analogous boundary is promotion, the single decision that the agent never makes on its own. The provenance fields are modelled on the Content Credentials data model of the C2PA specification [23], with the practical intent that the per-activity audit log can be ingested by provenance-aware tooling outside EDDIE [24]. The same events are mirrored as xAPI statements [25] for analytics pipelines that already consume xAPI streams.

3.4 Reversibility (P4)

The source course is, at every moment in time, exactly the course the instructor authored. No agent-issued API call ever lands on its resource handles, and the principle of least privilege of [21] already invoked for P1 against deletions here serves a complementary role as it isolates the write surface. EDDIE's adapters allocate every agent-produced course as a separate `course_id` on either platform, and the agent never holds a write-handle on the source course. An instructor who deletes an agent-produced course therefore cannot affect the source. The host LMS's standard backup/restore workflow remains the institutional fallback, nothing about EDDIE's operation degrading it.

3.5 Open Source (P5)

The four preceding principles are technical commitments. The fifth is a deliberate boundary on those commitments: The EDDIE codebase will be published under a permissive MIT-class license whose warranty disclaimer is the legal complement of P1 - P4.
This means that institutional deployments are wrapped by the host institution's own risk acceptance and governance regime. Stating P5 here is not a defence against P1 - P4 but is the recognition that an architectural promise cannot replace an institutional contract, and that the two layers do different work.

3.6 Concept Summary

Three weaknesses survive the principles above and are stated explicitly here. First, data flows to the LLM provider as even a read-only agent forwards course content to an external service during course-description and matching steps. Our prototype Agent EDDIE V0.9 (section 4) uses an internal LLM proxy, which keeps the egress traffic inside the institutional perimeter, but data minimisation across providers remains an open work item. Second, the visibility race introduced under P2 is closed by setting the `visible=0` flag in the create API call itself, not in a follow-up update: but the soundness of this mitigation depends on the LMS's own atomicity guarantees, which neither Moodle nor Canvas documents formally. Third, the mis-promotion failure, since an instructor may click acknowledge without reading the manifest. UX guard rails as a required reading delay, a counter-signed-by line or a visualisation of the diff prior to the action are deferred to future work. In summary, defensive operation is necessary but not sufficient and is a necessary condition for an institution's consent to deploy Agent EDDIE.

4. Prototype

As a proof-of concept. a prototype of agent EDDIE with limited functionality has been build. The authors wish to thank Mohammad Dahi (HS Offenburg) for his implementation, EDDIE V0.9. It provides the most defensive instance of P1 as it has read-only access. The prototype observes a Moodle test instance, hands the observation to a controlled LLM endpoint, and renders the result as a per-module traffic-light view as a quality measure.
V0.9 is a four-step pipeline. A `core_course_get_courses` web-service call, authenticated by a single `wstoken`, returns the full course list with each entry's visible flag. The list is combined with a static module list in V0.9 hard-coded into the script, with module-handbook ingestion deferred to the first milestone (M1) discussed in Section 5. Both lists are forwarded to the HSO-internal LLM proxy (llm-proxy.imla.hs-offenburg.de, model gpt-5.1, temperature=0), which returns structured JSON mapping to each module to matched courses and their visibility status. The JSON is finally rendered as a tabular per-module traffic-light view (Fig. 2). The Moodle endpoint accessed by V0.9 is the institutional test instance, not production as the boundary between the two remains an institutional governance question.

Fig. 2. Sample output of EDDIE V0.9 provided by Mohammad Dahi (HS Offenburg)

EDDIE V0.9 was executed once by the implementer on 2026-04-30 against the HSO Moodle test instance. The inputs were a static list of nine study modules excerpted from a faculty handbook and the live course inventory of the test instance. Notice that there is a triple-match to "Statistik" with three corresponding courses (all with similar, but not identical titles) identified by the LLM's matching.

5. Future Work

EDDIE V0.9 is the first artifact created in order to build a fully-functioning AI agent, a proof-of-concept for the idea of using AI to automate certain (easy) tasks. We derived four milestones on the way which according to their complexity are:

5.1 Inter-System Course Transfer (M1)

At milestone M1, EDDIE is capable of transferring a basic LMS course from Moodle into Canvas and vice versa. Due to the open nature of the LMS (for example, novel plug-ins), the number of transferable items is limited and the transfer thus always partial. As pointed out earlier, EDDIE needs a rubric to evaluate course quality: The number of “transferable items” might be used (yet not improved by EDDIE) at this stage.

5.2 Inter-Language Course Transfer (M2)

At milestone M2, EDDIE can translate the language of LMS courses without altering the course items. As a quality rubric, one could pass part of the translated text to an LLM to evaluate if and how well the language matches a given particular language (for example, technical English). Then EDDIE could compare different system prompts to achieve an optimal for optimum translation quality. Translation itself could also be done using an LLM (not necessarily the same as for the quality rubrics).

5.3 OER Integration (M3)

At milestone M3, EDDIE is capable of analysing a course’s use of external learning resources (books, audio, video). As a quality metrics, it is capable of determining the appropriate abundance of external resources and estimate their respective license information. If material without or with unclear licence status is found, EDDIE offers to add an appropriate OER replacement or license. If OER material with insufficient license information is found, EDDIE offers to add the necessary information.

5.4 Didactic Quality (M4)

At the final milestone M4, EDDIE is capable of evaluating how good courses for a desired outcome, prior knowledge and student work-load look like. EDDIE can conduct an automated activity-level audit on courses running on a live LMS, suggest measures to improve didactic quality [9] and implement them (in hidden courses, according to P2 and P3).

6. Conclusion

Agent EDDIE represents a significant step toward achieving academic sovereignty in the integration of AI within Higher Education. By decoupling the logic of course auditing and migration from specific LLM providers, the project ensures that universities maintain control over their pedagogical data and instructional standards. The current V0.9 prototype successfully demonstrates the feasibility of automated course auditing via a model-agnostic proxy layer. Future milestones are inter-system migration and automated OER integration. EDDIE will provide educators with the tools to bridge the "trust gap" and ensure that digital learning environments remain both high-quality and pedagogically sound in an increasingly automated landscape.

Disclaimer and Acknowledgements

The creation of this paper was supported by the ChallengeEU project. The authors acknowledge that Artificial Intelligence was utilized during the preparation of this paper for the purpose of language improvement and linguistic refinement.

Artificial Intelligence for Teaching Reading: A Bibliometric Analysis of Research Trends, Collaboration, and Scholarly Development

Ntswaki Matlala

University of Johannesburg, Johannesburg Business School, South Africa

Abstract

Artificial Intelligence (AI) has emerged as a transformative educational technology with potential to improve reading instruction through personalised learning, adaptive feedback, accessibility, and learner-centred pedagogical support. Despite increasing scholarly interest, research on AI for teaching reading remains fragmented across educational and technological domains. Therefore, this study aims to conduct a bibliometric analysis of scholarly publications on the use of Artificial Intelligence for teaching reading to map the intellectual structure, publication trends, collaboration patterns, and thematic development of the field. A total of 10,587 English language scholarly publications were analysed using bibliometric techniques, including keyword co-occurrence, co-authorship, and country-level scientific production visualised through VOSviewer. Findings indicate growing scholarly attention toward adaptive learning, intelligent tutoring systems, multilingual literacy support, learner engagement, accessibility, and AI literacy. However, challenges relating to digital inequality, infrastructure readiness, ethical governance, and teacher preparedness remain evident. The study provides evidence-based insights to inform future research, educational policy, and pedagogical practice concerning responsible and inclusive AI-supported reading education.

Keywords: *Artificial Intelligence; Teaching, Reading, AI literacy, Pedagogical support*

1. Introduction

Reading is a foundational skill that underpins academic success [1]. While the study [2] highlights that it strengthens critical thinking as a predictor of reading, and lifelong learning. Further, the work of the study of [3] sees it as a gateway to knowledge acquisition across all disciplines. In contemporary education systems, the ability to read for meaning is essential for learner progression and overall educational attainment. However, global and local evidence suggests that many learners continue to struggle with reading proficiency, limiting their academic and socio-economic opportunities. Multiple studies highlighted that a significant proportion of learners are unable to read for meaning at grade-appropriate levels [4-7]. According to [8], highlights a persistent literacy crisis that affects both school and tertiary education outcomes. These challenges are often exacerbated by socio-economic inequalities, limited access to reading materials, and language barriers in multilingual contexts. At the same time, rapid advancements in Artificial Intelligence (AI) are transforming the educational landscape [9], by enabling more personalised, adaptive, and data-driven learning environments.

AI technologies, including natural language processing, machine learning, and intelligent tutoring systems, have increasingly been integrated into digital reading platforms to support learners' comprehension and engagement. Digital reading itself has evolved significantly, characterised by interactive, multimodal, and non-linear text engagement, which offers new opportunities for enhancing learning but also introduces challenges such as reduced deep reading and increased scanning behaviours. AI has the potential to mitigate these limitations by guiding learners through personalised reading pathways, providing real-time feedback, and adapting content to individual learning needs.

Despite significant advancements in Artificial Intelligence (AI)-enabled educational technologies, the integration of AI in teaching reading remains uneven, fragmented, and contextually dependent. Existing scholarship demonstrates that AI technologies possess considerable potential to improve reading comprehension, vocabulary acquisition, learner engagement, and personalised instructional support through adaptive learning systems, intelligent tutoring systems, AI-based chatbots, and generative technologies that tailor learning to individual learner needs [10 -12]. Studies increasingly show that AI-supported reading systems can strengthen literacy development by improving learner interaction with reading materials, enabling personalised differentiation, and supporting adaptive feedback processes

[12,13]. For example, research examining AI-mediated reading environments demonstrates positive associations between AI-supported pedagogical interventions and learner reading achievement, motivation, self-efficacy, and critical thinking [12]. However, much of the literature remains concentrated on specific technological applications, isolated educational contexts, or discipline-specific settings, thereby limiting broader understanding of scalable and sustainable AI implementation in literacy education across diverse educational systems [14,15].

Moreover, several structural and institutional barriers continue to constrain the effective implementation of AI within reading education. Persistent challenges associated with digital inequality, inadequate technological infrastructure, insufficient educator preparedness, and concerns relating to ethical governance and learner privacy continue to influence educational adoption and implementation outcomes ([14,15]. Studies further highlight concerns relating to uneven access to educational technologies, implementation costs, mismatched institutional readiness, and inadequate teacher competencies needed to support AI integration effectively within teaching and learning environments [16,17]. These constraints may be particularly pronounced in multilingual, under-resourced, and socio-economically disadvantaged educational contexts, where technological disparities risk reinforcing rather than reducing educational inequalities. Importantly, despite growing scholarly attention toward AI supported educational interventions, there remains a lack of comprehensive synthesis capable of systematically mapping the intellectual structure, thematic evolution, publication trajectories, and collaboration patterns within the field, particularly regarding key dimensions such as personalisation, accessibility, learner outcomes, and educational inclusion.

The need for such synthesis is particularly critical within the Global South, where persistent structural inequalities in educational systems demand scalable, inclusive, and contextually responsive educational interventions. AI-supported reading technologies offer important opportunities to strengthen literacy development by improving access to reading materials, enabling multilingual educational support, enhancing adaptive instruction, and supporting personalised literacy pathways for diverse learner populations [10–11,18]. Emerging scholarship further demonstrates that AI-mediated reading interventions may contribute to more inclusive educational environments through differentiated learning support and intelligent educational scaffolding capable of responding to learner variability and contextual constraints [14,19]. However, without a systematic understanding of how scholarships in this domain have evolved, researchers, educators, and policymakers may struggle to identify dominant themes, conceptual gaps, and future research priorities capable of informing evidence-based educational interventions.

Therefore, this study aims to conduct a bibliometric analysis of Artificial Intelligence as a tool for teaching reading to map the intellectual structure of the field, analyse publication trends, and identify dominant scholarly themes concerning the current level of research, influential contributors, collaboration structures, and future research directions emerging within AI-supported reading education. Specifically, the study seeks to examine the growth trajectory of scientific output, identify influential authors and collaborative networks, and explore thematic clusters shaping scholarly development. By doing so, the study contributes toward a deeper understanding of how Artificial Intelligence is reshaping reading education and provides evidence-based insights capable of informing future research, educational policy, and pedagogical practice aimed at promoting inclusive and high-quality literacy education.

To address the identified knowledge gap and provide a systematic overview of scholarly development in the field, the study was guided by four research questions. These questions focus on publication growth, scholarly collaboration, thematic development, and emerging research directions within Artificial Intelligence supported reading education. Research Questions:

RQ1: What are the publication trends and growth trajectories of research on Artificial Intelligence for teaching reading?

RQ2: Who are the most productive authors, institutions, countries, and collaborative networks in the field?

RQ3: What thematic and conceptual structures characterise research on AI supported reading education?

RQ4: What emerging research trends and future directions shape AI-supported reading instruction?

2. Literature Review

A growing body of scholarship demonstrates that AI can enhance reading instruction by supporting personalised learning and differentiated access to text. The study of [12] argues that AI tools can assist teachers in adapting children's reading materials to different learner needs, thereby creating opportunities for personalised reading support in early childhood and elementary education. Similarly,

[20] show that AI large language models can improve readability by simplifying educational materials to more accessible reading levels while retaining accuracy and content quality. These studies suggest that AI can support reading accessibility by modifying text complexity, scaffolding learner comprehension, and enabling more inclusive access to learning materials.

AI has also been explored as a mechanism for improving reading comprehension and learner engagement. The study of [21] emphasized that using PISA reading data across 32 OECD countries, found that ICT-related learner autonomy, competence, and school-level digital resources were associated with reading performance in blended learning settings. Their findings suggest that AI-informed and data-driven approaches can help educators better understand the relationship between digital learning environments and reading outcomes. The study of [12] further demonstrates that graphical summarisation combined with AI-based chatbots can improve learners' reading comprehension achievement, motivation, self-efficacy, critical thinking, and cognitive load. This indicates that AI can strengthen reading instruction not only by providing content but also by supporting metacognitive engagement, feedback, and learner confidence.

In language education, AI-supported reading is increasingly linked to English as a Foreign Language (EFL) and multilingual learning contexts. The study of [19] conceptualises AI as a mediating tool for EFL reading innovation through the SAMR model, showing how AI can shift reading tasks from basic comprehension activities toward more inquiry-driven literacy practices. The study of [21] similarly propose a generative pre-training-based intelligent tutoring system for English teaching, highlighting the potential of AI to address uneven access to personalised tutoring and learner support. Further, [23] found that AI chatbots can support English language learning by improving classroom interaction and learner experience. These studies suggest that AI may be particularly useful in multilingual and EFL contexts where learners require differentiated linguistic support, feedback, and guided practice.

Emerging research also highlights AI's role in early literacy and foundational reading development. The study of [13] examined the use of an AI-based conversational chatbot in kindergarten reading instruction and found that AI may support decoding practice and early grapheme phoneme correspondence development. This is important because early reading competence forms the basis for later reading fluency, comprehension, and academic success. Similarly [18], argues that extensive reading can be reconceptualised in the age of AI, as intelligent systems may help provide abundant, comprehensible, and self-selected reading input while addressing practical challenges related to resources, assessment, and learner motivation.

Despite these opportunities, literature also identifies important constraints. The study of [14] highlight that although AI can improve college English instruction through personalised learning and efficiency, challenges remain regarding implementation costs, resource allocation, and teacher training. Similarly [15], identify broader challenges in AI adoption in education, including ethical concerns, institutional preparedness, and uneven readiness for implementation. In rural and under-resourced contexts, [17] show that AI-augmented and culturally responsive multimedia can support EFL reading comprehension, but such interventions require contextual sensitivity, infrastructure, and pedagogical alignment. These findings suggest that AI-supported reading education cannot be separated from issues of digital inequality, teacher readiness, ethical governance, and local educational conditions.

Overall, the literature indicates that AI has considerable potential to support teaching reading through personalisation, adaptive feedback, accessibility, multilingual support, and learner engagement. However, current scholarship remains fragmented across different tools, educational levels, language contexts, and methodological approaches. There is therefore a need for bibliometric analysis to map the intellectual structure, publication trends, collaboration patterns, and thematic evolution of research on Artificial Intelligence as a tool for teaching reading.

3. Research Methodology

3.1 Research Design

This study employed a bibliometric research design to analyse the scientific development of research on Artificial Intelligence (AI) for teaching reading. Bibliometric analysis is a quantitative approach used to examine publication patterns, collaboration networks, thematic structures, and intellectual development within a research domain. The method was selected because it enables the systematic mapping of large bodies of scholarly literature and provides objective insights into research trends and knowledge structures.

3.2 Data Source and Selection Strategy

Data was retrieved from the Scopus database because of its extensive coverage of peer-reviewed scholarly publications and citation metadata. The search was conducted in June 2026 using combinations of keywords related to Artificial Intelligence, reading, literacy, and education. The search query was applied to titles, abstracts, and keywords. An initial dataset of 23,275 records was retrieved.

3.3 Inclusion and Exclusion Criteria

Table 1 illustrates the inclusion criteria, which restricted the analysis to English language journal articles indexed in the Scopus database and focused on AI and reading.

Table 1. Inclusion and exclusion criteria

Inclusion Criteria	**Exclusion Criteria**
English language publications	Non-English publications
Articles	Conference papers, book chapters, books and other
Publications related to AI and reading education	Publications unrelated to teaching reading
Indexed in Scopus	Non-indexed sources

3.4 Bibliometric Analysis Procedure

The bibliometric analysis was conducted using VOSviewer software. The search string included terms related to artificial intelligence ("artificial intelligence" OR "AI" OR "machine learning" OR "natural language processing" OR "intelligent tutoring systems") AND ("reading" OR "reading comprehension" OR "literacy" OR "digital reading") AND ("education" OR "teaching" OR "learning" OR "instruction") Boolean operators AND OR were employed to combine concepts and maximise retrieval accuracy while maintaining relevance. Table 2 illustrates the inclusion criteria restricted the analysis to articles and scholarly documents written in English. From an initial dataset of 23,275 retrieved publications, a total of 10,587 articles and documents met the inclusion criteria and were retained for analysis.

Table 2. Documents published in Scopus

Document type	**Number of results**
Article Conference paper Book chapter Book Other	11,030 8,155 1,495 460 2135
Total	23275
Inclusion: Articles and written in English	10587

4. Results and Discussion

4.1 Publication Trends and Growth Trajectories

The results in Figure 1 demonstrate a substantial increase in scholarly production, particularly between 2021 and 2025, where publications increased from 633 to 3,304, representing a growth rate of approximately 422%. The 2026 value represents a partial year at the time of data collection.

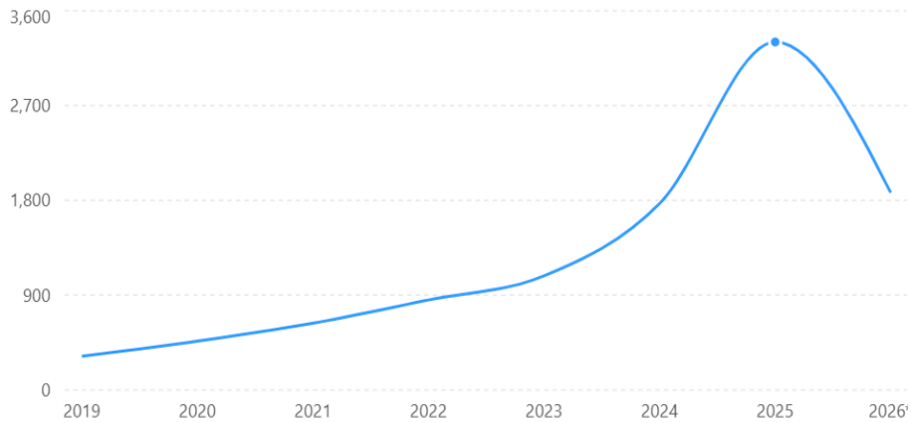

Fig. 1. Annual publication output indexed in Scopus (2019–2026).

4.2 Co-Authorship Network

The co-authorship analysis in Figure 2, identified 84 authors distributed across 12 collaboration clusters, revealing a fragmented yet moderately interconnected scholarly network. The visualisation indicates the presence of several central collaborative nodes, particularly around authors such as Wang Ying, Zhang Yu, and Zhang Wei, who appear to function as bridging scholars linking multiple research groups. While collaboration is evident, the high number of clusters relative to total items suggests dispersed research activity characterised by small institutional or thematic teams. Peripheral authors and isolated subgroups further indicate limited cross-cluster collaboration, highlighting opportunities for stronger international and interdisciplinary partnerships within the field.

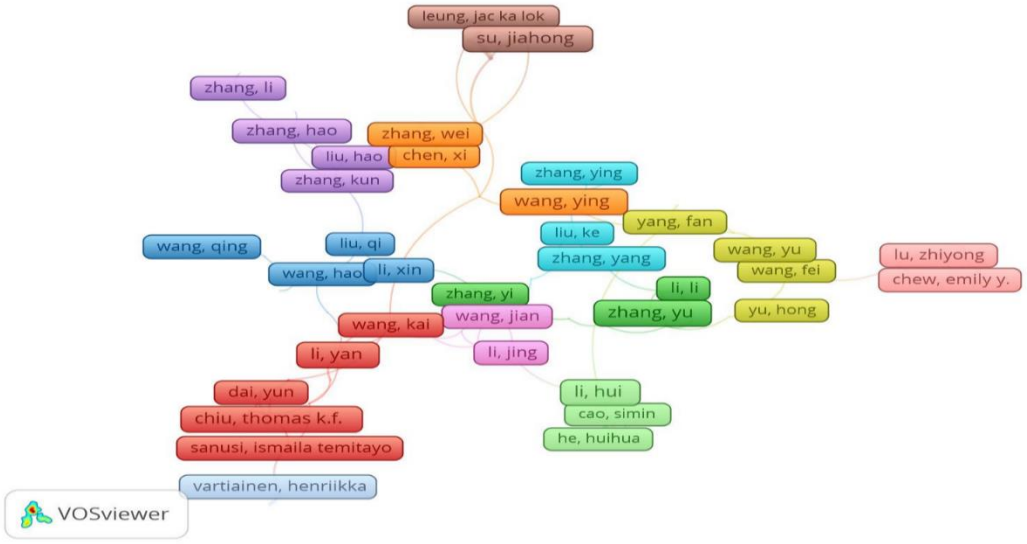

Fig. 2. Co-authorship network

4.3 Country Level Production

Country-level scientific production in Figure 3 provides important insights into geographical distribution, intellectual concentration, and internationalisation of scholarship concerning Artificial Intelligence (AI) as a tool for teaching reading. Countries with stronger technological infrastructures and advanced higher education systems appear to contribute more substantially to the development of AI-supported reading scholarship, particularly in relation to intelligent tutoring systems, adaptive learning environments, personalised literacy instruction, and generative AI applications [10,15]. These findings suggest that scientific production in this domain remains closely associated with national investments in digital education, technological innovation, and educational transformation agendas.

Importantly, the findings suggest that Global South representation remains comparatively limited, despite the significant literacy challenges affecting many developing educational systems. This imbalance is noteworthy because multilingualism, educational inequality, teacher shortages, limited instructional resources, and infrastructural constraints remain particularly pronounced across many Global South contexts [5; 8]. Consequently, there exists an important opportunity for future scholarship to strengthen representation from under-researched educational systems and to examine context-sensitive approaches to AI-supported literacy instruction in resource-constrained settings.

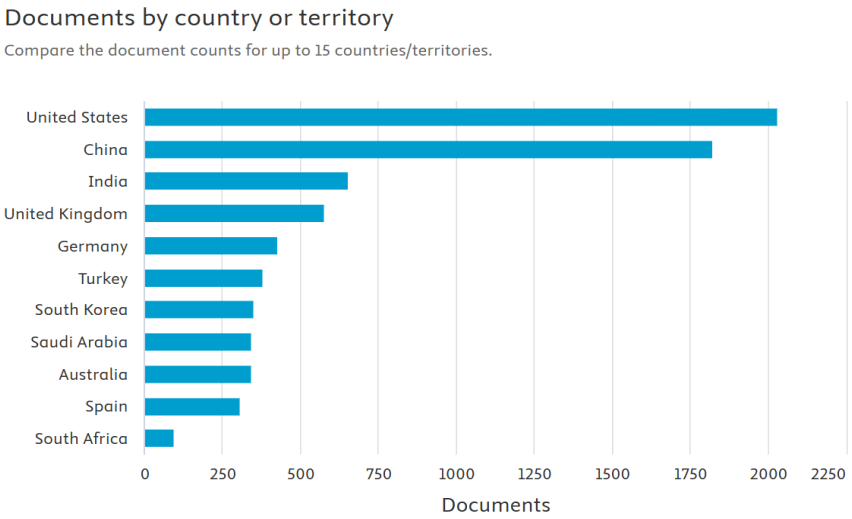

Fig. 3. Countries' level of documents

4.4 Keyword Co-Occurrence Network

Keyword co-occurrence Network in Figure 4, reveals that the intellectual evolution of artificial intelligence scholarship between 2021 and 2025. Early research focused predominantly on technical applications of machine learning, including image processing, segmentation, data mining, and intelligent tutoring systems. From 2023 onward, scholarships increasingly shifted toward interdisciplinary and human-centred applications involving information literacy, explainable AI, telemedicine, and critical thinking. More recent studies (2024–2025) demonstrate strong emphasis on AI literacy, large language models, patient education, and generative AI platforms such as ChatGPT-4o, Claude, and Google Gemini. The prominence of keywords such as artificial intelligence, machine learning, AI literacy, and large language models suggests an emerging paradigm shift toward responsible, competency-driven, and human centred AI integration across education and healthcare contexts.

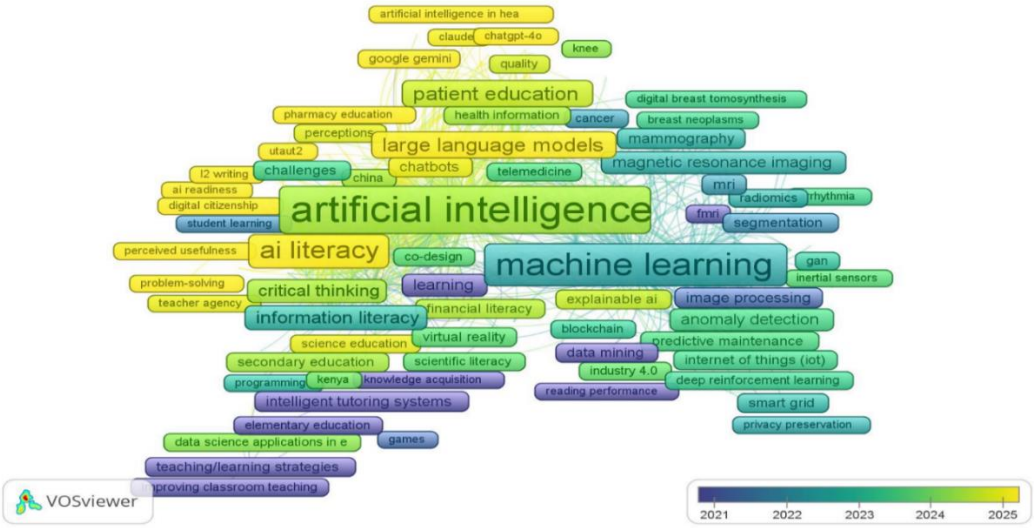

Fig. 4. Keyword Co-occurrence Network

5. Limitations

This study relied exclusively on the Scopus database as the source of scholarly publications. Although Scopus is widely recognised as one of the largest and most comprehensive citation databases, reliance on a single database may have limited the retrieval of relevant studies indexed in alternative sources such as Web of Science, ERIC, IEEE Xplore, ACM Digital Library, SpringerLink, and Google Scholar. Consequently, relevant scholarships concerning AI-supported reading instruction may not have been fully captured. Additional limitations include English-language bias, exclusion of grey literature, potential keyword-search limitations, and reliance on bibliometric techniques that may not fully capture contextual or pedagogical nuances.

6. Conclusion and Future Research Avenues

The primary objective of this study was to examine the intellectual structure and scientific development of scholarship concerning Artificial Intelligence as a tool for teaching reading through a bibliometric analysis of scholarly literature. By systematically analysing publication patterns, thematic evolution, collaboration structures, and conceptual relationships, the study sought to map current scientific development and identify future research directions shaping AI-supported literacy education.

The findings reveal that scholarships concerning AI supported reading instruction constitute an emerging yet rapidly expanding field, characterised by increasing interdisciplinary integration and growing pedagogical relevance. Publication trends demonstrate increasing scholarly attention toward adaptive learning, intelligent tutoring systems, personalised literacy support, learner engagement, accessibility, and multilingual educational technologies. At the same time, keyword co-occurrence analysis suggests a clear thematic transition from technology-oriented experimentation toward more learner centred, pedagogically meaningful, and ethically informed educational applications.

The co-authorship and country analyses further indicate that while scholarship demonstrates increasing collaboration and internationalisation, scientific production remains moderately fragmented and geographically uneven. Contributions appear concentrated within technologically advanced educational systems, while representation from Global South educational environments remains comparatively limited despite persistent literacy challenges requiring scalable educational interventions.

Importantly, the findings reinforce the growing significance of Artificial Intelligence as a pedagogical mechanism capable of supporting literacy development through personalised learning, adaptive instruction, intelligent feedback systems, multilingual educational support, and educational accessibility. However, the study simultaneously highlights persistent implementation barriers relating to digital inequality, infrastructure limitations, teacher preparedness, learner privacy, ethical governance, and responsible technological integration.

Future scholarship should therefore prioritise longitudinal learner outcomes, teacher readiness and educator competencies, Global South and multilingual educational contexts, and the pedagogical effectiveness of generative AI technologies in reading instruction. More specifically, future research should investigate how conversational AI systems, intelligent tutoring agents, adaptive literacy platforms, and large language models may be implemented responsibly while simultaneously protecting learner autonomy, promoting educational equity, and improving literacy attainment.

Future research may further benefit from mixed-method, comparative, and context-sensitive research designs capable of integrating bibliometric evidence with systematic literature reviews, classroom interventions, qualitative inquiry, and educational effectiveness studies. Such approaches may provide deeper understanding regarding the educational impact, scalability, and contextual relevance of AI-supported literacy interventions.

Overall, the study demonstrates that Artificial Intelligence scholarship in teaching reading is evolving toward a more coherent, pedagogically grounded, and socially relevant field of inquiry. Through responsible implementation, stronger interdisciplinary collaboration, and contextually informed educational innovation, Artificial Intelligence may contribute substantially toward improving literacy outcomes and advancing equitable, inclusive, and high-quality education.

Education and Healthcare

Professional and Didactic Competence of Instructors as a Quality Criterion in Continuing Education for Emergency Medical Services and Emergency Medicine: A Trauma Care Course as an Example

Adina Friedrich[1], Marcel Köhler[2]

[1]Nordland Hospital Vesterålen, Norway
[2]Faculty of Nursing and Health Sciences, Nord University, Norway

Abstract

The professional and didactic competence of instructors is considered a key quality criterion for continuing education in emergency medical services and emergency medicine, especially when it comes to complex topics such as interprofessional prehospital trauma care. The aim of the study is to examine the perceived professional and didactic competence of instructors in a trauma training course and its significance for learning relevance, interaction, and practical relevance from the participants' perspective. Two one-day training courses on prehospital trauma care for emergency medical personnel and physicians at a German educational institution in 2024 (n=21) and 2025 (n=17) were examined. The data is based on standardized evaluation forms with ratings on professional and didactic design, as well as supplementary qualitative feedback from participants. The quantitative data was evaluated descriptively, and the free comments were subjected to a structured qualitative content analysis according to Mayring [1]. Results indicate that participants predominantly rated the professional and didactic competence of the speakers as good and described the training as practical, motivating, and conducive to learning. Particular importance was attached to authentic case studies, clearly structured input, and explicitly designed interaction and reflection phases that supported interprofessional cooperation and confidence in prehospital trauma management. Criticism mainly focused on organizational aspects and communication processes. The results emphasize that professional and didactic competence is understood as a combination of professional expertise, structured learning organization, and interactive teaching. This area of competence is also perceived as a key quality feature of traumatology training courses in emergency medical services and emergency medicine. If further data analyses confirm the findings, this will have consequences for the selection and qualification of instructors as well as for the curricular design of practice-oriented, reflexive trauma training formats.

Keywords: *Interprofessional training, Prehospital trauma care, Pedagogical competence, Instructional design, Educational quality*

1. Introduction

The quality of continuing education in emergency medical services and emergency medicine is a central concern in the context of patient safety and medical professionalism [2, 3]. Prehospital trauma care in particular places considerable demands on the professionals involved: it requires not only a solid foundation of medical knowledge, but also the capacity for structured interprofessional collaboration under time pressure and in dynamic, resource-limited operational environments [3, 4, 5]. Practice-oriented, simulation-based training formats play a pivotal role in sustainably developing and consolidating these action competencies [6, 7, 8].

One aspect that has received comparatively limited empirical attention in this educational domain concerns the significance of instructors' professional and didactic competence for the perceived quality of interprofessional continuing education. While general educational research has produced extensive findings on professional instructor competencies over several decades [e.g., 9, 10], their systematic investigation in the context of continuing medical education for adults, and in emergency medicine training in particular, remains limited [11, 12].

The present study addresses this research gap. It examines how participants in an interprofessional trauma course for emergency medical personnel and physicians perceive the professional and didactic competence of the instructors, and what significance this perception holds for the learning relevance, quality of interaction, and practical orientation of the training. The empirical basis consists of

standardized evaluation forms supplemented by qualitative participant feedback collected across two course iterations at a German educational institution in 2024 and 2025. In doing so, the study contributes empirical evidence to quality development in emergency medicine continuing education and provides impetus for the curricular design as well as the selection and professional development of instructors in this field.

2. Background

2.1 Theoretical Frameworks for Professional Instructor Competence

The concept of professional instructor competence rests on a well-differentiated theoretical foundation within educational research. Of particular significance for contemporary understanding is Shulman's (1986) concept of Pedagogical Content Knowledge (PCK), which distinguishes between Content Knowledge (related to a subject), (general) Pedagogical Knowledge, and Pedagogical Content Knowledge (related to subject-specific didactic knowledge) [9]. PCK describes a specific body of knowledge which enables instructors to prepare subject matter content in a learning-conducive manner. That is, to transform complex bodies of knowledge in such a way that they become comprehensible and meaningful to the learners in question. This three-dimensional framework has since been recognized as an important reference point in international teaching and learning research [13].
In the German-speaking academic context, the model of professional instructor competence was further developed through the COACTIV research program [10, 14]. Baumert and Kunter (2011) distinguish four core competence domains: professional knowledge (comprising the sub-dimensions of subject matter knowledge, subject-specific didactic knowledge, pedagogical-psychological knowledge, organisational knowledge, and counselling knowledge), beliefs and values, motivational orientations, and self-regulatory abilities. Subject matter knowledge and subject-specific didactic knowledge are identified as the central dimensions of professional action competence, both of which have been empirically shown to be associated with instructional quality and student learning outcomes [10, 14]. Although the COACTIV competence model was originally developed as a generic framework for the school context, its underlying assumptions are transferable to contexts of vocational and continuing medical education [14].
In the domain of adult education, educational researchers emphasize that competence must always be understood as the interplay of cognitive abilities, motivational prerequisites, and practical skills, an interplay that enables situationally appropriate action [15, 16]. Professional and didactic competence in the context of continuing vocational education therefore encompasses not only the structured transmission of knowledge, but equally the design of interaction and reflection processes that are conducive to learning, as well as the capacity for adaptive learning facilitation with heterogeneous groups of participants [15, 16].
A further theoretical framework of reference is provided by the concept of Interprofessional Education (IPE) [17, 18]. The World Health Organization (WHO) defines IPE as a learning approach in which members of different health professions learn together, from and with each other, with the aim of fostering effective collaboration and improving the quality of care [19]. Instructors in interprofessional training formats must therefore possess, in addition to subject matter and subject-specific didactic knowledge, competencies in the facilitation of heterogeneous groups and in promoting interprofessional communication processes. Findings from clinical education research demonstrate that instructional quality, particularly with regard to structured knowledge transmission, clinical authenticity, and the promotion of active learning processes, contributes substantially to learning effectiveness in continuing medical education [3].

2.2 Professional and Didactic Competence in Emergency Medicine Training

The theoretical approaches outlined in this study can be applied to the specific context of trauma training in emergency medical services and emergency medicine. Prehospital trauma care is characterized by a pronounced degree of complexity and time-criticality: it requires the coordinated interaction of paramedics and emergency physicians within dynamic operational environments with limited resources [3]. Continuing education formats in this field must therefore not only convey subject-specific content, but also explicitly foster interprofessional action and communication competencies.
Applying the COACTIV-competence-model [10, 14] to the context of trauma care training, the following implications emerge for instructors: subject matter knowledge encompasses current medical and prehospital care knowledge, including clinical procedures and guideline-compliant treatment protocols.

Subject-specific didactic competence refers to the ability to prepare this knowledge in such a way that it is comprehensible and applicable in practice for participants from diverse professional backgrounds. Pedagogical-psychological knowledge, finally, is expressed in the competent design of learning sequences that are conducive to learning, sequences that integrate authentic case studies, structured content phases, and explicitly facilitated interaction and reflection phases.
In accordance with the WHO Framework for Action on Interprofessional Education and Collaborative Practice [19], appropriately qualified instructors contribute not only to the development of subject-specific competencies, but also to fostering interprofessional collaboration competency and strengthening participants' confidence in operational contexts. Against this background, the applied didactic approach, understood as the interplay of subject matter expertise, structured learning organization, and interactive instructional design, emerges as a central quality criterion of the continuing education course. Building on this theoretical foundation, the present study examines the extent to which participants in an interprofessional trauma care course perceive the professional and didactic competence of the instructors as learning-relevant, interaction-promoting, and practice-oriented, and what conclusions can be drawn from these perceptions for the curricular design and quality assurance of continuing education programs in emergency medicine.

3. Data Collection and Analysis

The empirical basis of the present study consists of standardized evaluation data from two one-day continuing education courses on prehospital trauma care conducted in Pirna, Germany. A total of N = 21 participants took part in the 2024 course and N = 17 in the 2025 course. The participants included paramedics and emergency physicians. Data was collected immediately upon completion of the respective course.
The data collection instrument was the standardized evaluation form of the Saxon Medical Association for the evaluation of externally certified continuing education events. The questionnaire captures study-relevant data including five items (Items 1.1 to 1.5), comprising both closed rating questions and dichotomous questions. Items 1.1 to 1.3 employed a five-point rating scale (ranging from excellent to very poor) to assess the perception of the overall quality of the course (1.1), the professional and didactic competence of the presenters (1.2), and the practical relevance and currentness of the course content (1.3). Items 1.4 and 1.5 used a dichotomous format (yes/no) to assess whether interaction and discussion among participants had been facilitated (1.4) and whether the scheduled time frame of the event had been adhered to (1.5). An additional open-ended text field offered participants the opportunity to provide a free-text comment.
The quantitative data from the closed-ended items were analyzed using descriptive statistics. Frequency counts were conducted for the dichotomous items. The free-text comments were evaluated through a structured qualitative content analysis following Mayring [1]. The analysis was conducted inductively: the coding process proceeded without pre-defined categories, with codes being derived directly and systematically from the data material. The aim was to represent the participants' perspectives as authentically as possible and to identify recurring patterns across responses. The study was exploratory in nature overall, with the objective of generating initial empirical findings on the perception of professional and didactic instructor competence in this emergency medicine continuing education context, thereby laying the groundwork for more in-depth future analyses.

4. Results

4.1 Quantitative Part of the Survey

Across both survey years, all five evaluated items achieved a median of 1, indicating a high level of satisfaction among most participants (Table 1). Adherence to the schedule was rated excellent unanimously by all participants in both years (M = 1.00), reflecting a consistent and reliable time structure throughout the course.
In 2024, the mean scores across all items ranged from 1.00 to 1.19, reflecting a near-uniform distribution of the highest possible rating. In 2025, the overall impression of the course showed the greatest deviation from the optimal value, with a mean of 1.41. This score nonetheless remains within the upper range of the scale. Professional and didactic competence (M 2024 = 1.19; M 2025 = 1.29) and practical relevance (M 2024 = 1.05; M 2025 = 1.12) were rated consistently positively in both years, with only marginally higher mean scores in 2025. As the medians are identical across all items and both years,

the slight differences in mean scores reflect isolated ratings in the categories good or adequate, which have no bearing on the central tendency of the distributions.

Table 1. Descriptive statistics of evaluated items 1.1 to 1.5 (N = 38)

Item	2024 (n = 21)			2025 (n = 17)		
	Mdn	*M*	*SD*	*Mdn*	*M*	*SD*
Overall impression of the course	1	1.14	.36	1	1.41	.62
Professional & didactic competence	1	1.19	.51	1	1.29	.47
Practical relevance and currentness	1	1.00	.00	1	1.18	.39
Participant interaction & discussion	1	1.05	.22	1	1.00	.00
Adherence to schedule	1	1.00	.00	1	1.00	.00

A comparison of the two survey years revealed minor differences in mean scores. In both cohorts, all mean values remained below 1.5, consistent with an overall highly positive evaluation. The overall impression did not improve from 2024 (M = 1.14) to 2025 (M = 1.41). Rather, the slightly higher mean in 2025 indicates a marginally more critical assessment, while still remaining within the range of excellent to good. Given the ordinal scale level and the small sample sizes, inferential statistical testing was not performed.

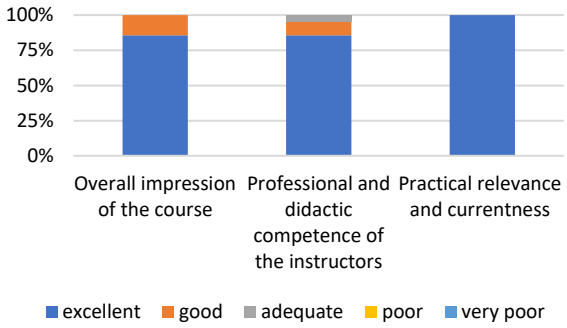

Fig. 1. Percentage distribution of participant ratings across items 1.1 to 1.3 (n = 21, 2024).

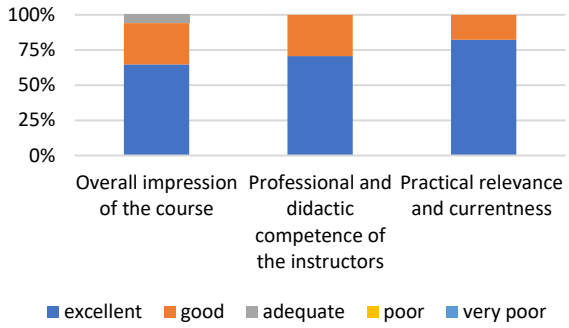

Fig. 2. Percentage distribution of participant ratings across items 1.1 to 1.3 (n = 17, 2025).

Figures 1 and 2 demonstrate the percentage frequency distribution of ratings for the three ordinally scaled items, presented separately for each survey year. In both years, the response categories “poor” and “very poor” were not selected for any of the criteria, indicating a consistently positive evaluation of the course across both cohorts.

In 2024 (n = 21), responses were strongly concentrated in the “very good” category: practical relevance and currentness were rated very good by all participants unanimously (100% each). Overall impression and professional and didactic competence were each rated very good by 85.7% of respondents. For professional and didactic competence, an additional 4.8% selected “adequate”, representing the only instance of this rating category recorded across the entire 2024 cohort.

In 2025 (n = 17), a slight shift toward the “good” category was observed across these items: professional and didactic competence was rated “very good” by 70.6% and “good” by 29.4% of participants, while practical relevance received ratings of “very good” (82.4%) and “good” (17.6%). For overall impression, 64.7% of respondents selected “very good”, 29.4% “good”, and 5.9% “adequate”.

Comparing the two survey years, a marginal increase in “good” ratings is observable for these items in 2025, while 2024 showed a stronger concentration in the highest rating category. Nevertheless, these differences must be considered negligible, as all responses in both survey years remained exclusively within the positive range of the scale.

The dichotomous items, 1.4 and 1.5, likewise received predominantly positive ratings in both survey years (Table 2). A slight improvement in perceived interaction quality is evident when comparing the two cohorts, with 2025 yielding a fully affirmative response across all participants.

Table 2. Percentage distribution of participant ratings across items 1.4 and 1.5

Year	Response	Participant interaction and discussion (%)	Adherence to schedule (%)
2024 (n=21)	Yes	95.24	100.00
	No	4.75	0.00
2025 (n=17)	Yes	100.00	100.00
	No	0.00	0.00

4.2 Qualitative Part of the Survey

Of the 38 completed evaluation forms, a total of 26 (68.4%) contained a free-text comment. Participation rates differed between the two cohorts: in 2024, 17 out of 21 participants (81.0%) provided written feedback, compared to only 9 out of 17 participants (52.9%) in 2025. Inductive categorization of the comments revealed consistent thematic priorities across both years, alongside discernible shifts in content emphasis:

1. **Time management** was the most frequently mentioned topic across both cohorts. In both years, participants repeatedly requested more time for practical exercises and skills training (*e.g., 2024: "please allow more time for the practical exercises" [Participant 2]; 2025: "would appreciate more time scheduled for practical exercises" [Participant 10]*). In the 2025 cohort, this request was articulated more specifically, including suggestions to shorten break times in favour of practice time or to allocate an additional ten minutes per station
2. **Interprofessional collaboration** was explicitly and positively highlighted by multiple participants in 2024 (*e.g., "very good collaboration" [Participant 20]; "it was great to have the physicians participate so we could practise with them" [Participant 14]*). In the 2025 cohort, this aspect was no longer mentioned in the comments, potentially indicating a normalization of the interprofessional learning format among participants
3. **Team composition** was raised exclusively in the 2025 cohort: two participants advocated for the integration of trainees into mixed teams or, alternatively, for the formation of separate trainee-only teams.
4. **Organisation and communication** were evaluated more critically in 2025 than in 2024: one participant called for improved advance communication to external participants regarding work attire, catering, and the daily schedule. In 2024, the only organisational criticism concerned the limited visibility of the event through internet searches.
5. **Overall impression and atmosphere** were commented on positively in both cohorts. Praise was directed at the quality of the case studies, the realistic nature of the practical exercises, and the pleasant learning environment. Catering received more frequent explicit positive mentions in 2024 than in 2025.

In summary, the qualitative feedback from both cohorts is thematically consistent and reflects the same central area for improvement: increased time for practical exercises. However, the 2025 comments demonstrate a higher degree of specificity and suggest a more differentiated reflection on the learning environment, particularly with regard to team composition and organizational conditions.

5. Discussion and Conclusion

The evaluation data from both survey years (N = 38) demonstrate consistently high levels of participant satisfaction: all five assessment criteria achieved median scores of 1, and the response categories “poor” and “very poor” were not selected in either cohort. The particularly high ratings for practical relevance/currentness and participant interaction/discussion indicate that the instructors successfully structured subject content in a learning-conducive manner and actively facilitated interprofessional communication processes. Both of these represent core elements of professional and didactic instructor competence as conceptualised in the COACTIV model and the WHO framework for interprofessional education [10, 14, 19]. The marginal shift in ratings toward the “good” category in 2025 should not be overinterpreted given the small sample sizes. Across both cohorts, time management represents the central qualitative theme: the repeatedly expressed desire for more time given to practical exercises points to a structural tension between the aspiration for comprehensive interprofessional competence development and the constraints of a single-day format.
For curricular development, the following recommendations are proposed: (1) extending practice time at skills development stations, (2) didactic consideration of heterogeneous participant groups, and (3)

improved advance communication for external participants. The limited sample size constrains the generalizability of these findings. A longitudinal analysis incorporating additional cohorts, supplemented by objective measures of competence, would substantially strengthen the evidence base of this study. Furthermore, the findings suggest that the selection and professional development of instructors in emergency medicine continuing education should explicitly include, alongside subject matter expertise, didactic competencies in designing interactive and practice-oriented learning sequences as well as experience in facilitating interprofessional groups as core selection criteria and qualification objectives.

Soft Skills and Signature Pedagogies in Higher Education: A Comparative Analysis between the Humanities and Healthcare Areas

Maria Antonia Pertosa

University of Trieste, Italy

Abstract

In contemporary higher education, soft skills are increasingly recognized as strategic competences in professional degree programs; however, their presence within curricula remains heterogeneous and often implicit. Grounded in the Dublin Descriptors and the construct of signature pedagogies (Shulman, 2005), this study investigates how soft skills are declared, integrated, and assessed in the official syllabi of four professional undergraduate programs at the University of Trieste: Education Sciences (19 syllabi), Social Work (22 syllabi), Speech Therapy (73 syllabi), and Physiotherapy (42 syllabi).
How are soft skills formally represented across different disciplinary areas? A systematic documentary analysis was conducted through recursive readings of 156 syllabi, identifying soft skills embedded in learning objectives, teaching methodologies, and assessment practices. Through an inductive analytical process, soft skills were categorized based on semantic affinities and recurrent patterns, then coded as present (1) each time the competence appeared, whether explicitly or implicitly; the final score is the sum of occurrences, capturing the overall pervasiveness of the phenomenon. Although occurrences were categorized as explicit or implicit during the reading process, both were assigned the same value in order to map the extent of the phenomenon as a whole; the distinction between forms of explication will be systematically addressed in the second phase of the research, through phenomenographic interviews with lecturers.
Findings reveal a shared core of soft skills (communication, critical thinking, teamwork, and analytic skills), alongside significant disciplinary variations. Humanities programs emphasize empathic-reflective capacities and dialogic-participatory competences and situated, practice-based pedagogies. A structural-discrepancy emerges in the curricular recognition of internships: highly formalized as core component in healthcare programs, they remain less structured in humanities programs, revealing implicit epistemological hierarchies between technical-procedural knowledge. These results inform curricular design aimed at fostering transformative teaching and learning practices in Higher Education. The analysis of the humanities area also serves as a methodological model for the ongoing investigation of the healthcare area.

Keywords: *Soft skills, Signature Pedagogies, Higher Education, Syllabus Analysis, Documentary Analysis*

1. Signature Pedagogies as a Device for Professional Training

Every profession rests on a distinctive pedagogy. Shulman [1] defines signature pedagogies as the specific ways in which a discipline teaches students to think, act and become professionals: “Signature pedagogies teach students to think, to perform and to act with integrity. They form habits of the mind, habits of the hand, and habits of the heart” (p.59). The construct operates on three levels: surface (visible teaching acts: lectures, placements, case discussions), deep (implicit epistemologies: learning to “see” a professional situation) and implicit (values tacitly transmitted: what matters and what is right in this profession). This partition makes signature pedagogies a powerful analytical tool for reading professional curricula - not only for what they declare, but for what they implicitly structure. Soft skills – communication, critical thinking, teamwork, reflexivity, empathy – are not decorative additions to technical knowledge but constitutive dimensions of professionalism as described by Eraut [2] and Goleman [3]: embodied modes of professional being and acting oriented by values, relationships and ethical judgements. In professional Higher Education this integration often remains implicit, fragmented and entrusted to individual teacher initiative rather than shared curricular design, despite the growing emphasis on transformative university education [6]. It is within this tension that the present research is situated.

2. Research and Methodology

The research is articulated in two phases. The first involved a systematic documentary analysis of the syllabus of undergraduate degree programs in the humanities area - Education Sciences (L-19, according to the Italian Ministry of University and Research classification, n= 19 syllabi) and Social Work (L-39, n=22 syllabi) and in the healthcare area - Speech Therapy (L/SNT2, n= 73 syllabi) and Physiotherapy (L/SNT2, n=42 syllabi) - for a total of 156 syllabi analyzed at the University of Trieste. The corpus comprises the entirety of available syllabi for each three-year programme, restricted to TAF A (basic disciplines), B (core/characterizing disciplines) and C (related and integrative disciplines), as these constitute the professionalizing component of each pathway.
Syllabi have been treated as artefacts of didactic design [4], [5]: documents in which lecturers render visible - or leave implicit - their formative choices regarding learning objectives, teaching strategies and assessment criteria. The constructive alignment model [5] defines the quality of curricular design as coherence between these three components and provides the analytic framework for reading the syllabus. Soft skills were searched across the entire text of each syllabus - course description, disciplinary content, learning objectives, teaching methodologies and assessment methods - since they may emerge in any section: the unit of analysis is therefore the syllabus.
The analytical framework was built through an inductive process conducted directly by the researcher in three stages: integral and recursive reading of each syllabus with collection of all textual expressions related to soft skills; systematic comparison of labels in a spreadsheet to identify cross-cutting recurrences; aggregation into categories by frequency and semantic proximity. This process led to the identification of 13 categories; communication; planning; analytical skills; critical thinking; teamwork; discussions; reworking; sector-specific language; reflective; comprehension; empathic; application and judgement skills. Each occurrence – explicit, when named in the objectives, or implicit when inferable from methodologies and content - was assigned the value 1. The final score is the sum of occurrences: it returns the qualitative pervasiveness of the phenomenon in the document rather than a quantitative measurement.
The second phase involves phenomenographic interviews with lecturers from the selected programs. For the humanities area, interviews have been fully conducted and analyzed; for the healthcare area, the process is not yet complete. The presentation of the humanities area therefore serves a dual function: it returns the specific findings of that area and acts as a methodological model, exemplifying how the presence, absence and forms of explication of soft skills in the syllabus are illuminated through the voices of the lecturers. Interviews are anonymised with the coding system described in the methodological note and used as interpretative lenses for documentary data: instruments for making visible what the syllabus cannot capture.

3. Syllabus Analysis

3.1 Education Sciences: Profile by Year of Study

The graphics (Fig.1-3) illustrate the distribution of soft skills by subject and year. The most significant data are discussed in the text; for a complete reading the reader is referred to the figures. Placement, which in the Education Sciences programme falls under F credits rather than TAF A-B-C - lacks a formal syllabus and does not appear in the documentary analysis. This structural absence is itself a significant interpretive finding and will be addressed in Section 4.
In the first year (cf. Fig.1), signature pedagogies are oriented primarily towards building disciplinary language: the integrated course in General Pedagogy and History of Pedagogy (TAF A) reaches 9 for sector-specific language skills and 8 for reworking Psychology of the Life Cycle (TAF A-B) presents the highest score of the year for reworking, 11; and planning, 7. Teamwork is almost absent: maximum value 4, 0 in most subjects.
In the second year (cf. Fig. 2) the profile becomes more articulated: Early Childhood Pedagogy and Children's Literature (TAF B-C) reaches 10 for reworking and 5 for planning; Educational Planning and Evaluation (TAF B) presents the highest teamwork value across the entire three-year programme, 5, signalling that core methodological subjects constitute the curricular space where collaborative competences find their most explicit expressions.
In the third year (cf. Fig.3), the syllabus analysed belongs to TAF A, B and C; programme credits are also distributed across placement activities which as noted lack a formal syllabus. Among the syllabus recorded, Experimental Pedagogy (TAF A) presents the richest profile with 4 for analytical skills and 2 for reflective skills.

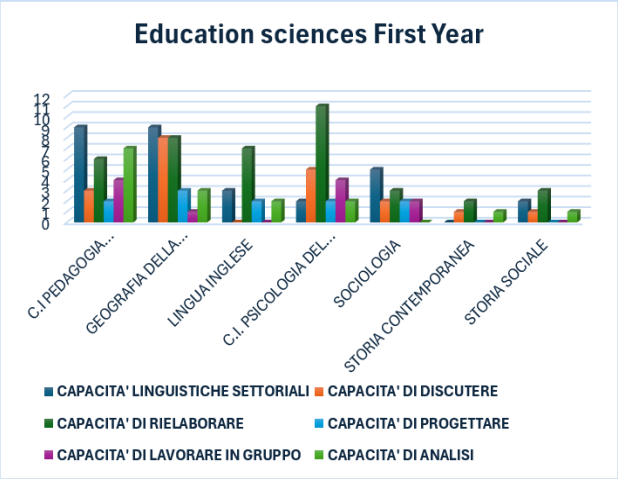

Fig. 1. Distribution of Soft skills in Education Sciences-first Year

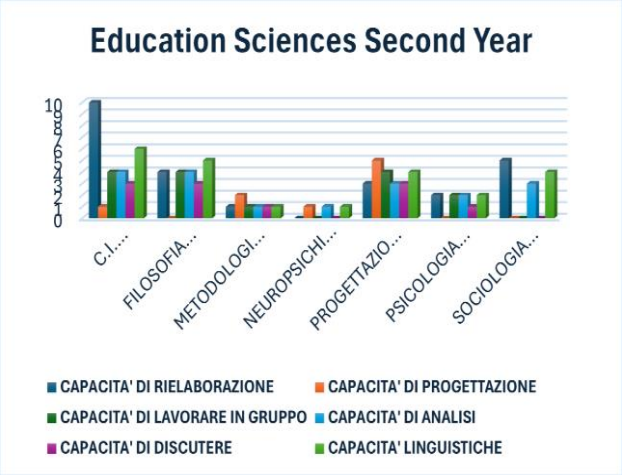

Fig. 2. Distribution of Soft Skills in Education Sciences-Second Year

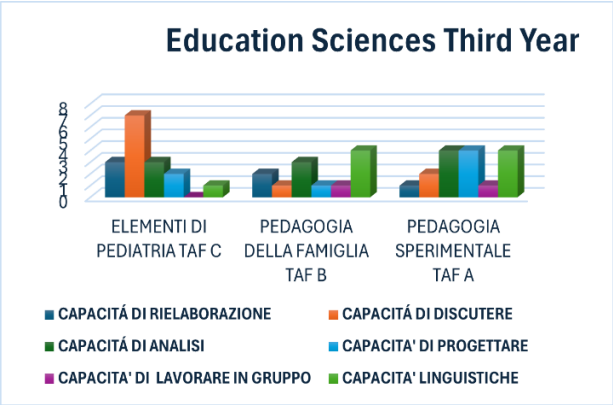

Fig. 3. Distribution of Soft Skills in Education Sciences-Third Year

3.2 Social Work: Profile by Year of Study

The graphics (Fig.4-6) below illustrate the profile of the Social Work degree programme. The documentary analysis was conducted on the academic year 2024/2025.
In the first year (cf. Fig.4), relational soft skills appear more explicitly than in Education Sciences: Methods and Techniques of Social Work1 (TAF B) reaches 7 for communication skills, 4 for critical thinking and 4 for teamwork.
In the second year (cf. Fig.5), the integrated course in Social Policy (TAF A) reaches 6 for communication skills. Two second-semester subjects do not appear in the analysis because, at the time

of data collection (academic year 2024/2025), the relevant syllabus had not yet been uploaded to the institutional platform as the teaching positions were subject to external contract tenders; this is not a structural curricular gap but a temporal limitation of the documentary analysis.
In the third year (cf. Fig.6), Methods and Techniques of Social Work3 (TAF B) presents 4 for critical thinking and 3 for communication skills and teamwork; one TAF C subject does not appear for the same reasons.

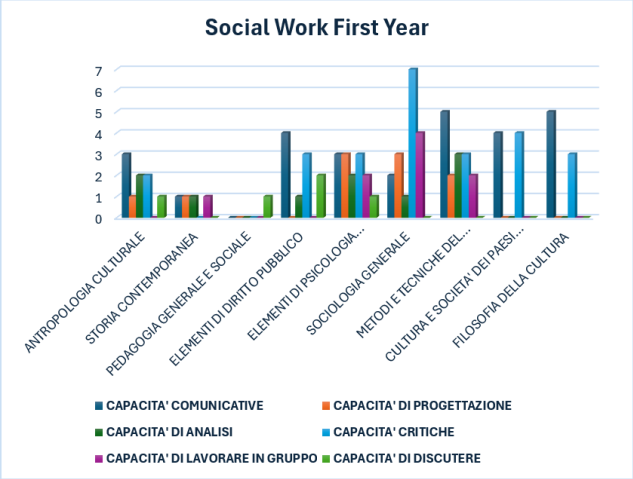

Fig. 4. Distribution of Soft Skills in Social Work

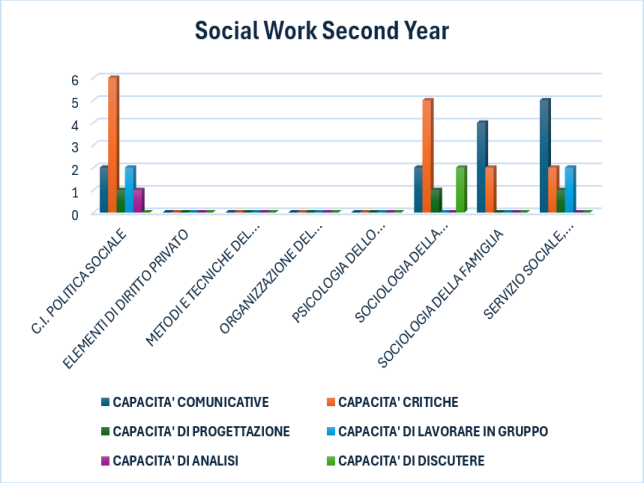

Fig. 5. Distribution of Soft Skills in Social Work

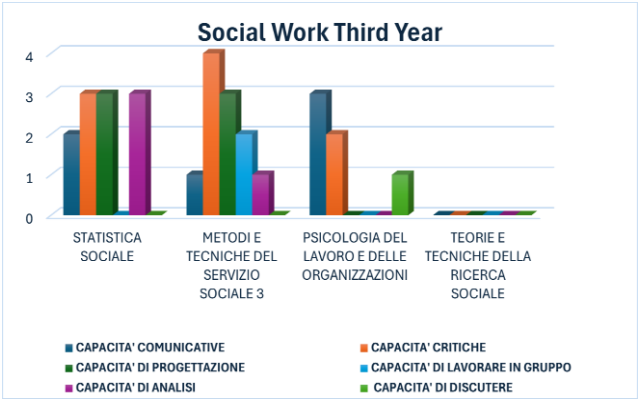

Fig. 6. Distribution Soft Skills in Social Work

3.3 Physiotherapy: Profile by Year of Study

The graphics below (Fig.7-9) illustrate the distribution of soft skills in the Physiotherapy programme. The structurally distinctive element compared to the humanities area is the presence of placement - belonging to TAF B and with its own syllabus structured in the same way as other disciplines - in all three years of the programme.
In the first year (cf. Fig.7), the first-year placement (TAF B) presents the highest values of year; 7 for critical thinking and 5 for language skills, confirming that the practical-situated moment is formally framed as a declared learning objective from the very beginning of the programme. Research Methodology (TAF A) and Human Morphology and Biochemistry contribute balanced scores for critical and analytical skills.
In the second year (cf. Fig.8), the integrated course in General Surgery (TAF A-B) reaches 4 for critical thinking and 3 for reflective and analytical skills. The second-year placement (TAF B) presents 5 for reflective skills and 4 for critical thinking and communication skills.
In the third year (cf. Fig.9), the third-year placement (TAF B) reaches the highest score of the entire three-year programme with 7 for communication skills and 4 for teamwork, demonstrating a coherent progression in which the practical component contributes increasingly to the development of soft skills.

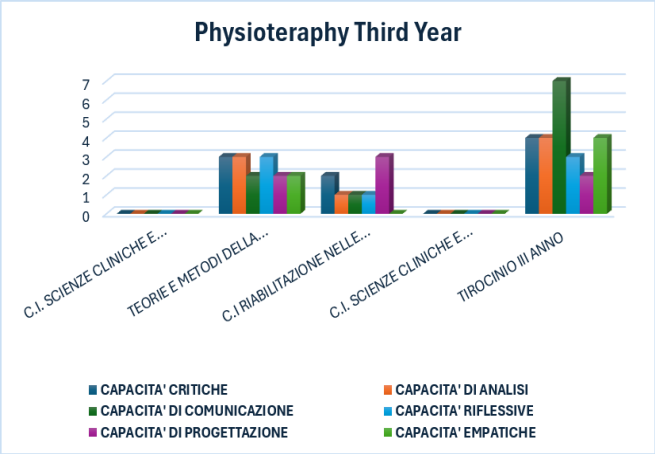

Fig. 7. Distribution of Soft Skills in Physiotherapy

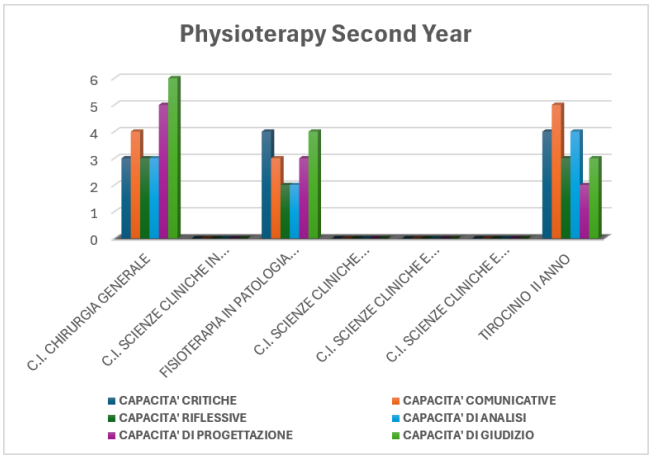

Fig. 8. Distribution of Soft Skills in Physiotherapy

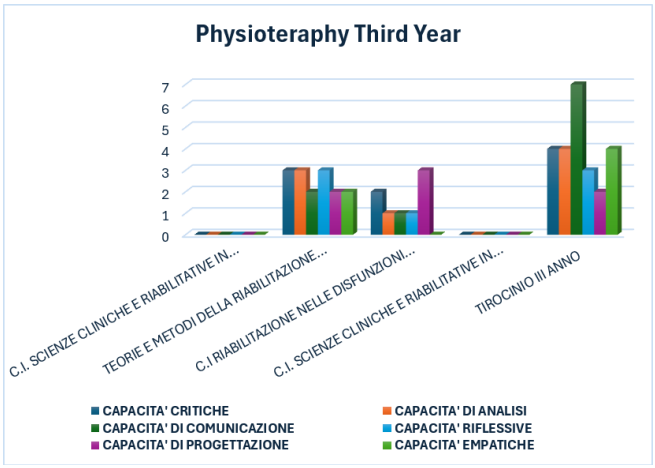

Fig. 9. Distribution Soft Skills in Physiotherapy

3.4 Speech Therapy: Profile by Year of Study

The graphics below (Fig.10-12) illustrate the distribution of soft skills in the Speech Therapy programme, which presents the highest scores in the entire comparative analysis.
In the first year (cf. Fig.10), Human Sciences (TAF A-B) reaches 11 for critical thinking, 8 for communication skills and 7 for sector-specific language skills; Language Development (TAF A-B) contributes 8 for critical thinking and 7 for communication skills. The first-year placement (TAF B) already presents relevant scores in the first year, confirming the centrality of clinical practice from the very beginning of the programme.
In the second year (cf. Fig.11), Neurology and Logopedics of Aphasia (TAF B) reaches 8 for critical thinking and 7 for analytic skills; the 2nd year placement (TAF B) contributes 3 for judgement skills.
In the third year (cf. Fig. 12), Neurological Pathologies (TAF B) reaches 10 for planning skills, 7 for critical thinking and 4 for teamwork; the third-year placement (TAF B) presents 6 for judgement skills and 5 for critical thinking, communication and language skills.

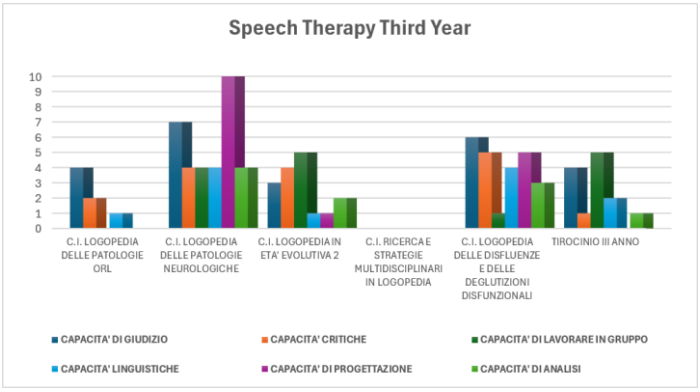

Fig. 12. Distribution Soft Skills in Speech Therapy

3.5 Comparison between the Two Areas

Given the qualitative nature of the scoring system, which captures pervasiveness rather than measuring quantity, aggregate comparisons are intentionally avoided; the asymmetries described are grounded in the patterns observed across the full corpus of 156 syllabi. The comparison between the humanities and healthcare areas reveals three structural asymmetries. The first concerns formalisation: in the healthcare area soft skills are declared explicitly with greater frequency and scores are distributed more evenly across the three years.
The second concerns placement: in the healthcare programmes it is integrated as a curricular device with its own syllabus belonging to TAF B in every year, whereas in Education Sciences it is structurally absent from documentary analysis and in Social Work it is present but with still partial formalisation.
The third concerns progression: the healthcare programmes show a coherent growth of scores from the first to the third year, in which clinical practice contributes increasingly to the development of soft skills: in the humanities area this progression is not detectable in the documents.

4. The Signature Pedagogies of the Humanities Area: What the Syllabus Does Not Tell

Documentary analysis returns what lecturers have chosen to write. Phenomenographic interviews give access to what the syllabus cannot capture: the conceptions, practices and tensions inhabiting professional training. The connection between documentary data and lecturers' voices is the central interpretive device of this section; for each thematic node, the analysis begins from the specific syllabus data of the interviewed lecturer and enters their voice as explanation, confirmation or contradiction of that data.

4.1 Soft Skills as Constitutive of the Profession

The syllabus documents of both programmes show soft skills predominantly implicit in methodologies. This implicit presence is not accidental; it reflects a conception in which soft skills are not additional to

technical knowledge but constitutive of it. A lecturer (DLSE_02) - whose syllabus includes explicit objectives for professional communication and teamwork - articulates these with precision:
"I don't distinguish between soft and hard skills; soft skills are part of the technical competences of educators. They are concerned about the very heart of educational work. They are indispensable cogs, not decorations."
In the Social Work programme, a lecturer (DLSS_03) - whose first-year syllabus shows significant scores for communication and analytical skills - draws the crucial distinction between relational competence as a personal disposition and as a conscious methodological acquisition:
"In active listening I must be able to reformulate to stimulate the other's narrative. In the profession I am aware of the competence I am using at the moment because I have acquired a method."
This distinction is epistemologically significant: university training is called not to form "relationship-gifted" people, but professionals who consciously master their soft skills as tools of their work.

4.2 The Gap between What Is Practiced and What Is Written

The most recurrent finding in the analysis is the gap between rich teaching practices and syllabus that don't declare them. A lecturer (DLSE_04) - whose 3rd year syllabus reaches 4 for analytical skills, the highest score of the year, through explicit formulation in the Dublin Descriptors - represents the case of coherence between document and practice:
"I made them explicit within the learning objectives: knowledge and understanding is a transversal capacity; autonomy of judgement is explicit. It isn't difficult to do it - you just have to decide to do it."
By contrast another lecturer (DLSE_05) – whose second-year syllabus shows group activities in the methodologies but no soft skills in the objectives – states:
"In my syllabus soft skills aren't present. Final exams are based on content: I don't assess soft skills because I haven't declared them as an objective."
The same gap emerges in the Social Work programme: a lecturer (DLSS_02) practices case analysis in small groups daily - whose syllabus shows significant scores for communication and teamwork - but when asked about soft skills in the syllabus indicates she would need to check. Another lecturer (DLSS_01) identifies the structural reason for this fragmentation:
"Building a transversal pathway means entering into dialogue between lecturers. We often cannot do this not because we don't want to but because institutional time doesn't allow it."

4.3 Active Teaching as Signature Pedagogies in Action

The highest teamwork scores are concentrated in methodological, and laboratory subjects. Interviews reveal the didactic logic underlying these scores - logic that syllabus cannot capture. A lecturer (DLSE_03) - whose syllabus presents the highest teamwork value across the entire three years programme - explains:
"Soft skills cannot be taught frontally: made explicit, they become trivialized. I ask students to work in a small group on a real planning project, through all its phases. If I ask the questions, they already have an answer; if they ask themselves, they discover they need to adjust many things."
In the Social Work programme, a lecturer (DLSS_02) - whose syllabus shows balanced scores for communication and teamwork - describes a teaching that reproduces real professional work conditions:
"I bring a real case; we analyse it together in small group stimulating teamwork: that is what they will be doing. Working together to solve a problem is already forming for the profession."
Both practices correspond to what Shulman calls the surface level of signature pedagogies: the visible teaching acts through which the values and epistemologies of the profession are transmitted in an embodied way. That these practices are scarcely documented in the syllabus is the central contradiction of the humanities area.

4.4 Placement: Structural Absence and A Vision to Build

Placement is the formative device in which signature pedagogies would find their fullest expression. Its absence from the Education Sciences syllabus is not bureaucratic oversight: it is the symptom of a deeper problem. A lecturer with a placement coordination role (DLSE_01) articulates this clearly:
"We do not have a single shared placement model across Italian Education Sciences programmes. The fundamental question is: what idea, what vision, what model of placement do we have? When we have this shared thinking, we will be able to establish which soft skills to develop and how."
Another lecturer (DLSE_03) articulates the problem in didactic terms:

"There is a gap between placement and courses. Without this integration I must work on students' imaginative capacity. With integrated placement we would have a real training ground."
In the Social Work programme, placement is present from the first year, but a lecturer (DLSS_04) notes that the systematic focus on soft skills still depends on individual supervisors rather than a shared framework:
"From the first-year students have a placement in which they practise these competences. I am not sure how much tutors have a specific focus on these. They are competences the social worker cannot do without - but there is not yet a shared model for developing them."

5. Discussion and Conclusions

The research shows that the humanities area possesses recognisable signature pedagogies - oriented towards relationship, reflexivity and situated planning - but that these exist predominantly in lecturers' practices not in the official curricular documents. This gap has three concrete implications for curricular design.
The first concerns syllabus as pedagogical acts. What is not written cannot become a shared objective, cannot be systematically assessed, and does not orient students as a declared formative goal, particularly in a Higher Education context increasingly oriented toward measurable learning outcomes [7]. Making soft skills explicit in the syllabus does not mean bureaucratising teaching: it means rendering visible and transmissible a signature pedagogy that already exists in the classroom. As the case of DLSE_04 demonstrates - the only lecturer who has systematically made soft skills explicit through the Dublin Descriptors - this formalisation is possible and does not impoverish practice.
The second concerns placement as a curricular device. The recent establishment of the professional register for educators (Law 55/2024) opens a normative space in which it is finally possible - and necessary - to build a shared placement model with declared learning objectives and measurable soft skills, following the model already in place in the healthcare programmes with placement belonging to TAF B. Without this step, the formative device most directly involved in building professional identity will remain without an explicit reference framework.
The third implication concerns shared curricular design. The gap between practices and documents, and the fragmentation between courses, are not individual problems: they are effects of an institutional structure that does not provide time and spaces for pedagogical dialogue between lecturers. As DLSS_01 notes, building a transversal pathway requires dialogue – dialogue that is not yet systematically possible. The research will continue with the analysis of interviews with lecturers in the healthcare area, to examine whether and to what extent greater documentary formalisation is accompanied by a different conception of the role of soft skills in professional training.

Abstract

In the occupational environment, workers' motivation and satisfaction are essential for their work performance. In the occupational school environment, emotional exhaustion can lead to a decrease in workers' performance. The associations between motivational dimensions and those of job satisfaction as well as their associations with the burnout score in workers from 3 school units (a high school, a kindergarten and a middle school) were monitored during periodic medical check-ups using the following questionnaires: The Multidimensional Work Motivation Scale, The Job Satisfaction Survey, Oldenburg Burnout Inventory. There are numerous associations between motivational and job satisfaction dimensions, as well as between these and burnout scores and socio-demographic indicators. These associations are frequently different depending on the school unit. In the 3 schools, workers have low levels of burnout emotional.
In all 3 schools, the following similar correlations are remarkably observed between the following variables:
-Intrinsic motivation correlates positively with Satisfaction with Pay (p1=0.005; p2=0.007; p3=0.002) and with Satisfaction with Fringe Benefits (p1=0.015; p2=0.028; p3=0.026);
-Amotivation correlates negatively with Job Satisfaction Survey scale score (p1=0.016; p2=0.008; p3=0.004)Ş
-Burnout score correlates positively with Satisfaction with Coworkers (p1<0.001; p2=0.019; p3=0.002) and with Satisfaction with Communication (p1<0.001; p2=0.018; p3=0.003).
For school workers, low levels of emotional exhaustion are associated with satisfaction with Coworkers and Satisfaction with Communication. The school occupational environment being one
in which communication as well as social interrelations represent the environment and object of work, worker involvement, good communication and collaboration with other actors of the educational act in school manifest themselves in the initial stages of the burnout syndrome.
Lack of motivation at work is bidirectionally associated with a decrease in employee job satisfaction.
The vocational motivation of school workers increases if these workers receive material benefits or incentives of another nature. Even for teachers who exercise their work by vocation, a decrease in remuneration or other incentives or benefits can lead to a decrease in their motivation and involvement in the educational act.

Keywords: *school, workers, job satisfaction, work motivation, burnout*

Introduction

In the educational environment, the quality of the learning process, the performance of employees depends primarily on their involvement, their motivation in the educational process. It is known that emotional exhaustion can lead to a decrease in workers' performance. A good job satisfaction of workers stimulates their motivation and involvement in obtaining good results.
In psychology, the theory of self-determination shows that well-being and performance are greater when individuals' actions are guided not so much by external factors but by will and pleasure, through the so-called intrinsic motivation [1]. The individual pursues his fundamental needs for autonomy, competence and relationships having the following ways of regulating motivation:
-amotivation which shows the lack of any motivational impulse. The teacher does not obtain satisfaction in the teaching activity which can lead from low performance to career abandonment;
-extrinsic motivation in which actions pursue a material reward or social recognition (or obligation);

-controlled motivation (or regulated by introjection) the individual assimilates rules and values and obeys them because they consider them important even though they do not necessarily belong to their own value system. Motivation regulated by introjection is a form of extrinsic motivation in which workers are driven by the desire to maintain their good image in society, self-esteem, fear of failure or feelings of guilt without being convinced of the intrinsic value of the activity performed;
-motivation regulated by identification in which the individual's actions have personal significance and value. Workers perform certain activities or behaviors because they consider them valuable and integrate them into their own professional value system, not necessarily out of pleasure. When the results of their activity bring them lasting satisfaction and pleasure, they can move to the higher stage of intrinsic motivation;
-intrinsic motivation in which the individual's actions are performed with joy, passion and interest. Intrinsic motivation is manifested by the worker through passion, enthusiasm, curiosity and professional development. The decrease in external, social or material support can diminish enthusiasm without the worker giving up involvement in the activity at work.
Although for teachers the teaching activity is considered a vocational one, through intrinsic motivation, external factors (social and material) have an important role in maintaining motivation and involvement in the profession in the long term. External, extrinsic motivation is based on both financial rewards (remuneration through salary or bonuses for seniority or performance), the provision of modern teaching aids (digital platforms, computers) and valuation from society (esteem from parents, the community, school management). It is important to know if there are associations between certain dimensions of motivation and those of Job Satisfaction as well as between these and the Burnout syndrome [2], [3]. Well-motivated teachers can increase the quality of the educational act and the performance and school efficiency of students.

Material and Methods

During the medical check-up of workers from 3 school units, namely a high school, a middle school and a kindergarten, all located in urban areas, they were offered a voluntary questionnaire that monitored, along with socio-demographic variables (age, length of employment in the school, biological gender, type of residence), the type/types of motivation of workers at work, types of job satisfaction as well as the presence of emotional exhaustion in them.
Workers' motivation at work was evaluated through The Multidimensional Work Motivation Scale (MWMS), having 19 items with answers on a Likert scale from 1 to 7. This scale has 6 dimensions representing the types of motivation, namely: Amotivation, Extrinsic regulation (social), Extrinsic regulation (material), Introjected regulation, Identified regulation, Intrinsic motivation. Except for the Introjected regulation dimension which has 4 items, the other dimensions each have 3 items. The maximum possible score of these dimensions is 21 except for the Introjected regulation dimension which can achieve a maximum of 28 points [4].
Burnout syndrome was assessed in workers using the Oldenburg Burnout Inventory, a questionnaire that has 16 items on a 4-point Likert scale and presents 2 dimensions of burnout syndrome, namely Disengagement and Exhaustion. The maximum total possible score on this scale is 64, each of the 2 dimensions, Disengagement and Exhaustion, can achieve a maximum score of 32 [5], [6]. .
The Job Satisfaction Survey was used to assess the ways of satisfaction of workers at work. With 36 items, each scored on a 6-point Likert scale, this questionnaire tracks the following types of Satisfaction, namely: Pay, Promotion, Supervision, 3, Fringe Benefits, Contingent Rewards, Operating Conditions, Coworkers, Nature of Work, Communication. Each dimension, having 4 items, can achieve a maximum of 24 points. The maximum possible score of the Job Satisfaction Survey is 216 [7], [8].

The questionnaire was administered for voluntary completion to workers in a high school (School no. 1), a kindergarten (School no. 2), and a middle school (School no. 3) which together totaled a total of 184 employees. The distribution of the number of workers and respondents in each school is as follows:
-in School no. 1 there are 89 employees with 76 respondents;
-in School no. 2 out of 37 employees there were 18 respondents;
-in School no. 3 with 58 employees presented 47 respondents.
Respondents are predominantly female in all 3 schools (Table 1).

Table 1. Percentage of respondents by gender within respondents

gender	School no. 1	School no. 2	School no. 3
women	69.74	100	82.98
men	30.26	0	17.02

The respondents' type of residency is predominantly urban in all 3 schools (Table 1).

Table 2. Percentage of respondents by type of residence within respondents

type of residence	School no. 1	School no. 2	School no. 3
urban	95.77	58.82	78.72
rural	4.23	41.18	21.28

Results

The workers are on average in middle adulthood, at which point they generally reach a maximum professional level. The average length of experience at the current job between 5 and 13 years shows a good professional experience as well as a stability of these workers at the current job. (Fig. 1.)

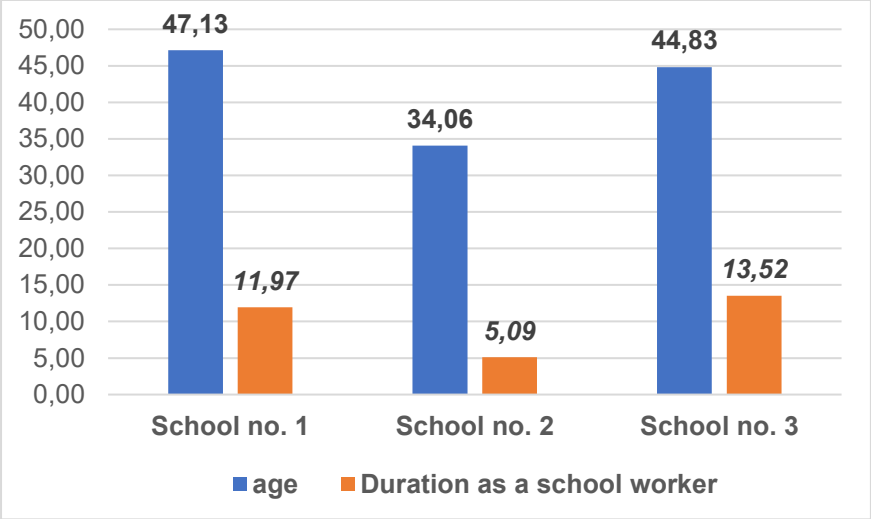

Fig. 1. Age and duration as a school worker by school

Low-average burnout levels in the state for the total score as well as the 2 subdimensions are present in workers from the 3 schools. (Fig. 2.)

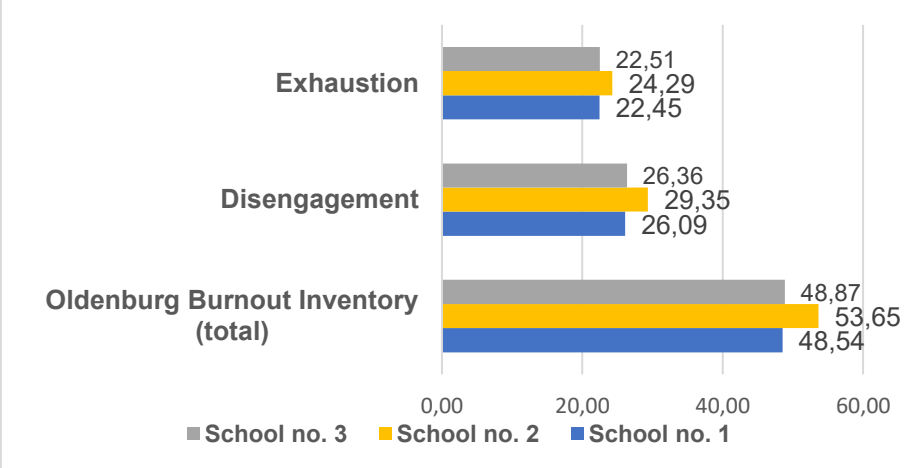

Fig. 2. Average levels of burnout score dimensions in the 3 schools

Workers from the 3 schools have higher scores on Intrinsic motivation and Identified regulation, while also achieving the lowest scores on amotivation. (Fig.3)

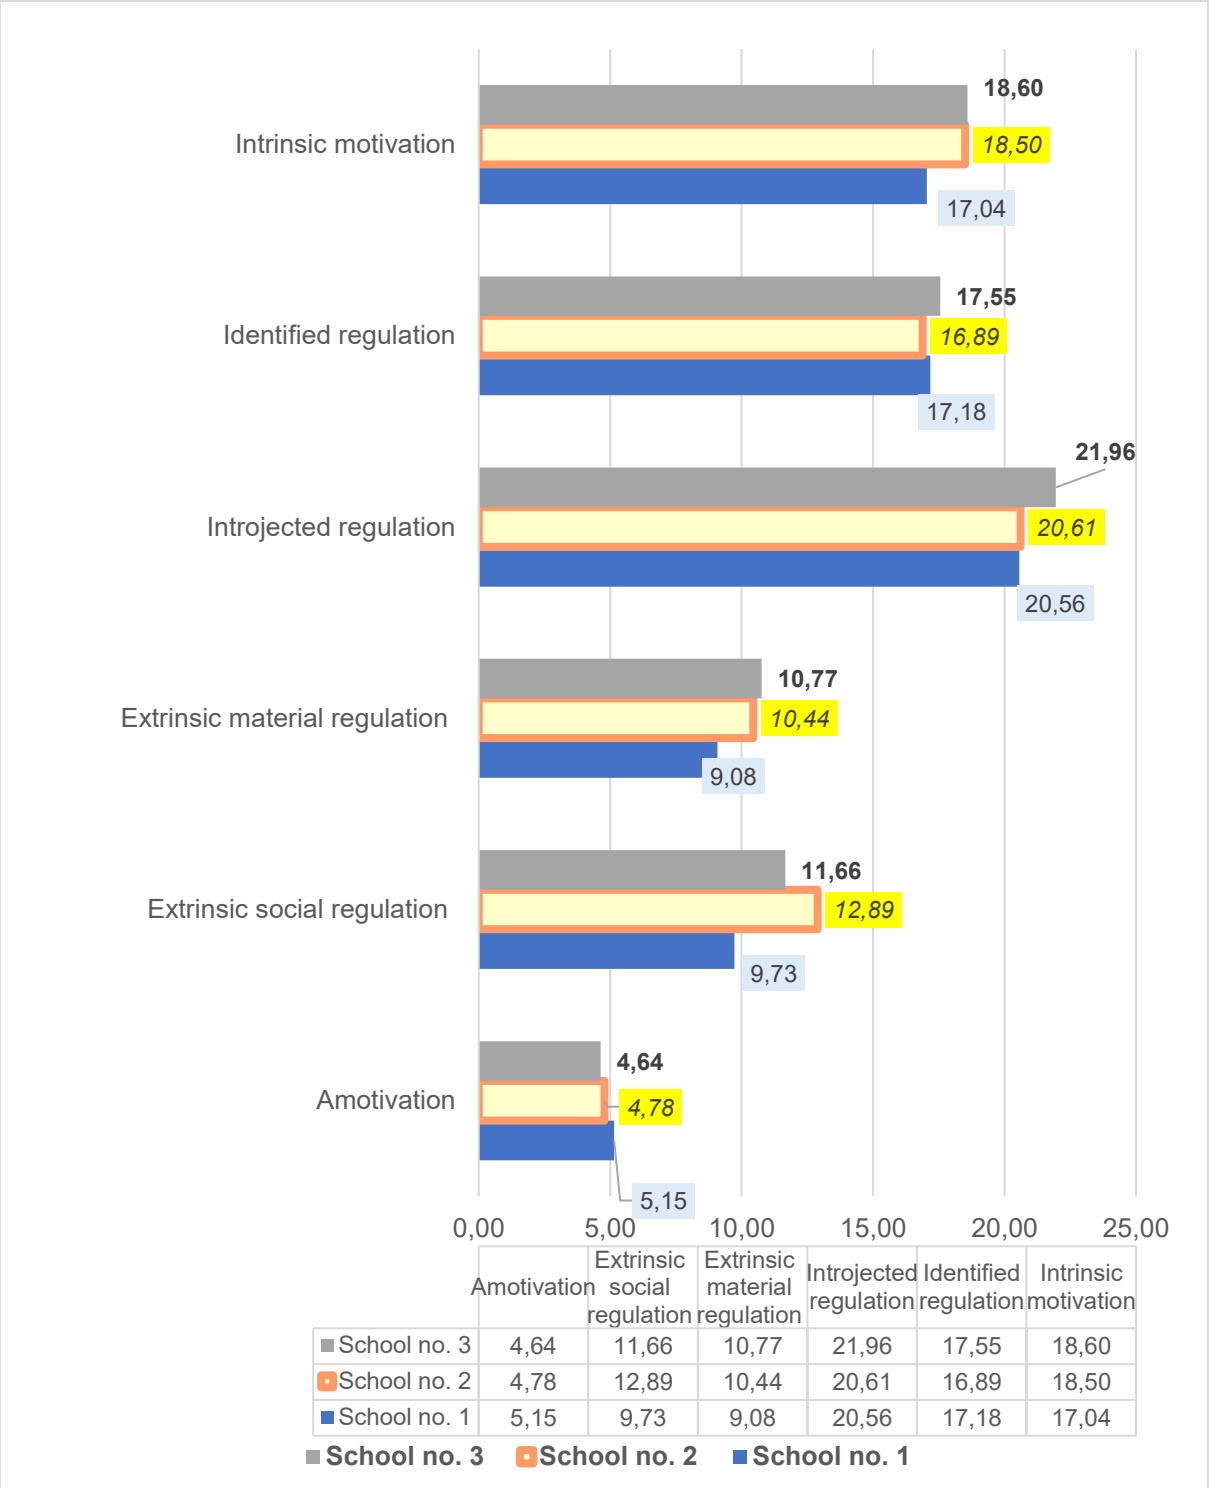

Fig. 3. The average scores on the Multidimensional Work Motivation Scale for workers from the 3 schools

The scores on Introjected regulation are higher due to the fact that this scale has 4 items compared to the others which only have 3 items.
The average scores of the dimensions of the Job Satisfaction Survey scale are shown in the following figure (Fig.4.)

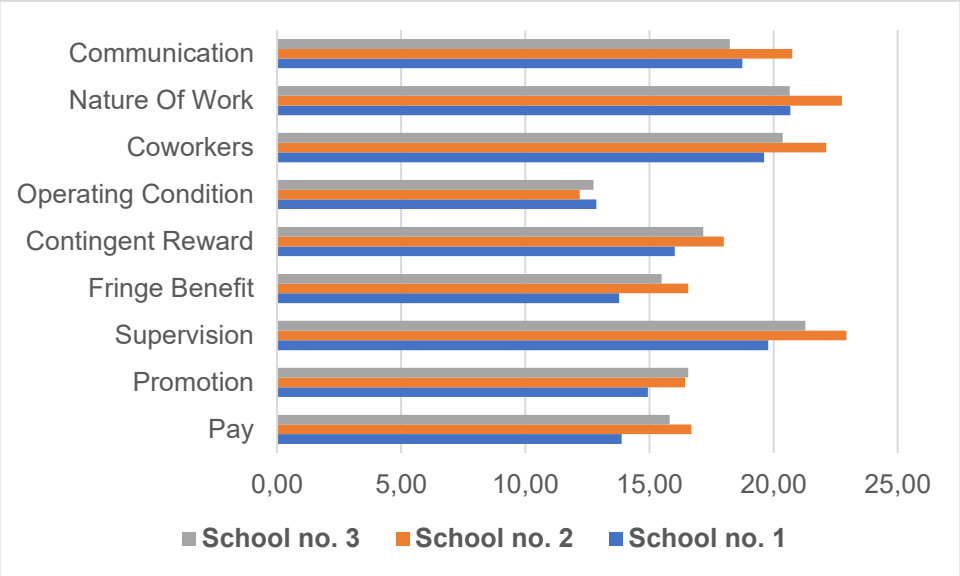

Fig. 4. Average scores of the Job Satisfaction Survey dimensions in the 3 schools

The highest scores are obtained for satisfaction with supervision, nature of works, coworkers, communication and the lowest value for operating condition.
There are numerous different correlations between the studied variables depending on the school unit. There are also correlations present similar in all 3 school units that show the generalizability of these results.
In all 3 schools, the following similar correlations are remarkably observed between the following variables:
-Intrinsic motivation correlates positively with Satisfaction with Pay (p1=0.005; p2=0.007; p3=0.002) and with Satisfaction with Fringe Benefits (p1=0.015; p2=0.028; p3=0.026);
-Amotivation correlates negatively with Job Satisfaction Survey scale score (p1=0.016; p2=0.008; p3=0.004)
- Burnout score correlates positively with Satisfaction with Coworkers (p1<0.001; p2=0.019; p3=0.002) and with Satisfaction with Communication (p1<0.001; p2=0.018; p3=0.003).
For school workers, low-medium levels of emotional exhaustion are associated positively with satisfaction with coworkers and satisfaction with communication.

Conclusions

Workers from all 3 schools have as main dimensions of motivation introjected regulation, Intrinsic motivation, Identified regulation. Among the smallest motivational dimensions are social and material Extrinsic regulation and the lowest modality of motivation is amotivation. The concordant values obtained in the 3 schools on the presented dimensions show a general character of these results.
Satisfaction with supervision, nature of works, coworkers and communication being the most important dimensions (modalities) of job satisfaction show a vocational occupational environment and good communication with colleagues and hierarchical superiors and which are appreciated by workers from these schools.
The smaller sources of satisfaction compared to the first ones being Fringe Benefits, Pay, Promotion indicate the importance of improving the organizational aspects of stimulating performance and promotion based on performance criteria in the school as well as of the appropriate remuneration for the work performed. The fact that operating condition has the lowest values supports the importance of involving decision-makers, from society, in improving and creating better working conditions as a premise for obtaining performance from workers in the educational act. The similar values obtained in the 3 schools show that the aspects presented are not accidental but allow their generalization.
For school workers, having low-medium levels of emotional exhaustion are associated positively with satisfaction with Coworkers and Satisfaction with Communication. In schools, workers who have higher levels of job satisfaction in terms of satisfaction with collaboration with other employees and communication with other actors in the educational act (colleagues, students) achieve higher levels of burnout syndrome score. The relationship is bidirectional, workers with higher levels of burnout score

present greater job satisfaction in terms of collaboration with other employees and communication with participants in the educational act (colleagues, students).
The school occupational environment being one in which communication as well as social interrelations represent the environment and object of work, worker involvement, good communication and collaboration with other actors of the educational act in school manifest themselves in the initial stages of the burnout syndrome.
Lack of motivation at work is bidirectionally associated with a decrease in employee job satisfaction.
The vocational motivation of school workers increases if these workers receive material benefits or incentives of another nature. Even for teachers who exercise their work by vocation, a decrease in remuneration or other incentives or benefits can lead to a decrease in their motivation and involvement in the educational act.

Understanding Nursing-Specific Polysemous Terms: An Exploration with Hong Kong L2 Nursing Students

Mei Yung Vanliza CHOW

Hong Kong Metropolitan University, HKSAR, Hong Kong

Abstract

Extensive research has been conducted on the discipline-specific vocabulary required by students across different fields. In nursing, certain general English words are polysemous, such as the term 'line(s)' may acquire specialized meanings through figurative extensions to convey nursing knowledge. For L2 English learners (learning English as a second language), recognizing and understanding these ordinary yet polysemous nursing-specific terms can be challenging. Investigating how these terms convey nursing knowledge and identifying the difficulties faced by L2 nursing students contribute to improving the teaching and learning of nursing-specific vocabulary, thereby enhancing their expertise and the provision of healthcare.

To this end, a two-phase study was conducted. The first phase involved investigating the knowledge embedded in the general English polysemous term, 'line(s)', as found in the Oncology Corpus compiled for this study. The second phase consisted of a survey aimed at exploring the challenges Hong Kong L2 nursing students when interpreting the figurative meanings of the term 'line(s)' within the nursing context.

The first phase of the study reveals that the term 'line(s)', an ordinary English word, frequently has its multiple meanings extended through metaphor and metonymy. The findings indicate that 'line(s)' commonly appears in universal metaphors such as the pathway to convey nursing knowledge. Furthermore, the term occurs in many general English idiomatic expressions and functions as an important nursing-relevant linguistics resource in nursing workplace spoken communication. The survey with ninety nursing students indicates that their awareness of the figurative extensions of this polysemous term needs to be strengthened. Some participants underinterpreted or misinterpreted its nuanced meanings. The findings also reveal cultural variations and first language influence in participants' interpretation of the term when it is extended figuratively.

It is recommended that seemingly general but figurative polysemous terms, such as the term 'line(s), be explicitly addressed in nursing curricula. Instruction should focus on detailed metaphorical mappings to support nuanced understanding of nursing knowledge. Teachers should also attend to cultural differences and first-language influences among L2 learners, which may shape their interpretation of these figurative extensions. In sum, these measures can promote greater precision in healthcare practice and enhance patient safety.

Keywords: *Discipline-specific polysemous terms, nursing-relevant linguistic resources, idiomatic expressions, figurative expressions, health-care communication*

1. Introduction

Since the inception of English for Specific Purposes (ESP) as a distinct field, considerable research has been devoted to examining discipline-specific vocabulary [18][20][23]. This vocabulary encompasses important concepts and specialized knowledge unique to a particular field. Proficiency in this vocabulary is essential for students' academic success and their ability to perform appropriately and effectively in future professional settings. In the field of nursing, the acquisition of discipline-specific medical terminology serves as a key indicator of nursing students' understanding of their field's specialized knowledge. It is integral to their professional identity and also plays a crucial role in fostering workplace competence. Proficiency in this terminology enables nursing students to communicate accurately and appropriately with both healthcare professionals and patients, carrying out clinical responsibilities with precision, and ultimately contribute to ensuring patient safety [2][10].

[20] classifies vocabulary for English learners in academic contexts into four categories: high-frequency words, technical words, academic words, and low-frequency words. In the nursing field, the Unified Medical Language System (UMLS), a resource for health and biomedical informatics, includes 1,208 multiply-categorized vocabularies and terminologies, illustrating various types of polysemy in healthcare

contexts [19]. Some of these polysemous terms are high-frequency general English words, adopting specialized meanings in the nursing field. Nevertheless, there is a general tendency for students to overlook the important nursing knowledge embedded within these seemingly ordinary English terms, particularly given their polysemous nature.

As [24] point out, the various senses of a polysemy can be classified into two broad categories: core meanings, which encompass general and familiar interpretations, and non-core meanings, which include peripheral or extended interpretations. Non-core meanings are often new senses derived metaphorically or metonymically from the core meanings [7][22]. Generally, metaphor involves a comparison between two entities, while metonymy relies on contiguity relationships between a component and the object it represents. It has been well-documented that metaphor and metonymy are employed by different disciplines to frame the knowledge and social world of their fields [6][9], as well as building the identity and sharing the values of a discourse community [5]. For instance, the 'pathway' metaphor is frequently employed by the healthcare professionals taking care of end-of-life cancer patients to express their views about the lengthy nature of cancer treatments [21]. In cognitive linguistics, metaphor is understood as systematic comparisons between two conceptual domains, namely the source and the target domains, rather than a mere comparison between two discrete entities. As exemplified by the conceptual metaphor 'life as a journey', where elements of the source domain 'journey', such as 'distance', 'obstacles' and 'different paths' are systematically mapped onto aspects of the target domain 'life', such as 'longevity', 'difficulties', and 'different decision-making' [12][25].

Another example illustrating how a general English polysemous word can acquire discipline-specific meanings through metaphor or metonymy in the nursing context is the term 'line(s)'. The general English word 'line', which ranks 274th among the 2801 high-frequency headwords in the New General Service List (NGSL) [4], literally refers to a physical line or a line-shaped entity. In the nursing context, the term 'line(s)' refers to the equipment catheter lines (also as 'tubes') used in intravenous therapy. For example, the term 'PICC lines' (Peripherally Inserted Central Catheter lines) is a device in administering intravenous therapy. Furthermore, its meaning can also be extended metaphorically to denote types or methods, as seen in expressions such as 'many lines of treatment'. Certain meanings of 'line' can also evolve into what is described as 'a metaphor from metonymy', as illustrated by the example of 'advice line', which is further discussed in Section 4. Notably, some of these extended senses tend to be associated with particular grammatical patterns [16], such as the singular form of 'mouse' instead of the plural form 'mice' is more likely to be extended as a computer device in Computer Science.

In sum, it is important for nursing students to recognize that certain seemingly ordinary English words may function as discipline-specific polysemous terms through figurative extensions. Developing competency in interpreting both the literal and figurative meanings of these discipline-specific polysemous terminologies, such as 'line(s)' within the nursing context, is crucial. This competency facilitates a deeper understanding of nursing knowledge, promotes effective and precise engagement in professional discourse, and thereby enhances their workplace performance and patient safety.

Nevertheless, L2 learners (learners of English as a second language) often rely on the core meaning - usually the literal sense - of a polysemous word to interpret a text or context. When general English words acquire new meanings through metaphorical or metonymical extensions, this can create comprehension challenges for L2 learners [8]. The problem becomes more complex when both the literal and figurative senses of a general English polysemous term are frequently used in discipline-specific writing since students are required to master not just the multiple meanings of a discipline-specific term, but also metaphoric competence to help them discern whether the literal or figurative sense of the term is applied in a specific text or context. One example is the difficulties faced by L2 nursing students in interpreting polysemous terms in nursing questions in their examination, as [1] explain. [13] also observed that Computer Science students in her study struggled to understand the term 'data field' because they were more familiar with the general literal meaning of the word 'field' in the agricultural sense. Furthermore, comprehension and interpretation problems may arise not only with single-word polysemy but also when they occur in multi-word units. [17] identifies the difficulties that a group of Bangladeshi ESP students experienced when they encountered the metonymic term '*can do* civil servants' which refers to a set of civil servants with a particularly positive attitude; the Bangladeshi students thought it simply meant 'capable' civil servants since they attempted to understand the meaning of 'can do' separately and were not aware that an extended metaphorical meaning has been assigned to the two words when they appear as one multi-word unit.

2. Objectives and Research Questions

Considering these challenges, this paper aims to explore the potential difficulties faced by L2 nursing students in Hong Kong when interpreting general English polysemous words as nursing-specific terms. The focus of this study is placed on how the ordinary English polysemous term 'line(s)'is extended through metaphor and metonymy in oncology nursing research articles. Oncology nursing research articles have been selected for this study due to the increasing significance of cancer as a global health threat and the important role of catheter lines, commonly referred to as 'line' in the administration of cancer treatments. Through exploring the potential challenges that L2 nursing students in Hong Kong encounter when interpreting this discipline-specific polysemous item, particularly within the context of oncology nursing, it is hoped that the findings can provide pedagogical insights into helping Hong Kong L2 nursing students in understanding nursing discipline-specific polysemous items more effectively.
The research questions guiding this study are:

1. What kinds of knowledge related to nursing, particularly oncology nursing, are encoded through the polysemous term 'line(s)' in oncology nursing research articles?
2. What potential challenges L2 nursing students in Hong Kong face in understanding the meanings of this general English polysemous is extended as discipline-specific polysemous term, especially when these meanings are motivated figuratively, by metaphor or metonymy?

3. Methods

To answer the two research questions, research articles containing the words 'cancer', 'care', 'healthcare', 'nurse(s)', 'oncology' and 'patient(s)' extracted from the *European Journal of Oncology Nursing* and *Cancer Nursing Practice* between 2010 and 2016 were downloaded, which were compiled into a corpus called the Oncology Corpus (ONCO Corpus). The total number of words in this corpus is approximately 1.05 million. With the assistance of the corpus tool named *AntConc*, the instances containing the term 'line(s)' were displayed in key words in context format (KWIC) [3].
There are in total 284 instances of 'line(s)' in the Corpus. In general, it has been observed that the multiple meanings of this term within the nursing context can be categorized into three major types: i. a specialized term within the nursing context, ii. an academic term in academic writing and, iii. other less frequent applications (please refer to Figure 1 below). The focus of Section 4.1 is on the first category, that is, the specialized knowledge related to nursing, particularly oncology nursing, as encoded through the polysemous term 'line(s)' in oncology nursing research articles compiled for the Oncology Corpus (addressing Research Question 1). Subsequently, Sections 4.2 and 4.3 examine the procedures and findings of a survey conducted among ninety university nursing students in Hong Kong. This survey aims to explore the challenges faced by these L2 nursing students in Hong Kong when interpreting the meaning of this discipline-specific polysemous term, particularly when these meanings are figuratively motivated by metaphor or metonymy (addressing Research Question 2).

4. Results

4.1. Nursing Knowledge Particularly Oncology, Encoded through the Polysemous Term 'Line(S)'

Examples	Meanings of 'line(s)' (frequencies in brackets)	Literal/Figurative
I. As a specialized term within the nursing context (158)		
a. Related to professional role of nurses		
e.g.,1 '…effective psychological support can be partially provided by **front line** cancer nurses.'	-nurses in direct patient/primary care role	Metaphor
e.g.,2 'who do not work consistent **line**'	-irregular work patterns/shifts /teams	Metaphor
b. Related to intravenous therapy		

e.g.,3 'receiving **many lines** of treatments…'	-methods/ types	Metaphor
e.g.,4 'Dacarbazine is the drug of choice for **first-line treatment**…'	-Priority/sequence of the treatments provided	Metaphor from metonymy
e.g.,5 …symptoms arose for these three patients at cycle one, but **the PICC line** was not inserted until cycle three. e.g.,6 …retrograde back up of stagnate blood clot into **lines**… e.g.,7 'Two centers give locks with gentamicin in case of positive **line cultures**.'	-Referring to the medical devices(catheter) for intravenous therapy -The presence of microorganisms (infection) from a catheter ('line)	Literal
c. Related to workplace nursing spoken communication		
e.g.,8 'Keeping **lines** of communication open and being honest enhances trust between healer…'	-maintaining communication channels	Metaphor
e.g.,9 '…stay on the **line'**	-via telephone: non-face-to-face communication	Metaphor from metonymy
e.g.,10 'Because I had almost a terror to say: I came to **the finishing line**.'	-Idiom / Euphemism: 'came to the endpoint of life'	Metaphor
e.g.,11 'when the **line** would be drawn…'	-Idiom / Euphemism: When it is the time to establish a boundary or make a decision (stop treatment)	Metaphor
II. As a word/ phrase in academic writing (118)		
e.g.,12 'This is **in line with** previous research showing that fear of …'	-Consistent with what has been previously found	Metaphor
e.g.,13 'The data were then examined **line-by-line**, and statements and phrases …'	-Referring to careful manners when investigating data	Metaphor Literal
e.g.,14 'Note how Sarah uses the future progressive tense in **line** four in …' e.g.,15 'This numerical rating scale comprises a **5-point horizontal line**, ranging from 0 (no information needed) to 4 …'	-Referring concretely to each physical or textual line of a text / in a graph	Metaphor from metonymy
e.g.,16 'as a larger cohort study in which all the women had answered **a base-line** questionnaire…'	-A research method-initial measure/reference before intervention/treatment	
III. Other less frequent usage of the term 'line' (10)		
e.g.17 'The peritoneum is a filmy membrane, which **lines** the abdomen…'	-Referring to something covering the abdomen	Literal
e.g.,18 '…their disadvantaged profile with 100% judged below the **poverty line**…'	-Socioeconomic threshold for poverty	Metaphor

Fig. 1. The multiple meanings of 'line(s)' in ONCO Corpus

As illustrated in Figure 1, the multiple meanings of 'line(s)' are often extended figuratively. When 'line(s)'is utilized as a specialized term within the nursing context (Category I in Figure 1 below), it mainly conveys three kinds of information. Firstly, it provides general information about the professional roles of nurses (Examples 1 and 2). Secondly, the term delineates two major duties of nurses in clinical practice, that is, administering intravenous therapy (Example 3) through catheter lines (Examples 4-7), and providing guidance and advice through verbal communication (Examples 8-11).

It is worth noting that Examples 8-11 reveal the importance of specific multi-word units, commonly known as idiomatic expressions, as valuable nursing-specific linguistic resources that support appropriate and effective verbal communication within the nursing context. This skill is essential for providing information, offering advice, and building rapport with both medical professionals and patients. For instance, the phrase 'stay on the *line*' (Example 9), a common general English phrase, illustrates a 'metaphor from metonymy' [14], where the word 'line' metonymically refers to the telephone line which is then metaphorically extended to represent nurse-patient spoken communication. This reveals that the telephone line is conceptualized as a prototype and metaphorically adapted to describe the provision of non-face-to-face guidance and counselling services by nurses. Other examples demonstrating the importance of general English phrases or idiomatic expressions as valuable linguistic resources within the nursing context are 'came to the finishing *line*' (Example 10) and 'when *the line* would be drawn' (Example 11). These general English phrases become effective vague language or euphemism to

indirectly signal that a cancer patient is nearing the end of life, and that the cessation of treatment is imminent. Overall, the transformation of these 'line'-related general English phrases or idiomatic expressions as nursing-specific linguistic resources, help facilitate effective verbal communication that is both truthful and compassionate, making it more acceptable to patients and their families.
Additionally, the term also functions as part of an academic term employed in discussions pertaining to nursing research (Category II). Examples include 'line-by-line' (Example 13) and 'a base-line' questionnaire' (Example 16), which are frequently observed in the oncology research articles analyzed for this study. it can also be seen that the term 'line(s)' is occasionally employed to describe special situations within the nursing context (Category III, Examples 17 & 18).
To summarize, the multiple meanings of the polysemous term 'line' demonstrate how certain general English words are adapted into polysemous nursing-specific terminology via figurative extensions. These multiple meanings can be interpreted both literally and metaphorically to conceptualize various aspects of nursing practice. Furthermore, they underscore the significant role of specific general English phrases or idiomatic expressions in evolving into useful nursing-specific linguistic resources, thereby facilitating effective as well as compassionate verbal communication in the field.

4.2 The Survey

In the summer term of 2020, a survey was conducted with ninety L2 nursing students at a university in Hong Kong, with Cantonese as their native language. The survey was administered while the students were completing the final term of their first year of study. They were given eight extracts selected from the ONCO Corpus (See Appendix A for the extracts). All these extracts contain the polysemous item 'line(s)' as an individual word or as part of a phrase introduced in Figure 1. Figure 2 below shows the eight phrases with their meanings and their figurative mappings (if any) in the extracts. As shown in Figure 2 below, the meaning of 'line(s)' is figuratively extended in all cases except Extract 7. Overall, these eight 'line' phrases were selected from Category I in Figure 1 above, delineating the professional roles of nurses and two of their major responsibilities introduced in Section 4.1. Participants were invited to explain, in either English or Cantonese, the meanings of the term.
The survey, which focused on their interpretation of the polysemous term 'line(s)' in nursing contexts, sought to explore the potential challenges faced by L2 nursing students in Hong Kong when interpreting meanings of polysemous terms, which are predominantly influenced by metaphor and metonymy within the discipline-specific context of nursing.

Extract	Line-related phrases	Metaphor/literal	Mapping
1	'came to **the finishing line**'	Race metaphor	The finish line in a running race is mapped onto the concept of the end of life.
2	'**front line** health professional'	Military/battle metaphor	The foremost position in a battle is mapped onto direct-contact healthcare roles
3	'open the **lines** of communication'	Conduit metaphor	Messages are metaphorically mapped as flowing through channels or pipes.
4	'when **the line** would be drawn'	Boundary metaphor	The act of drawing a physical boundary line to separate spaces is mapped onto the process of making a decision, i.e., determining the time to stop treatment.
5	'who do not work **consistent lines**'	Organization as a 'line' metaphor	Team alignment or structural arrangement is metaphorically mapped onto a physical line.
6	'receiving **many lines** of treatments'	Pathway metaphor	Multiple routes/ courses of treatments are mapped onto different pathways.
7	'the retrograde back up of stagnate blood clot into **lines**'	Literally referring to catheter (the tubes)	Literally referring to the catheter lines for treatment.
8	'stay on **the line**'	Metaphor from metonymy (part-for-whole)	Staying on a telephone line stands for the whole verbal communication system,

Fig. 2. The eight phrases of 'line(s)' and their meanings in Extracts 1-8

4.3 Participants' Performance in Interpreting the Meanings of 'Line(S)'

Overall, their performance was categorized into seven major groups based on a classification framework adapted from [15] (see Figure 3 below). The participants' interpretations of the eight 'line-related' phrases were independently evaluated by two researchers using this framework. Any discrepancies in their assessments were resolved through discussion. Major interpretative challenges observed from these participants of the polysemous item 'line(s)' are discussed in subsections i to v.

Categorization	Description
Type Y	Correct interpretation of the figurative mapping of the term 'line(s)'
Type A error	No attempt at all
Type B error	Difficult to evaluate the provided interpretation, for example, the interpretation is off topic, not related to the meaning of 'line(s)', or incomplete.
Type C error	Difficult to evaluate as only direct Chinese translation of 'line(s)' is provided
Type D error	Provided overall correct meaning of the extract but ignored the meaning of 'line(s)' in their interpretation
Type E error	Wrong interpretation: provide a wrong or unclear literal meaning
Type F error	Wrong interpretation: provide a wrong or unclear metaphorical meaning

Fig. 3. Classification of participants' interpretation of line(s)

i. Insufficient readiness in interpreting 'line' as a general yet figurative nursing-specific term

Figure 4 below illustrates the overall performance of these students in interpreting the term 'line(s)' across the eight extracts provided. As illustrated in Figure 4, Row 1, the majority of participants successfully interpreted the meanings of the 'line'-related phrases in Extracts 1 and 6, achieving accuracy rates exceeding 65%. The accuracy rates for Extracts 2-3 were also relatively satisfactory, at around 50%. However, participants encountered greater difficulties in interpreting the 'line'-related phrases in Extracts 4, 5, 7 and 8, with accuracy rates ranging from 12% to 24 %. Notably, in three of these four extracts (excluding Extract 7), the polysemous term 'line(s)' is embedded within various multi-word idiomatic expressions. The low accuracy rates for these extracts suggest that these multi-word idiomatic expressions may not be in common use among Hong Kong Cantonese speakers, despite their frequent use in the English language. Another possible reason for their low accuracy rates is that participants may assume subject-specific knowledge is typically conveyed through complex vocabulary. As a result, encountering colloquial, everyday general English expressions in nursing texts may have conflicted with their expectations.

In the case of the literal interpretation of the term 'line' in Extract 7, approximately one-fifth of the participants (23%) correctly identified its literal meaning as referring to the physical instrument, 'catheter'. However, a significant proportion of participants misinterpreted the literal meaning of 'lines' in this Extract, associating it with 'blood vessel' or 'blood capillaries'. Additionally, one participant mistook its meaning as metaphorical, associating it with 'lines of *members*' (Appendix H, Responses 79). This confusion highlights a challenge that L2 students may face in understanding nursing-specific polysemous terms, whose meanings can shift between literal and metaphorical contexts. Overall, findings in Row 1 suggest that general English words, such as 'line(s)', may not be as readily understood by L2 learners as anticipated when these words take on discipline-specific meanings, particularly when they appear as part of everyday general English idiomatic expressions. Learners may disregard seemingly simple general English words in a text, thereby hindering their ability to grasp nuanced nursing knowledge embedded within them.

	Type	Extract 1 Appendix B	Extract 2 Appendix C	Extract 3 Appendix D	Extract 4 Appendix E	Extract 5 Appendix F	Extract 6 Appendix G	Extract 7 Appendix H	Extract 8 Appendix I
1	Y	66%	43%	49%	**20%**	**24%**	75%	**23%**	**12%**
2	D	2%	12%	8%	4%	1%	0%	5%	31%
3	A	15%	15%	14%	16%	17%	17%	18%	19%
4	B	9%	10%	26%	22%	29%	7%	28%	13%
5	C	3%	15%	0%	2%	1%	0%	2%	0%
6	E	3%	1%	2%	28%	12%	1%	23%	18%
7	F	2%	4%	1%	8%	16%	0%	1%	7%

Fig. 4. Overall performance of the students' interpretation of the term 'line(s)'

ii. Underinterpretation of nuanced knowledge in the figurative mappings of certain universal metaphors

In the first place, the comparatively higher accuracy rates in interpreting the extended figurative meanings of 'line(s)' in Extracts 1, 2, 3 and 6, that is, 'I came to the fishing line', 'front line professionals', 'open lines of communication', and 'receiving many lines of treatment' (Figure 4, Row 1) suggest that universal metaphors - such as race, battle, conduit, and pathway observed in these Extracts - are more accessible to individuals from diverse cultural backgrounds, including the L2 Hong Kong nursing students who participated in this study. Nevertheless, the insufficient elaboration provided by them in interpreting 'many lines' in the phrase 'receiving many lines of treatments' (Extract 6) indicates the importance of understanding the detailed metaphorical mappings between source and target domains when universal metaphors are utilized to convey nursing knowledge, to ensure nuanced comprehension. In this metaphor, the term 'lines' is conceptualized as distinct courses to medical care. Most students correctly interpreted the general meaning of 'many lines of treatments' to mean that the patients described in the extract received various kinds or courses of treatments. However, only a few succeeded in further elaborating on its more nuanced meaning. While it is accurate to interpret 'many lines' (source domain) in the phrase 'many lines of treatments' as generally referring to 'various types or courses (target domain) of treatments', the pathway metaphor more precisely suggests that just as distinct routes or pathways lead to different processes and outcomes (a detailed mapping within the target domain, the pathway metaphor), different courses are carefully tailored to the unique trajectories of different patients' recovery or illnesses. Developing an awareness of such nuanced metaphorical mappings is essential for nursing students to deliver nuanced, precise, and context-sensitive nursing care.

iii. Cultural variations in interpreting figurative meanings

Interestingly, many participants employed the bridge metaphor to explain their understanding of 'open the lines of communication' (Extract C). For instance, a participant explained 'open the lines of communication' as 'the connect, the *bridge* of communication from person to person' (Appendix D, Response 19) while another participant interpreted the phrase as 'the nurses are *bridges* between the patient and their family or relatives' (Appendix D, Response 57).

Firstly, this demonstrates that metaphor is an essential tool that human beings employed to express their ideas or conceptualize their thoughts on different domains. That is to say, metaphor is also the language that nurses live by for workplace communication [12]. Secondly, their use of the bridge metaphor in explaining the metaphorical meaning of 'open lines of communication' also draws our attention to cross-cultural variation in metaphorical conceptualization of nursing knowledge. The bridge metaphor utilised by the L2 Hong Kong Chinese students in this study while interpreting the phrase 'open lines of communication', is a 'spatial metaphor', suggesting their emphasis on 'connection and relationship'. However, this phrase in English is a channel (or conduit) metaphor, focusing on 'flow and transmission of information', which may reflect a more functional and mechanistic view of communication in English-speaking cultures [11].

iv. Misinterpretation of general yet essential nursing-relevant figurative idiomatic expressions

The low accuracy rates observed in interpreting Extracts 4 and 8 (Figure 4, Row 1, 20% and 12% respectively) highlight participants' limited awareness and understanding of general English figurative idiomatic expressions as essential linguistic resources in nurses' workplace communication. For instance, when interpreting the general English phrase 'stay on line' (Extract 8), where 'line' typically refers to telephone line or the internet, some participants misinterpreted 'line' as 'job position' and the entire phrase to mean 'staying in their job position' (Appendix I, Response 3). While this interpretation does not hinder nurses' understanding of their responsibility to provide guidance and information to patients and family, it suggests a lack of knowledge about the common idiomatic expressions they can use to facilitate workplace communication, particularly building rapport and showing care with patients. Another example revealing participants' insufficient awareness and understanding of general English idiomatic expressions is evident in their interpretation of 'line' in 'I came to the finishing line' (Extract 1). While 'the finishing line' is a widely recognized metaphor referring to the endpoint of a race – and life is often metaphorized as a race - some participants misinterpreted it as the end point of a personal goal in life, rather than the conclusion of life's challenges. For instance, a participant misinterpreted 'the finishing line' as 'the goal that I wanna achieve in life and I have tried my best' (Appendix B, Response 11) while two others misinterpreted it as 'their work or target' (Appendix B, Responses 86 and 87). These examples emphasize the need for developing greater familiarity with figurative English idiomatic expressions to enhance nurses' communication skills in nursing professional contexts.

v. Potential ambiguity arising from L1 interpretation

Finally, it is observed that some participants merely provided Chinese translation equivalents to the English 'line'-related phrases they were required to explain. For example, some participants provided the Chinese translation equivalent, '前線' (*qián xiàn*) while interpreting the meaning of 'front line health professional' (Extract 2). While '前線' (*qián xiàn*) is a typical Chinese translation employed to explain the

meaning of 'front line', it is uncertain whether the participants were aware of the nuanced mapping embedded in this battle metaphor that 'nurses are the workers who take the lead in treating patients and whose work is dangerous', as accurately elaborated by a participant (Appendix C, Response 59). Another example illustrating this uncertainty is in the participants' interpretations for Extract 4, 'when the line would be drawn'. While some of them accurately explained the phrase as 'deciding on when it is the exact time that treatments can be stopped (see examples in Appendix E, Responses 74, 78 and 88), some students explained the phrase as '劃界'*(huà jiè)* , which is the Chinese translation equivalent of the phrase 'the line would be drawn' (Appendix, E, Responses 63 and 76). In sum, the above Chinese translation equivalents provided by the participants leave us a gap as to whether they understand the precise and elaborative meaning of the phrase in the context of these two extracts.

5. Discussion and Conclusion: Pedagogical Implications

In this paper, through examining the multiple meanings of the term 'line(s), the ways in which an ordinary English word can evolve into a nursing-specific polysemous term via metaphorical and / or metonymical extension have been explained. Based on the challenges discussed in Section 4.3, it is recommended that teachers can explicitly direct their students' attention to the literal and figurative meanings of these ordinary yet polysemous nursing-specific terms. It may also be helpful to first introduce universal metaphors, such as the pathway and conduit metaphors, which are commonly employed to conceptualize nursing knowledge and are more accessible across different cultures. It is essential to emphasize their nuanced source-target mappings to foster a more precise understanding of the complex and nuanced nursing knowledge embedded within them. Additionally, teachers should be aware of cultural variations embedded in metaphorical conceptualization, as explained in the use of the bridge metaphor by the participants to explain the meaning of 'open lines of communication'. Awareness of cultural variation helps teachers understand the focus of the nursing knowledge delivered through different metaphors and assess how students direct their attention when using different metaphors to interpret and understand the figurative extensions of English nursing polysemous terms. Finally, the findings also highlight students' use of their L1 in articulating their understanding of nursing knowledge. Teachers should be cautious of the false assumption that the L1 translation equivalents y their students provided when explaining nursing terms necessarily indicate an accurate and nuanced understanding of the nursing knowledge conveyed in English nursing texts. Likewise, teachers should be mindful of the potential risk of overlooking the teaching of nuanced nursing knowledge when relying on L1 translation to explain nursing knowledge.
In sum, the strategies aim to improve the teaching and learning of figurative nursing-specific polysemous terms, thereby enhancing professional expertise, health-care provision, and patient safety.

APPENDICES

The survey (Appendix A) and the survey results (Appendices B-I) can be found from the Mendeley data repository (DOI: 10.17632/hbjm3wpxts.1).

Intercultural Competence in Nursing Education: Integrating Theory, Practice, and Didactics in Higher Education

Christina Wiesenhofer[1], Sarah Aldrian[2]

[1,2]University of Applied Sciences Burgenland, Austria

Abstract

The increasing cultural diversity of European healthcare systems means nurses need to develop competencies that go beyond clinical expertise. This article examines the relevance of intercultural competence in nursing practice and education. Using theoretical approaches such as Campinha-Bacote's Process Model of Cultural Competence as a basis, the paper analyses three case studies addressing intimate care and gender roles, family involvement in decision-making, and culturally shaped understandings of pain and medication adherence. The analysis reveals that intercultural competence encompasses cognitive knowledge, reflective awareness, empathy, communication skills, and the capacity to negotiate culturally sensitive solutions within institutional constraints. The article also discusses implications for the didactic approach in higher nursing education, emphasising case-based learning, reflective practice, simulation-based training and the systematic integration of intercultural learning into curricula. It concludes that intercultural competence should be considered a cross-cutting professional competence, developed throughout nursing curricula rather than as an isolated teaching topic. The findings emphasise the necessity of providing structured learning opportunities, employing qualified educators, and implementing valid assessment methods to prepare future nurses to deliver culturally sensitive, patient-centred care in an increasingly diverse healthcare landscape.

Keywords: *Intercultural competence, Nursing education, Cultural diversity in healthcare*

1. Introdution

The increasing cultural diversity in European healthcare systems presents nursing professionals with complex demands that go beyond purely clinical expertise. Migration, demographic change, and globalization mean that patients with different cultural backgrounds, value systems, and concepts of health encounter one another in healthcare settings. This diversity affects not only communication processes, but also expectations of nursing care, decision-making, and approaches to illness and therapy [1]. For nursing professionals, this means that they must be able to recognize culturally shaped needs and respond to them appropriately. Intercultural competence is therefore increasingly understood as a key qualification in professional nursing. In addition to communication skills, it includes reflection on one's own cultural influences as well as the ability to adapt nursing practice in a context-sensitive manner [2]. Despite the high relevance of intercultural competence, nursing education often shows insufficient systematic integration of corresponding content into curricula [3]. Teaching offerings often remain selective and are not sufficiently linked to practical experience. This creates the need to develop didactic concepts that convey theoretical foundations while also promoting their application in realistic situations [4].

Against this background, the present paper pursues three objectives: First, the significance of intercultural competence for nursing practice is examined using concrete case examples. Second, these cases are analyzed with reference to established theoretical models of interculturality. Third, didactic approaches are discussed that enable the sustainable integration of intercultural learning into university-based nursing education.

2. Theoretical Background

Various theoretical models exist for the conceptual classification of intercultural competence, describing different dimensions of cultural sensitivity and practical competence. The following section presents selected approaches that are particularly suitable for analyzing nursing interaction situations.

2.1 Intercultural Competences in Nursing

In the health sciences discourse, intercultural competence is understood as a multidimensional construct that comprises cognitive, affective, and action-related components [5]. It describes the ability of nursing professionals to act effectively and appropriately in intercultural situations. In addition to knowledge about cultural differences, intercultural competence particularly includes reflection on one's own values and the ability to adapt nursing interventions to different cultural contexts [6].
In nursing science, intercultural competence is often linked to the concept of cultural competence, which aims at patient-centered and culturally sensitive care. The focus is not on attributing static cultural characteristics, but rather on a dynamic understanding of culture as situationally and individually shaped [4]. In nursing, intercultural competence is understood as the ability to act reflectively, appropriately to the situation, and with consideration of patient-specific needs in intercultural care situations [7].

2.2 Models of Intercultural Competence Development

To further conceptualize intercultural competence in nursing, various developmental models can be used that focus on learning and professionalization processes. One internationally widely received model is Campinha-Bacote's "Process of Cultural Competence in the Delivery of Healthcare Services," which describes cultural competence as a dynamic and never fully completed process. The model comprises the dimensions of cultural awareness, cultural knowledge, cultural skill, cultural encounters, and cultural desire, thereby emphasizing that both conscious self-reflection and repeated intercultural encounters are central prerequisites for competent action. From a nursing education perspective, this implies creating learning opportunities in which students can question their own assumptions, build knowledge about diversity, and test concrete action strategies in protected settings [8].
In addition to process-oriented models, approaches to cultural sensitivity and transcultural competence play an important role. These distinguish between ethnorelative and ethnocentric orientations and thereby describe developmental stages of intercultural attitudes. Nursing literature also emphasizes that intercultural competence is always embedded in institutional frameworks and organizational cultures and therefore must not be understood solely as an individual characteristic of nursing staff [6]; [7]. For university-based nursing education, this has two consequences: First, curricula should provide progressive learning opportunities along these developmental dimensions; second, opportunities for realistic, practice-oriented experience are essential in order to support the transition from cognitive knowledge to situational, action-related ability [4]; [3].

3. Analysis of the Case Examples in Relation to the Theoretical Framework

The following case vignettes are now analyzed with regard to the theoretical concepts of intercultural competence explained above. The aim is to systematically identify the demands on nursing action that become visible in these situations and to relate them to the dimensions of cultural competence, particularly cultural awareness, cultural knowledge, and cultural skill. On this basis, concrete reflection and learning potentials for university-based nursing education are subsequently derived. The analysis is carried out exemplarily using the first case vignette and can be applied analogously to the other cases.

Case 1 – Linguistic and Cultural Barriers in Intimate Care
On a surgical ward in an acute hospital, a female patient is on the second postoperative day following a lobectomy. The nursing care plan provides for her to be supported with personal hygiene and mobilized that morning in order to prevent postoperative complications. Due to the staffing situation, however, only a male nurse is on duty on the relevant side of the ward, while several patients requiring extensive and time-intensive care need to be attended to on the opposite side. The patient, who has a Muslim background, firmly refuses support with personal hygiene from the male nurse and justifies this with religious and cultural ideas of intimacy and gender roles. The male nurse faces the challenge of reconciling the nursing requirements of postoperative care with the patient's culturally and religiously grounded wishes, as well as with the organizational conditions.

Case 2 – Family Involvement and Decision-Making in Nursing Care
On an oncology ward, an older male patient is being cared for after chemotherapy. The treating physician plans an informational discussion about the further course of therapy and possible palliative options, since the previous treatment has not achieved the hoped-for success. The responsible nurse prepares the conversation and asks the patient whether he has any questions in advance or whether

she can organize anything for him. The patient responds hesitantly and asks for his entire family (his wife, adult children, and a brother-in-law) to be present during the discussion. He also expresses the wish that important decisions be made jointly with the family and not by him alone. The nurse is unsettled, as she assumes a patient-centered model in which the patient himself is at the center as the autonomous decision-making authority. She faces the challenge of reconciling the culturally shaped expectation of collective decision-making and family involvement with the principles of informed consent and individual autonomy, without disregarding the patient's needs or excluding the family.

Case 3 – Understanding of Pain and Adherence to Medication Intake
In a geriatric care facility, a resident with chronic back pain is being cared for. Despite a physician's prescription for regular pain medication, the resident frequently refuses to take it and states that pain "is part of life" and that one "has to endure it." In conversations, it becomes clear that the resident comes from a cultural environment in which expressing pain is considered a sign of weakness and in which taking strong medication is viewed with mistrust. The nurse observes that the resident is becoming increasingly immobile and is avoiding social activities, which indicates insufficiently treated pain. The nurse faces the task of building a trusting relationship, understanding culturally shaped ideas about pain and medication, and working together with the resident to find ways that both respect her values and enable appropriate pain therapy. In doing so, the nurse must navigate between the duty of nursing care, respect for autonomy, and consideration of culturally shaped patterns of interpretation.

3.1 Identified Competence Requirements

The three case vignettes presented illustrate that intercultural competence in nursing practice must be understood as a complex interplay of knowledge, attitude, and ability to act. At the cognitive level, all three situations require an understanding of culturally and religiously shaped ideas that significantly influence health behavior and interaction. In the first case, nursing professionals must recognize concepts of intimacy, gender roles, and professional distance as relevant influencing factors instead of interpreting them merely as "special requests." In the second case, knowledge of different concepts of autonomy and collective decision-making is necessary in order to understand family involvement not as a restriction of patient autonomy, but as a culturally embedded form of self-determination. The third case shows that culturally shaped concepts of pain and ideas about medication can influence adherence and that nursing professionals must be aware of these interpretive patterns and incorporate them into their care planning.
At the reflective and affective level, the ability for self-reflection and empathy becomes particularly evident in all three cases. Nursing professionals are required to critically question their own ideas of efficiency, professionalism, autonomy, and pain management and not to judge prematurely why patients reject certain offers or express different expectations. This also includes recognizing power asymmetries in the nursing situation: patients are in vulnerable positions, while nursing professionals possess institutional interpretive authority as well as temporal and organizational resources. Intercultural competence is shown here in the willingness to adopt the perspectives of patients and relatives and to take their reasons seriously, without negating one's own nursing responsibilities. This reflective attitude is particularly relevant in the second case, where Western-influenced concepts of individual autonomy come into tension with collective decision-making models, as well as in the third case, where the duty of care and respect for culturally shaped coping strategies must be balanced.
At the action-related level, several concrete competence requirements can be identified. These include the ability to shape negotiation processes with patients and relatives in which nursing requirements and cultural or religious needs are made transparent and shared solutions are developed. In the first case, this may mean actively shaping organizational conditions and seeking interprofessional or team-based support, for example through reorganizing task distribution or making temporal adjustments. In the second case, this requires communicative competence in order to involve the family without overriding the patient's voice, as well as the ability to sensitize the interdisciplinary team — for example physicians and social workers — to culturally sensitive discussion formats. In the third case, nursing professionals must be able to develop alternative approaches to pain therapy that take culturally shaped reservations into account, for example through gradual education, involvement of trusted persons, or adjustment of the form of administration. The case vignettes thus demonstrate exemplarily that intercultural competence includes both individual and organizational dimensions of action.

3.2 Reflection and Learning Potentials for Students

For university-based nursing education, the three case vignettes offer diverse potential for stimulating reflection processes among students and specifically promoting the development of intercultural competence. At a first level, students can be invited to view the situations from different perspectives: from the perspective of the patients, the relatives, the nursing professionals, and the organization. Such perspective-taking supports the development of empathy and helps to relativize premature judgments — such as “the patient is uncooperative,” “the family is interfering,” or “the resident is non-compliant” — in favor of a more differentiated understanding of reasons for action and contextual conditions. In guided reflection sessions, students can also address their own reactions, irritations, or defensive attitudes and thereby contribute to the development of cultural awareness.
Furthermore, the cases are suitable for integrating theoretical models of intercultural competence development into didactic work. Students can, for example, systematically work through the process of managing the situation using models such as the process of cultural competence — for example cultural awareness, knowledge, skill, encounters, and desire — and examine which dimensions are particularly required in the respective case constellations. In the first case, cultural awareness, meaning self-reflection on one’s own norms, is central; in the second case, cultural knowledge, meaning understanding collective decision-making models; and in the third case, cultural skill, meaning communicative negotiation in the context of adherence problems. In this way, theoretical knowledge is not treated abstractly, but is concretely linked to realistic nursing situations. At the same time, it is possible to discuss which additional competences — for example in the area of organizational negotiation or interprofessional collaboration — have so far been insufficiently represented in classic competence models.
Finally, the vignettes open up possibilities for action-oriented forms of learning, for example through role plays, simulation-based scenarios, or case-based discussions. Students can try out different communication strategies, develop alternative solutions, and reflect together on their effects. Through feedback from teachers and peers, they can experience how word choice, nonverbal communication, timing, and the way nursing measures are justified affect trust and willingness to cooperate. This makes clear that intercultural competence does not arise solely through cognitive learning, but above all through repeated, guided practice and reflection in complex, ambiguous situations. Such learning arrangements lay the foundation for students to later be able not only to theoretically justify culturally sensitive decisions in their professional practice, but also to implement them responsibly in practice.

4. Didactic Implications for Nursing Education

The analysis of the three case vignettes has shown that intercultural competence in nursing comprises cognitive, reflective, and action-related dimensions that must not be developed in isolation from one another, but rather integrated into complex practical situations. This results in concrete requirements for the design of university-based nursing education. The following section discusses three central didactic approaches that enable the systematic and practice-oriented integration of intercultural learning into curricula: case-based learning and reflective practice, simulation-based learning formats, and intercultural training modules and their curricular anchoring.

4.1 Case-Based Learning and Reflective Practice

Case-based learning is particularly suitable for depicting the complexity of intercultural nursing situations and encouraging students to analytically engage with real problems. The case vignettes presented can be used in various teaching formats, such as seminar discussions, small-group work, or portfolio assignments. What is essential is that the cases are not presented as examples of “right” or “wrong” solutions, but rather as starting points for differentiated engagement with competing values, institutional conditions, and professional scope for action. Students can be guided to adopt different perspectives, develop alternative courses of action, and evaluate them with regard to nursing, ethical, and cultural dimensions. Current reviews show that case-based learning contributes to competence development particularly when it is linked to guided reflection phases in which students can address their own assumptions, uncertainties, and affective reactions [4],[2].
A central element of reflective practice is the systematic promotion of cultural awareness, that is, conscious engagement with one’s own cultural influences, normative assumptions, and positions of power [8]; [6]. This can be supported through structured reflection tasks, such as keeping learning journals, guided self-reflection exercises, or peer-feedback formats. Teachers should create a protected

space in which students may also articulate irritations, uncertainties, or internal resistance without having to fear being judged as “intolerant.” Especially the confrontation with one’s own blind spots and assumptions is an essential component of intercultural learning processes and can be specifically initiated through case-based work (Dimitrova & Sehouli, 2023; [6].

4.2 Simulation-Based Learning Formats

In addition to case-based discussion formats, simulation-based learning environments offer the opportunity to experience and practice intercultural nursing situations in an action-oriented way. In role plays or with simulated patients, students can reenact the situations described in the case vignettes and try out different communication strategies, forms of argumentation, and nonverbal behaviors. Within the protected framework of simulation, students can make mistakes, experience uncertainty, and learn from these experiences without real patients being affected. International studies show that simulation-based training can contribute to the development of cultural competence, particularly when it is combined with structured debriefing phases in which the experience is jointly reflected upon and theoretically contextualized [4].
Concrete simulation scenarios can be developed for the three case vignettes presented. In the first case, concerning intimate care and gender roles, students can practice how to conduct a respectful conversation with the patient within a limited timeframe, negotiate organizational solutions, and at the same time make nursing necessities transparent. In the second case, concerning family involvement and decision-making, it can be simulated how an informational discussion can be structured in a way that both recognizes the patient as an autonomous subject and involves the family without perceiving their presence as a “disruption.” In the third case, concerning understanding of pain and adherence, students can practice how to build a trusting relationship, address culturally shaped reservations, and develop viable compromises together with the resident. Such simulations make it possible to specifically train cultural skill, that is, the concrete application of intercultural competences in interaction, and to deepen it through repetition and variation [2];[8].

4.3 Intercultural Training Modules and Curricular Anchoring

In addition to selective teaching and learning arrangements, systematic curricular anchoring of intercultural competences is necessary in order to achieve sustainable learning effects. This means that intercultural content should not be addressed only in individual elective modules or projects, but must be integrated as a cross-cutting theme in various modules and across several years of study [3]; [4]. The integration of cultural competence into nursing education can take different forms: through the design of independent cultural competence courses, through the embedding of cultural content into existing theoretical and clinical courses, or through the continuous consideration of cultural diversity in all learning opportunities. Studies show that continuous development of cultural competence throughout the entire nursing program, both in theory and practice, is more effective than isolated individual measures [4].
A particular challenge lies in the assessment and evaluation of intercultural competence development. While cognitive knowledge can be assessed through traditional examination formats, reflective and action-related dimensions are more difficult to measure. Regular assessment of students’ competence development is considered necessary in order to monitor learning progress. Alternative examination formats such as OSCEs — Objective Structured Clinical Examinations — with standardized patients can be used for this purpose, enabling feedback on professionalism, communication skills, and culturally sensitive behavior [4].
Moreover, the qualification and continuing education of university lecturers themselves is a central prerequisite for successful cultural education [9]; [10]; [3]. Lecturers should possess intercultural competences and receive continuous training in culturally and linguistically appropriate care [4]; [9]. Studies show that lecturers with international education, multilingual abilities, and participation in cultural training are better able to engage students in discussions about cultural diversity. The importance of age, multilingualism, and continuing education for the development of cultural competence among lecturers is emphasized by current research. Therefore, targeted interventions such as language support programs, cultural competence training, and the promotion of reflective practices should be implemented in order to improve the cultural competence and transcultural teaching behavior of nursing educators [9].
Finally, the involvement of external partners, such as intercultural trainers, self-organizations, or patient representatives, is valuable. Through guest lectures or joint workshops, students can gain insights into

different perspectives. Such participatory approaches help to avoid essentialist notions of culture and promote a dynamic, context-related understanding of diversity [3]; [4].

5. Discussion and Conclusion

In light of increasing social diversity, the development of intercultural competence in nursing education represents a central educational policy and professional challenge. The present analysis shows that a theoretically grounded understanding of culture and cultural competence, as offered by Campinha-Bacote's Process Model [8], is a necessary but not sufficient prerequisite for practice. Sustainable competence development can only succeed through the combination of theoretical grounding with evidence-based didactic strategies.

The examined teaching and learning strategies, such as case-based learning, simulation training with standardized patients, cultural immersion experiences, and curricular integration, prove effective when they build systematically upon one another and are implemented throughout the entire course of study [4]; [3]. Particular emphasis should be placed on the importance of reflective learning processes that enable students to recognize and critically question their own cultural influences [1]; [2]. Without this self-reflection, there is a risk that cultural knowledge leads to stereotypical attributions rather than to differentiated, context-sensitive nursing practice.

A central finding is that intercultural competence must not be understood as an additive curriculum element, but as a cross-cutting competence embedded in all modules. However, this also requires university lecturers themselves to possess the corresponding competences and to receive continuous professional development [9], [10]. The qualification of lecturers, particularly with regard to their cultural sensitivity, language competence, and didactic skills, is therefore an essential institutional task.

Implications of Correlations between Communication Stressors and Correlations between Anxiety and Mental Health

Dorin-Gheorghe Triff[1], Zorica Triff[2], Mușata Dacia Bocoş[3]

[1,2]Technical University of Cluj-Napoca, Romania
[3]Babes-Bolyai University of Cluj-Napoca, Romania

Abstract

During the periodic medical check-up, workers from one high school (having 93 employee) and 2 middle schools (with 43 and respectively 35 employee) received a voluntary questionnaire that included the following:
-socio-demographic variables (age, length of employment in the unit, biological gender, type of residence);
Six occupational stressors that scored the worker's stress (on a Likert-type scale) related to communication with colleagues, students and their parents: "Verbal violence from other employees", "Verbal violence from some students", "Verbal violence from some parents", "Physical violence from some parents", "Difficult cooperation with some parents", "Difficult cooperation with some students";
-the personality traits of Gray's Behavioral Inhibition and Activation Systems [BIS/BAS], namely anxiety, fun-seeking, drive, reward-responsiveness
- The General Health Questionnaire (12 item). This questionnaire in used as a screening instrument for mental health and psychological -psychiatric disorders in non clinical settings
In the 3 schools the level of stressors ranges from low to medium.
In all 3 schools there are positive correlations between occupational stressors as follows:
-"Verbal violence from other employees" correlates with "Verbal violence from some parents"(p1=0.001;p2=0.016;p3=0.009) and with "Physical violence from some parents"(p1=0.030 ;p2<0.001;p3=0.002);
-"Verbal violence from some parents" correlates with: "Difficult cooperation with some parents"(p1=0.001; p2=0.006;p3<0.001) and with "Difficult cooperation with some students"(p1=0.001;p2=0.016;p3=0.002);
"Verbal violence from some students" correlates with "Difficult cooperation with some students" (p1=0.001; p2=0.001; p3=0.017).
In all 3 schools, GHQ correlated with Anxiety (BIS) (p1<0.001; p2=0.044; p3=0.006).
Although the number of respondents is not large, the consistent results obtained in all 3 schools draw attention to the importance of the results obtained. Although the level of stressors related to communication problems with students and their parents is low, the data obtained lead to the conclusion that in schools, in the present and at least in the immediate future, the efficiency of student-teacher communication and in fact the success of the educational act requires the active involvement, at least from the point of view of facilitating communication, of parents.
Among school workers, although anxiety levels are not high, their association with mental health disorders shows the importance of informing workers about this issue and managing anxiety-generating situations.

Keywords: *Anxiety, mental health, school, communication stressors, students, parents*

Introduction

In the educational environment, communication is essential for the efficiency of the educational act. Good communication allows for relationships with others and even the establishment of interpersonal relationships, and the way in which teachers communicate with students modulates their behaviors and integration in the classroom and even socially, the advantages of effective communication being numerous.
For teachers, stressors related to communication are mainly represented by tense interactions with students (lack of receptivity, disinterest, disruptive attitude and indiscipline in the classroom, resistance to dialogue by students, emotional barriers of students), with parents (unrealistic expectations of parents, intrusion and criticism of teachers, insufficient involvement in home education, etc.), with

colleagues (gossip circles, uncollegial attitudes, unconstructive criticism, etc.) and with the management department (bureaucratic requirements, lack of institutional support, conflicts of ideas, authoritarian communication, ineffective meetings, etc.). Along with students, parents can influence the way they communicate with school staff.
If the teacher is stressed even by the inefficiency or deficiencies of communication with students, the stress can spread to the students and their behavior worsens, reflecting more stress on the teacher and can lead to a generalization of the stress level in the classroom. This vicious circle of stress related to student-teacher communication once it is started, becomes difficult to break.
Stress on school staff can be influenced by their personality traits. For example, it is known that the Behavioral Activation System (BAS) or the "start" system, activates approach motivation, regulates responses to pleasant stimuli, goal achievement and rewards. People with a high BAS show joy, enthusiasm, hope, are predominantly extraverted, impulsive, action-oriented. The Behavioral Inhibition System (BIS), also known as the "braking" or threat avoidance system, regulates the response to dangers, punishments, frustration, and is associated with anxiety, fear, and insecurity. Individuals with a high BIS are more sensitive to criticism and avoid risks [1].
In assessing workplace stressors, it is also important to assess the mental state, anxiety, and/or well-being of the individual. At the organizational level, questionnaires can be used that, in order not to burden the respondent's schedule or time, should be as easy or quick to complete as possible.

Material and Methods

During the periodic medical check-up, workers from one high school (having 93 employees) and 2 middle schools (with 34 and respectively 35 employees) received a voluntary questionnaire that included the following:
- socio-demographic variables (age, length of employment in the unit, biological gender, type of residence);
-six occupational stressors that scored the worker's stress (on a Likert-type scale in 3 steps, on a perceived level of stress scored from "very low"=1, to "medium"=2 and to "high"=3) related to communication with colleagues, students and their parents: "Verbal violence from other employees", "Verbal violence from some students", "Verbal violence from some parents", "Physical violence from some parents", "Difficult cooperation with some parents", "Difficult cooperation with some students";
- The General Health Questionnaire (GHQ12). having 12 items on a 4-point Likert scale is used as a screening instrument to detect mental health and psychological -psychiatric disorders and common psychological issues like anxiety, depression, and social dysfunction in non-clinical settings [2];
-the personality traits of Gray's Behavioral Inhibition and Activation Systems [BIS/BAS], namely anxiety, fun-seeking, drive, reward-responsiveness [3].
The present study aimed to evaluate the level of stressors in school workers related to communication with students, colleagues, and parents as well as the perceived level of negative reactions they have towards the workers (GHQ12) [4], in relation to the personality traits of the workers (BIS/BAS dimensions) and socio-demographic indicators [5], [6].

Results

The number of participants (respondents) completing the questionnaires is high in the 3 school units (Table 1).

Table 1. Number of workers and number of non-respondents by school unit

School unit	number of workers	number of non-respondents
School no 1	92	33
School no 2	33	3
School no 3	34	5

School no. 1 is located in an urban area and schools no. 2 and no. 3 are located in a rural area. The proportion of workers is similarly distributed by type of residence (Table 2).

Table 2. Percentage of female workers and those living in urban areas by school

	percentage of women	percentage of people living in urban areas
School no 1	68	82
School no 2	79	6
School no 3	79	4

Female workers predominate in all schools compared to males. In terms of age and length of employment in the school, workers in the 3 school units have an average age between 45 and 48 years and an average length of employment in the unit between 12 and 17 years (Fig. 1.).

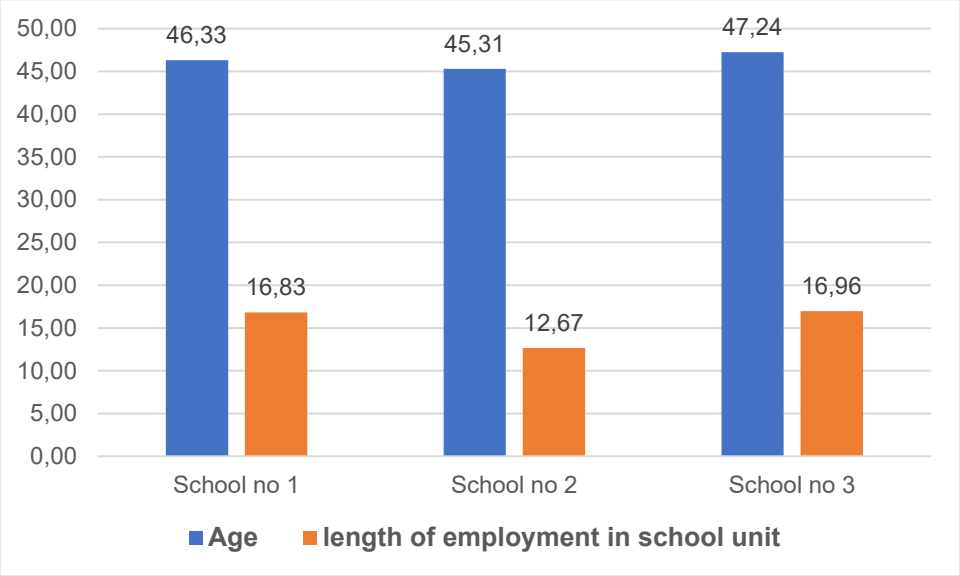

Fig. 1. Age and average duration as a worker in the unit after school

Middle adulthood or mature adulthood, between 40 and 65 years of age, indicates self-confidence, clear values, and reaching the peak of one's professional life. An optimal duration for an individual to have good professional experience at a workplace is a minimum of 3 years. A longer duration shows professional experience on the part of the worker as stability, loyalty, and interest in the workplace and in the respective activity. In the 3 schools the level of stressors ranges from low to medium (Fig. 2.)

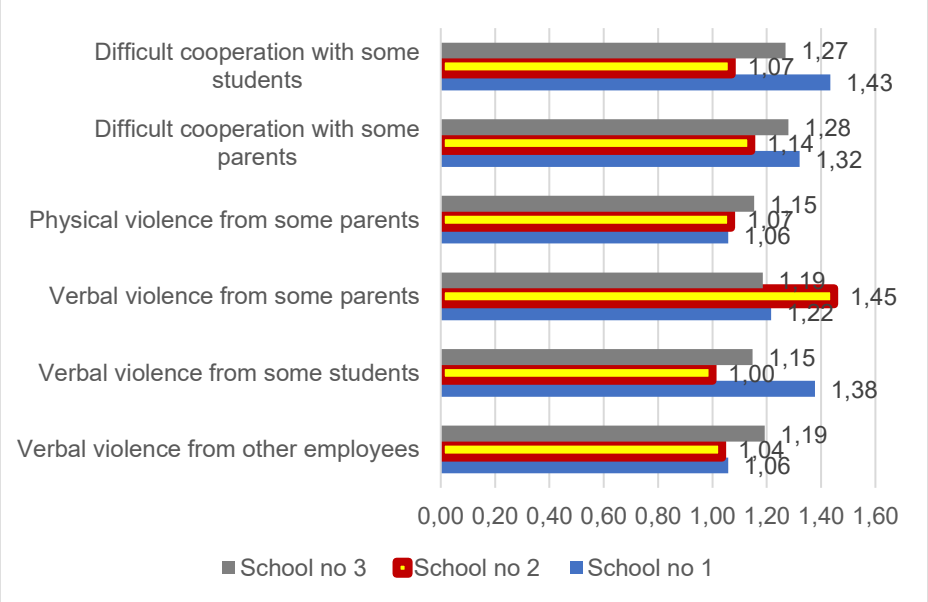

Fig. 2. Average level of stressors in workers by school

Average values of personality traits dimensions [BIS/BAS] in workers are similar in the 3 schools (Fig. 3.)

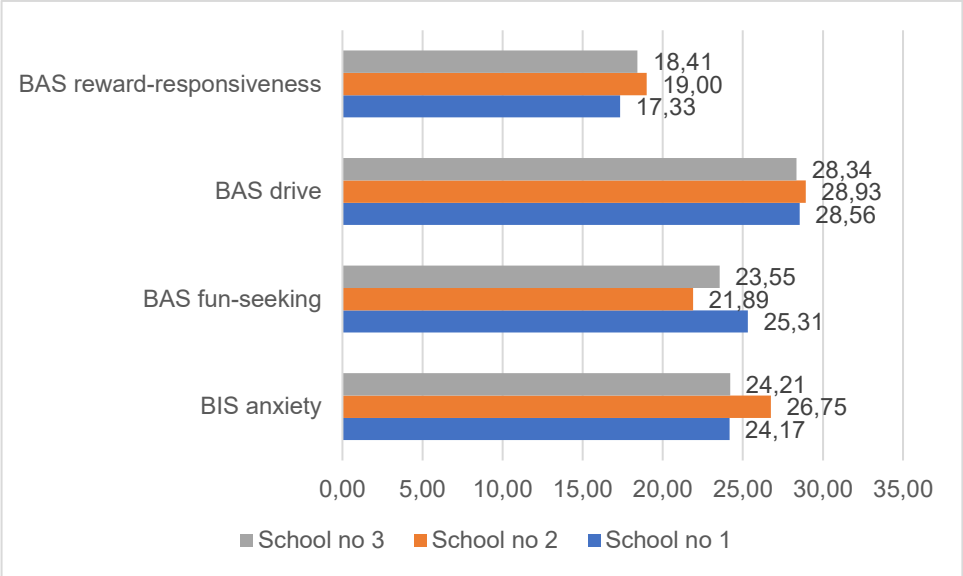

Fig. 3. Average values of personality traits dimensions [BIS/BAS] in workers depending on school

The distribution of respondents by school department is presented in Table 3. The main occupational group is represented by teachers. The non-teaching department includes cleaners, security guards, maintenance workers, and drivers, while the auxiliary department includes accountants, property administrators, financial administrators, librarians, secretaries, and IT network administrators.

Table 3. Distribution of respondents in the 3 schools by department

School unit / department	number of workers		
	auxiliary	(didactic) teaching	non-teaching
School no 1	2	55	2
School no 2	2	21	7
School no 3	3	19	7

Among the variables studied, there are significant differences between the values of the variables studied between workers in the 3 compartments, only those mentioned.
Thus, in School no.1, workers in the non-teaching compartment (p=0.018) have the highest average value (namely 2) of the stressor "Verbal violence from other employees" compared to workers in the auxiliary compartment (namely an average score of 1) who have the lowest value.
In School no.2, there are no significant differences between the variables studied depending on the school compartment.
In School no.3, workers in the non-teaching compartment have the highest (p=0.001) age (with an average of 56.29 years) compared to workers in the teaching compartment (with an average value of 43.68 years).
In the total group of respondents from the 3 schools, there are significant differences between the variables studied by department for 2 variables as follows:
-Age (p=0.034) workers in the non-teaching department have the oldest age (with an average of 52.71 years) compared to workers in the teaching department (with an average value of 45.26 years);
-"Verbal violence from some parents" has the highest value (p=0.011) among workers in the non-teaching department (with an average of 2.17) compared to workers in the auxiliary department who have the lowest value (average value of 1.17).
There are numerous correlations between the variables studied, different according to the school unit. However, similar correlations also appear in all 3 schools, which suggests a tendency to generalize these results.
In all 3 schools there are positive correlations between occupational stressors as follows:

-"Verbal violence from other employees" correlates with "Verbal violence from some parents"(p1=0.001;p2=0.016;p3=0.009) and with "Physical violence from some parents"(p1=0.030; p2<0.001; p3=0.002);
-"Verbal violence from some parents" correlates with: "Difficult cooperation with some parents"(p1=0.001; p2=0.006;p3<0.001) and with "Difficult cooperation with some students"(p1=0.001;p2=0.016;p3=0.002);
"Verbal violence from some students" correlates with "Difficult cooperation with some students" (p1=0.001; p2=0.001; p3=0.017).
In all 3 schools, GHQ correlated with Anxiety (BIS) (p1<0.001; p2=0.044; p3=0.006).

Conclusions

The levels of stressors related to communication between workers and students, parents of students and other employees are generally low and do not differ significantly between teachers and workers in other departments (auxiliary and non-teaching). Overall, workers in the non-teaching department have significantly higher stress levels compared to workers in other departments in Verbal violence from parents.
The perception of stress related to communication with other workers is associated with the perception of stress given that communication with parents (even with physical violence from them) is expected to be unrelated to personality traits of Gray's Behavioral Inhibition and Activation Systems [BIS/BAS].
Although the number of respondents is not large, the consistent results obtained in all 3 schools draw attention to the importance of the results obtained. Although the level of stressors related to communication problems with students and their parents is low, the data obtained lead to the conclusion that in schools, in the present and at least in the immediate future, the efficiency of student-teacher communication and in fact the success of the educational act requires the active involvement, at least from the point of view of facilitating communication, of parents.
Anxiety as a personality trait is associated with affecting the state of health (mental health and psychological -psychiatric disorders) without these being constantly associated with perceived stress as a result of communication difficulties with students, their parents and other employees.
Among school workers, although anxiety levels are not high, their association with mental health disorders shows the importance of informing workers about this issue and managing anxiety-generating situations.

Abstract

The digitalization of healthcare systems and the increasing complexity of medical infrastructure require engineers capable of operating at the interface between engineering and healthcare. This study presents the Erasmus+ project Smart Healthcare Engineering (SHEng) that aims to create an educational framework that combines engineering, healthcare technologies, hospital management and practical training in real medical environments. The concept brings together universities and healthcare institutions from Romania, Spain and Türkiye to develop innovative learning resources, intensive international training program and an open e-learning platform dedicated to healthcare engineering [1]. The educational model integrates theoretical instruction, laboratory activities, hospital based case studies and collaborative international learning experiences. A key component of the project consisted of intensive training program organized in Spain and Romania, involving students from different academic and cultural backgrounds. The results showed clear improvements in students' knowledge and understanding of healthcare engineering topics, while also highlighting the positive impact of transnational and multidisciplinary learning environments on student engagement and performance. The study outcomes include innovative educational materials and a new methodology for competency based training in healthcare engineering. The results indicate that international collaborative learning, supported by digital educational tools and practical hospital exposure, is a good method for preparing future engineers to meet the technological challenges of healthcare.

Keywords: *Healthcare engineering, international training, healthcare management*

1. Introduction

The healthcare systems are changing very quickly and now hospitals are no longer only medical facilities where doctors and nurses provide care but are a complex technical environment that depends on medical devices and digital systems, water systems, ventilation systems and many other support services. In this context, engineering has a key role in healthcare and without well designed, maintained and safe technical systems, the medical care cannot be delivered at the required level of quality.
Healthcare engineering can be understood as the application of engineering knowledge, technical management and problem-solving methods to healthcare system, being closely connected with hospital engineering. The engineer that works in the hospital is the professional that can support decisions related to technology selection, safety, maintenance, risk reduction, regulatory compliance, user training and the integration of medical technologies into clinical workflows. Yadin D. [2] shows the major impact of clinical engineers and Health Technology (HT) on global patient outcomes. In many hospitals, engineering departments contribute directly to patient safety, cost control and the effective use of medical technologies.
The role of engineers in hospitals has become more visible because of the increasing number and complexity of medical devices. Imaging systems, monitoring equipment, ventilators, laboratory equipment and digital health platforms require permanent technical support [3]. These technologies must be selected, installed, calibrated, maintained and used correctly because a technical failure can affect diagnosis, treatment, patient safety or the continuity of medical services. For this reason, the hospital engineer must understand not only the technical characteristics of equipment, but also the clinical context in which the equipment is used.

At the same time, hospitals are under strong pressure to reduce energy consumption, optimize resources, improve patient flow, control infections, reduce risks and integrate digital solutions. These challenges cannot be solved only by medical staff. They require interdisciplinary teams, where engineers, doctors, nurses, managers and IT specialists work together. Studies in clinical engineering and healthcare technology management show that engineering professionals can have an important impact on the performance of healthcare systems, especially when their activity is connected with patient outcomes and hospital management [4].
Digital transformation is another important factor that changes the role of engineering in healthcare as uprising technologies are now part of healthcare facilities [6]. Artificial intelligence (AI) is now used in image processing and interpretation but also in data analysis from sensors spread in the hospital areas [8]. These technologies create new opportunities, but also new risks in terms of cybersecurity, data flow, equipment connectivity, user acceptance and the validation of digital health solutions [9,10].
The Digital health cannot be implemented only by buying technology but requires training, organizational change and technical support from specialized engineers.
A graduate who wants to work in healthcare engineering should understand medical technology, hospital infrastructure, safety, quality management, digital systems, sustainability and communication with healthcare professionals. This type of profile is not easy to develop through traditional engineering profile from EU Universities. The current engineering curricula are often organized by discipline, such as materials, mechanical engineering, electrical engineering or industrial engineering. However, the hospital environment is interdisciplinary by nature. The same technical problem can include aspects of mechanics, electronics, materials, software, standards, hygiene, ergonomics, maintenance and human behavior. For this reason, engineering education must create learning situations that are closer to the real conditions of healthcare practice. Students need to see hospitals not only as users of technology, but also as complex systems where engineering decisions have direct effects on medical activity. Experiential learning, project-based learning and workplace learning are useful approaches in this direction. They allow students to apply knowledge in real or realistic contexts, to work in teams, to solve open problems and to understand the connection between theory and practice [5].
Therefore, education must prepare students to communicate across professional boundaries. Interprofessional education has been widely discussed in health professions education, especially for improving collaboration and patient care [11-13]. Although engineering students are not always included in classical interprofessional healthcare training, their future role in hospitals makes such preparation important.
This study presents the concept of a project developed in this context. The project responds to the need for a new educational framework able to prepare engineering students for the technological and operational challenges of modern hospitals. It brings together universities and healthcare institutions from Romania, Spain and Türkiye and proposes an interdisciplinary model based on international collaboration, intensive training program, hospital visits, laboratory activities, e-learning resources and practical case studies [1].
The main idea of the study is that healthcare engineering cannot be taught only from books. The students need to understand that healthcare engineering is not limited to medical devices. It includes maintenance, quality, risk management, metrology, medical gases, corrosion, materials, energy efficiency, digital systems, occupational safety as well as many other technical aspects that support hospital activity.
The purpose of this paper is to present the educational methodology and implementation of the SHEng concept, with a focus on the activities developed during the intensive training program and on the general educational impact observed during the project.

2. Methodology

The educational methodology from this study was designed to combine theoretical learning, practical hands on demonstrations, hospital visits and international collaboration. The project was not built as a classical course, but as a learning ecosystem that includes intensive training programs, learning materials, and hospital case studies. The project consortium includes higher education institutions and healthcare organizations from Romania, Spain and Türkiye. This partnership is important because it connects the academic perspective with the practical needs of hospitals. Universities provide teaching expertise, research knowledge and student groups. Hospitals provide real examples, infrastructure, clinical context and professional experience. Figure 1 shows the main concept of the Smart Healthcare Engineering concept.

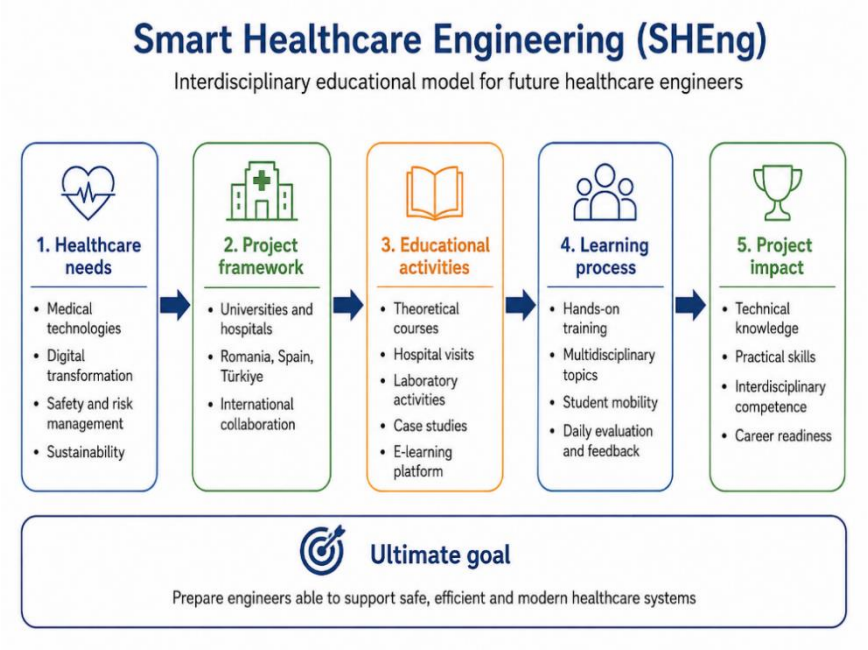

Fig. 1. Smart Healthcare Engineering educational concept

The Smart Healthcare Engineering concept is based on two different directions. One is the intercultural interaction between students and teachers and on the modern teaching activities organized as intensive training sessions. The main concept is based on organizing intensive training programs for small groups of international students from engineering fields and prepare them for a future career in the healthcare domain.

The training sessions were designed as international learning experiences, where students from different universities participated in lectures, practical sessions, laboratory work and hospital visits. The training program was not limited to a single discipline but included topics from healthcare engineering, medical technology, hospital infrastructure, materials, maintenance, quality, safety and digital systems.

Fig. 2. During the teaching session at Dr. Negrin Hospital, Las Palmas de Gran Canaria, Spain and at Transilvania University of Brașov, Brasov, Romania

The general structure of the intensive training programs included 12 daily teaching activities, technical presentations, practical demonstrations and evaluation activities before and after each teaching sessions. The topics were selected to show the broad role of engineering in hospitals, including hospital risk areas, protection of staff and patients, role of the healthcare engineer, medical equipment and machinery, metrology, communication between engineers and medical staff, corrosion in hospital installations, stainless steels used in healthcare, medical gases, oxygen pipelines, energy saving, Legionella prevention, SCADA systems, maintenance indicators, non-destructive testing and safety procedures.

A strong element of the methodology was the use of hospital based learning that helped students to connect abstract technical concepts with real hospital applications. For example, i) a topic such as corrosion becomes more relevant when students understand its effect on hospital installations, ii) a topic

such as maintenance becomes more concrete when students see how a failure can affect a medical service, iii) a topic such as medical gases becomes clearer when students see the pipeline route and understand the importance of oxygen supply for patient care.
The teaching activity also included case studies that have been built around equipment maintenance, hospital infrastructure, energy consumption, technical risk, safety incidents, medical gas systems, infection prevention or communication between departments. These case studies help students develop problem solving skills and understand that hospital problems are rarely simple because often involve organizational and human factors.
The teaching-learning methodology included student evaluation based on multiple-choices questionnaires and self-assessment tests used daily to monitor learning progress and student perception. The aim of the evaluation was to identify changes in student knowledge, engagement and understanding of healthcare engineering topics.
A key element was the adjusting of the course level each day based on the results of the evaluation made on the previous training day. In this way, the teachers knew what were the strong and week point in the students knowledge. This educational methodology and structure is aligned with current trends in engineering education, where students are expected to develop not only technical knowledge, but also transversal skills [14, 15]. In the SHEng concept, these methods were adapted to the specific field of healthcare engineering.

3. Results

The first important result of the project was to identifying the complexity of the healthcare engineering field and creation of an interdisciplinary educational framework for healthcare engineering.
This teaching - learning concept connects engineering education with real hospital needs by offering to students the possibility to understand how technical systems support medical activity and how engineering decisions can influence safety, efficiency and quality in hospitals. The project also helped clarify the professional role of the healthcare engineer as a link between technology, infrastructure, management and clinical practice.
A visible result after the training sessions was the increased awareness of students regarding the complexity of hospital infrastructure as many engineering students being familiar with industrial systems, but not fully understand the technical complexity of hospitals.

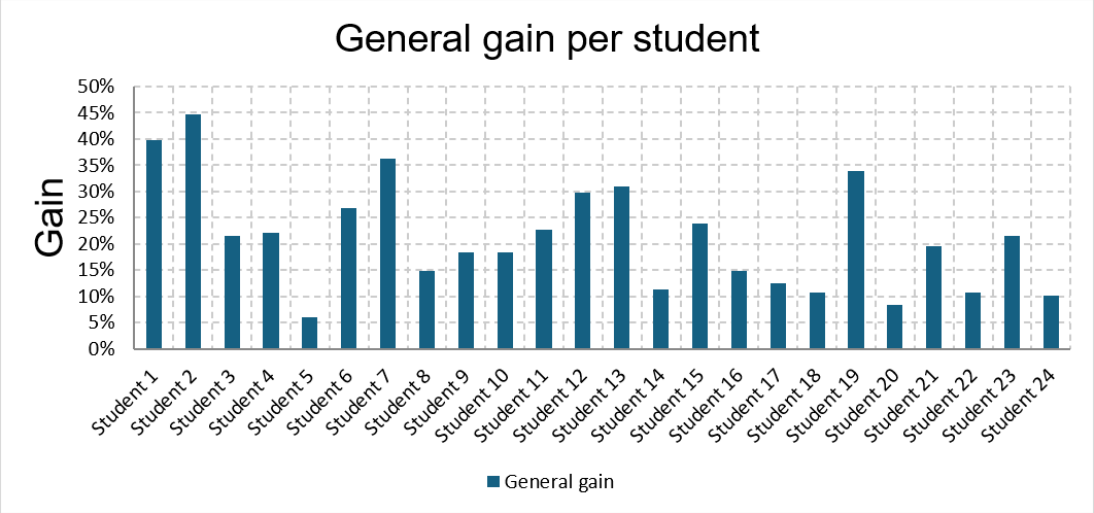

Fig. 3. General gain per student during the Smart Healthcare Engineering training activities.

Figure 3 presents the general learning gain obtained by each of 24 students after participation in the Smart Healthcare Engineering 12 days of training activities. The gain was calculated as the difference between the initial and final level of knowledge, expressed in percentage points, as follows:

$$Gain_i = Post\ i - Pre\ i \quad (1)$$

where:
$Post_i$= score of student *i* in **Test general after** the training

Pre_i= score of student *i* in **Test general before** the training

The results show a positive gain for all students, which indicates that the educational activities contributed to an improvement in the general understanding of healthcare engineering topics.
All students show positive general gain after the training activities, and most gains appear to be between 10 and 30 percentage points, with several higher values around 30% to 45%. At the same time, the graph of fig. 3 shows some variation between students. This variation is normal in an international training program, because participants had different academic backgrounds, previous knowledge, learning styles, levels of attendance and engagement during the activities. Students with lower gains should not automatically be interpreted as having poor performance, because a smaller gain may also be related to a higher initial score before the training.
The observed feedback from students and teachers indicated that the practical and international character of the project was appreciated. Students were interested in topics that connected engineering with real hospital problems. They also showed interest in understanding how medical technologies are used, maintained and managed and some students expressed an interest in following a career in healthcare engineering. This is important because many students do not initially associate their engineering education with healthcare.

4. Discussion

The SHEng project and educational concept confirm the importance of practical and interdisciplinary education in healthcare engineering. Modern hospitals require engineers who can understand both technical systems and healthcare needs. This type of professional cannot be prepared only through traditional lectures as the students must be exposed to real problems, real infrastructure and real communication situations. The project responds to this need by combining classroom learning with, hospital visits, hands-on activities and international collaboration.
One important aspect is the role of hospitals as learning environments. In many instances the hospital as learning environment is associated with residents, doctors and nurses that are involved in the medical act. Hospitals are sensitive institutions where patient safety, confidentiality, hygiene and clinical activity are priorities and the learning activities for the technical part of the facility often raise issues in affecting the daily medical work. The content of the classes must be organized in a clear way and on site visits should be spot on, so that students do not feel overwhelmed by the large amount of information.
The training sessions also had some limitations. The different academic background of the students was one of the main challenges. The participants came from different countries, universities and years of study. In this particular case, the students were from industrial engineering, materials science, electrical engineering and bioengineering and were enrolled in the first, second or third year of study. This diversity was useful for interdisciplinary learning, but it also required the teachers to adapt the level and rhythm of the courses. Another challenge was the English language. Even if the students had a good level of English, the specific terminology used in healthcare engineering created some difficulties during the learning process. This issue was addressed by providing explanations in simpler terms and when necessary, by translating key concepts into the students' mother language during the classes. Student feedback also indicated that the training sessions were long and at the end of the day it was more difficult to maintain attention and focus. Another challenge appeared during the hospital visits. Engineering students are not future medical staff, and spending too much time in a hospital environment, where patients are present, can be difficult.

5. Conclusions

The Smart Healthcare Engineering project presents an interdisciplinary educational model for preparing engineering students to understand and support modern healthcare systems. The concept responded to the growing need for engineers who can work in hospitals and contribute to medical technology management, infrastructure, safety, maintenance, digital systems and sustainable healthcare services. The teaching methodology creates a relevant learning environment where students can connect engineering knowledge with real healthcare applications. The activities implemented in Spain and Romania showed that students benefit from direct practice to hospital infrastructure, practical demonstrations and collaboration with colleagues from different countries.
The SHEng model can be adapted by other universities interested in healthcare engineering, biomedical engineering, industrial engineering or hospital technology management. Future work will include the

integration of the quantitative evaluation results, the further development of the e-learning platform and the expansion of collaboration between universities and healthcare institutions.

Education and Society

Promoting Knowledge Exchange between Academic Roles through Third Mission

Lucrezia Bano

University of Turin, Italy

Abstract

This paper is based on an empirical research promoted by the University of Turin, aimed at answering the research question about what synergies exist between the institutional missions of teaching, research and Third Mission – the vocation of university to generate societal value – within the lives of faculty members. In compliance with an exploratory sequential mixed design, a first qualitative study was conducted through interviews, subjected to software-assisted content analysis using NVivo. The synergy of knowledge exchange between different academic roles during Third Mission was recognized, thanks to collaborative interaction between people in various academic positions, such as professors, tenured and non-tenured researchers, research technicians, postdoctoral fellows, PhD students. Some faculty members put informally acquired resources and know-how to the service of Third Mission activities. By the respondents' account, interaction between colleagues in different roles – particularly those with generational gaps – and between teachers and students during Third Mission has allowed a two-way exchange. For teachers, it has resulted in the acquisition of extra-academic knowledge, which has proven to be useful in planning new educational experiences, and for junior academics as a formative space in view of faculty life. For students, the active learning prompted by Third Mission initiatives was identified as a synergy between teaching and Third Mission: the respondents found, in their experience, that the participation of students in Third Mission initiatives provided effective learning opportunities, beneficial to better achieving pre-established learning objectives.

Keywords: *Third Mission; Faculty development; Knowledge exchange; Higher education; Active learning*

1. Introduction: the "Third Mission"

Object of the research here presented is "Third Mission", also known, since the beginning of the twenty-first century, as "third stream", "outreach" [4], "engagement and impact" [16], "knowledge valorisation" [5], in Italy called from 2023 "knowledge enhancement" by the National Agency for the evaluation of universities and research (ANVUR). It is the most recent function of higher education to have been recognized, after teaching and research, and consists in the creation of societal value (understood as of economic, social, cultural, environmental nature) *for* and *with* the context in which the institution is located, through the mobilization of academic knowledge as research products and teaching content. The involvement of external stakeholders can happen at various levels, from the transmissive model (university spreading its knowledge to society) to the co-creative one, which implies a university-society collaboration for the generation of new, plural knowledge: Third Mission as a two-way process is also the interpretation that is gaining most ground at an international level [11]. Third mission can be acted out through activities of technology transfer, conservation of artistic and cultural heritage, production and management of public goods, public engagement, open science, continuing education and lifelong learning, clinical trials and all other initiatives for the promotion of sustainability, public healthcare and inclusion, protection of vulnerable groups, contrast of poverty and inequalities.

If many works have been dedicated to the relationship between teaching and research [1], less is known about intersections between teaching, research and third mission, considering the growing development of the concept worldwide, as in the Italian context [3]. Synergies and imbalances are fragmentally recognized on many layers: on a strategical point of view, the vision of the three mission as a virtuous cycle, and not three independent pillars, seems to be a goal for institutions [8]; however, from the perspective of the individual, Third Mission is subordinate to the other two missions, since it is perceived as optional and less rewarding [11, 13], or it is less visible inside the academia, or has less evident connections with some highly abstract disciplinary areas [6]. Nevertheless, inside-academia socialization, like the affiliation with internal university structures, research centres and laboratories, seems to play a pivotal role in the conduct of Third Mission [12].

The research problem arises from the intent to reconstruct elements that proactively contribute to cohesion between missions and, on the other side, disruptive elements. However, this paper aims to present only some selected research results, concerning the role of inside-academia collaboration and knowledge exchange between academic roles during Third Mission activities.

2. Research Design

The research question wonders which synergies exist between Third Mission and the other academic missions, teaching and research, and if some missions prevail over others. Research hypothesis is that, over a decade after institutionalization in Italy as the third institutional mission, imbalances still exist to the detriment of Third Mission and in favor of teaching and research, and synergies between missions are rare. The research objective is to understand the experiences of faculty members, focusing particularly on synergies between research and Third Mission. The objective is pursued through an exploratory sequential mixed design: firstly, a qualitative explorative study, conducted through semi-structured interviews, aimed at investigating the role of Third Mission initiatives in the work life of faculty members and any difficulties in integrating them and carrying them out alongside teaching and research commitments. Transcripts were analyzed accordingly to content analysis [7, 10] using the NVivo software, version 15, and 23 semantic categories were extracted. According to the mixed design, the qualitative part is followed by a second study aimed at quantitatively descript the distribution of the emerging points of view, through a semi-structured questionnaire.
For the qualitative study, the population corresponds to the faculty members of the University of Turin and the sampling technique is non-probabilistic for representative elements, in which representation refers to the number of Departments. The sample size consists in 27 respondents, including 14 associate professors, 5 full professors, 3 tenured researchers, 2 non-tenured researchers, 2 research technicians and one research fellow.
For the quantitative study, population corresponds to faculty members from the University of Turin, La Sapienza of Rome, University of Padua, Alma Mater Studiorum of Bologna, Milano Statale University in Milan, University of Udine, University of Salerno, University Institute for Modern Languages (IULM) of Rome, Université Savoie Mont Blanc in France, University of Glasgow in Scotland, King's College of London in England and University of Applied Sciences and Arts of Southern Switzerland (SUPSI). A non-probabilistic convenience and snowball sampling technique was applied: academic representatives for Third Mission were invited to spread the questionnaire into their department or University, and then questionnaires were collected by voluntary self-completion, for a total sample size of 304 respondents. Respondents resulted to belong mostly to Italian universities (71%), then French universities (27%) and only a few from UK and Switzerland (1.3% and 0.7%). The sample is quite balanced in terms of gender identity (49.7% female, 49.4% male, 0.9% who preferred not to answer), age group (38% from 41 to 50 years old, 29% from 51 to 60 years old, 21% from 31 to 40 years old, 11% from 61 to 70 years old and 1% until 30 years old) and disciplinary field, based on the ERC classification, despite with a prevalence for STEM (31% into Life Sciences, 29% into Physical sciences and engineering, 24% into Social sciences, 12% into Humanities, 4% into an interdisciplinary field), with a teaching experience equal or longer than 10 years for the 69% of respondents and equal or longer than 15 years for the 57%.

3. Results

The role of inside-academia collaboration was identified as crucial for the conduct of Third Mission, in both the qualitative – here tackled in the first instance – and quantitative study. Counting on the support of colleagues makes it possible to carry out Third Mission:

> "… *without collaboration I would have zero activity of Third Mission right now" (*16-RT)

> "… *the importance of having a working group that divides tasks between members (…) nobody can follow everything well, the risk is to do everything bad."* (15-PO)

Also, the presence of peer-to-peer knowledge exchange was confirmed, between both people who know each other through previous experiences and people who met because of Third Mission.
In the first case, the origin of Third Mission initiatives can be informal moments, as casual conversations and "coffee break" situations with known colleagues (20-PA), and Third Mission can be a means to explore interests and discover common ground:

> *"… We had already interacted, but on other matters, not on projects of this kind... This gave me the opportunity to learn about the activities carried out by colleagues who perhaps... whom I did not suspect... I did not assume had an interest in this regard."* (06-PO)

In the second case – faculty members who met because of Third Mission – Third Mission prompts academic socialization that is useful for other academic purposes. In this sense, academic socialization can be considered both an enabler and fallout of Third Mission. Knowledge exchange appears to be particularly relevant in case of interdisciplinary connections, eventually transposable to research, also between social sciences or humanities and STEM sciences (02-PA, 08-PA, 09-RA, 20-PA, 21-PO, 24-PO, 25-PA):

> *"… I collaborate extensively with the Energy Department. Precisely because I met some of these professors during my Third Mission activities."* (09-RA)

> "… *Each of us conducts research, obviously, on related topics. However, starting from our research skills, what we found ourselves focusing on was precisely Third Mission. (…) There are many interdisciplinary and interdepartmental influences, even in that case, which have led to meeting colleagues with whom we are now working on research projects."* (12-PA)

> "… *This event also allowed us to get to know each other, and now we're trying to organize some research activities together, pooling our expertise."* (18-RA)

Besides the integration of fields mastery thanks to peer-to-peer knowledge exchange, Third Mission may require other skills to be deployed than just authority on one, or more, research subjects. This and other reasons may lead some senior figures to seek the support of colleagues with various academic roles: Third Mission creates a space of collaboration between professors and research technicians, who possess specialist expertise in more applied fields (10-RB). Collaboration is also formed with junior faculty members, as research fellows (post-doctoral fellowships, early career fellowships) and even students (PhD students, Master's degree students), belonging to various age groups. In fact, Third Mission was defined in an interview as «a field in which hierarchical roles could be a little more nuanced» (01-RT). In addition to the lack of some skills, another reason for the involvement of other academic roles may be that, while senior figures are burdened by considerable teaching commitments and organizational-managerial tasks deriving from institutional roles, junior figures are less charged and have greater training needs concerning faculty life (07-PA).
Many kinds of knowledge exchange between different academic roles are recognized. Most of them exploit the generation gap as a reflective and generative resource, not only paving the way for dialogue in a more horizontal context, but as an actual contamination of know-hows. These initiatives proved to be an opportunity for senior faculty members to gain confidence in the capability of juniors to take on responsibilities and tackle challenging tasks (11-PA, 12-PA).
Younger people, both junior faculty members and students, detain sought-after competences in outreach and effective communication skills, use of digital tools and audio-video equipment, social media expertise and related codes. Having these kinds of competences inside academia made it possible not to seek external figures and not to invest further financial resources:

> *"In reality, we managed to find the webmaster through a PhD student who agreed to do it for free, because you can't find a webmaster for a year with two thousand euros."* (06-PO)

The support of younger people was found also to be productive to engage primary and secondary school students during public engagement activities (10-RB, 17-TR) and create appropriate social network content (23-PA, 27-TR):

> *"And the second thing is that, in any case, it's an experience for them, and some of them, for example, decided after their PhD that their path would be, I don't know, school teaching, because they really enjoyed working with children, or something*

> *like that, or maybe organizing scientific dissemination events, so... A career, a job, more oriented towards that field."* (15-PO)

An interesting note is the possibility for professors to transpose into academic courses, as teaching tools, what they experienced in Third Mission, being in contact with junior faculty members:

> *"… communication, use of social media, use of various software programs, which, even when used in lessons, become a wonderful way to reach students more effectively…"* (07-PA)

> *"No thought is ever given to internal public engagement, involving all members of the academic community. There are also other actors and resources that are underutilized and that Third Mission could make use of, in a highly efficient and effective manner, which would then reflect on them and thus also become a way of teaching, because they integrate skills and competences that might otherwise remain hidden.*" (24-PO)

Junior faculty members experience a direct involvement, not only in the execution but also design and supervision of the activities (02-PA, 06-PO, 18-RA): respondents often cited the "fresh" ideas that were put on the table by them (08-PA, 17-TR, 19-PA, 22-PO, 27-TR). The benefits they derive from conducting Third Mission are tacit knowledge and background insights about academic culture, career development advice (22-PO), academic socialization and networking between peers (06-PO) and junior/senior (01-RT, 02-PA, 19-PA), effects on motivation and planning of future choices (15-PO).

> *"… She [a professor] involved a postdoc research fellow, so even the juniors began to work together and created some interesting synergies…"* (02-PA)

Professors and other senior faculty members with teaching commitments are not only facilitated in practically conducting Third Mission, but rather Third Mission configures as a form of continuing education for them. The interaction with junior colleagues activates useful reflections on how to innovate and adapt their teaching, as they have to deal with students belonging to progressively more distant generations (06-PO).
For students, Third Mission experiences generate active learning, as they construct knowledge in new dynamic settings *extra-moenia* (17-TR, 18-RA, 24-PO), and put them in condition to mobilize informally acquired competences for academic purposes; Third Mission brings also to students a new perspective on how university can be lived (24-PO). For all actors involved, general benefits can be found in the discovery of research areas and interests other than those already known (02-PA, 14-PA, 19-PA), between senior and junior faculty members as between peers.
The quantitative study controlled frequency distributions of categories emerged from the qualitative study. By the questionnaire's results, collaboration was confirmed to be prevalent. The question "Did Third Mission activities help in establishing contacts with academic colleagues, useful for teaching and research?" (274 total compilations) permitted to indicate whether collaboration happens through the establishment of new contacts, through the exploitation of pre-existing contacts, through both, or if it doesn't happen. 212 respondents (78%) answered that some kind of academic collaboration occurs; between those, 117 respondents (55%) conduct Third Mission with both new academic contacts and known colleagues, 54 (26%) only with known colleagues and 41 (19%) only with new academic contacts.

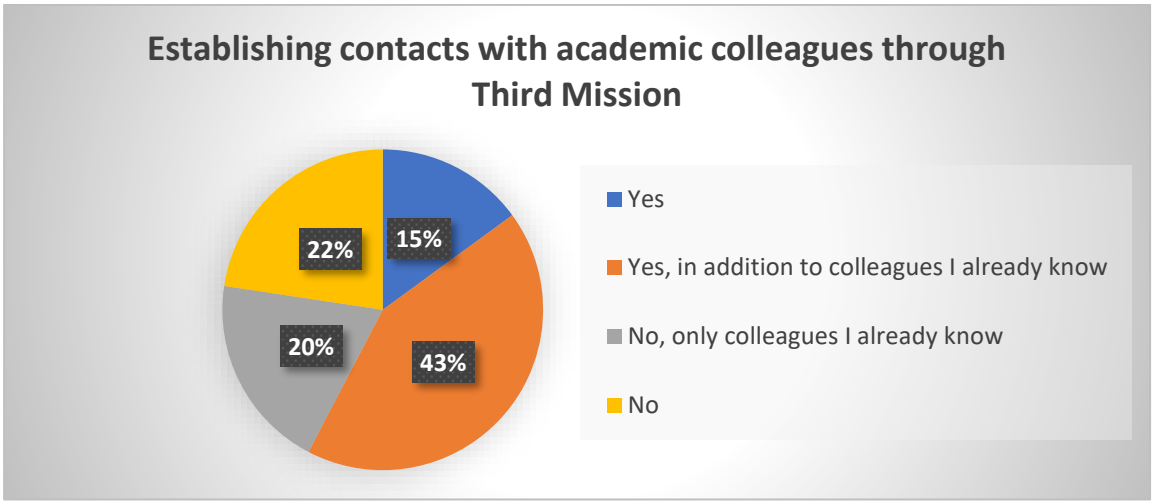

Fig. 1. The chart shows responses to the question: "Did Third Mission activities help in establishing contacts with academic colleagues, useful for teaching and research?" (274 total compilations)

To the question "Did you carry out Third Mission activities together with people in different academic roles from yours?", which received 276 compilations, 254 respondents (92%) answered that it happened, while only 22 (8%) answered that they carried out Third Mission only with people in the same academic role.

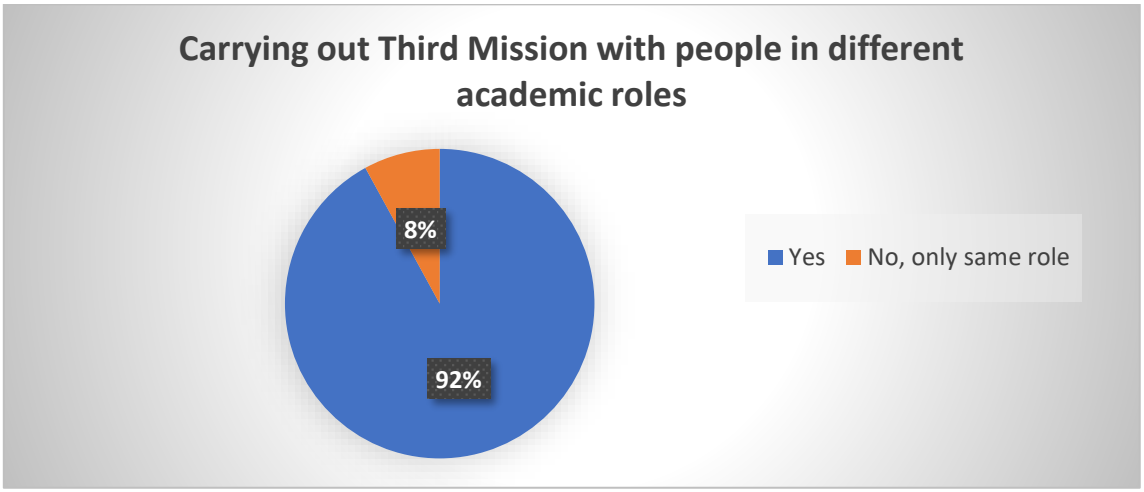

Fig. 2. The chart shows responses to the question "Did you carry out Third Mission activities together with people in different academic roles from yours?" (276 total compilations)

To the question "Did the contact – thanks to Third Mission – with people in different academic roles from yours (eventually including students) give you tools that were useful for teaching and research?", which received 254 compilations, 176 respondents (69%) answered "yes", while 78 respondents (31%) answered "no".

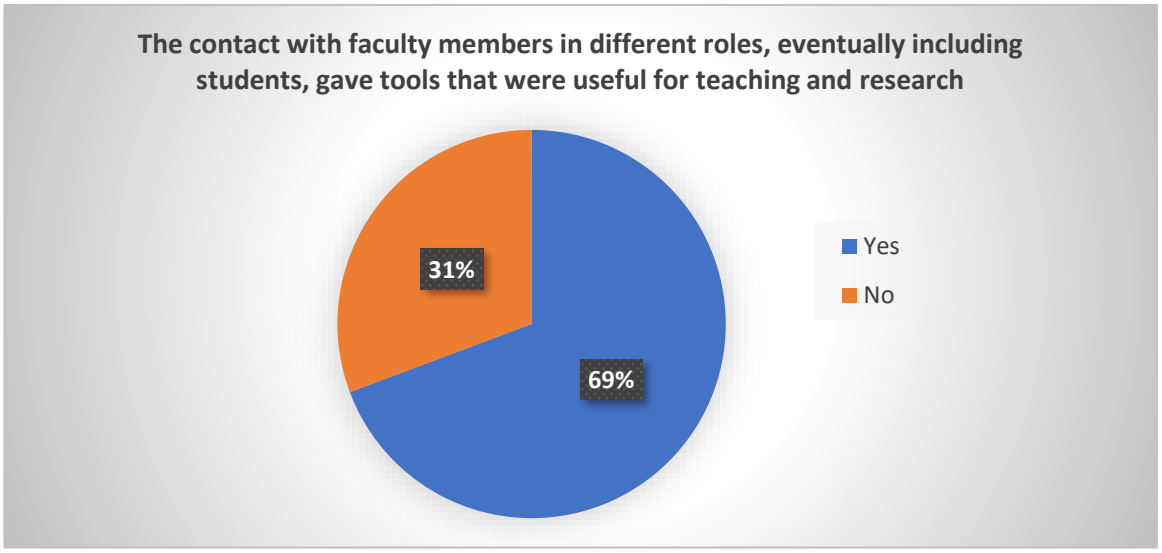

Fig. 3. The chart shows responses to the question "Did the contact – thanks to Third Mission – with people in different academic roles from yours (eventually including students) give you tools that were useful for teaching and research?" (254 total compilations)

4. Limits of Validity and Conclusions

The quantitative study strongly confirmed high frequencies for the qualitative findings related to collaboration during Third Mission and collaboration between different roles, and more than half of respondents engaging in collaborations confirmed that knowledge exchange takes place to various extents. Nonetheless, some limits of validity of the research can be extended to both the qualitative and quantitative study. As regards interviews, a limit consists in the selection of representative elements during the sampling phase, as they are representative of each Department of the University of Turin, but not entirely representative of faculty members, due to the commitment demonstrated in Third Mission. Namely, 16 respondents detain institutional commitments toward Third Mission, that include planning and monitoring of the activities at a departmental level. This could advantage their contribution to the research, because of their overall view of the departmental context, but at the same time, due to their role, they are already positioned and informed actors about the research object. As regards the survey, a bias can be found in the access to compilation, based on interest in Third Mission, as 88.8% reported having conducted Third Mission activities at least once.
Even if other qualitative and quantitative research results attested the presence of still-occurring imbalances in frequence, available resources and perception of Third Mission compared to teaching and research, Third Mission proves to be a channel of learning, for all actors involved, junior as well as senior. New teaching modalities are both implemented and experienced, new insights for future teaching are suggested and reflected upon, informal training and mentorships on faculty life and career are established. Inside-academia collaboration represents a crucial lever to make the most of intersections between missions, valorising the heterogeneity of academic communities.

Leaning into the Tensions of 'Lived' and 'Living Experience': The Ethics of Representation in the Social Work Classroom

Maria Liegghio

School of Social Work, York University, Canada

Abstract

Critical and feminist scholars contending with the ethics of representation in research have asked whether, or not, there is truly an ethical way of representing others. The ethics of representation refers to the good and harm that can result from the ways in which we, as researchers, and I contend here, as educators represent others. As a social work educator, not unlike others, I bring into the classroom examples from the field of the lives and identities of the people, families or communities, disadvantaged along intersecting social dimensions of power, with whom I worked. I do so cognizant that I am representing "Others" who are unable to represent themselves or have been [mis]represented, not only in the education system, but across systems: health and mental health, criminal justice, child welfare, or immigration. I am also cognizant that in the classroom are students with lived or living experiences of the very issues we are interrogating. Although I open classes with a qualifier about emotional triggers, self-care, and the importance of boundaries and of using the space for learning, rather than cathartic release, the acknowledgment of lived or living realities always produces awkward moments and unacknowledged tensions. Against the backdrop of these tensions, in this paper, I consider the implications of the ethics of representation for the classroom and conclude by suggesting decolonial and feminist practices of "multivocality" and of "reflexivity" or "reflection-in-action". I suggest that rather than engaging in voyeuristic learning practices of "gazing at the Other", or passing over the tensions, ***we lean in****, and that the tensions become the "Other-case" for learning with the classroom reconfigured as the field we are aiming to change as social justice-oriented practitioners.*

Keywords: *education, ethics of representation, lived or living experiences, Other or Othering, reflexivity*

Introducing the Tensions: Representations of the "Disadvantaged Other" in the Classroom

Critical and feminist scholars contending with the "ethics of representation" in research have asked whether, or not, there is truly an ethical way of representing others. Broadly, the ethics of representation refers to the good and harm that can result from the ways in which we, as researchers, and I contend here, *as* ***educators****,* represent others, the peoples and communities whose lives and conditions are at the centre of our social justice-oriented work [1], [2], [3], [4]. More than drawing attention to the harms that can come from "how" we represent others, the ethics of representation draw attention to "how who we are" come explicitly or implicitly into those representations, and in turn, cause or uphold harm. Falling under the purview of relational ethics, the ethics of representation align with critical and feminist pedagogies that question the ways curricula, instruction and assessment practices, as well as student-student and student-educator relationships can both uphold or disrupt unjust social relations, processes, and conditions [5], [6], [7], [8]. As a critical social worker and educator, I have always understood and treated the classroom as a microcosm of society – a place and space where racism, classism, sexism, cis-genderism, heterosexism, ableism, sanism, ageism, colonialism, and other forms of oppression, disadvantage, and marginalization are materially and symbolically reproduced and upheld, as well as confronted and resisted [9].

Additionally, my teaching and learning are organized by pedagogies of liberation that emphasize the transformative power of education for students and educators alike, positioned as both learners and knowers. I am committed to "interrogating the power differentials between educators and learners, encouraging empowerment and community building, acknowledging lived experience as 'a way of knowing', and respecting diversity" (p.1547) [10]. Although the academy has long faced criticisms for subjugating and erasing lived and living experiences as important knowledges and ways of knowing [11], critical social work pedagogies consider lived knowledges as important for our theories and training [12], [13] [14], [15]. Not unlike other educators, I bring into the classroom life stories as "case studies" or "cases from the field" of the people, families or communities with whom I worked – the "disadvantaged Other" – who as a structural dimension of their personal and interpersonal experiences were unable to

represent themselves or have been misrepresented, not only in the education system, but across systems: health and mental health, criminal justice, child welfare, or immigration. By bringing into the classroom their stories, lived and living experiences are represented [16], and from there, we engage in reflexive practices of interrogating power and the structural conditions of their lives imagining the changes that could and should occur for a more just society [17], [18], [19].

Additionally, I am cognizant that in the classroom are also students with lived or living experiences of the very issues we are interrogating, issues over which I am expected to demonstrate a certain level of "professional expertise" as a social work and instructor. Although I open sessions with qualifiers about emotional triggers, self-care, and the importance of boundaries and of using the space for learning, rather than cathartic release, the acknowledgment of lived or living experiences can produce awkward moments and unacknowledged tensions. For instance, sharing experiences of "mental illness" can trigger concerns related to the stigma of mental illness and of being judged or constructed as "incompetent" and other sanist microaggressions, such as the use of references like "crazy" or "this is crazy" [20], [21], [22]. Learning about race, racism, and racialization can trigger for white students fears of being called "racist" and shame of being implicated for upholding white supremacy [23], [24], while anti-racist and anti-colonial educators continue to raise concerns about the harms racialized and Indigenous students experience. These harms include microaggressions, such as the covert and overt dismissals of white supremacy and racial discrimination constructing it as issues of the past, or of being constructed as "angry" or as "white-passing" [25], [26], [27], [28], [29].

As an instructor, a major tension I experience is how voyeuristic and self-serving it can sometimes feel working with lived and living experiences (whether it be cases from the field or personalized disclosures) for the purpose of preparing and professionalizing students to become "social workers". From within decolonial studies, "voyeurism" refers to the ways in which the colonial logics of subjugation and erasure in the academy are reproduced and maintained through practices and processes of treating some people, the "disadvantaged Other", as objects to be gazed at, exoticized, and studied [30]. As a critical social worker, I am conscious of how, at times because of "who I am", ***I pass over*** the tensions and ***I lean on students***, racialized and other students with experiences of disadvantage, to verify, uphold, or give legitimacy to the knowledges, representations, and analyses I present as the instructor. Despite the best of intentions, by leaving the tensions unacknowledged and unaddressed, colonialism, white supremacy, and other forms of domination are upheld, reinforced, and reproduced by "who I am". As mentioned, critical and feminist scholars of the ethics of representation question whether, or not, there is truly an ethical way of representing others. They complicate notions of "objectivity" suggesting that the idea of a "neutral" or "unbiased" stance from which we can see and know, and thus, represent the people, communities, and the world is impossible; and instead, we are understood as positioned and located ***within social relations of power*** organized around our race, class, gender, gender identity, sexual orientation, able-mind-bodiedness, age and generation, Indigeneity, and geopolitical geographies and locations. In other words, our representations of others are not apolitical but interconnected and intertwined with "who we are" and with "where we see and know the world" [31], [32], [33], [34].

Ethics of Representation: Moving from Asking "Who Are You" to Asking "What Histories, Relationships, Conditions and Experiences Bring You Here?"

As educators, the choices we make from the topics, theories, films, and reading materials we choose to include in a course, to the assignments, exercises, and activities we encourage or discourage, to the ways we present lived and living experiences are all influenced and organized by our intersecting embodied experiences, our lived and living experiences of our race, class, gender, gender identity, sexual orientation, able-mind-bodiedness, age and generation, Indigeneity, and geopolitical geographies and locations. From a relational perspective, many argue that an ethical practice is "to make our gaze transparent" by disclosing our identities and social positions, not as a list of characteristics, but for ***how*** those categories and positions organize our interpretations and interactions with others [35], [36], [37], [38], [39]. At the opening of and throughout any course I teach, my aims are to facilitate conditions of open-mindedness, humility, and vulnerability for students and myself to open-up, suspend our fears and epistemic arrogance, and learn from one another.

Setting the stage for these conditions, I open courses with "introductions", an exercise of answering the question, "who are you" by sharing our names, pronouns, professional goals, and what we bring to and hope to learn from one another and the course materials. As an initial activity, introductions are an example of how lived and living experiences are invited into the classroom. Moreover, throughout the course students are asked to consider how "who they are" – how the intersecting, interlocking social

dimensions of their embodied experiences inform and organize their analyses and interpretations of the materials, the people, and issues under study. As suggested

> ...you may locate your epistemological claims, theoretical allegiances, and positionality on the various axes of recognized difference, but perhaps you also ought to mull over what your work cultivates and cuts off in you, what brings you to it, what you are looking for and thus likely to find (p. 616) [40].

As noted, revealing our stance by listing the categories or dimensions of our identities is not enough, and instead, questions of "who are you" shift to questions about "what histories, relationships, experiences, and conditions bring you here", bring us to the analyses and interpretations we make? The ethics of representation assert that it is not enough to show how we produce our interpretations, but that we locate ourselves and our interpretations within the ideological and institutional contexts from which the accounts are produced [41], [42].

Informed by this assertion, along with "introductions" I also open courses with a political historicizing, offering "acknowledgements" of the Lands; the Treaties over which the Lands are governed as the legal expectations of settlers (Stewart-Ambo & Yang, 2021); and of the First Nations, Métis, and Inuit peoples (and all other Indigenous nations referring to "Canada" as the context) whom from time and memorial are stewards and caretakers of the territories on which the classroom and university are located. As stated,

> …it is in our most intimate spaces (e.g., our bodies, the people that we are in community with across place, space, and time) that power operates most transparently to reveal its most stubborn dynamics. In declaring these truths, we provide critical knowledge about the politics of power that keep us trapped in the matrix of domination and/or shift us into a matrix of liberation (p. 781) [43].

While my efforts are to shift towards questions about the histories and legacies we carry [44], land acknowledgements are criticized as "performative" and "tokenistic" [45], [46], [47], [48]. Sometimes I feel that along with being voyeuristic, acknowledging lived and living experiences in the classroom is also performative and tokenistic.

Representations of others are the outcomes of epistemological and institutional processes. I understand that unless we reveal our "selves", or perhaps more accurately, our "politicized selves" over "place, space and time" for scrutiny, we run the risk of reproducing the very conditions we are attempting to change – performative educations embedded in colonial logics reproduced onto the bodies of students and other people who are or have been objects of our professional gazes as social workers. Representations reflect certain knowledges and ways of knowing and being, while obscuring and subjugating others. They reflect colonial logics of "singularity" – the filtering of diverse knowledges and ways of knowing and being towards a singular and essentialized way of knowing and being. Rather than engaging in voyeuristic practices of "gazing at the Other" [49], [50], I suggest ***we lean in***, and the tensions become the "Other-case" for learning with the classroom as "the field" we are aiming to change. The reconfiguration of the classroom, as a colonial territory, begins with a stance of "decolonial not knowing" – an epistemological approach for resisting the colonial logics of "singularity".

"Leaning In": Reconfiguration of the Classroom Through a Stance of "Decolonial Not Knowing"

As a social work educator, I am institutionally sanctioned to work with knowledge, specifically with knowledge about the human condition, social problems and their solutions – to produce, share, present, or endorse certain knowledges over others. As an epistemological process, when I present a case from the field – the disadvantaged Other – I take the details of their lives, interpret those details, and then [re]present those details as "knowledge". The same can be said of lived and living experiences of students and educators, alike. As the instructor, I decide what details are important, and in what ways those details should be [re]presented as the "problems" or "solutions" under study. Together, students and educators consider "professionalized", "social work" interpretations of those details and then [re]present those interpretations as "expert knowledge" [51]. In the professionalized "social work" descriptions, the person, their experiences, their communities, and the details of their lives and histories become subjugated, and ultimately unrecognizable against the professionalized renditions [52], [53], [54], [55]. For an action-practice-oriented discipline like social work, I also [re]present that knowledge as personal, interpersonal and social interventions for how the disadvantaged Other should be "treated" – what practices should be used and for what aims.

Ironically, while lived and living experiences in the classroom are ways of recognizing lived knowledges as important, epistemological differences are nonetheless erased through voyeuristic practices of commodifying, reducing, and treating people "as problems" [56]. The person and their conditions

become objects, commodities for learning, and lived and living experiences in the classroom become tokenistic gestures of inclusion and diversity – tokenistic gestures of "social justice". The reconfiguration necessary of the classroom, and of education more broadly, starts with adopting a stance of "not knowing". From studies in cultural humility, "not knowing" is interconnected with ideas of "not acting on our assumptions" and instead, "assuming a posture of not knowing", which then in practice translates to "asking and continuing to ask for clarification", rather than assuming to know the other person [57]. This is what I suggest is the current practice, a problematic practice, for how lived and living experiences are treated in education that inadvertently reproduce the colonial logics of voyeurism, commodification, tokenism, and singularity. Delinking from colonial logics require epistemological versus cultural approaches or practices.

As a way forward, in research, there are calls for moving away from an ethics of representation to an emancipatory ethics grounded in a commitment "that the marginalized have a moral right to own and control knowledge produced about them" (p.p. 48-49) [58]. Others suggest that what is required is a democratization of social relations [59], [60], [61]. In liberatory pedagogies, this moral imperative is also recognized as important [62], [63] and relies on an epistemological (versus cultural) stance of "not knowing" born out of border or borderland epistemologies. Border or borderland epistemologies refer to the knowledges and ways of knowing and being born out of conditions of struggle and resistance to encounters with colonialism and coloniality as systems of domination and subjugation [64]. From border or borderland epistemologies, "not knowing" refers to a posture and practice whereby we "recognize and refuse the epistemic conceits of singularity by inhabiting the undecided situation" [p. 90) [65]. The premise of a "decolonial not knowing" is that we reject arrogance, epistemic arrogance, and the beliefs and practice that we have right to know another person's ways of being, knowing, and knowledges, and in turn are entitled to act on that knowledge and ways of knowing and being as if they are our own. As an educator, I understand the idea of "inhabiting the undecided situation" to mean resisting against approaches and practices of singularity, essentializing and universalizing knowledges and ways of knowing and being, and instead, practicing "decolonial not knowing" through two practices: 1) reclaiming "multivocality" [66] and 2) "reflexivity" as "reflection-in-action" [67] for practices of looking "with" [an]Other, rather than "at" the Other [68].

1) Practicing "Decolonial Not Knowlng": Embracing Multivocality

Rooted in border epistemologies, "multivocality" is anchored in assumptions that there are multiple ways of being, and in turn, multiple ways of knowing and knowledges of the same phenomena [69]. Within this framework, multiplicity and differences are valued, social power is organized and shared horizontally. The aims are not dominance and subjugation, but reciprocity and mutual growth, change, and learning. Multivocality centers practices that are not new, but that are reclaimed from what has always existed, for example, oral traditions of storytelling [70], but were subjugated, suppressed, and targeted for extermination by colonial and imperial violences [71], [72]. As an example of reclaiming multivocality, "encuentros" [translated from Spanish: encounters] are described as a praxis used in the 1980s and 1990s to bring women across Central America together to learn about and share their experiences of participating in revolutionary movements [73]. The "encuentros" were intended to document, support, and address the sexism and androcentrism women revolutionaries had encountered while in their fight for class justice. As a practice, "encuentros" are organized as horizontal exchanges and dialogues with all participants (women, observers, "educators") positioned as "testigos" [witnesses], while the exchange of the experiences is framed as "testigando" [witnessing], and the information shared are "testimonios" [testimonies]. Intentional to addressing the androcentric logics of the revolutionary movements, the erasures of women's epistemologies in their fight for justice, the aims of the "encuentros" were to visiblize the multiple knowledges and ways of knowing, being, and voicing women's experiences.

As a delinking from colonial reductionist logics, the aims are not to make visible the same experience, nor funnel diverse experiences through a process of essentializing, for example towards "best practices", but to make visible multiple voices and multiple realities of the same or similar experiences [74]. The implication for preparing professional social workers is that the classroom and social work training are reimagined, moving away from from being "experts of problems" (the disadvantaged Others) to being "facilitators" and "brokers" of epistemological differences where multiple knowledges and ways of knowing can emerge and flourish as non-hierarchical exchanges and encounters. Critical to building pathways, the aim of social work education shifts from discovering, reducing, and professionalizing (colonial logics) to describing, voicing, and demonstrating complexities that make up the social world and the human condition [75], [76]. Critical for breaking away singularity, the exchanges and encounters

are understood as resulting in more inclusive solutions or responses for addressing inequities because "professional knowledges" or "social work knowing" emerge out of and are constructed from more knowledges and ways of knowing and being, thus, are more inclusive of more epistemologies [77]. Intertwined with practices of multivocality are reflexivity as reflection-in-action for practices of looking "with" [an]Other [78].

2) Practicing "Decolonial Not Knowing": Reflexivity as Reflection-in-action for Practices of Looking "With" [an]Other

Broadly, "reflexivity" refers to a practice of self-reflection that occurs during our interactions with others [79], [80]. Reflexivity is differentiated from other types of reflection, such as reflection-on-action or critical reflection [80]. It is understood as occurring during the interactions, while reflection-on-action occurs looking back on interactions that has already occurred [82]. As a practice, reflection-in-action is useful for interrogating processes as they are occurring. Feminist approaches to reflexivity bring into question our claims to knowledge and to how power is enacted in our interactions and encounters with others [83], [84], [85]. Recognizing that power differences cannot be fully leveled because of the ways in which social roles and institutional power are organized along the social dimensions of a person's identities , the aim of reflexivity is not to erase differences, but to close the epistemological gaps between people [86] by moving each person in the exchange closer and closer to shared understandings of one another without losing or subjugating the "self/other" to one another [87]. Closing the epistemological gap does not mean coming to the same understanding but coming to multiple understandings which include mutual and mutually constructed understandings suggesting a third space. From decolonial or borderland epistemologies, this third space is understood as [an]Other possibility, and involves looking "with" [an]Other rather than treating the Other as an object, for example, of learning or research [88]. The classroom becomes the site for the third space.

The classroom is reconfigured from being a conceptual space of "expert knowledges" and "expert practices" to a space, place, and time for deep dialogue and contemplation where different epistemologies come together and interact with the aims of developing multiple, and some mutual and mutually constructed understandings of the issues, topics, and materials under study. The exchange is no longer conceptual but an exchange that requires us to interrogate our [inter]actions with one another as embodied experiences of one [an]Other as differently positioned learners-knowers [89]. The stance of looking ***with*** [an]Other has all parties in the encounter positioned alongside one another, not of experts of each Other, but as having different knowledges and ways of knowing and being, each epistemology just as relevant and important to the topic under study. Looking with [an]Other means abandoning, or at the very least, resisting notions of "expert" and "expert knowledges" and of knowing and speaking for Others. The classroom as a colonial territory is reconfigured as a space where subjugation and domination of expert knowledges are resisted, and multiple knowledges are embraced resulting in more inclusive solutions or plans for addressing inequities. Again, the implication for preparing professional social workers is that the classroom and social work training are reimagined as moving away from developing "experts of problems" (experts of the disadvantaged Others) to being "facilitators" and "brokers" – accompanying the processes of epistemological differences where multiple knowledges and ways of knowing can converge, emerge, and flourish as non-hierarchical exchanges and encounters and relationships.

Conclusion and Moving Forward

Throughout this paper, the implications of the ethics of representation from research were considered for education, and specifically social work education. To summarize, social work as a discipline is concerned with the human condition, with social, personal, and interpersonal "problems" and their solutions. Moreover, social work is a practice or action-oriented discipline, that is a discipline committed to social change and transformation at the levels of the person, family, communities, and institutions. Representations of others, and in the case of social work, representations of the "disadvantaged Other" are understood as constructions emerging out of colonial logics and epistemological processes: voyeurism, commodification, tokenism, and singularity in the classroom. In liberatory pedagogies, power differentials, empowerment, community-building, lived and living experiences, as well as respecting diversity are all considered important dimensions for producing a more equitable, fair, and just educational system [90]. From the ethics of representation and border epistemologies, we include the democratization of social relations in the academy or what has also been referred to as relational reflexivity [91], [92], [93].

Moving forward, I wonder what it would look like if social work education was reconfigured outside of the academy, and instead, positioned fully in the community with curricula co-designed, co-constructed, and co-delivered with the people and communities we are socially and legally sanctioned to serve and support. While I recognize that many social work educators have lived and living knowledges, as asserted by the ethics of representation, even if we are closest to the issues under study, the representations are constructions that emerge from our positions as university-located and university-positioned educators/learners/professionals. In other words, having lived and living experiences is not an immunity from reproducing, upholding, or being the brunt of colonial logics of commodification, voyeurism, and tokenism in the classroom. By the time we make it to the university, regardless of our backgrounds, we are members of a professional elite, and our representations are constructions that represent our privilege as members of that elite. I am left unsettled by the tensions as they persist, and by the question of how a "decolonial not knowing" through practices of multivocality and reflexivity should be implemented when "social workers" and "social work practices" continue to be born out of the imaginations of "experts", "professionals", "educators", and "researchers" located and positioned primarily in classrooms and university settings? In my efforts to show the importance of lived and living knowledges, what I alluded to but never fully interrogated is the change required at an institutional level, particularly for of how we conceptualize "professional education". In other words, what would it look like if social work education and training for practice was reconfigured outside of the academy and positioned fully in lived and living knowledges as they occur in community in the local contexts and conditions of people's lives and realities?

Empowering Educational Leaders as Change Catalysts: Strategic Leadership Approaches in VUCA Spectrum

Abegail A. Malabuyoc

Polytechnic University of the Philippines Sto. Tomas Campus, Philippines

Abstract

Educational institutions today operate within environments characterized by volatility, uncertainty, complexity, and ambiguity (VUCA), driven by rapid technological change, evolving policies, and large-scale societal disruptions such as pandemics and economic instability. These conditions challenge traditional models of school leadership and require educational leaders to function not merely as administrators but as change catalysts who can foster resilience, innovation, and organizational learning. This study examined how educational leaders in the Division of Sto. Tomas, Batangas adopt and enact strategic leadership approaches to navigate VUCA conditions, and how these practices influence perceived leadership effectiveness and school adaptability. A mixed-methods research design was employed, combining survey questionnaires and semi-structured interviews with 30 school leaders and 100 teachers from public secondary schools. Quantitative data assed the extent of adoption and perceived effectiveness of transformational, distributed, adaptive, and instructional leadership approaches, while qualitative data explored leaders lived experiences, challenges, and adaptive strategies in managing uncertainty. Descriptive and inferential statistical analyses were used alongside thematic analysis to integrate findings. Results revealed that transformational and distributed leadership were the most widely adopted and perceived as very effective in addressing VUCA challenges, while adaptive and instructional leadership were also considered effective. Significant differences in perceived leadership effectiveness were observed across age, educational attainment, and leadership position, suggesting that professional context and role influence leadership perceptions. Qualitative findings further illuminated three core themes: navigating uncertainty through rapid yet compassionate decision-making, leading through complexity by fostering collaboration and shared vision, and demonstrating emotional resilience through empathy, trust-building, and reflective practice. Leaders consistently viewed themselves as mentors who empower teachers, institutionalize organizational learning, and encourage innovation. Integrating the quantitative and qualitative findings led to the development of a Strategic Empowerment Framework emphasizing leadership development, organizational learning, and innovation with resilience. Despite limitations related to scope and self-reported data, the study offers practical implications for leadership development, policy formulation, and professional learning systems. Overall, the findings underscore that adaptive, emotionally intelligent, and collaborative leadership is essential for enabling schools to thrive within the evolving demands of VUCA educational and societal contexts.

Keywords: *VUCA Environment, Educational Leadership, Transformational Leadership, Distributed Leadership, Organizational Resilience, Education and Society*

1. Introduction

Educational systems in the 21st century operate amid rapid technological change, shifting policy demands, and global disruptions such as pandemics and economic instability. These conditions place schools within a volatile, uncertain, complex, and ambiguous (VUCA) environment, where traditional leadership models are increasingly insufficient. Educational leaders are therefore required to balance innovation with stability while addressing persistent challenges related to equity, access, and organizational sustainability. The central issue is not the existence of VUCA conditions, but how leaders respond to them. Without adaptive and forward-thinking leadership, schools risk functioning reactively rather than strategically. As such, educational leaders are increasingly expected to act as change catalysts, individuals who anticipate disruption, mobilize stakeholders, and guide institutions toward resilience and long-term improvement. Recent studies emphasize the importance of leadership competencies such as agility, collaboration, vision, and adaptive decision-making in VUCA contexts (Estillore, 2022). Philippine-based research further suggests that collaborative leadership structures enhance teacher productivity and self-efficacy during periods of uncertainty. Theoretical literature

likewise underscores the relevance of transformational and adaptive leadership, highlighting the role of innovation, systems thinking, and tolerance for ambiguity in sustaining institutional effectiveness. Applying these perspectives to the Division of Sto. Tomas, Batangas is particularly relevant. As a rapidly developing city with growing student populations and diverse educational needs, Sto. Tomas schools experience both the challenges and opportunities associated with VUCA environments. Although localized empirical studies remain limited, existing Philippine research demonstrates that professional development initiatives and transformational leadership practices strengthen trust, motivation, and adaptive capacity among educators. Despite these insights, notable research gaps persist. Few studies examine how school leaders in mid-sized Philippine cities enact VUCA leadership in daily practice or how local context, institutional history, and resource constraints shape adaptive leadership. Additionally, limited research investigates the sustainability of VUCA-responsive leadership practices or their long-term effects on student outcomes. Addressing these gaps through localized quantitative and qualitative inquiry is essential for developing context-responsive and transferable leadership frameworks. This study responds to these needs by examining how educational leaders in Sto. Tomas navigate VUCA conditions and how strategic leadership approaches empower them to function as change catalysts.

1.2 Statement of the Problem

This study examines how educational leaders can be empowered as change catalysts through strategic leadership approaches in navigating the VUCA spectrum. Specifically, it seeks to determine:

1. The demographic and professional profile of educational leaders.
2. The strategic leadership approaches commonly adopted in VUCA conditions.
3. The perceived effectiveness of these leadership approaches.
4. Differences in perceived effectiveness when grouped by demographic and professional profile.
5. The lived experiences and adaptive strategies of educational leaders in managing VUCA challenges.
6. How leaders view their role as change catalysts?
7. The strategic empowerment framework that can be developed based on the findings.

1.3 Hypothesis

H_0: There is no significant difference in the effectiveness of transformational and distributed leadership approaches compared to traditional leadership approaches in navigating VUCA challenges.

1.4 Significance of the Study

- Educational Leaders: Provides insights into adaptive leadership strategies.
- Teachers: Promotes collaboration, innovation, and resilience.
- Policymakers: Informs leadership development and education policy.
- Future Researchers: Serves as a basis for further leadership studies in VUCA contexts.

1.5 Scope and Limitations

The study focuses on public secondary school leaders and teachers in the Division of Sto. Tomas, Batangas. It examines leadership practices, perceptions, and adaptive strategies. Limitations include purposive sampling and reliance on self-reported data, which may affect generalizability.

2. Methodology

2.1 Research Design

This study employed a mixed-method design focusing on surveys and interviews to gain a comprehensive understanding of leadership practices in VUCA environments.

2.2 Participants

Participants included 30 school leaders (principals, assistant principals, department heads) and 100 teachers from selected public secondary schools in the Department of Education (DepED) Division of Sto. Tomas.

2.3 Research Instrument

The researcher utilized a survey questionnaire to measure the leadership styles, adaptive strategies, and school resilience indicators. However, the interview guide questions are also used to gather deeper insights into challenges and innovative practices.

2.4 Data Collection

Data were collected through online and face-to-face surveys, followed by semi-structured interviews with selected participants. Ethical considerations such as confidentiality and informed consent were strictly observed.

2.5 Data Analysis

The quantitative data were analyzed using descriptive and inferential statistical methods to address the study's specific objectives:

1. Descriptive Statistics such as frequency, percentage, mean, and standard deviation were utilized to summarize and describe the demographic and professional profiles of the respondents, as well as their responses regarding the extent of adoption and perceived effectiveness of various leadership approaches (transformational, distributed, adaptive, and instructional) in navigating VUCA conditions.
2. Analysis of Variance (ANOVA) or t-test (depending on the number of groups) was employed to examine whether the perceived effectiveness of leadership approaches differs significantly when respondents are grouped according to their demographic and professional characteristics.
3. Data Familiarization used to transcribe interviews and written narratives were repeatedly read to gain a deep understanding of the participants' perspectives.
4. Initial Coding used for key phrases, words, and ideas were coded to identify meaningful data segments related to leadership practices, empowerment, and VUCA experiences.
5. Theme Generation the codes were organized into broader themes and sub-themes reflecting patterns.

3. Results and Discussion

Table 1. Demographic and Professional Profile of Respondents

Profile Variable	Category	Frequency (f)	Percentage (%)
Age	25-34 years old	36	27.7
	35-44 years old	44	33.8
	45 years old and above	32	24.6
	51 years old and above	18	13.8
Sex	Male	52	40.0
	Female	78	60.0
Civil Status	Single	46	35.4
	Married	84	64.6
Educational Attainment	Bachelor's Degree	59	45.4
	Master's Degree	58	44.6
	Doctorate Degree	13	10
Position/Designation	Principal	10	7.7
	Assistant Principal	8	6.2
	Department Head	12	9.2
	Teacher	100	76.9
Length of Service	1-5 years	33	25.4
	6-10 years	47	36.2
	11-15 years	30	23.1
	Above 15 years	20	15.4

Table 1 presents the demographic and professional profile of the respondents. Most participants fall within the 31-40 age range (33.8%), with 60.0% female and 64.6% married, indicating a professionally mature workforce. Nearly equal proportions hold bachelor's degree (45.4%) and master's degrees (44.6%), reflecting strong academic preparation. The majority of respondents are teachers (76.9%),

while 23.1% occupy formal leadership positions. More than half of the participants (51.6%) have over six years of service, suggesting substantial professional experience. Collectively, these characteristics indicate a stable and competent educational workforce capable of responding to the demands of volatile and unpredictable educational environments. This finding aligns with Suryarati (2021), who reported that educators with higher academic qualifications and longer professional experience demonstrate stronger reflective decision-making, collaboration, and adaptive capacity key competencies for leadership effectiveness in VUCA contexts.

Table 2. Extent of Adoption of Strategic Leadership Approaches

Leadership Approach	Mean	SD	Verbal Interpretation
Transformational Leadership	4.35	0.58	Very Highly Adopted
Distributed Leadership	4.18	0.62	Highly Adopted
Adaptive Leadership	4.10	0.60	Highly Adopted
Instructional Leadership	3.98	0.72	Highly Adopted
Overall Mean	4.15		Highly Adopted

Table 2 presents the extent of adoption of strategic leadership approaches. Transformational leadership emerged as the most adapted approach (M=4.35, SD=0.58; Very Highly Adopted), followed by distributed leadership (M=4.18, SD=0.62; Highly Adopted) Adaptive leadership (M=4.10, SD=0.60) and instructional leadership (M=3.98, SD=0.72) ranked lower but remained highly adopted. These results indicate that educational leaders prioritize vision-driven and collaborative practices while maintaining responsiveness to uncertainty. The predominance of transformational leadership supports previous findings emphasizing its role in enhancing teacher motivation, organizational commitment, and openness to innovation. Aboramadan (2020) notes that transformational leadership strengthens trust and shared purpose, enabling leaders to guide institutions effectively through volatile and ambiguous conditions. This leadership approach fosters collaboration, adaptability, and continuous learning core competencies for navigating VUCA environments.

Table 3. Perceived Effectiveness of Leadership Approaches

Leadership Approach	Mean	SD	Verbal Interpretation
Transformational Leadership	4.42	0.55	Very Effective
Distributed Leadership	4.25	0.63	Very Effective
Adaptive Leadership	4.18	0.61	Effective
Instructional Leadership	4.00	0.70	Effective
Overall Mean	4.21		Very Effective

Table 3 presents the perceived effectiveness of leadership approaches in managing VUCA challenges. Transformational leadership was rated a very effective (M=4.42), while distributed leadership was assessed also very effective (M=4.25). Adaptive leadership (M=4.18) and instructional leadership (M=4.00) were also rated as effective. The overall mean score (M-4.21) indicates that leadership strategies are generally perceived as very effective in addressing current VUCA challenges. The strong ratings for transformational and distributed leadership underscore their critical role in enabling schools to adapt and perform effectively under uncertainty. This finding aligns with Nguyen et. al. (2021), who emphasize that these leadership approaches promote collaborative problem-solving, shared responsibility, and professional teamwork. While transformational leadership motivates and inspires through shared vision, distributed leadership empowers educators through collective decision-making. Together, these complementary strategies enhance institutional resilience and sustain performance and innovation amid VUCA disruptions.

Table 4. Difference in Perceived Effectiveness by Profile Variable

Profile Variable	Computed Value	p-value	Decision	Interpretation
Age	2.15	0.041	Significant	Varying perceptions across age groups
Sex	1.23	0.228	Non-Significant	Same perception across sexes
Educational Attainment	3.02	0.018	Significant	Perception differs by educational level
Position/Designation	2.77	0.032	Significant	Role influences perception
Length of Service	1.45	0.212	Non-Significant	Similar perceptions regardless of tenure

Table 4 indicates significant differences in perceived leadership effectiveness when respondents are grouped according to age, educational attainment, and position, while no significant differences were found when grouped by gender or length of service. These results suggest that professional maturity, academic background, and leadership role significantly influence how leadership effectiveness is evaluated in VUCA contexts. In relation to the study hypothesis, the findings partially reject the null hypothesis, as differences in perceptions of leadership effectiveness exist across key demographic and professional variables. Respondents who are older, hold higher academic qualifications, or occupy leadership positions may possess broader experiential and theoretical perspectives, resulting in more critical or informed assessments of leadership strategies. Conversely, the absence of significant differences by gender and length of service indicates that leadership effectiveness is not influenced by these factors. These findings support Zembylas (2021), who emphasized that leadership perceptions vary according to professional roles and responsibilities, particularly in uncertain and complex environments. Overall, the results highlight the importance of contextual and role-based considerations in evaluating leadership effectiveness and reinforce the need for differentiated leadership development strategies in VUCA educational settings.

Table 5. Emergent Themes on Lived Experiences

Main Themes	Subthemes	Description/Illustrative Statement
Navigating Uncertainty	Crisis Communication, Decision Agility	"We must decide quickly without complete data but with compassion and trust."
Leading through Complexity	Collaboration and Shared Vision	"We engage our teachers to co-create solutions to unpredictable challenges"
Emotional Resilience	Empathy, Self-reflection	"I learned to stay calm and reassure my staff amid fear and confusion.)

Table 5 presents the qualitative findings on the lived experiences of educational leaders in navigating VUCA conditions. Three major themes emerged: navigating uncertainty, leading through complexity, and emotional resilience. These themes reflect leaders' ability to make timely decisions with compassion, engage stakeholders in collaboration problem-solving, and maintain emotional stability during periods of disruption. The findings emphasize that effective leadership in VUCA contexts extends beyond technical management skills and relies heavily on relational and emotional competencies. Leaders who demonstrate composure, empathy, clear communication, and shared vision are better able to sustain trust and morale within their organizations. This aligns with Leithwood et al. (2021), who found that emotionally intelligent and collaborative leadership practices significantly enhance organizational resilience and staff-well-being, particularly during crises such as the COVID-19 pandemic. Overall, the results highlight in VUCA environments as a human-centered and adaptive process grounded in empathy, trust, and collective purpose.

Table 6. Themes on Leadership as Change Catalyst

Themes	Illustrative Statements	Implication
Empowering Teachers	"I see myself as a mentor who nurtures confidence among my team."	Leadership empowerment drives teacher engagement
Building Organizational Learning	"We document best practices and share them school-wide."	Continuous learning fosters adaptive culture
Promoting Innovation	"We experiment with new teaching models and embrace digital tools."	Innovative leadership enhances VUCA readiness

Table 6 highlights that educational leaders view themselves as active agents of change. Respondents emphasized their role in empowering teachers, fostering organizational learning, and promoting innovation to sustain school improvement in VUCA environments. As mentor, leaders build teacher confidence, support professional growth, and encourage experimentation with new pedagogical approaches and educational technologies. The findings further indicate that empowering leadership practices and reflective processes enhance both organizational performance and resilience. This aligns with Harris and Jones (2020), who noted that imaginative and empowering leadership strengthens teacher agency, professional collaboration, and adaptive capacity in challenging educational contexts. Overall, the results suggest that effective leaders do not merely manage change but enable others to lead and innovate, positioning schools for continuous improvement and future readiness.

Table 7. Proposed Strategic Empowerment Framework

Core Dimension	Key Strategies	Derived from Findings
Leadership Development	Continuous training in adaptive and transformational leadership	High Adoption, Empowerment themes
Organizational Learning	Knowledge sharing, mentoring, reflection sessions	Collaboration and learning
Innovation and Resilience	Encourage experimentation, technology integration, flexible policies	Effectiveness ratings, Innovation insights

Table 7 presents the Strategic Empowerment Framework, which emphasizes three interconnected components: leadership development, organizational learning, and innovation and resilience. Together, these elements strengthen educational leaders' capacity to navigate volatile, uncertain, complex, and ambiguous (VUCA) environments. Continuous professional development in transformational and adaptive leadership prepares leaders to respond to rapid change while inspiring collective action toward shared goals. The framework also highlights the importance of collaborative organizational learning through mentoring, reflection, and knowledge sharing, which enhances collective adaptability. In addition, the promotion of innovation, effective use of digital technologies, and flexible policy implementation support institutional resilience during periods of uncertainty. These findings align with Berkovich and Eyal (2021), who argued that empowerment-based leadership frameworks grounded in continuous learning and innovation enhance leaders' self-efficacy, adaptability, and collaborative competence. Overall, the framework supports the transformation of schools into resilient learning organizations capable of managing complex educational challenges.

4. Summary of Findings, Conclusions, and Recommendations

4.1 Summary of Findings

The findings indicate that the respondents are predominantly mid-career, academically qualified, and professionally experienced, providing a strong foundation for leadership in complex educational settings. Transformational leadership emerged as the most frequently adopted approach (M=4.35), followed by distributed (M=4.18) adaptive (M=4.10), and instructional leadership (M=3.98), reflecting leaders' emphasis on collaboration, shared vision, and empowerment in VUCA contexts. Overall, leadership strategies were perceived as high effective (M=4.21), with transformational (M=4.42) and distributed leadership (M=4.25) rated very effective. Significant differences in perceived leadership effectiveness were found across age, educational attainment, and position, but not across gender or length of service, suggesting that professional maturity and leadership role influence leadership evaluation. Qualitative findings revealed three dominant themes: navigating uncertainty, leading through complexity and emotional resilience, highlighting the importance of empathy collaboration, and adaptive decision-making. Educational leaders viewed themselves as change catalysts, emphasizing teacher empowerment, organizational learning, and innovation, which informed the development of a Strategic Empowerment Framework integrating leadership development, organizational learning, innovation, and resilience to strengthen leadership effectiveness in VUCA environments.

4.2 Conclusions

The study concludes that educational leaders in the Division of Sto. Tomas are academically prepared and professionally experienced, providing a strong foundation for managing complex and uncertain school environments. Transformational and distributed leadership emerged as the most prevalent and effective approaches, highlighting the importance of collaboration, shared vision, and empowerment in navigating VUCA conditions. Leadership effectiveness was influenced by age, educational attainment, and position, underscoring the role of professional maturity in leadership judgment. The findings further emphasize the human dimension of leadership particularly emotional intelligence, empathy, and communication as critical to sustaining trust and morale during periods of disruption. Overall, fostering organizational learning, innovation, and teacher empowerment enhances institutional resilience, while the Strategic Empowerment Framework offers a practical model for strengthening leadership capacity and supporting continuous professional development in VUCA educational contexts

4.3 Recommendations

Educational institutions and the Department of Education should implement comprehensive leadership development programs emphasizing transformational, adaptive, and distributed leadership to strengthen leaders' capacity to manage VUCA conditions. School divisions are encouraged to support continuing professional education through scholarships, leadership seminars, and research mentorships to enhance academic and leadership competencies. Leadership evaluation and mentoring systems should be institutionalized to support succession planning and sustained leadership growth. Schools should also foster a culture of collaboration and organizational learning through reflective practices, teamwork, and cross-departmental initiatives. In addition, providing emotional resilience training and psychosocial support is essential to help leaders manage stress and uncertainty. Educational institutions should adopt flexible and innovation-oriented policies that encourage experimentation and the integration of new pedagogies and technologies. Finally, the Strategic Empowerment Framework should be adopted as a guide for leadership development, performance assessment, and professional learning communities to cultivate empowered, resilient, and future-ready educational leaders in VUCA environments.

Short and Long-term Impacts of School Safety Drills: Student and Family Perspectives

Sara C. McDaniel[1], Courtney O'Grady[2], Alison Kearley[3]

[1,2,3]University of Alabama, United States of America

Abstract

In the United States, school shootings have become more prevalent over the past 40 years. In response, legislators and schools have added various policies and expectations for various safety drills, often named "active shooter" or "code red" drills, to their existing weather-related safety drills. While some research exists regarding how active shooter drills impact students, there little understanding how active shooter drills impact children and their families, let alone creating student- and family-centered practices. This paper presents persepctives of students and their families on their experiences with these drills.

Keywords: *Trauma, School Safety, Student perspectives, family perspectives, school shootings*

In the 2020-2021 school year there were 41 school deaths which included 20 homicides and 17 suicides. From 2000-2022, 131 school students were killed and 197 injured in active shooter incidents. In those 22 years, only 5 years saw zero active shooter incidents. Two of those years saw 5-6 active shooter incidents in schools.

Drill History

In 1999, high school students murdered 12 students and one teacher, with the gunmen dying by suicide. This event is frequently noted as the "watershed" moment that made legislators realize school safety laws were required (evolution of state school safety). Subsequently, numerous other school shootings have occurred, and legislators have passed regulations, and statues to attempt to prevent further school shootings. Most of the current school safety laws are reactive strategies rather than preventative strategies. One response strategy that is not normalized in U.S. schools are school shooter or "code red" drills during normal school days and throughout the school year. While active shooter preparedness is one important component to these far-too normal tragedies, the federal Departments of Education, Health and Human Services, Justice, and Homeland Security identify six other practices that should be equally focused on to prevent future school shootings (evolution document): character development and connectedness specifically mentioning multitiered systems of support (MTSS) and positive behavior interventions and supports (PBIS), preventing cyberbullying, mental health services, reporting and threat assessment systems, educator training, and security of buildings. According to Child Trends and EMT Associates Analysis of state statues May 2019- in evolution document), multi-hazard drills as mentioned above, and active shooter drills are encouraged or required in numerous states. The trend for both has increased over time with 42 states requiring training for hazards as of 2019 and 37 states requiring active shooter drills as of 2024. Oftentimes active shooter drill training frequency and procedures are decided on by individual school districts and sometimes in cooperation with their local law enforcement department. It has been recommended that local officers receive a minimum of eight hours of specific school active shooter training that pair with already required trainings for students and teachers. Gaps in consistent, systematic local law enforcement training put the oneness of active shooter preparation back on educators and students.

What are Active Shooter Drills?

First, it is important to note that there are various safety drills and terms for safety drills used in schools that are often conflated with one another [1]. Some of these terms include active shooter drills, lockdown or emergency lockdown drills, armed assailant training [1], live exercises, and school preparedness drills. The National Association of school Psychologist (NASP) and the National Association of school Resource Officers (NASRO) (2017) note that the term "active shooter drills" has "become an unhelpful catch all" for "very different types of drills," including: "options-based drills" where students are taught to run, hide, or fight; simulation drills where there are "sensorial components" such as sounds and actors

playing roles; and lockdown drills where students shelter in place (p. 2). Yet, because students, schools, and the literature base widely use these terms interchangeably [2] we do not distinguish a difference in these drills. We define "active shooter drill" to mean a planned set of school activities that are organized by school leadership and faculty/staff, such as teachers and school counselors, who mimic the possible scenario and safety procedures in the event of an active assailant on or near a school campus.

Concerns about Active Shooter Drills

Though active shooter drills in their various forms have been implemented for many years in American public schools [1] there are many concerns about these drills including: a) the blurring student and faculty roles and responsibilities during drills, b) their overall effectiveness to promote/increase student safety, and c) leading to cause additional stress or trauma for students and staff.

Blurring Student and Faculty Roles and Responsibilities

One concern about active shooter drills is that students and are being saddled with the responsibility to act as a defense for themselves and their classmates in danger, especially students who may or may not have the development understanding or ability to do so [3]. Guidance from the National Association of School Psychologists, the National Association of School Resource Officers, and Safe and Sound Schools emphasize that "at no point should students be given the instruction or impression that they are expected to act as heroes (i.e., fight, defend, counter) in a life-threatening situation" (p. 7). Additionally, one of the weak modes of implementation observed in the practice of school lockdown drills is the failure to provide accurate orientation for the students and their parents by the school authorities and the use of school counselors against their primary role towards the students [3].

Overall Effectiveness to Promote Student Safety

Current research shows mixed effectiveness of active shooter drills for student safety [1] [2]. In fact, 2021 study [4] on the impact of school shooters drills on the psychological well-being of American K-12 schools and communities with the use of machine learning and interrupted time series analysis which filtered 54 million social media posts, in 114 schools, spanning 33 states shows a 39-42% increase in the level of anxiety, stress and depression in the school communities. The mental well-being of the American K-12 school students is perceived to be threatened by the popular acceptance and implementation of school shooters drills. The drill is carried out by school administrators to prepare the school population which includes, the students, teachers and other school officials and staffs against random shooting. Students report an 39-42% increase in the level of anxiety, stress and depression around active shooter drills.

Causing Additional Stress or Trauma for Students and Staff

One of the biggest concerns about active shooter drills is the potential for these drills to cause emotional stress and trauma such as fear, anxiety, and worry from students, parents and counselors [1] [2]. Teachers can and should help students understand how to respond to an emergency situation without causing undue emotional stress; in fact, there are numerous steps that have been suggested to teach students of various ages and developmental levels about drills without students actively having to engage in a typical active shooter drill. The National Association of school Psychologist (NASP) and the National Association of school Resource Officers (NASRO) (2017) hold the view that schools who are implementing the lockdown drill as a safety measure should consider the psychological effect the drill might have on students by putting into the realization of their plans an effective precautionary measures and emotional care. In fact, it has been noted that if these drills are “not implemented correctly, they can cause (psychological) harm” to students and teachers (2021, p. 1).

Purpose

While the field works to prevent school shootings, it is clear that active shooter preparation is still required for U. S. teachers and students in addition to local law enforcement. However, less is known about the balance of effectiveness and harm done with students participating in active shooter drills as they are currently implemented in the U.S. Thus, our purpose of the current study is to better understand the perceptions of students and families participating in multi-hazard and active shooter drills, their

impacts, and potential lessons to learn to reduce harm while ensuring effectiveness. This is a single district case study that examines both qualitative and quantitative data from students and caregivers. This multi-informant, multi-method study provides a comprehensive glance of problems, perceptions, and strategies for improvement.

Method

Because of the limited prior research on student and parent perceptions of school safety and experiences with school safety drills, we used a constructivist perspective rooted in grounded theory (Charmaz 2006; 2014). This perspective allowed us to conduct an inductive analysis to discover patterns in participant perspectives and insights of school safety drills and overall school safety. This allowed us to view patterns in the data without implementing pre-determined categories onto the data, which allowed findings to emerge inductively from the data sets.

Setting

We conducted this study from a southeastern state that has seen increases in weapons in K-12 campuses, including 144 incidents of students possessing and/or using a gun (of any type) on school grounds during the 2022-2023 school year. We conducted the study with parents and students from midwest and southeastern states with various cultural and political values regarding gun control and use. Additionally, participants varied in their own exposure to or experience with the use of guns and/or gun violence in their schools and private lives. Though some participants may have disclosed opinions and values on guns and gun culture in the online survey or during interviews, the investigators did not specifically ask questions about the parent, student, or family's personal views on the matter because the study was focused on school safety and active shooter drills rather than personal and cultural views on guns and gun control.

Participants

We recruited parents and/or caregivers (e.g., foster parents, custodial grandparents) of Pre-K through 8th grade students who participated in at least one active shooter/school safety drill during the 2023-2024 school year. In December of 2023, we began recruitment through social media posts for the study, as well as through snowball sampling via these posts being shared and others referred to the study from public shares of the original post(s) online (Johnson, 2014). Parents/caregivers were directed to an online consent form and online survey to complete, where the initial survey included an option for the parent/caregiver to express interest in participating in a follow-up interview with researchers, either alone or as a dyad with their child(ren). The online survey and interviews were administered from spring of 2024 through the end of 2024. A total of fifty-five participants agreed to the online consent and at least partially completed the online survey. Sixteen participants (eleven parents and five students) consented to and completed an online interview. We did not have a set number of desired participants, but rather we consulted the data as interviews were conducted, and stopped seeking participants when we concluded there was a point of saturation with the data and data analysis (Saunders et al., 2017).

Data Collection

In this study we used two primary forms of data collection: an online survey and individual/dyad interviews. The online survey incorporated open-ended and short answer questions to provide a way to collect descriptive data from the participants, including basic demographic information and their experiences with, and related thoughts and feelings about, active shooter drills (Creswell & Poth, 2018; Patton, 2015). The interview protocol was developed in a semi-structured manner with predetermined guiding questions to further explore the perspective of parents and students individually or in dyads on active shooter drills in schools. An example of the interview protocol can be viewed in Appendix 2. Again, we did not have a set number of desired interviews, but rather we consulted the data as interviews were conducted, and stopped seeking participants when we concluded there was a point of saturation with the iterative data analysis.

Data Analysis Plan

Because the goal of this project was to capture participant perceptions, we used inductive analysis with multiple, iterative rounds of reading through and coding the data. Throughout the data analysis process, we used a collaborative, constant comparative analysis approach to identify patterns in the interview data. First, we acquainted ourselves with the data by reading through a few of the interview transcripts. We then used In Vivo coding with the participants' own words and phrases used to generate potential main codes and sub-codes from the interview transcripts. When the first round of coding was complete, we met as a team to review these codes and resolve any disagreements or questions about the codes created. We created a codebook that included the main codes, subcodes, and examples of these codes. Next, we reviewed the data with these main codes and sub-codes in mind, and repeated the process of meeting and resolving any disagreements or questions from the second round of coding to reach consensus on the coding processes. Additionally, the team read through the survey data and coded the data with the existing main codes and sub-codes. Because the survey data was less in-depth, the interview transcripts were used as the main source of data, with the surveys used as supplements to the interview transcripts.

Researcher Reflexivity

We recognize that research is not neutral, and our collective backgrounds and experiences informed how we approached this study. The first author has a counseling and art education background. The second author has a background in early childhood special education, and had reservations about how 'active threat' drills were conducted both as a preschool teacher and as a parent. The third researcher is a parent of children who have experienced school safety drills and focuses their research on the social, emotional, behavioral wellbeing of teachers and students.

Findings

We identified key themes corresponding to each research question. Each theme is described in the following sections. All participants are assigned numbers.

Student Perceptions of Safety Drills

For the most part, students largely expressed ambivalent feelings towards fire and tornado drills. They described being familiar with the routines and procedures. Despite the variance in participant ages and locations, these types of drills were described almost identically across students, e.g., having to leave the classroom for a fire drill, having to bend down and protect their heads for a tornado drill, teachers doing a 'head count.' Some children did note that they did not like the noise associated with fire drills, for example, P4 shared "It scares me sometimes, because the alarms are so loud." There was much more variance in how students described 'safety' or 'code red' drills, and expressed more of a sense of being afraid during these types of drills, such as P5: "I feel scared…I don't like dark…your teacher would like put black paper over the window on your door." P2 described having to hide:

> We have to get down and be very, very quiet…and we have to hide in a corner. We get behind some desks…but [he] could still see us because he would just look, I think he would just look over the tables…the bad guy, if he had a gun, he would just shoot us.

P4 described how procedures were different according to gender:

> Code red they lock your door, turn off the lights, shut the screen. The girls get to go in the closet, and they lock it. The boys have to hide under the desks and like barricade the door. The teacher has a golf club and waits by the door.

Parent Perceptions of Safety Drills

Overall, parents expressed a general sense of their children's safety while at school. For example, P1 shared, "They've never been wronged by anybody at school. So, they're still trusting and believe that the adults at school will take care of them." Parents had a general sense of how drills were conducted, especially fire and tornado, which follow similar procedures to when parents themselves were students. However, they described not having to experience 'school safety' drills as children themselves, and this being a new experience. Parents mostly described learning about 'school safety' drills from their children, rather than from school communication. For example, P3 shared how 10 yearold explained

these drills: “I started asking him questions. He was like, ‘oh yeah, they’re really scary. And you get shot. And you have to stay super quiet, so that the person with the gun doesn’t know where you are.” Another parent shared how these drills have contributed to her daughter’s fears at school when coming across an unfamiliar adult: “She didn’t know this person, it was an adult male, later found out it was a student teacher and it was totally fine and safe…, but she came home and told me about this and said ‘I was so scared he was gonna have a gun.” Other parents also described their children being scared after the drills, such as P9:

> I think she’s really just rattled…once that happens, she’s kinda like, ‘this is all I can think about’, and I think the difference for them is a fire drill or a tornado feels like an an active…beyond anyone’s control. And so, she doesn’t get as nervous for those, those feel more like ‘ok here’s the process. This is how we can stay most safe’. Where is the active shooter drills feels like they know it’s going to be someone that’s known to the school in some form or fashion…and she’s kind of freaked out. She comes home talking about it. You could tell she’s jittery.

P10 noted how she tried to assuage her child’s fears, describing:

> You know, they did have a suicide in their school last year. You know, he lost a close classmate and friend, and that was very upsetting to him. But even before that, he's always felt very uneasy when those drills come up, and it kind of reminds him that someone in his kind of peer group could actually be the aggressor, and that, again, the activities, I think, can make him feel more vulnerable than any might otherwise, right? And again, as a parent, we've tried to explain to him is like, look, this really is in your best interest. We hope this event never occurs. You need to be prepared for this eventuality, just like a fire, just like a a tornado drill. But again, while those are natural effects, this is, you know, kind of a result of, you know, perhaps a peer, perhaps a member of the community you know, in, you know, coming in to do harm indiscriminately. And I think it's the unknowing nature of that that upsets him.

Desired Changes

When asked what if anything they would change about drill procedures at their child’s school, many parents mentioned improved communication, such as P2:

> I wish that we would get notifications beforehand, about the drills. We don't get notifications about fire or tornado drills, but after they've had an active shooter or lockdown drill, then we get the notification. And I sometimes feel like… It's only because they feel obligated because somebody said something about it. It doesn't seem like it's a routine thing. That they tell us about and, every time we do get the notice, it seems reactionary, like. You know, it wasn't… It was in response to a parent who's been upset or their kid has been upset. Um, so I wish that we would just at least just know that, hey you know, hey, we're going to do this. And you know, even if they ask us not to say anything to our children about it, at least when they come home and they talk to us about it, we know how to appropriately respond. Or if, you know, if they did let us know that we could talk to them about it, you know, we could also just remind them how they need to behave or how they need to respond in these situations. So that they know that they don't need to be afraid, that it's just practice…I mean, I know what a fire drill sounds like, but you know, as a child, that's scary and you don't know what's going on. So, if you got a heads up beforehand, either from your parents or for your premier teacher. I think that could ease, some of the you know, the nervousness and the anxiety that they might experience when it's actually comes time to have this…And I am a huge fan of educating yourself about things, you know you know, your surroundings and things that could happen, but I certainly don't want to live in fear and I don't want my children to live in fear, so I think being able to have an active open conversation about it with my children, but also with the educators and the school system you know just so that we know how to address it…we're putting our trust in these educators to make sure that they teach our kids what they need to know, let us help you here. Let us try to…I don't know, do our part as parents to ease this. So, they understand that, you know, we're not trying, no one's trying to scare you on purpose. No one is trying to make this so that you're afraid of everything. We just want you to be aware. And so, I think, you know, together parents and educators, group effort is better, a better approach anyway.

P3 expressed similar feelings:

> Well, the other thing I think, that I probably would have said under I would change is, I think, that parents should be notified before they have these drills. It doesn't even have to be like today at nine o'clock we're gonna do X. But I think it could be helpful to say, especially for kids who are high anxiety like, I can imagine, I mean, this wasn't really an issue with my older son because

> we weren't doing this comes to drills then. But, um, if he were in elementary school now, I think he'd have a lot more anxiety about it. I think it could be helpful to preface that even just like on Monday morning, you know, a note from the principal- "sometime this week we're gonna have a drill." So, it can still be a surprise if that's beneficial, I guess. But, um, where you can talk to your kids about it. Um, I mean, we do this for this the special needs teachers-They know when those drills are coming and they prep those students. And so, um, we just assume that the rest of the student body doesn't also need that. But, um, and if, the if the faculty feels that there's some benefit to it kind of being sprung on you. I mean, okay, I'm not. That's not a hill I'm gonna die on. But also, I think that there's no reason that we can't say like within the next week, so that parents can kind of prep their kids and talk to them about it. And you know, just kind of get them in a better place. So, I mean, if you haven't heard about this drill, if they do, if they truly do it once for a semester. You haven't heard about it since September. It's, it's November, you mean. That's going to be pretty overwhelming. So that's the only other thing I think that. I bring up the community communication around it is pretty abysmal, honestly.

P6:

> They don't communicate. I, I never know if they have a drill or not. Which we…(Crosstalk) In kindergarten was, I did, I did call and complain, and I didn't seem to care, but when he had his first lockdown drill, when I picked him up he was in a mood. And I was like, okay. Got home and I'm like what happened. And he started to cry like what, what happened? He's like "we had this lockdown drill, and we all had a huddle together like at the corner of the classroom, and we thought bad guys were coming, and…" I was like, Oh, wow! And was like, "well, that was just practice, and it's okay." And, but I was, I called because I'm like, could you like next time, like, maybe give warning to parents. I understand they need to be a surprise…Or like right after send us…You send us emails all day long for like pointless things I'm like, can you send us, like, the language you're using to talk to them so we can kind of make it less scary and be on the same page, and it didn't happen this year.

Questioning the Utility of Drills

As they considered what they might change or do differently regarding school safety drills, parents also questioned the utility of these drills given the adverse impact, such as P7 who shared "These things are happening without any consideration of like, how it makes the kids feel." P3 noted:

> I think that research tells us that kids aren't overly… well, the very limited research that is out there, aren't safer necessarily because of these drills. And so, is there really any utility in like banging on doors and yelling out, um, for kids? I mean I think that if we're gonna do that we could do that without students present. Like teachers could practice that like like, there's a teacher in every situation, anyway.

A couple of parents shared that their children would not follow the drill procedures in the event of a real emergency, such as T11:

> Their safety policies actually put them in danger. And I have told them. And I'm not gonna lie. I have told them not to listen to anybody. I said, you hear a gunshot. You run as fast as you can out. And I know that they're trying to prevent chaos, but it also causes them to be sitting ducks, and it's not working, it's just not working. So, I told him, 'Run as fast as you can as far as you can, and then call me, and I will come pick you up.

Other parents shared how their children felt the drills were not effective, such as P9:

> My daughter, who's in high school, came home sort of saying, "This is BS, mom. If, if I know that there's a shooter, if there's some kid that graduated who's coming back to shoot us, I am not staying in the room, there's no way that's happening." So, she kind of took it as like, "I'm not listening to my teachers in that moment. I'm gonna do what I think is best."

P12 shared, "Oh, it goes through their heads. They're smart, they're not. you know. We don't always, as adults give the kids the credit that they deserve. But they're smart. And the boys know, my son's like 'they're useless.'

Finally, one parent suggested that these types of drills be stopped:

> I guess honestly, I feel like they should stop doing the active shooter drills. Um, I think the fire drills, and for us, tornado drills, are, are fairly important… Again, and, and maybe this is my own bias, and that's why my kids feel the same way, but it's like, if there's a fire, they need to know how to get out. Just like they'd need to know how to get out of the house…Like they need to know how to get out of the house if there's really something, you know, they need to know what we're doing as a family. Same thing with the tornado, like they know, like we've had tornado

watches and warnings. There's been touchdowns near us, and so they know, we've, you know we take our food, we go down to the basement. We kind of huddle in the basement. They kind of know what those are about. I don't do, for example, in my house, I don't do, “Hey, if someone breaks into our house, this is what you do,” like…We just don't do that, and maybe it's a… (Pause) maybe that's a shortcoming, I don't know, of our family, but it's like, we talk to them a lot about how to stay safe when they're out in public, and things like that. We talk to them about those types of things. But I I've never felt the need to scare them about, “What if someone breaks into our house with a gun,” you know? (Laughs) And that's a very real possibility. I mean, I live in Chicago. It's a real possibility, um…but we just don't do that. We've never felt the need, so honestly, I wish that we would stop doing the active shooter drills. I also think that they're… an active, an active shooter situation is so volatile that, and it's so different depending on is there one person shooting? Is there multiple kinds of gun? Do they have like… And, and…I don't know. I guess it is gonna be what it's gonna be, do you know what I'm saying? I'm not sure that there's any drill that is going to prepare people for if someone really comes in the school with a gun, I think we can do a better job monitoring our front doors and making sure that people are checking in with the…You know the front desk, whoever is kind of responsible for manning the doors and schools. I don't think we should be saddling our students and our teachers with it. Um… Well, certainly, our students, our teachers, need to know, you know again, how do they stay safe and how do they do the best job they can, keeping our kids safe, I'm just not sure we need to bescaring kids, multiple times a year about this. So, I guess that's the thing that you know when we think about this, like, if our job is as adults, is to provide a safe environment for our students, um, and our teachers and our staff members, then that is where the responsibility lies. And so there should be other things happening at the school to take all precautions necessary to prevent someone coming in and shooting the school up. Not to plan extensive reactive measures for the inevitable. You know what I mean? It's like this shouldn't be the inevitable.

Considerations when Planning Active Shooter Drills

There are several considerations for active shooter drills that are important to keep in mind in relation to practicing these drills in schools and the findings from this case study. First, it is important to note that the planning of active shooter drills must consider the impact of drills on the students, who are direct participants in the drills [1]. NASP emphasized that planning and preparation should be carried out before the lock down drill exercise occurs. One finding highlights the need for additional considerations for students with disabilities, prior trauma, communication issues, and health isues with specific considerations for those involved during the drill and after, as a measure to reduce the observable negative impact that the drill might cause to student's psychological well-being, and to maximize the benefit of safety in carrying out the drill. Also, proper preparation and planning should be carried out by school leadership in collaboration with parents, and teachers in accordance with the type of lockdown which can either be a full-scale lockdown (employed when the students' lives and the school is in imminent danger) or a secured perimeter/lockout (a mild observance of door and window locks). It also emphasized the orientation of students as a means of preparing for lockdown drills. And a reassurance of safety during lockdown with provision of mental health intervention after lockdown drill experiences. School psychologists and other mental health-trained service providers have a critical role in ensuring that the process of active shooting drill in schools is safe and carefully planned with the involvement of police officers as law enforcement agents, who are well educated on the likely danger and adverse effects shooting can have on students, parents, and school administrators; with school Psychologist; who are trained to understand the healthy emotional stability required for the smooth implementation of school active shooting and the school crisis team, can lead to a worst experience of shooting drill exercise. The trauma history of students, staff and schoolteachers is a factor to consider in the planning of school drill. This is because NASP have observed a positive relationship between school shooting drill and reoccurrence of trauma, not just as an immediate negative effect but an occurrence in the future. These negative outcomes of lockdown drills shows that necessary precaution, sensitization and awareness should be done as guideline for positive outcome.

Another important consideration in planning, implementing, and debriefing from active shooter drills are the students who have varying developmental and physical abilities and understanding of the drills. Schools carry the responsibility to not discriminate against a student based on the (dis)ability, age, national origin, or race of students, which includes when forming and implementing the policies and practices of school safety. These students may include students with “mobility challenges,

communication, hearing or sight impairments, heightened sensory or distress reactions, or cognitive impairments may need additional support to fully participate in and benefit from drills," as well as English-language learners. Schools should "not use simulation techniques with students, and exercises should be appropriate to the participants' developmental level and physical abilities". Not only is it important to consider students with clearly documented needs that are connected to disability or assistance, it is also important to consider students (and staff) who may have other needs, "such as previous exposure to trauma," violence, or other life stressors that may be unknown to the staff and/or administration.
Another consideration is the planning, implementation, and effectiveness of active shooter drills. Many schools spend considerable money and time on commercial programs designed as 'Crisis intervention program' to train and equip teachers on the best mode of response to prepare students ahead of crisis. Many of these intervention programs lack an empirical basis to ascertain the effectiveness of their contents. Additionally, researchers have found that the benefit of this drill is not fully determined as it has adverse effects on students' perception, causing emotional instability such as fear, a disturbing feeling of attack and lack of security (Zullig). This calls for the need to carry out evidence-based research to establish the best possible ways for schools to successfully implement lock down drill for maximum benefits while minimizing harm. To ensure that schools comply to the need to successfully implement evident based strategic lock down drill, interventions and organizations like Every town for Gun safety support funds, the American federation of Teachers and National Education Association provides useful information as guidelines to effective lock down drills. A recent publication from NASP highlights numerous strategies to help reduce harm during required active shooter drills including: (a) carefully planning, (b) preparation that includes announcing the drill and account for individual student trauma histories and instruct adults to monitor for stress and trauma responses, (c) during drills providing clear, calm direction with reassurance for students that this is a drill, and (d) after a drill notify families, monitor for stress symptoms, evaluate the lockdown and its impacts.

Co-Creating the Future City: Imagination and Participation in Formal Education of Students

Mirna Tkalčić Simetić[1], Tihana Rubić[2], Valentina Gulin Zrnić[3]

[1,3]Institute of Ethnology and Folklore Research, Zagreb, Croatia
[2]Faculty of Humanities and Social Sciences, University of Zagreb, Croatia

Abstract

In the article we illustrate our recent efforts and experience as urban anthropologists and university teachers to encourage future literacy in participatory urban planning among students and residents. Guided by the need to strengthen the links between education and society, i.e. the relationship between academic knowledge and the various societal issues, and to improve participatory and democratic processes in urban planning in Croatia, we have recognized that a step towards the aforementioned could take place within the framework of collaborative projects of the academy and civil society organizations. In the next three years, we intend to connect students, citizens, city governance bodies and the academic community through the research and workshops, using service-learning method. The aim is to design a new syllabus and enhance students' skills for future thinking about the city, public space and governance; to facilitate residents in voicing their needs; to strengthen governance – citizens communication channels and ways of negotiation and involvement. In this article we outline the collaborative project based on service-learning, address the importance of civic participation in urban planning, and discuss the concept of futures literacy in contemporary university education.

Keywords*: urban anthropology, service-learning; futures literacy; participatory urban planning*

Introduction

What kind of cities do we want? This question lies at the core of our ongoing project on contemporary urban transformations of urban visions, practices and ethics in Croatian cities (funded by European Union – NextGenerationEU), which builds upon a prior bilateral project exploring urban futures in several Croatian and Slovenian towns (funded by Croatian Science Foundation, and Slovenian Research and Innovation Agency) (www.citymaking.eu). Both research projects are rooted in urban anthropology (a subfield of cultural anthropology) and are grounded in its qualitative methodology. The Urban Anthropology course is taught at the Faculty of Humanities and Social Sciences at the University of Zagreb focusing not only on theoretical social, cultural and spatial issues but also aiming at developing applied skills and competencies for managing urban social processes. Beyond academic research and university teaching, we collaborate with civil society organizations and various local and urban initiatives. Recently, the cooperation has expanded into the design of a joint educational program based on service-learning. This experiential pedagogical method has not previously been utilized within the Urban Anthropology course, nor within the broader curriculum of the ethnology and cultural anthropology education in Croatia. The new educational program specifically aims to enhance participatory and democratic processes in urban planning in Croatia.

Project PARTICIPARE and Service-learning Method

In collaboration with the initiative *Društvo i prostor* (Society and Space) and the NGO *Pravo na grad* (Right to the City) we have conceptualized the project *PARTICIPARE – Civic Participation and Spatial Planning: Developing Qualitative Approaches, Youth Engagement, and Local Community Involvement*. Within the next three years the project intends to: a) provide a platform for training university teachers and NGO professionals in service-learning pedagogy; b) design a new syllabus integrating the service-learning method with a focus on participatory urban planning within the Urban Anthropology course; c) implement this syllabus to cultivate students' capacities for future thinking about the city, public space and governance; facilitating residents in voicing their needs; and strengthening communication channels, negotiation mechanisms, and engagement strategies between local governance and citizens in participatory planning frameworks.

Service-learning constitutes an established pedagogical method that has been used in higher education for many decades. Our approach adopts a comprehensive definition, conceptualizing service-learning as a "hybrid methodology of socially responsible teaching, collaborative action, and experiential learning that fosters the personal and professional development of students and the community through a partnered, organized, and structured experience of working to resolve social problems in the local community" [3, p. 11]. Precisely its experiential dimension is of particular importance for our approach, as service-learning places equal emphasis on both community service and learning components, with the aim of expanding knowledge and acquiring new skills [15, p. 286].
Furthermore, the service-learning method extends the educational process beyond the classroom, and the conventional teacher-student binary. It introduces the third actor – NGO professionals, who are familiar with current local social needs and experienced in coherent and immanent articulation and problem-solving. The fourth partner is the local community itself. In this setup, service-learning is not only oriented toward fieldwork in the community and the acquisition of personal and methodological skills (by students) but also contributes to community empowerment, influencing social change within the community – primarily through democratic involvement in problem-solving and decision-making processes on relevant issues.
However, one of the method's biggest challenges lies in balancing educational outcomes with social impacts, alongside the potential risk of inadvertently reproducing existing stereotypes and unequal power dynamics [13, p. 9]. "Critical service-learning" represents one of the approaches through which these challenges are addressed, primarily by encouraging continuous critical reflection and collaborative efforts aimed at achieving social justice and social transformation [13, p. 10]. Cultural anthropology also holds the capacity to respond to such concerns, as certain elements of social service-learning align with the core approaches of the ethnographic method, which is at the very heart of the discipline cultural (and urban) anthropology.
Specifically, these convergences encompass fieldwork premises, qualitative interviewing grounded in interpersonal relations, active participation within the studied community, the understanding of local experiences, collaborative approaches, and systematic reflexivity on research process. Precisely because of these qualities, cultural anthropological approach to service-learning holds particular potential for balancing its educational and social dimensions while fostering more critical, socially sensitive, locally grounded, future oriented, and transformative forms of learning and civic participation that are grounded in present social realities. In other words, there are many points of convergence that make service-learning a close and easily applicable method in the teaching of cultural and urban anthropology. These overlaps can be perceived as "a valuable route to melding good anthropological practice and citizen activism with effective teaching and scholarship" [12, p. 6].

Civic Participation in Urban Planning

Within the framework of the Urban Anthropology course, a significant part of learning is devoted to participatory and democratic processes in urban governance, specifically focusing on urban and spatial planning. In many contemporary societies, democracy and participation are mutually constitutive, reinforcing and sustaining one another. In its broadest sense, participation entails citizens 'taking part' (Latin: *pars, partis* + *capere*) in collective social action, while in a narrower political sense, it is vital to democratic systems because it implies the direct involvement of citizens in political and public decision-making processes. Precisely because it constitutes a foundational pillar of civic political subjectivity, integrating the concept of participation into all levels of education is exceptionally important. Namely, participation can be learned experientially through socialization processes, the family environment, and informal education, where various forms of engagement (in the local community, at school, etc.) may not explicitly emphasize participation as a core value but nevertheless build a certain civic *habitus*. Formal education, however, should provide systematic learning about the ways and possibilities of participating in specific spheres of society and political decision-making. Ideally, the integration of formal, non-formal, and informal learning and experience would lead to the acquisition of knowledge and skills on how to achieve participation, as well as the development of attitudes, affects, and moral values regarding the importance of participatory action.
A 2021 study, conducted within the Urban Anthropology course with approximately thirty students, indicates that while all participants recognize the significance of civic action and participatory decision-making at both local/neighborhood and institutional levels, none had actively engaged in any form of social or political action – such as formal local government bodies, civic associations, grassroots initiatives, or university student unions. As articulated by the students, the primary drivers of this disengagement or reluctance to act were a profound distrust in formal decision-making channels and

governance structures, coupled with a pervasive conviction that individual and collective agency remains ineffectual. These insights – reflecting political apathy, institutional distrust, and a sense of futility – mirror common themes in everyday discourse and align with broader empirical research examining citizens' attitudes toward public administration [14, 10, 25]. Therefore, learning about participation seems exceptionally important within the university environment in which we operate, with the goal of strengthening students' 'capacity to aspire' [1] as well as encouraging and nurturing an 'ethics of possibility' [1] that integrates imagination, hope, and social action leading to the active shaping of the future.

Within the Urban Anthropology course, participatory processes in urban planning in Croatia are an important topic. Participation is a foundational value promoted across numerous global and European policy documents, such as *The New Urban Agenda* (UN Habitat, 2016) or *The New Leipzig Charter* (EU 2020). The former states, among other principles, that cities should provide inclusive platforms that "allow meaningful participation in decision-making, planning and follow-up processes for all" (NUA art. 41). Similarly, the latter emphasizes that "experimenting with new forms of participation can help cities manage conflicting interests, share responsibilities and find innovative solutions while also reshaping and maintaining urban spaces and forming new alliances to create integrated city spaces" (NLC, sec. C). Regarding urban spaces and built environment, this democratic imperative is formally operationalized through participatory planning – the systematic inclusion of citizens in planning and decision-making processes, which is legally regulated at both national and municipal levels.

In the Republic of Croatia, the *Physical Planning Act* prescribes the principle of public and civic participation in spatial planning (Art. 16). Alongside "expert discussions" with invited participants (public, private, economic, and other stakeholders) (Art. 118-120), there is a mandatory "public inspection" period during which the proposed spatial plan is accessible to the general public. During this period, a public hearing is conducted "in which everyone can participate", coupled with a requirement for a formal presentation by experts. This framework provides interested parties the opportunity to ask questions or submit written inquiries, allowing the public to voice "opinions, suggestions, and remarks" to which planning experts must respond (Art. 121-128). While this legal framework is respected, monitoring the processes of participatory planning reveals significant shortcomings: the lack of transparency in official procedures and the hermetic nature of technical, professional language frequently alienate citizens from planning process. Furthermore, positioning public/civic involvement at the very final stage of the planning process severely restricts the potential for effective citizen-led interventions, thereby demoralizing and disempowering the citizens.

According to the ladder of participation in spatial planning conceptualized by Sherry Arnstein in the late 1960s, the current model defined by Croatian legislation fluctuates between the levels of "non-participation" and "tokenism" (symbolic involvement) [2] and does not enable or create true citizen power. When analyzing participatory planning as a distinct niche of participatory governance, empirical research across various national contexts demonstrates that participation can also function as a mechanism of dominance and control. Specifically, it often excludes vulnerable and marginalized groups who face systemic barriers or lack access to information, formal communication channels, and political influence. Consequently, it is crucial to understand how participation "works, for whom, and with what social justice outcomes" [8, pp. 6-7]. This implies that a rigorous focus on asymmetrical power dynamics is essential both in the analytical evaluation of participatory processes and in their practical implementation, particularly when the objective is to cultivate the transformative potential that participation can possess [8].

Our insights to date, derived from ongoing research projects and observations of citizens' involvement in spatial planning, indicate that there is insufficient knowledge regarding how the city is organized, how spatial planning processes work, how broader public interests could be articulated, and what are the specific avenues available for civic engagement in shaping spatial policies. In a recent collaboration within the project PARTICIPARE we have reflected on the necessity of integrating participatory learning into university curricula as a means to empower youth for participatory planning. The underlying intention of the project is to enhance futures literacy through educational engagement with civic participation in urban planning.

Futures Literacy and Cultural Anthropology in Participatory Planning

The term Futures Literacy, coined by a futurist Riel Miller [16, 17] in the mid-2000s, emerged from the field of futures studies. Grounded in understanding anticipation as a "pervasive" feature of reality [19, p. 55], it emphasizes the human capacity to recognize and reflect on "anticipatory assumptions" that shape how futures are imagined and "used" [18, p. 49]. Its core premise is that rendering these assumptions

visible can enhance capacities for engaging uncertainty and crises. Since Futures Literacy is epistemologically aligned with foresight rather than forecast, this approach privileges open-ended and exploratory engagements with alternative futures [19, p. 56]. From 2012 onward, UNESCO adopted Futures Literacy as a core competence for the twenty-first century, framing "using-the-future" as a resource for learning and decision-making (https://www.unesco.org/en/futures-literacy). This institutionalization helped consolidate the concept through Futures Literacy Laboratories – participatory processes through which diverse actors collaborate in exploring anticipatory assumptions [5].
Recent interdisciplinary scholarship has called for a critical expansion of Futures Literacy beyond its dominant framing as a neutral competence. Marking a shift toward critical futures literacy as a reflexive, situated, and transformative "set of practices", it simultaneously opens space for recognizing diverse already existing futures literacies [6, p. 7]. A key move in futures literacies pedagogy is oriented toward the democratization and pluralization of how futures are imagined and enacted, through forms of education that cultivate responsibility for shaping more just societies [11, p. 58]. Building on these premises, critical futures literacy links futures thinking with critical pedagogy and epistemic justice, emphasizing the importance of shaping students' capacities to "question, co-create, and act" upon alternative futures [26, pp. 1, 3].
Despite overlapping concerns, there has been relatively little exchange between Futures Studies and social science and humanities approaches to the future [21, p. 6]. The anthropology of the future [20, 4, 9] offers one way of bridging this gap by expanding the framework of Futures Literacy and connecting it with critical pedagogical approaches. From this standpoint, the pedagogical task extends beyond making anticipatory assumptions visible to also identifying and analyzing the multiple and interconnected ways of relating to the future. Situated within cultural anthropology, this approach draws on its long-term fieldwork orientation, bottom-up perspective, and close collaboration with communities. Through its methodology, grounded in interviewing and participant observation, cultural anthropology offers well-developed ways of building relationships with communities and understanding their experiences and needs, which are central to participatory processes. This perspective could inform the PARTICIPARE project (as well as broader teaching practices and community-engaged initiatives), where futures literacy is cultivated within the social-service learning framework, through learning based on experience, research and engagement oriented toward socio-spatial transformation.
Within this framework, futures literacy operates on two interconnected levels. First, at the level of student education, it involves cultivating analytical sensibilities rather than transmitting standardized competencies. These include recognizing the future as one dimension of temporality, alongside past and present [22, p. 18]; understanding anticipation as only one among multiple relations to the future [1, 4]; and recognizing the coexistence of diverse *temporal* orientations and their relation to action [24]. Such preparation leads to a better understanding of why people engage (or do not engage) in efforts to transform their living environments. Moreover, it can provide tools for understanding how various relations to the future emerge, interact, and sometimes collapse in concrete social and spatial contexts, while foregrounding everyday practices and experiences, civic engagement, power relations, and inequalities in the complex processes of "future-making" [9, 23, 24]. Second, in community engagement, students are understood as participants in processes through which existing, situated futures literacies can be articulated, reflected upon and potentially reshaped. This implies shifting from teaching futures literacy toward supporting articulation of existing relations to the future and the forms of action linked to them. Such processes remain grounded in present material and social conditions, and attentive to questions of social, epistemic and spatial justice. Although anticipation remains only one among multiple relations to the future, it may become a particularly relevant mobilizing orientation in participatory process aimed at enabling community-driven change.
It may be concluded that cultural anthropological expansion of futures literacy lies in understanding futures literacy as a relational, situated and participatory practice grounded in empirical realities, temporal and affective relations, but also in uneven capacities to imagine and shape futures. This shift builds on calls for the democratization and pluralization of futures literacy [11], while grounding them in anthropological fieldwork and methodological practice. In this way, futures literacy is approached as an evolving methodological and pedagogical practice co-developed through research, collaboration and ongoing critical engagement.

Conclusion

Within the proposed service-learning project PARTICIPARE integrated into the Urban Anthropology course, diverse social actors will collaboratively address contemporary urban planning challenges. This cooperative framework enables participants to learn from one another while practicing democratic

processes and futures literacy, which should guide the participatory shaping of urban spaces in accordance with residents' needs and visions. The entire process of teaching, learning, and action is conceived as overlapping and complementary, yielding both tangible and intangible outcomes for local communities, students, and other stakeholders/participants in the process.

These objectives focus particularly on raising awareness about the importance of more permeable and accessible participatory processes, enhancing the recognition of civic voices in decision-making concerning their lived environments, and fostering more balanced power relations between institutions, experts, and local communities. Furthermore, the project aims to foster collaborative and participatory practices that support social inclusivity, civic engagement, and more just forms of shaping urban space. In this context, it seeks to strengthen the role, visibility and relevance of cultural anthropology in participatory urban planning by further advancing approaches that intersect research, education, and civic participation, while concurrently reinforcing transdisciplinary collaborations and promoting dialogue among the diverse actors involved in the co-creating of cities and futures.

Within this framework, the service-learning infrastructure enables futures literacy to function as a connective practice that bridges these different aspects by enabling the democratization of urban futures through the transformation of how futures are imagined and acted upon within present socio-spatial contexts. Additionally, such a participatory format for envisioning and collectively shaping urban public space would specifically serve as a model for development of participatory and educational practices, promoting decentralization, experiential learning, applied scholarship, social inclusivity, and the advancement of participatory governance practices.

Youth Experience in Sport: A Case of Football Development Programs in Lithuania

Edgaras Stankevicius[1], Vilija Bitė Fominienė[2]

[1,2]Lithuanian Sports University, Lithuania

Abstract

Participation in organized sport is widely recognized as an important context that can support children and adolescent's health, positive development, and well-being. Football development programs, which involve the largest number of youths worldwide, also contribute to these educational and developmental outcomes through sport. However, survey-based measures that capture key aspects of youth experiences in organized sport have not yet been applied in Lithuanian sports education context. The aim of this study is to assess youth experience in football using Lithuanian versions of the adapted and validated Youth Experiences Survey for Sport (MYES-S) and four subscales from the Life Skills Scale for Sport – Transfer Scale (LSSS-TS). A total of 121 male athletes aged 14-15 participated in the study. Data were collected using the MYES-S and teamwork, emotional skills, time management and leadership skills subscales from LSSS-TS and the Coach-created Empowering and Disempowering Motivational Climate Questionnaire (EDMCQ-C). The current study provides support for the validity and reliability of the Lithuanian version of the MYES-S, as well as the validity and reliability of the Lithuanian version of four subscales from LSSS-TS. In addition, the study found that initiative (M = 3.49; SD = 0.46), personal and social skills (M = 3.27; SD = 0.51), and teamwork (M = 4.03; SD = 0.59) are the most prominent youth experiences acquired through sports. Meanwhile, cognitive skills are indicated as the least developed (M = 2.41; SD = 0.82). In addition, it was found that youth experiences in football are related to the motivational climate created by the coach.

Keywords: *Sport education, youth, personal experience*

1. Introduction

Children and adolescents' participation in sports activities is widely recognized as an important context that can support their health, positive development and well-being [1]. When this activity is implemented through sports education programs within the framework of non-formal education, the educational function of sports is particularly highlighted [2]. This means that organized sports education becomes an important part of the overall physical, emotional, social and psychological health of children and adolescents [3] , where the positive effect is achieved mainly through physical activity, an essential part of most sports [4]. Becoming a means to achieve the recommended level of physical activity, directly associated with a lower risk of cardiovascular diseases and metabolic disorders, better development of motor skills, normal or even stronger skeletal development [5], sports education also leads to better mental health [6], influences the system of values [7] and contributes to positive developmental outcomes. It ensures higher academic achievement, social adaptation, less antisocial behavior, the formation of stronger relationships and a positive peer network, a lower level of social and emotional problems [8,9], and contributes to cognitive, emotional, moral, social and identity development [10]. In other words, sports education of children and adolescents forms socially integrated and functional personalities, which is closely related to the theoretical paradigm of Positive Youth Development (PYD) in sports education. It is most often used to analyze how sports contribute to the holistic development of young people, their life skills development and emotional maturity by emphasizing strengths, not just sports results [11,12].

Despite the advantages and positive outcomes, organized youth sports also have negative educational consequences, such as injuries, aggression, selfishness, disrespect for others, burnout, depression, etc. [13,14]. And this is clearly associated with high-performance sports education programs, whose main goal remains the systematic development of sports results [15].

Football development programs are also highlighted in this negative context. It has been found that programs aimed at adolescents and dominating the number of sports participants in the world, when compared to programs aimed at children, focus much more attention on the development of sports performance excellence, physical and psychological preparation, thus aiming to prepare a highly skilled

football player. [16]. This situation is further exacerbated and made worse by the peculiar treatment of football as a “male sport”, which leads to the application of training models aimed at men and ignoring the needs of girls, which limits their involvement and positive experience [17]. However, scientific insights state that these sports education programs, despite the main goal of achieving sports results, can significantly contribute to the development of personality [18]. However, positive developmental outcomes are not guaranteed by participating in sports. Therefore, the need for continuous research is increasingly emphasized, which would allow us to understand how sports in a changing environment affect the health and development of youth [19].
Thus, although sports education can be a significant factor in positive youth development, its impact remains ambiguous as it depends on both the educational environment and the nature of the programs. Despite the growing international interest in youth experiences in sport, in the Lithuanian context there remains a lack of empirically grounded understanding of the real situation in sports education programs, especially in football. In view of this, the aim of this study is to assess youth experience in football using Lithuanian versions of the adapted and validated Youth Experiences Survey for Sport (MYES-S) and four subscales from the Life Skills Scale for Sport – Transfer Scale (LSSS-TS).

2. Methodology

A quantitative, cross-sectional research design was employed to examine youth sport experiences associated with positive developmental outcomes. The study involved participants from football development programs designed to nurture elite youth athletes. As only male players participate in the Lithuanian Cadets’ Football Championship (U13–U14 age group; https://jaunimofutbolas.lt/english), the research sample consisted of 121 male athletes (mean age = 14.49 years, SD = 0.50). Participants were selected using convenience sampling. Data were collected via paper-and-pencil questionnaires administered across several football academies.
The study was conducted in accordance with the Declaration of Helsinki and approved by the Research Ethics Board of the Lithuanian Sports University (Protocol No. SMTEK-43, 2025.04.18). Prior to data collection, informed consent was obtained from parents and/or legal guardians. Participants were informed about the purpose of the study, the instruments used, the research procedures, and their right to voluntarily participate and withdraw at any time.
A questionnaire survey employed several instruments described below. To assess the social environment of football development programs, the Coach-Created Empowering and Disempowering Motivational Climate Questionnaire (EDMCQ-C), adapted for use in Lithuania [20], was used. The questionnaire consists of 34 self-report items, divided into two subscales that assess empowering and disempowering motivational climates within the team. Items are rated on a 5-point Likert scale ranging from 1 (*strongly disagree*) to 5 (*strongly agree*). Mean scores were calculated for each subscale.
Youth sport experiences were assessed using the Modified Youth Experiences Survey for Sport (MYES-S) [21] and four subscales from the Life Skills Scale for Sport – Transfer Scale (LSSS-TS) [22]. The MYES-S consists of 26 items assessing six dimensions: personal and social skills, cognitive skills, goal setting, initiative, physical and psychological health, and negative experiences. Items are rated on a 4-point Likert-type scale (1 = *not at all*, 4 = *yes*).
The LSSS-TS subscales assess life skills transferred through sport participation, including teamwork, emotional skills, time management, and leadership skills, and consist of 23 items. Responses are provided on a 5-point Likert scale (1 = *not at all*, 5 = *very much*).
Prior to data collection, all instruments assessing youth experience in sport underwent translation and cross-cultural adaptation in accordance with the *Guidelines for the Process of Cross-Cultural Adaptation of Self-Report Measures* [23]. This process involved five stages: (1) initial translation, (2) synthesis of translations, (3) back-translation, (4) expert committee review, and (5) pretesting of the final version.
To evaluate the psychometric properties confirmatory factor analysis (CFA) was conducted. Reliability was assessed using Cronbach’s alpha and McDonald’s omega, while construct validity was examined through composite reliability (CR) and average variance extracted (AVE). To examine external validity, the EDMCQ-C was used to assess its relationships with youth sport experience and life skills transfer constructs measured by the MYES-S and LSSS-TS.
All analyses were conducted using IBM SPSS Statistics and AMOS software.

3. Results and Discussion

In this study, football was chosen as the context due to its popularity, early specialization tendencies, and large number of participants. Considering this, this sport can be considered representative for analyzing youth sports development processes.
The sample for this study consisted of 121 male football players, aged 14 to 15 years. All study variables were normally distributed, and the values of asymmetry and kurtosis were within acceptable limits, indicating suitability for parametric analysis. Descriptive statistics and internal consistency indices of the instruments (MYES-S and LSSS-TS) are presented in Table 1.

Table 1. Descriptive statistics and reliability

Scale	Subscale	M	SD	α	ω
MYE-S	Personal and social skills	3.27	0.51	0.75	0.76
MYE-S	Cognitive skills	2.41	0.83	0.85	0.85
MYE-S	Goal setting	3.17	0.57	0.73	0.74
MYE-S	Initiative	3.49	0.46	0.74	0.76
MYE-S	Physical and psychological health	3.40	0.55	0.61	0.62
MYE-S	Negative experiences	1.53	0.56	0.89	0.87
LSSS-TS	Teamwork skills	4.03	0.59	0.81	0.80
LSSS-TS	Emotional skills	3.77	0.81	0.86	0.87
LSSS-TS	Time management skills	3.60	1.00	0.89	0.89
LSSS-TS	Leadership skills	3.72	0.80	0.90	0.90

M – Mean, SD – Standard Deviation, α – Cronbach's alpha, ω – McDonald's omega

The mean scores (min - 1, max - 4) on the MYE-S subscales ranged from 1.53 (SD = 0.56) for negative experiences to 3.49 (SD = 0.46) for initiative. Others, Personal and social skills (M = 3.27, SD = 0.51), goal setting (M = 3.17, SD = 0.57), and physical and psychological health (M = 3.40, SD = 0.55) also showed relatively high levels of positive developmental experiences, while cognitive skills showed lower scores (M = 2.41, SD = 0.83).
The mean scores (min - 1, max - 5) for the LSSS-TS subscales were: teamwork (M = 4.03, SD = 0.59), emotional skills (M = 3.77, SD = 0.81), time management (M = 3.60, SD = 1.00), and leadership (M = 3.72, SD = 0.80).
Internal consistency across all subscales was acceptable to good. Cronbach's alpha values for the MYE-S scale ranged from 0.61 to 0.89 (overall α = 0.87) and for the LSSS-TS subscales ranged from 0.81 to 0.90. McDonald's omega coefficients ranged from 0.74 to 0.90. The internal consistency of the subscale “Physical and psychological health“ was marginal but acceptable for research purposes.
An exploratory factor analysis (EFA) was conducted to examine the structure of the adapted instruments. The data were validated for factor analysis using the Kaiser-Meyer-Olkin (KMO) and Bartlett's test of sphericity ($\chi^2 = 2320$, $p < 0.001$). The KMO was 0.86.EFA was conducted using principal axis factoring with oblimin rotation.
The MYE-S data largely confirmed the original six-factor structure, although some overlap was observed among the dimensions of positive development. The items from the LSSS-TS clearly aligned with the four factors of the theoretical subscales. The extracted factors explained an adequate proportion of total variance.
Confirmatory factor analysis (CFA) was conducted separately for MYE-S and LSSS-TS. The results show that the six-factor MYE-S model fit the data well: $\chi^2(260) = 366.55$, $p < 0.001$; $\chi^2/df = 1.41$; CFI = 0.916; TLI = 0.903; RMSEA = 0.058. Meanwhile the four-factor LSSS-TS model fit the data acceptably: $\chi^2(244) = 370.80$, $p < 0.001$, $\chi^2/df = 1.66$, CFI = 0.90, TLI = 0.89, RMSEA = 0.074. The standardized factor loadings were statistically significant ($p < 0.001$), ranging from 0.39 to 0.92 for the MYE-S model and from 0.59 to 0.88 for the LSSS-TS model.

Convergent validity revealed that the composite reliability (CR) values of the MYE-S ranged from 0.61 (Physical and psychological health) to 0.90 (Negative experiences), and the average variance extracted (AVE) ranged from 0.35 (Physical and psychological health) to 0.60 (Negative experiences and cognitive skills). The CR values for the LSSS-TS ranged from 0.81 (teamwork) to 0.90 (leadership), and the AVE values ranged from 0.38 (Teamwork) to 0.68 (Time management). These results indicate acceptable convergent validity for most of the constructs.
The EDMCQ-C was not included in the validation procedures because the study used its previously validated Lithuanian version [20]. Instead, it was used to examine external relationships with the adapted measures.
Descriptive statistics showed that the empowering motivational climate created by the coach was rated higher by the subjects (M = 4.05, SD = 0.64) than the disempowering climate (M = 2.43, SD = 0.68). Internal consistency was high for both subscales (enabling: α = 0.91; disabling: α = 0.87). Pearson correlation coefficients between motivational climate and the validated constructs are presented in Table 2.

Table 2. Pearson correlations between motivational climate and study variables

Variable	1	2	3	4	5	6	7	8	9	10	11	12
1. Empowering climate	-											
2.Disempowering climate	-0.49**	-										
3. Personal and social skills	0.42**	-0.05	-									
4. Cognitive skills	0.21*	0.13	0.51**	-								
5. Goal setting	0.37**	-0.03	0.62**	0.53**	-							
6. Initiative	0.45**	-0.27**	0.40**	0.20*	0.55**	-						
7. Physical and psychological health	0.37**	-0.05	0.35**	0.29**	0.38**	0.49**	-					
8. Negative experiences	-0.25**	0.29**	-0.06	0.21*	-0.03	-0.24**	-0.12	-				
9. Teamwork	0.58**	-0.23*	0.62**	0.41**	0.52**	0.37**	0.34**	-0.12	-			
10. Emotional skills	0.36**	0.05	0.59**	0.37**	0.57**	0.48**	0.39**	-0.07	0.56**	-		
11. Time management	0.29**	0.04	0.61**	0.53**	0.64**	0.36**	0.29**	0.01	0.50**	0.58**	-	
12. Leadership	0.43**	0.01	0.69**	0.52**	0.66**	0.40**	0.34**	-0.03	0.63**	0.67**	0.70**	-

* p < .05, ** p < .01

The results of the study, after calculating the correlations between the variables, revealed that the empowering climate was positively correlated with the skills being developed, and the correlations ranged from low to strong (r = 0.21–0.58). Specifically, according to the MYE-S scale, the empowering climate showed a significant positive relationship with personal and social skills (r = 0.42, p < 0.01), cognitive skills (r = 0.21, p < 0.05), goal setting (r = 0.37, p < 0.01), initiative (r = 0.45, p < 0.01) and physical and psychological health (r = 0.37, p < 0.01). Similarly, the empowering climate was moderately to strongly correlated with the skills measured on the LSSS-TS scale, i.e. was moderately or strongly associated with teamwork (r = 0.58, p < 0.01), emotional skills (r = 0.36, p < 0.01), time management (r = 0.29, p < 0.01), and leadership (r = 0.43, p < 0.01). In contrast, the disempowering climate revealed weaker and less consistent associations with the developmental outcomes assessed. Negative associations were found with selected MYE-S and LSSS-TS scale variables, such as initiative (r = -0.27, p < 0.01) and teamwork (r = -0.23, p < 0.05). Meanwhile, correlations for other skills were insignificant.

The disempowering climate was found to be positively associated with negative experiences ($r = 0.29$, $p < 0.01$).
First, the acceptable reliability and factorial validity of the MYES-S scale and the selected LSSS-T scale subscales adapted in this study support previous evidence that youth development outcomes associated with positive development can be measured across cultural and social contexts [24]. Second, the results of the study revealed that adolescents participating in football education programs perceive that they gain positive experiences and develop a range of skills that are considered to be outcomes of positive youth development. This undoubtedly supports the positive impact of sport on adolescents found in other studies [11, 25]. And the high scores in the dimensions of initiative, personal and social skills and goal setting indicate that football education programs can be meaningful as a youth education context in which goals related to sports performance do not become essential. However, one should not ignore the fact that lower scores in the cognitive skills dimension may be associated with an orientation towards sports results, typical of elite youth football programs, where an orientation towards positive youth development is not a priority [26].
The study also revealed that an empowering motivational climate created by the coach has a positive relationship with both positive outcomes in sports education, which is consistent with research based on self-determination theory and positive youth development [27]. On the contrary, the established relationship between a coach's disempowering climate and negative experiences can be linked to the findings of other studies showing that a controlling, goal-oriented coach harms the well-being and development outcomes of the athlete [28].
Taken together, the results of this study confirm that positive developmental outcomes in youth sport are not guaranteed by participation in sports activities alone, but are largely determined by the social environment [11]. In summary, the results of the study highlight the role of coaches as key social agents in sports education, related to the formation of youth's football experience, and emphasize the importance of their behavior in practical activities.

Conclusion

This study provides empirical evidence that reveals the suitability of football education programs implemented in Lithuania as a context for positive youth development. However, appropriate motivational conditions should be created for this. The adapted Lithuanian versions of the MYES-S and selected LSSS- TS subscales were characterized by acceptable psychometric properties, confirming their use in assessing youth sports experience in the national context. The results revealed that the majority of young football players stated a high level of assessed skills, and indicated that they had relatively few negative experiences. Importantly, the results emphasized the key role of the motivational climate created by the coach, showing that an empowering climate was consistently associated with more positive experiences and was more conducive to the development of skills associated with positive youth development. In contrast, a disempowering climate was primarily associated with negative experiences in sports activities, i.e. playing football. These results confirmed theoretical insights that suggest that participation in sports does not guarantee positive developmental outcomes. Such results are highly dependent on the quality of the social and motivational environment. From a practical perspective, these research results highlight the need for coach education related to their behavior and the activities they implement. Further research should include athletes from different sports and genders in order to better understand the current situation and promote sustainable youth development through sport.

From Displacement to Possibility: Teachers' Roles in Restoring Hope for Refugee Students

Leila Kajee

University of Johannesburg, South Africa

Abstract

Refugees, unlike immigrants who relocate voluntarily, face challenges that are distinct and often severe. These include educating children who have endured sustained trauma, the loss of family members and social support networks, health vulnerabilities, and significant cultural and linguistic barriers. Global incidents have intensified the urgency for teachers, school leaders, and policymakers to be adequately prepared to serve refugee learners. While schools may function as safe spaces for many students, they can represent either a source of stability or an additional site of distress for refugee children. Globally, nearly 50 million children are refugees, and almost half remain out of school. For those who do access schooling, new difficulties emerge the moment they enter the classroom. This paper is anchored in the theme of restoring hope (Karkouti, Wolsey, & Toprak, 2019) to the context of schooling for refugees. This work explores how hope is lived, contested, and cultivated. Within this landscape, teachers confront significant challenges in responding to the diverse needs of refugee learners. Drawing on a case study framework, 20 high school teachers were interviewed, and the findings demonstrate the following themes: Teachers as Emotional First Responders; Language as Both Barrier and Resource; and Schooling as a Site of Either Hope or Harm. The paper concludes that there is a need for Reflective, Hope-Oriented Pedagogy. The findings suggest that refugee education in South African high schools is shaped more by systemic constraints and limited professional preparation than by teachers' willingness. The study positions teacher wellbeing and reflective practice as central to restoring hope and fostering inclusive, humane educational spaces.

Keywords: *refugees, displacement, teachers, restoring hope*

1. Introduction

"Without a minimum of hope, we cannot so much as start the struggle," (Paulo Freire, 1992).
The current global geopolitical landscape is defined by uncertainty, political strife, and rivalry between major world powers. As a result, those affected are forced to flee their countries, often at great personal cost. Consequences include translocality, or human relocation, and the need to rethink the spaces we occupy. Translocality refers to the way in which displaced populations become "regrounded…because of the new space of mobility" (Appadurai, 1996, as cited in [1} Zembylas, 2012, p. 165). A translocality, then, "is a space grounded in the daily lives, activities and social relationships of migrants" (Appadurai, 1996, as cited in Zembylas, 2012, p. 165). Migrants and refugees are often made to feel unwelcome in host countries, particularly in contexts of conflict. Educational organisations are obligated to address the needs of refugees and migrants and to mitigate the concerns and prejudices of local communities, yet little is known about how teachers may address these challenges. Since South Africa's transition to democracy in 1994, the influx of refugees has increased rapidly. African refugees in South Africa have become the new "other" and most likely occupy the lowest rungs of the new social order, facing severe issues of exclusion and marginalisation. When people arrive in a new country, the pressure to adapt is immediate. For children, this means attending school. For teachers, the responsibility of teaching children who have experienced sustained trauma—such as forced displacement, the possible loss of family members, the loss of social support networks, health challenges, and cultural and linguistic barriers—can seem insurmountable. While school can be a safe space for many students, for refugee learners, it can either provide a sense of stability or become a source of enduring distress. Nearly 50 million children worldwide are refugees, and almost half of them do not attend school [2](UNICEF press release, 2016). This growing crisis paints a bleak picture of the lives and circumstances of millions of children and their families affected by violent conflict and instability, often making perilous journeys seem safer than remaining in their home countries.
In this context, teachers face significant difficulties in responding to the diversity introduced by refugee learners. Social legacies of disempowerment and dehumanisation persist despite global efforts to

transition towards more socially just political orders. With human relocation occurring at unprecedented levels worldwide, it is imperative that educational organisations address the needs of refugees and migrants while also mitigating the concerns and prejudices of local communities.
Current educational settings in diverse societies often provide limited support for students from varied backgrounds. Preconceived notions about the cultures and identities of diverse communities, coupled with limited understanding of students' needs and traumas, may further marginalise them. This results in the creation of vulnerable student populations. What becomes evident is a "divide that exists between many educational institutions and the students they are supposed to serve" [3] (Paris & Alim, 2017, p. 95). This divide intensifies when students do not feel that their identities are affirmed in the curriculum; instead, they may perceive it as irrelevant, impractical, and exclusionary of their backgrounds, experiences, and lived realities.
These are the 'ethnoscapes' and 'translocalities' to which [4; 5] Appadurai (1990, 1996) refers. This is particularly relevant for refugee children; therefore, schools cannot disregard issues that contribute to classroom diversity. Such considerations are deeply embedded in social justice. The work of [6] Karkouti et al. (2019) with Syrian refugee children is instructive in this regard. Their findings reveal that teachers and administrators are primary providers of the social support children need to succeed academically. However, when such support is absent, children are likely to adopt coping strategies such as independence, perseverance, self-efficacy, and peer teaching. These findings are highly relevant for education systems and schools. Clearly, as teachers, we need to commit to more than just teaching content. The multiple complexities and disconnects related to language, culture, and identity—which contribute significantly to dehumanising practices in classrooms—require careful consideration.
[7] The South African Constitution (1996), [8] the Bill of Rights, and the [9] Refugees Act (1998) collectively protect the rights of all children in South Africa, including refugee children. All children are entitled to quality education. However, with the increasing number of refugee and migrant youth in South African schools, questions arise regarding how they experience these spaces, including the impact of language barriers, bureaucratic processes, and challenges related to cultural and social integration [10] (Harju, 2018). According to [11] Cerna (2019), refugee children are particularly vulnerable for two main reasons: forced displacement and the failure of education systems to adequately meet their needs. This undermines their potential for academic success, as well as their social and emotional well-being. My experiences as a researcher, teacher, and teacher educator have prompted me to explore how [12] Paulo Freire's (1970) critical pedagogy can deepen our understanding of teaching refugee learners. This article therefore examines how concerns about refugee children's experiences of schooling may be addressed through a pedagogy of hope, offering a framework for responding to these dissonances.

2. Theoretical Framework: Hope

Hope is the capacity to look beyond the present and imagine futures that do not yet exist. It is not neutral; rather, it is shaped by history, culture, and politics, as well as by the realities of race, class, and gender. In contemporary contexts, hope is a site of struggle. Yet it endures as a belief that new worlds can be created and that understanding across difference remains possible [13] (Mongane, 2025).
A 'pedagogy of hope' draws on the work of critical theorists such as [14] Paulo Freire, and [15] bell hooks. Freire emphasised hope as a critical dimension of teaching, enabling educators to confront dominant forces that disrupt lives and to work towards positive social change. In *Pedagogy of Hope: Reliving Pedagogy of the Oppressed* (1992), [14] Freire underscores that hope is essential for challenging oppression. In education, this requires critical consciousness and deliberate action to transform social realities. Hope is not passive; it demands engagement. Education must therefore be rooted in learners' histories and cultures, particularly in the case of refugee learners. A pedagogy of hope supports education for social change by addressing issues such as racism, xenophobia, and inequality, thereby contributing to the creation of inclusive societies.
Similarly, [15] hooks (2003) argues that inclusive communities generate hope through pedagogy [16] (Carolissen et al., 2011). She emphasises the importance of fostering inclusive spaces that challenge systems of oppression, encouraging teachers to move from critique towards active, hopeful, and democratic educational practices. For [18] Freire (1994), it is impossible to think about education without first acknowledging the power of hope. Hope is fundamental to human existence, and its educational implications are well established [17] (Webb, 2013). [16] Carolissen et al. (2011) suggest that a pedagogy of hope is grounded in both students' and teachers' awareness of themselves as practitioners and as human beings, particularly if education is to be non-threatening and anti-oppressive. Freire also highlights the importance of dialogic relationships between teachers and learners, where knowledge is co-constructed rather than imposed. Such interactions foster reflexivity, dialogue, and critical

engagement, enabling students to recognise both their own humanity and that of others, and to become critical citizens capable of effecting change within their communities.
[6] Karkouti et al.'s (2019) study, referenced earlier, explored Syrian refugee students' perceptions of the individuals who provide them with social support for academic success. Ten male Syrian eighth-grade students in a public middle school in Lebanon were interviewed. The participants expected teachers, supervisors, and administrators to offer such support; when it was lacking, they adopted coping strategies such as independence, perseverance, self-efficacy, and peer teaching. The perceived absence of support caused students to fluctuate between hope and hopelessness. Thus, the presence or absence of support directly influences experiences of hope or despair.

3. Research Design

This study adopts a qualitative approach, drawing on teacher narratives to generate data.

3.1 Narratives

Narratives are commonly used in qualitative research to elicit participants' stories and personal accounts of experience, "as told by them in their own words and worlds" [19] (Ntinda, 2020, p. 1), thereby placing people at the centre of research 20] [(Connolly & Clandinin, 1990). Narrative inquiry reflects how individuals experience the world, recognising that education and educational research involve the "construction and reconstruction of stories" (Connolly & Clandinin, 1990). Research on narratives is well established. [21] Hull and Katz (2006), for example, draw on [22] Ochs and Capps's (1996) work on personal storytelling to illustrate how narratives function as social practices. Their research with families from diverse backgrounds also demonstrates how children participate as co-storytellers.

3.2 Participants

The participants comprised 20 English teachers from high schools in Johannesburg. They were purposively selected, and all were enrolled in postgraduate education programmes at a university in Johannesburg.

3.3 Data Analysis

Narrative analysis was used to interpret the data. This approach involves examining stories shared within research contexts or everyday life. Researchers employing narrative analysis generate diverse yet meaningful interpretations by focusing on different elements within the stories.

4. Findings

The findings are presented across three themes: Teachers as Emotional First Responders; Language as Barrier and Resource; and Schooling as a Site of Hope or Harm.

4.1 Teachers as Emotional First Responders

Teachers consistently described their roles as extending beyond academic instruction, positioning themselves as emotional first responders to learners who have experienced trauma, displacement, and loss. Many participants reported encountering learners displaying anxiety, withdrawal, or aggression, often linked to past experiences of violence or instability. Such circumstances made teaching and learning particularly challenging.
P3 noted, "You can't just walk into the class and start teaching content. Some of them are carrying things we don't even fully understand. You first have to stabilise the child emotionally." Similarly, P7 explained, "Sometimes I feel like a counsellor more than a teacher. They come to you with stories—about losing parents, about moving from place to place." P11 added, "These are serious, damaging experiences; we cannot expect work to continue as normal."
This theme highlights the labour of care that teachers perform, often without formal training in trauma-informed pedagogy. While teachers expressed strong commitment, they also reported emotional fatigue. P1 reflected, "You want to help, but it becomes overwhelming because you are not trained for this." Emotional responsiveness is therefore central to teaching refugee learners, yet it remains under-recognised and insufficiently supported within formal schooling structures.

4.2 Language as Both Barrier and Resource

Language emerged as a complex and ambivalent factor in refugee education. Teachers identified language barriers—particularly for English First Additional Language learners—as a major obstacle to comprehension and participation.

P4 observed, “They struggle with the terminology. Even if they understand the concept in their own language, they can’t express it in English.” P8 noted, “Assessment becomes unfair because they know the work, but they can’t show it.” Teachers emphasised that learners who cannot engage in the language of instruction are significantly disadvantaged, making learning extremely difficult. However, teachers also recognised the potential of linguistic diversity as a resource. Some described using translanguaging strategies or encouraging peer support. P6 explained, “Sometimes I let them explain to each other in their own languages. You can see the understanding improve.” Translanguaging refers to hybrid language practices rather than strictly monolingual approaches. García (2009) describes it as the way bilingual and multilingual individuals draw on their full linguistic repertoires to make meaning and interact with the world. Greater accessibility to language can therefore enhance learning. Despite these efforts, teachers reported limited guidance on effectively integrating multilingual practices. While language is often framed as a deficit, it holds significant transformative potential when used strategically. This requires both professional development and systemic recognition of multilingualism as an asset.

4.3 Schooling as a Site of Hope or Harm

Teachers described schooling as a space that can either restore hope or reproduce harm for refugee learners. Positive experiences, characterized by inclusion, recognition, and support, were viewed as transformative.

P2 reflected, “When they feel safe and accepted, you can see the change. They start to believe in themselves again.” P6 added, “School can give them a sense of normality, something stable.” P11 stated, “School can be a safe space, given all these children have been through. We cannot make it stressful.”

Conversely, negative experiences such as exclusion, discrimination, or repeated academic failure can deepen feelings of alienation. P8 noted, “If they are constantly struggling or being left behind, school becomes another place where they feel they don’t belong.” P12 stated, “School can become additional stress, an unnecessary burden.”

This duality underscores the critical role of teachers and school environments in shaping refugee learners’ experiences. Hope is not inherent in schooling; rather, it is actively produced—or undermined—through everyday practices, relationships, and institutional structures.

4.4 Synthesis of Findings

Across all themes, a consistent pattern emerges: teachers demonstrate a strong willingness to support refugee learners, yet their efforts are constrained by systemic limitations, lack of training, and gaps between policy and practice. Restoring hope in refugee education therefore requires more than individual commitment; it demands structural change, sustained professional support, and pedagogical approaches that centre care, reflection, and inclusivity.

5. Conclusion

In conclusion, this study has shown that refugee education in South African high schools is shaped by a complex interplay of care, constraint, and possibility. While teachers demonstrate a strong ethical commitment to supporting refugee learners, often acting as emotional first responders and creating moments of inclusion and stability, their efforts are consistently limited by rigid curriculum demands, linguistic challenges, and uneven institutional support. The findings highlight that schooling is not inherently a site of hope, but one that can either enable belonging or reproduce marginalisation depending on how it is enacted. Central to addressing these tensions is the need for a reflective, hope-oriented pedagogy that recognises the emotional and professional labour of teachers, values multilingual resources, and is supported by coherent policy and targeted professional development. Ultimately, restoring hope in refugee education requires systemic shifts that move beyond individual teacher resilience towards more humane, responsive, and inclusive educational structures.

Culture Shock: The Effect of School Culture on Teacher Burnout and Motivation during Polarizing Times

Hadley Ruggles

Gladwyne Montessori and University of Pennsylvania, United States

Abstract

This research-based paper examines how school culture shapes teacher motivation and burnout during periods of heightened socio-political polarization. Schools increasingly function as microcosms of broader societal conflict, where debates surrounding race, gender, democracy, and public health enter classrooms and place new emotional and professional demands on teachers. Drawing on theories of motivation, burnout, and organizational culture, this qualitative study explores how teachers interpret and navigate these pressures through the lens of institutional alignment. Using critical incident methodology and semi-structured interviews with twelve teachers across three independent schools in the United States, the research identifies three distinct coping typologies: Insulators, who seek to shield themselves and students from external tensions; Activators, who engage societal conflicts as mission-aligned learning opportunities; and Gymnasts, who balance personal beliefs with institutional expectations. Findings reveal that perceived alignment between teachers' values and school leadership, policies, and mission significantly mediates experiences of burnout and motivation. When school culture functions as a coherent buffer—providing clarity, autonomy, and support—teachers report sustained engagement even during moments of societal rupture. Conversely, cultural misalignment amplifies isolation and emotional exhaustion. This study contributes to international conversations on teacher wellbeing, professional sustainability, and educational leadership by emphasizing the central role of school culture in navigating external pressures. Practical implications highlight the importance of mission-driven leadership, transparent communication, and professional autonomy in fostering resilient educational environments capable of supporting teachers in uncertain and contested times.

Keywords: *Education, society, burnout, motivation, politics, polarization*

1. Introduction

Over the past decade, U.S. citizens have endured a changing environmental climate, a pandemic, racial reckonings, insurrections, the overturn of Supreme Court rulings that were thought unassailable, financial bonanzas, and conversely, financial crises. Schools are microcosms of broader society and subject to any strife that the public feels. From natural disasters to political uprisings, schools field the concerns of their constituents. Rarely do outside concerns remain *outside*. Societal issues manifest in schools from the seemingly innocuous questions of children that ignite a culture war in the classroom to schools' policies on dress code that reify or accept gender and cultural norms. If there is a contested topic or major issue, that issue will find its way into classrooms and the daily dealings and interactions between teachers and students. While suicidal rates are on the rise domestically, they are also on the rise in individual schools [1]. While transgendered rights are debated, schools address antiquated bathroom systems with space for only two genders [2]. While the U.S. confronts racism, schools address student behaviors that mimic these racist tropes [3]. Teachers often are tasked with making sense of these crises to students. In this sense, the individual teacher faces the crushing weight of greater society if the school culture does not buttress and support the teacher's work. Additionally, a teacher who does not agree with a school's approach, mission, policies, and leadership will likely face frustration and greater levels of burnout. School leaders have no power to change society at a macro scale, but they do have the power to make the work of a teacher easier when confronting these challenges with students contributing to a mission-aligned culture.

The culture of the school is not divorced from the wider context of society, with phenomena from the national stage influencing a school's culture. This work examines the influences of all realms—the outer realm of society, the inner realm of a school's culture and context, and the most micro-realm focusing on the needs of individual teachers who face and make sense with students of these outer two realms [4]. This study argues that the school and its culture have the greatest impact on a teacher's sense of efficacy and motivation—the internal process that inspires a person to move toward a goal [5]. A teacher

who feels supported and culturally aligned with the broader school community will likely thrive despite any challenging influences from the broader realm of society. This study collects the narratives of teachers, all of whom have faced a challenging moment in their teaching, and records and analyzes their descriptions of these events, often commenting on the interplay between culture and motivation in the face of these events.
Increasingly, teachers are not contending with these issues in the abstract, but in concrete terms as these concerns manifest in schools directly. Ultimately, this is a study of what happens when a rupture that emanates from an outside fault line splits a school community affecting teacher motivation or conversely burnout levels. This work foregrounds the teachers who have borne the brunt of these challenges while examining the school culture that supported or hindered the teachers' efforts.

1.2 Research Questions

How do independent school teachers describe the ways which political tensions manifest in their work? What are the tensions, and how do they show up?

2. Theoretical Framework

This study applies theories of burnout, motivation, and organizational culture to examine teachers' experiences in the field of education during challenging societal times of extreme polarization. Drawing primarily from Herzberg's Motivation Theory [6], Maslach and Jackson's Burnout Theory [7], and Organizational Culture Theory [8], these frameworks situate teacher motivation and burnout not solely within individual psychology, but within the broader organizational and socio political contexts in which teachers work.
Herzberg's theory of motivation [6] still forms the basis of most contemporary theories and studies on the subject. Motivation, according to Herzberg, may come in many forms—pay, benefits, workplace regulations, etc.. Motivation also broadly speaks to why a teacher chooses to join the profession or why a teacher selects a particular school. Some teachers in this study are motivated by the freedom to design a curriculum free of the state standards found in other schools. In Herzberg's terms, this is motivating because of the autonomy it brings to teaching. The opposite, Burnout Theory [7] juxtaposes Herzberg's Motivation Theory. When examined in tandem—motivation and burnout—educational practitioners may discover some alarming trends of the teaching workforce. By addressing these trends, school leadership may retain teachers in the profession [9] and create motivated teachers who are more likely to inspire higher levels of student achievement [10].
More contemporarily, Dinham and Scott continue this work in the field of education with what they call the "third realm" of teacher satisfaction—the broader and larger macrosystems in which schools exist, going beyond just the immediate motivation of the workplace [4]. Dinham and Scott write that the third domain is "grounded in the wider environment surrounding the school, a domain which has grown in importance and influence and which teachers and school executives find uniformly dissatisfying." While day-to-day work associated with teaching brings educators joy, Dinham and Scott identify that what most dissatisfies or demotivates teachers is "largely out of the control of teachers and schools and found within the wider domain of society, governments, and the employing body." These "extrinsic societal and employer-based factors" cause a lack of motivation in teachers. This third realm houses the many factors that erode a teacher's satisfaction and cause a teacher ultimately to leave the profession. Throughout this study, readers will find Dinham and Scott's term of "third realm" with reference to society at large, and second realm and inner realm to mean the school and the individual teacher respectively. This study seeks to understand the relationship between the third realm—the realm of society—and the realm of school organizations and teachers, taking note of what actions school leaders may take to increase motivation (and decrease burnout) among teachers who feel the pressures of greater society.
This study also relies on theories of school culture coupled with notions of an individual's sense of motivation. Broadly, organizational culture presupposes "that the social context for work had a marked effect on the ways people approached their work, social relationships at work, and productivity" [11]. A teacher's placement within the social context of the school organization may evoke discord or harmony for that teacher. Culture provides a construct for how employees create a "shared meaning" of their organization derived from their experiences, the stories they hear, and the socialization process in their work setting [8].
The preceding theories set the stage for this study with the current state of U.S. affairs as the backdrop and ask if these theories are sufficient for the contemporary moment. Most importantly, this theoretical framework seeks to position schools as an institution within the broader socio-political landscape of the

nation by first examining the individual teachers, and then the culture of the school before venturing to the broadest realm of society.

3. Methodology and Research Design

This study commenced in the fall of 2023 with data collection, analysis, and review extending into 2025—past the influential U.S. Presidential election. I employed a phenomenological approach utilizing an emic perspective of teachers. The specific phenomenon examined was the experience of teaching in varying independent school settings during fractious times. I interpreted the results through a social constructivist framework, believing that knowledge is constructed through social interactions and the sharing of beliefs and practices.

I conducted this research by interviewing teachers at three independent schools that serve compulsory school-aged students in the Philadelphia area. Studies examining school-based phenomena such as culture, social-emotional learning, school models, and teacher efficacy commonly use three schools as the basis for conducting studies, citing three schools as a large enough sample to represent concerns found within a particular region [12].

My study focused on the perspective of 12 currently practicing educators (four teachers from each school site) who have remained in the field for a minimum of four years. This number represents roughly 10% of the teachers at each participating school or campus and mirrors participant totals found in several similar phenomenological studies centered on teachers' experiences [13]. Four teachers identified as "junior" with fewer than five years teaching while eight were tenured with more than a decade of experience. Teachers who entered the profession at least four years ago worked through the pandemic, the 2020 election, January 6th, Uvalde, and a number of other formative socio-political events.

Following participant selection, I interviewed teachers individually using semi-structured interviews to explore their experiences and the support they received in response to challenging socio-political events. Prior to the interview, I reviewed public-facing school documentation (i.e., mission statements and other documents available on school websites) to better understand the school's culture and therefore the context of the classroom experiences described. As part of the first interview, I read the school's mission statement aloud and asked whether the values expressed within it were practiced among the school's constituents.

I then used scenarios following the critical incident technique to illustrate examples of moments demonstrating how socio-political events test a school's ability to cope with such concerns. Definitionally, critical incidents are moments in one's career that test an individual's ability to cope with a situation using the skills, protocols, and knowledge available to that person [14]. These scenarios, based on race, socio-political events, gender, or identity politics, normalized discussion of challenging experiences and primed participants to consider similar incidents from their own schools. I concluded the first interview by asking participants to reflect on situations from their school to share during the next session. I allowed participants time between sessions to consider events and moments that may take time to remember or process. During the second meeting, we explored examples of similar situations from the participant's school.

The teachers also performed member checks, acting as a form of validity testing by bringing together educators from different schools to discuss their perceptions and review early findings. These group meetings created triangulation by allowing teachers from different organizations to share and compare their classroom experiences surrounding tense sociopolitical moments. The conversations were not intended to generate new data but rather to confirm or challenge my interpretations from earlier interviews.

Lastly, I continued validity testing by conducting a document review of mission statements and other school artifacts. For instance, a Friends school may process world events in accordance with egalitarian views found within its mission statement, whereas a Catholic school may approach such matters through different guiding beliefs. By contextualizing teachers' responses alongside the documents shaping their school environments, I added credibility to descriptions of the institutional culture surrounding these experiences.

I used an inductive method to code participant interviews, allowing themes and patterns to emerge from the data. Coding began with a provisional list of categories informed by my professional experience and by recurring themes in the literature surrounding motivation, burnout, and school culture. However, these early codes served only as an orienting framework rather than a predetermined structure imposed upon participants' experiences. Following the first round of interviews, I revised the coding list to reflect what actually appeared in the data. Codes that did not emerge in participants' narratives were removed, while

new codes were added to capture recurring but unanticipated ideas. For example, during the second round of coding, I found that explicit references to specific political parties or the 2024 election—topics I initially expected to surface—rarely appeared. Instead, teachers discussed broader concerns regarding polarization, identity, and institutional response without naming individual candidates or partisan positions. Likewise, while gender emerged as a significant topic, it primarily appeared through discussions of students' daily interactions rather than direct commentary on national political debates.
Similarly, I initially included several sub-codes related to compensation—salary, benefits, pay equity, and financial recognition—drawing from Herzberg's conception of "hygiene" factors [6]. However, compensation appeared only briefly in most interviews. This absence became a finding itself, suggesting that the sources of teacher burnout and motivation may have shifted since foundational studies on workplace motivation. Conversely, new categories emerged that I had not anticipated, particularly those related to mental health, counseling, and social media. Teachers described these themes as interconnected forces shaping both student experiences and their own professional motivation. Social media conflicts among students, for instance, frequently led to counseling interventions and classroom spillover that teachers were expected to manage.
To ensure the credibility and trustworthiness of the coding process, I engaged in several practices consistent with qualitative rigor. First, coding was iterative. After each interview cycle, I revisited both the raw data and the developing code list to confirm that the analytic categories accurately reflected participants' words. Second, I worked with a data partner who acted as a peer debriefer, helping identify blind spots and test whether coding decisions were grounded in the evidence rather than personal interpretation. We independently reviewed coded transcripts, compared patterns, and refined category definitions until agreement was reached. Third, I conducted member checks by sharing emerging typologies and code summaries with participants. These steps helped safeguard against researcher bias and reinforced the integrity of the analytic process.
It is important to note that the typologies presented in the following section were not predetermined or imposed upon the data. Rather, they emerged through iterative comparison of participants' narratives, recurring patterns, and points of contrast regarding how teachers navigated political tensions in their work. Initially, I observed distinctions between teachers who leaned toward open engagement with contentious topics and those who preferred preserving established norms or avoiding divisive issues. As analysis continued, however, additional responses surfaced that did not fit neatly within these emerging categories. The recognition of these outliers prompted deeper analytic reflection and eventually led to the identification of a third pattern that bridged aspects of the first two while introducing distinct behaviors and rationales of its own.
Once these patterns appeared stable and sufficiently distinct, I synthesized them into the typologies described in the findings. These typologies were treated as interpretive tools rather than definitive labels. They were intended to illustrate the range of teacher responses observed in the data rather than constrain them. Their formation was guided by the evidence and refined through peer review and participant validation. In this way, the coding process reflected the iterative, inductive, and reflexive nature of qualitative inquiry, privileging participant voice and allowing theoretical insight to emerge organically from their descriptions.

4. Findings

The following section shares findings from the study, analyzing the responses of 12 participants from three schools in the Philadelphia metropolitan area. The participants describe socio-political tensions they witnessed in the classroom, noting major themes of race, gender, identity, and global events such as the conflict in Israel and Gaza and the murder of George Floyd. In each case, a precipitating world event sparks a reaction at the local school level among students, faculty, and staff. Every participant's reaction could be categorized resembling elements of one of three themes, typologies, or coping patterns. Two participants exhibited characteristics spanning multiple typologies, suggesting that these categories function as interpretive tendancies rather than rigid classifications.

4.1 Description of Participants and Schools

Three schools participated in this study, representing three types or models of schools commonly found in eastern Pennsylvania independent schools— a Catholic girls' school serving grades 6-12, a Montessori school serving infants through grade 6, and a Friends' school associated with Quaker values serving early childhood through grade 12. All three schools are geographically near one another, spanning from Philadelphia to the Main Line, an affluent suburb outside of Philadelphia. All three schools

draw students both from within Philadelphia city limits as well as from the Main Line and other suburban areas. Additionally, all three independent schools enroll a predominantly white population of students. Nine of the 12 teacher participants identify as White female, matching national averages of teachers [15]. In this study, four teacher participants from each school shared their experiences, noting how various socio-political tensions have shaped their recent work.
Every teacher who participated in the study reported supporting their school's mission statement and what it represents. In each case, the mission statement contained key words to the organization or philosophy of the school (i.e. Catholic, Montessori, or a reference to Quaker values). In each case, a teacher shared that other members of the community may not be equally mission-aligned or might emphasize a different aspect of the mission statement. All participants viewed the mission statement as a guiding principle or a "differentiator" from other schools in the area. Furthermore, they felt the tension of when their school embodied the tenets of the mission statement or when they perceived that the basic principles of the mission statement were ignored.

4.2 Reaction to Critical Incident and Personal Critical Incidents

Critical incidents served the purpose to aid in research centered on "people's subjective impressions of organizational life, and the stories they construct in order to make sense of the environment in which they work" [14], by responding to a scenario and then sharing their own. These represented real events that the teachers had confronted during their teaching practice. Teachers often shared more than one critical incident. The topics included race, gender, and global events (with specific mention to conflict in the Middle East or the murder of George Floyd) as presented in Table 1.

Table 1.
Topics of Personal Critical Incidents

Topic	Times Shared
Race	11
Gender	3
Specific Socio-Political Event	9
Conflict in Middle East	3
Murder of George Floyd	6

Each of the participants' reaction to their experience can broadly be categorized in one of three thematic ways, creating typologies for the teachers: the Insulators, the Activators, and the Gymnasts.

4.3 The Insulators

Insulators represent teachers who strive to protect the established social order of their respective school and often have worked there for decades. They are not necessarily opposed to social or cultural changes within their school; however, they struggle with some aspect of socio-political tensions appearing in the classroom. Often during the interviews, the Insulators expressed yearning for the past, how the school used to be, while also recognizing that some change is good or necessary. They feel that conversations about socio-political or identity-based concerns is at best a distraction from the learning in the classroom or inappropriate or irrelevant at worst. Teachers that embody the Insulator theme often believe that it is not the work of the school to address issues as they arise in the world or contemporary society. They see these conversations as something inappropriate to discuss among children, something for parents to discuss with their own children at home, or altogether irrelevant to the lives of children. These teachers take umbrage with professional development that focuses on introspection or anything that evokes shame in them.
The teachers who belong to this category believe that schools are not porous, but rather that they have strong buffers protecting the students and school culture from the influences of outside culture. Contrarily, participants from the later sections (Activators and Gymnasts) believe the opposite that schools are porous to the influences of the outside world.

4.4 The Activators

Activators think schools are porous to outside events and accept that the tensions of the world will be felt within schools; however, these teachers hope that they can guide students through the lens of whatever mission the school holds (a Quaker, Catholic, or progressive lens). Activators see teaching as

a means of igniting change and raising the next generation with progressive values. Ultimately, they want their students to be aware, just, and progressive; leaders who are ready to bring about positive and liberal change for the world.
Activators are firmly anchored to their faith or school's philosophy, which is also deeply entrenched in their schools' mission statements. Their commitment to the school's mission, almost to a zealous manner, guides them through any crisis. School mission keeps them from drifting in their values and in some ways more committed to the institutional goals than even the school leadership who may have to appease a broader swath of the constituency. Activators mentioned elements of burnout, the challenges of the work and the frustrations of facing these tensions so regularly, as well as motivation, the desire to effect real change and serve a community in crisis. They have high hopes for their schools to serve the students in the manner presented by the schools' mission statements, and they are there to implement progressive teaching techniques, protect students' identities, and challenge authority when needed to make this happen.

4.5 The Gymnasts

Gymnasts exemplify teachers who acculturate to the organization, metaphorically bending over backwards to fit in. These participants find themselves at odds with their institutional culture or goals, while also performing acts that do not align with their personal beliefs. In each case, the independent school was a predominantly White institution that culturally or in some manner upheld the values associated with White, heterosexual, abelist, patriarchal culture. These teachers seem to perform mental gymnastics, overcoming what, as an outsider, appears to be cognitive dissonance to support their school and its implicit values. This type of acculturation requires a level of cognitive gymnastics to make two seemingly contrary principles coherent. In the case of all the participants, there was something redeeming about their organization that drew them. Whether they described their independent school as "like home," "comfortable," or "a place where [they wanted their] children to be," there was something about the institution that pulled them in and felt comfortable. They may believe they are part of "the fight to bring about change," or their actions may be deeply culturally or personally ingrained, and they are acting in the manner they believe is expected of them. Equally, there was something that felt like these teachers must reconcile– something with which they were at odds and had to remedy through logic and a compromise of their beliefs. These are the individuals that face the greatest possible harm or trauma because their identity is regularly not acknowledged. These practitioners exercise great perseverance in a system not rewarding of their work or always certain or supportive of their identity.

5. In Conclusion

Traditional frameworks for understanding burnout and motivation have largely focused on compensation, autonomy, and management. While these factors are undeniably important, they do not fully capture the complexities of teaching in today's highly politicized and socially charged environment. Current models of motivation and burnout fail to account for the emotional and psychological toll of navigating sociopolitical tensions in the classroom. Today's educators require a framework that acknowledges not just institutional factors, but also the broader cultural, political, and ideological landscape that shapes their daily work. As schools continue to navigate contentious political climates, rethinking how burnout and motivation are defined is essential to ensuring that teachers feel both supported and empowered in their roles. As schools become increasingly politicized spaces, the need for empirical studies exploring how institutional culture, community expectations, and national discourse impact teachers has only grown more urgent. Expanding the scope of research to include a more diverse sample of schools, geographic regions, and disciplinary fields would provide greater insight into whether the three identified typologies are universal or if additional typologies emerge in larger-scale studies.
These categories—the Insulators, Activators, and Gymnasts—offer a useful framework for understanding the ways teachers navigate political and cultural tensions in their professional lives. These typologies should not be seen as rigid or reductive classifications. Rather, they serve as a heuristic tool, a way to conceptualize the different approaches, challenges, and coping mechanisms teachers employ when faced with politically sensitive issues. Each individual teacher brings a unique perspective, but the presence of these typologies across all participating schools suggests that they may be applicable beyond this specific study, across different educational contexts.
For school administrators and policymakers, these themes hold significant practical implications, particularly when considering how to support faculty in politically complex times. Recognizing the presence of Insulators, Activators, and Gymnasts within a school community can inform strategies for

professional development, teacher engagement, institutional messaging, and school culture initiatives. Additionally, understanding these typologies can help administrators identify sources of burnout and create targeted retention strategies, particularly for Gymnasts, who often experience the greatest emotional strain as they attempt to reconcile personal values with institutional expectations.

Ultimately, teachers in this study described moments when external political events entered their daily practice of educating students. Questions of race, gender, religion, and national identity surfaced in lessons, in hallway exchanges, and in conversations with parents. In this sense, schools functioned as microcosms of the national dialogue, reproducing the same divisions and anxieties that characterize the public at large. These moments required teachers to draw upon their personal values while simultaneously navigating the expectations of their school's mission and leadership. The tension that emerged was not simply between individual and institution, but between the broader social climate and the educational environment charged with interpreting it. Teachers who perceived alignment between their personal commitments and their school's mission reported stronger motivation and purpose, while misalignment contributed to uncertainty, isolation, and burnout. When alignment exists, teachers experience affirmation and clarity of purpose. When it falters, teachers face moral and emotional dissonance that can erode their sense of vocation and purpose, demonstrating that motivation is not a fixed personal trait but a dynamic condition shaped by the relationship between the teacher and the institution.

The events of recent years—pandemic recovery, political unrest, racial reckonings, and renewed debates over gender and identity—have intensified these dynamics. Teachers have become interlocutors of the national conscience, often expected to mediate conflicts that the larger society has failed to resolve. For school leaders, this reality underscores the importance of transparent communication, mission clarity, and professional development that equips educators to approach contested issues with confidence. A school culture grounded in trust allows teachers to interpret these moments not as threats to stability but as opportunities for meaningful dialogue and growth.

The findings of this study suggest that motivation in teaching cannot be understood apart from the socio-political context in which teachers work. While traditional theories of motivation and burnout capture the internal dynamics of satisfaction and exhaustion, they do not fully account for the external pressures that now define the teacher's role. Future research must therefore continue to revisit these theories in light of evolving political realities, recognizing that what sustains teachers today may differ from what sustained them in earlier eras.

Teaching Digital Inclusion Early: Practical Approaches to Accessibility in Primary Education

Ann Marcus-Quinn[1], Ian Clancy[1], Ruth Bourke[2]

[1]University of Limerick, Ireland
[2]Mary Immaculate College, Limerick, Ireland

Abstract

Digital technologies increasingly shape how learners communicate, learn, and participate in civic life. However, when digital content is created without attention to accessibility, it can unintentionally exclude individuals with visual, cognitive, or physical disabilities. As schools prepare young people for a digitally connected future, accessibility must be understood as a foundational digital literacy rather than an optional or specialist skill [1]. This imperative is reinforced by the European Accessibility Act [2]. Education therefore has a critical role to play in embedding inclusive design principles early. This paper reports on work completed to date within SEED: Supporting Equity and Educational Design: Growing Awareness of Accessibility in Digital Classrooms in Ireland's Primary Schools*, a Research Ireland–funded project examining current practices and awareness of accessibility in Irish primary education.*

Keywords: *Digital accessibility; inclusive design; primary education; digital literacy;*

1. Introduction

Digital technologies increasingly shape how learners communicate, learn, and participate in civic life. However, when digital content is created without attention to accessibility, it can inadvertently exclude individuals with visual, cognitive, or physical disabilities. As schools prepare young people for a digitally connected future, accessibility must be recognised as a foundational component of digital literacy rather than an optional or specialist skill. This imperative is further reinforced by policy developments such as the European Accessibility Act, which highlights the need for accessible digital environments across sectors, including education. Education therefore has a critical role in embedding inclusive design principles from an early stage. Recent discussions surrounding young people's engagement with digital technologies have frequently framed technology use primarily in terms of risk and overuse. However, emerging research argues that such perspectives often fail to distinguish between passive or recreational engagement and structured, educational, and purpose-driven uses of digital technologies. It is important to emphasise the importance of avoiding "one-size-fits-all" approaches to youth digital engagement and instead advocate for guided, literacy-based participation supported through education and policy initiatives. Within this context, accessibility education represents a meaningful form of digital engagement in which learners actively develop awareness of inclusion, usability, and equitable participation in digital environments [3]. When accessibility principles are applied, digital content becomes clearer, more flexible, and more usable for all learners [4]. Developing awareness of accessibility in primary school not only supports learners with diverse needs, but also fosters inclusive mindsets and practices among all pupils. Despite this, accessibility is not yet consistently integrated into everyday classroom activities, and there remains a limited availability of accessible, affordable classroom materials that explicitly support the teaching of inclusive design principles.

This paper reports on work undertaken to date within *SEED: Supporting Equity and Educational Design: Growing Awareness of Accessibility in Digital Classrooms in Ireland's Primary Schools*, a Research Ireland–funded project examining current practices and awareness of accessibility in Irish primary education. The project investigates how accessibility is currently addressed in classrooms and identifies gaps in teacher knowledge and available resources. In Ireland there are varying levels of digital engagement across primary classrooms and while there is some structured support for teaching accessibility concepts as part of routine digital learning there are few dedicated hardcopy classroom materials. The SEED project seeks to develop practical, curriculum-aligned resources to support teachers in introducing accessibility in meaningful and age-appropriate ways. The following sections outline the project context, methodology, preliminary findings, and the development and pilot implementation of a classroom-based accessibility toolkit.

2. Background and Context

Accessibility is increasingly recognised as a core dimension of digital literacy, encompassing the ability to create and engage with digital content that is usable by diverse audiences. Within educational contexts, this extends beyond technical compliance to include an understanding of inclusive design principles such as readability, colour contrast, and multimodal representation [4]. Approaches informed by Universal Design for Learning (UDL) emphasise proactive design that supports a wide range of learners, rather than retrofitting content to meet individual needs. Policy frameworks at both European and international levels further reinforce the importance of accessibility in education. The European Accessibility Act establishes requirements for accessible digital products and services, while the United Nations Sustainable Development Goals, particularly SDG 4 (Quality Education) and SDG 10 (Reduced Inequalities), emphasise inclusive and equitable access to learning opportunities. Together, these frameworks position accessibility as a shared responsibility across sectors, including schools. Despite this policy and theoretical emphasis, the integration of accessibility into everyday classroom practice remains uneven. Research indicates that while digital technologies are widely used in primary education, explicit attention to accessibility is often limited with relatively few dedicated resources available to support its teaching.

3. Seed Project Toolkit Development

In response to the gaps identified in preliminary findings, the SEED project developed a practical, classroom-based toolkit designed to introduce accessibility concepts to primary school learners in an engaging and age-appropriate manner. The toolkit was created to support teachers in embedding accessibility within existing classroom activities, particularly in the context of digital content creation tasks commonly undertaken by pupils in the senior years of primary school.

3.1 Posters

The toolkit comprises two large-format (A1) posters and a hardcopy learning resource in the form of a foldable cube. The posters were designed in accordance with established principles of document and communication design, drawing on seminal work such as Schriver's *Dynamics in Document Design*, which emphasises a reader-centred, evidence-based approach to the integration of text and visuals [5,6]. In addition, guidance from the National Disability Authority in Ireland informed the application of universal design and accessibility principles, ensuring that the materials are usable, understandable, and inclusive for a wide range of audiences [7]. The posters are printed on fabric to enhance durability and sustainability, and to enable their continued use within classroom settings as visual prompts for discussion. At the centre of the poster design is a thematic focus on hedgehogs, selected as an accessible and engaging narrative device and introduced in alignment with Ireland's Hedgehog Week. The poster design was also intentionally based on the native Irish hedgehog, as this species is incorporated within the Green-Schools biodiversity programme and highlighted as a "Habitat Hero", ensuring alignment with existing classroom resources, while the decision to print the poster on fabric further reinforces the sustainability principles underpinning the Green-Schools initiative [8].
Each classroom is provided with two contrasting posters: one intentionally designed to demonstrate poor accessibility practice, incorporating common design errors, and a second illustrating accessible and inclusive design principles. This contrast-based approach supports critical discussion and encourages learners to identify and reflect on design choices. While the posters were designed by a researcher with professional experience in accessible communication, care was taken to avoid an overly polished or complex aesthetic. Highly stylised or technically sophisticated designs, while visually appealing, may risk overwhelming learners in the senior years of primary school and can appear difficult to replicate. Instead, the posters deliberately model good accessibility practices in a way that remains achievable for pupils. By balancing adherence to core design principles with a level of visual simplicity, the materials aim to support not only understanding but also application, encouraging learners to view accessible design as something within their own capability rather than as a specialised or unattainable skill.

3.2 Cube

Complementing the posters, each student is provided with a flat-pack cardboard cube that can be assembled into a three-dimensional object. Each face of the cube presents concise, child-friendly design

guidance relating to digital content creation. These guidelines include principles such as clear text use, colour contrast, effective use of images, and accessible audio and video practices. For example, the cube encourages pupils to “use short sentences and simple words” and to ensure that “text colour is easy to see on the background,” while also promoting inclusive practices such as adding subtitles to videos and describing images for clarity.

3.3 Teacher Supports

To further support teachers in mediating classroom discussions, the toolkit also includes a compact, teacher-focused resource in the form of a keyring comprising eight concise reference cards. Each card highlights a specific design principle and provides a brief explanation of its importance in relation to accessibility and effective communication. For example, individual cards explain the rationale behind design decisions such as font choice, emphasising readability and clarity, or the use of appropriate colour contrast to ensure visibility for all learners. This resource is intended as a practical, easily accessible prompt to support teachers in reinforcing key concepts during classroom activities. Together, these elements extend the functionality of the toolkit beyond static visual materials, providing both learners and teachers with structured, accessible guidance. The combination of whole-class visual artefacts (posters), individual interactive materials (cube), and teacher supports (keyring cards) reflects a multi-layered pedagogical approach that accommodates different modes of engagement and reinforces accessibility principles through both exploration and guided instruction.

3.4 Emergent Elements in Toolkit Development

An unanticipated development within the project was the creation of an Irish-language version of the student cube. While not originally planned within the initial funding proposal, informal engagement with participating teachers highlighted the value of providing resources that align with Irish-language teaching contexts. In response, the content of the cube was professionally translated into Irish, enabling its use in both English- and Irish-medium classrooms. This adaptation reflects the project’s responsiveness to practitioner input and supports broader inclusivity within the Irish primary education system.

A further factor shaping the development of the toolkit was an industry partnership that emerged during the early stages of the project. Following the award of funding, engagement with Brickfield Education Labs at a professional conference provided access to an existing presentation design resource used in adult training contexts. With permission from the organisation, the project team was able to adapt the cube template for use in primary education settings. This significantly accelerated the development process and enabled the production of high-quality classroom materials within the constraints of the project budget. It also ensured that the design guidance embedded within the cube was informed by established industry practice in accessible digital communication. The collaboration illustrates the value of cross-sector partnerships in supporting the translation of accessibility principles into practical, scalable educational resources.

The focus on presentation design reflects a growing classroom practice, where pupils are frequently required to create digital presentations as part of their learning. While instruction is often provided on content and structure (e.g., number of slides or topics to include), there is typically limited emphasis on visual design principles or accessibility considerations. The toolkit therefore seeks to address this gap by embedding foundational accessibility guidance into familiar learning tasks, enabling pupils to apply inclusive design principles in a practical and meaningful way.

4. Discussion

At the time of writing, the classroom toolkit is in the early stages of implementation, and formal evaluation data has not yet been collected. Initial engagement has focused on consultation with participating school principals to introduce the project and its resources. These preliminary discussions were highly positive, with principals expressing strong support for the initiative and recognising the relevance of accessibility within contemporary digital learning contexts. Particular appreciation was noted for the quality and durability of the printed materials, as well as the provision of additional classroom resources to support teaching and learning. This initial response suggests that the toolkit aligns well with school priorities and is perceived as both practical and valuable for classroom use.

The toolkit is currently being implemented in participating classrooms, with data collection planned following a period of use within the upcoming school term. This will include teacher feedback on usability, clarity, and perceived impact, and will inform further refinement of the resources. As such, the present

paper reports on the design and early-stage deployment of the toolkit, with full evaluation findings to be reported in subsequent work.

5. Conclusion

This paper has highlighted the importance of positioning digital accessibility as a foundational element of digital literacy within primary education. Through the SEED project, it identifies a clear gap between high levels of digital engagement in classrooms and the limited availability of accessible, affordable classroom materials that explicitly support the teaching of inclusive design principles. In response, the development of a practical, classroom-based toolkit demonstrates how accessibility concepts can be embedded meaningfully within existing curricular activities. While formal evaluation is ongoing, early engagement with schools indicates strong interest in and relevance of the approach. The project contributes to ongoing efforts to support inclusive education by providing scalable, contextually relevant resources and by emphasising the role of early intervention in fostering accessible digital practices.

Acknowledgements

The authors would like to thank Margaret Grene (University of Limerick) and Brickfield Education Labs for their valuable contribution to the design and development of the toolkit.
This work was supported by Taighde Éireann (Research Ireland) under the New Foundations programme.

Voices Against Violence: Community-Based Interventions for VAWC Prevention

Dorren D. Arenque[1], Ruel S. Arenque[2]

[1]Polytechnic University of the Philippines, Philippines
[2]Camarines Norte State College, Philippines

Abstract

The study investigated the demographic characteristics, knowledge, attitudes, and practices (KAP) of Anti-VAWC community champions, while also evaluating the efficacy of interventions executed in Ragay, Camarines Sur. The study detailed the respondents' demographic attributes, assessed their knowledge, attitudes, and practices concerning violence against women and children (VAWC), identified current interventions, analyzed the correlations among demographic profiles, KAP, and the intervention types, and ultimately suggested enhanced, gender-responsive programs.

The research utilized a descriptive-correlational design, incorporating a mixed-methods methodology. Quantitative data was obtained via structured survey questionnaires, which were distributed to a purposive sample of Anti-VAWC advocates - barangay officials, VAWC desk officers, law enforcement personnel, educators, and social workers. Qualitative data were collected through open-ended responses and subsequently analyzed using thematic analysis. The results indicated that the majority of respondents were female, belonged to the productive age bracket, and possessed a college education.

Knowledge regarding Violence Against Women and Children (VAWC) was assessed at a high to very high level, and attitudes were notably positive, indicating a robust awareness of gender issues and a dedication to safeguarding survivors. Practices demonstrated a certain degree of consistency, particularly in the areas of awareness campaigns, collaborative endeavors, and record maintenance; however, monitoring and follow-up protocols were identified as areas requiring improvement. Community-driven interventions were viewed as beneficial, particularly in fostering awareness and engagement, whereas monitoring systems demonstrated moderate efficacy. Statistical analyses revealed a significant relationship between demographic factors and knowledge, attitudes, and practices (KAP). Additionally, a strong positive connection was found between KAP and the specific interventions used.

Based on the Social Ecological Model, the study concluded that both individual skills and institutional structures influence how well interventions work. A sustainable, community-based approach was suggested to improve monitoring, strengthen referral systems, and enhance gender-sensitive Anti-VAWC programs.

Keywords: *Violence Against Women and Children (VAWC), community-based interventions, knowledge attitudes and practices (KAP), gender-based violence, Social Ecological Model, Philippines*

Introduction

Violence against women and their children (VAWC) remains a significant human rights and public health concern. Despite the implementation of Republic Act No. 9262, the Anti-Violence Against Women and Their Children Act of 2004 in the Philippines, occurrences of intimate partner violence, psychological abuse, economic abuse, and child maltreatment continue to be reported in various communities. Although legal structures are essential, successful prevention and intervention require sustained, community-based engagement that transcends formal judicial procedures.

Mirroring the situation in many rural municipalities, Ragay, Camarines Sur, relies on barangay-level structures, including VAWC Desk Officers, Women and Children Protection Desks (WCPD), the Municipal Social Welfare and Development Office (MSWDO), health units, and school-based advocates. The efficacy of these interventions is significantly influenced by the knowledge, attitudes, and practices (KAP) of both community advocates and institutional actors.

This study, based on the Social Ecological Model (Heise, 1998; CDC, 2022) and Social Learning Theory, suggests that Violence Against Women and Children (VAWC) is affected by various ecological levels. These levels include individual beliefs, relationships with others, and community norms, as well as larger

institutional and societal structures. Hence, prevention strategies should be multi-sectoral, gender responsive, and community driven.
Given the persistent issues of preventing and addressing VAWC on the ground, this study aims to produce empirical response evidence for successful community-based intervention in Ragay, Camarines Sur. This study specifically aims to assess the demographic characteristics and the Knowledge, Attitude, and Practices (KAP) of Anti-VAWC advocates. It will also examine how these factors affect the interventions used in their barangays and institutions. By combining quantitative data with qualitative information, the research seeks to identify institutional strengths, weaknesses, and areas for improvement. This will help to strengthen gender-responsive systems. Ultimately, the goal is to develop a sustainable, community-led Anti-VAWC framework. This framework will support referral systems, advocacy strategies, and participatory governance at the local level. Therefore, this will contribute to greater social justice, gender equality, and the empowerment of communities.

Methodology

This study utilized a descriptive-correlational design with a mixed-methods approach among 102 Anti-VAWC advocates who were purposively selected, including barangay officials, law enforcement personnel, educators, and social workers. Data were collected quantitatively using a self-made survey questionnaire, validated using a Likert scale with five sections: (1) demographic profile (2) Knowledge, Attitudes, and Practices (KAP) (3) Attitudes Toward VAWC (4) Practices in Anti VAWC Intervention and (5) Nature of Community Based Interventions. A pilot test was conducted with a minimum of 30 participants, succeeded by the computation of Cronbach's alpha to evaluate internal consistency. Qualitative data were gathered via focus group discussions (FGDs) and key informant interviews (KIIs) to gain a more comprehensive understanding of institutional coordination, referral mechanisms, implementation challenges, and sustainability practices. Descriptive statistics such as frequency, percentage, mean, and standard deviation were used to analyze quantitative data in order to assess levels of knowledge, attitudes, and practices. The relationships among demographic variables, KAP scores, and the type of interventions were analyzed using inferential statistics, like Pearson's r or Spearman's rho correlation analysis. The qualitative data from the interviews and focus group discussions were transcribed and thematically analyzed to identify recurrent themes of barriers between institutions, strengths in coordination, and possible avenues for improvement as a system. To improve validity and credibility of findings, including comparing quantitative

Results and Discussion

Quantitative Findings

The subsequent table elucidates the study's findings concerning community-based Anti-VAWC interventions within Ragay, Camarines Sur.

Table 1. Demographic Profile of Anti-VAWC Advocates in Ragay, Camarines Sur (n = 102)

Variable	*Category*	*Frequency*	*Percentage*
Age	26–35	34	33.33%
	36–45	38	37.25%
	46–55	16	15.69%
	56–65	12	11.76%
	66+	2	1.96%
Sex	Female	82	80.39%
	Male	18	17.65%
	Prefer not to say	2	1.96%
Civil Status	Married	66	64.71%
	Single	22	21.57%
	Others	14	13.72%
Educational Attainment	College	60	58.82%
	High School	20	19.61%
	Master's Degree	16	15.69%
	Doctorate	4	3.92%
	Others	2	1.96%

Table 2. Level of Knowledge on Violence Against Women and Children (VAWC) Among Respondents

Indicator	*Mean*	*Interpretation*
RA 9262 coverage	4.52	Very High Knowledge
BPO issuance	4.18	High Knowledge
Psychological violence	4.21	High Knowledge
Economic abuse	4.15	High Knowledge
First response protocol	4.27	Very High Knowledge
OVERALL MEAN	4.27	Very High Knowledge

Legend: 4.50 – 5.00 – Very High Knowledge, 3.50 – 4.49 – High Knowledge, 2.50 – 3.49 – Moderate Knowledge, 1.50 – 2.49 – Low Knowledge, 1.00 – 1.49 – Very Low Knowledge

Table 3. Attitudes of Respondents Toward Violence Against Women and Children (VAWC)

Indicator	*Mean*	*Interpretation*
Reporting cases	4.68	Strongly Agree
Gender norms contribute to VAWC	4.55	Strongly Agree
Survivor protection	4.74	Strongly Agree
Leadership responsibility	4.61	Strongly Agree
Training effectiveness	4.58	Strongly Agree
Inter-agency coordination	4.63	Strongly Agree
Community awareness	4.66	Strongly Agree
OVERALL MEAN	4.64	Strongly Agree

Legend: 4.50 – 5.00 – Strongly Agree, 3.50 – 4.49 – Agree, 2.50 – 3.49 – Neutral, 1.50 – 2.49 – Disagree, 1.00 – 1.49 – Strongly Disagree

Table 4. Practices of Anti-VAWC Advocates in the Implementation of Community-Based Interventions

Indicator	*Mean*	*Interpretation*
Awareness campaigns	4.41	Often
Coordination with agencies	4.32	Often
Case documentation	4.45	Often–Always
Training participation	4.28	Often
Referral protocol compliance	4.47	Often–Always
Monitoring and follow-up	3.76	Sometimes–Often
OVERALL MEAN	4.28	Often

Legend: 4.50 – 5.00 – Always, 3.50 – 4.49 – Often, 2.50 – 3.49 – Sometimes, 1.50 – 2.49 – Rarely, 1.00 – 1.49 – Never

Table 5. Perceived Effectiveness of Community-Based Anti-VAWC Interventions in Ragay, Camarines Sur

Indicator	*Mean*	*Interpretation*
Awareness campaigns	4.53	Very Effective
Referral systems	4.21	Effective
Case documentation	4.26	Effective
Inter-agency coordination	4.33	Effective
Monitoring & evaluation	3.89	Moderately Effective
Community participation	4.38	Effective
OVERALL MEAN	4.27	Effective

Legend: 4.50 – 5.00 – Very Effective, 3.50 – 4.49 – Effective, 2.50 – 3.49 – Moderately Effective, 1.50 – 2.49 – Slightly Effective, 1.00 – 1.49 – Not Effective

Table 6. Test of Relationship Between Demographic Profile, KAP, and Nature of Interventions (n = 102)

Variables	*Test Used*	*Computed Value (r)*	*p-value*	*Decision*	*Interpretation*
Demographic Profile & Knowledge	Pearson r	0.32	0.003	Reject H_0	Significant Relationship
Demographic Profile & Attitudes	Pearson r	0.28	0.007	Reject H_0	Significant Relationship
Demographic Profile & Practices	Pearson r	0.35	0.002	Reject H_0	Significant Relationship
Knowledge & Practices	Pearson r	0.61	0.000	Reject H_0	Strong Significant Relationship
Attitudes & Practices	Pearson r	0.58	0.000	Reject H_0	Strong Significant Relationship
KAP & Nature of Interventions	Pearson r	0.64	0.000	Reject H_0	Strong Significant Relationship

Legend: $p < 0.05$ = Significant

The results indicate that there is a statistically significant relationship between demographic profile, knowledge, attitudes, practices (KAP), and the nature of community-based Anti-VAWC interventions. The findings show that demographic variables such as age, sex, and educational attainment have a moderate but significant influence on the knowledge, attitudes, and practices of Anti-VAWC advocates. This suggests that individual characteristics contribute to variations in how advocates understand and implement VAWC-related programs.

More importantly, the results reveal a strong positive relationship between knowledge and practices ($r = 0.61$), as well as between attitudes and practices ($r = 0.58$). This suggests that those who support the cause, and who have more knowledge and positive views about VAWC, are more likely to use effective implementation strategies. Furthermore, the strong link ($r = 0.64$) between overall KAP and the type of interventions indicates that KAP is a key factor in determining the quality and success of community-based interventions.

The findings support the Social Ecological Model which suggest that individual factors, such as knowledge and attitudes, significantly influence behaviors and practices within a community. Furthermore, the results align with Jewkes et al.'s research, which highlights the importance of improving knowledge and changing attitudes to encourage behavioral change and reduce violence.

These findings also support the World Health Organization's view that to stop violence, you need to understand the problem and put what you've learned into practice all the time. The strong relationship observed between knowledge, attitudes, and practices (KAP) and the intervention's effectiveness suggests a direct impact of capacity-building efforts on program results. The significant correlations uncovered in this research carry several important implications. The authors first highlight the need for Anti-VAWC campaigners to participate in targeted capacity-building initiatives. These programs should be designed to improve their knowledge, attitudes, and practical skills.

Training programs should, therefore, employ a comprehensive approach that integrates legal comprehension, gender sensitivity training, and practical case management skills. Furthermore, the impact of demographic variables indicates that interventions must be contextually tailored, considering the backgrounds and attributes of the advocates involved. Customized training and support structures may be essential to mitigate disparities within particular groups.

The strong relationship between knowledge, attitudes, and practices (KAP) and how well interventions work highlights the importance of ongoing professional development and institutional support. Therefore, improving KAP is likely to enhance the effectiveness of Anti-VAWC programs, especially in areas like monitoring, referral systems, and community involvement.

Ultimately, the study's results emphasize the necessity of integrated, multi-tiered strategies for VAWC prevention. Strengthening individual capabilities must be coupled with fortifying institutional frameworks and fostering community participation to ensure enduring results.

Qualitative Findings

The qualitative results of this investigation, drawn from the unstructured feedback provided by Anti-VAWC campaigners concerning community-based programs in Ragay, Camarines Sur, are presented subsequently. These findings serve to deepen the understanding of the participants' lived experiences, the challenges they faced, and their suggested improvements, thereby complementing the quantitative data. Thematic analysis was used to identify patterns and commonalities in the responses we received.

The subsequent examples serve to clarify the research findings by illustrating the identified themes. The investigation revealed five key thematic areas: (1) challenges faced during the implementation phase, (2) factors that contribute to the reduction of violence against women and children (VAWC), (3) inadequacies within referral systems, (4) the need for improved support and training initiatives, and (5) suggestions for maximizing the effectiveness of interventions.

Table 7. Thematic Analysis of the Study

Theme	Codes (Key Ideas)	Description	Sample Verbatim Response
Challenges in Implementation	Underreporting, fear, stigma, lack of awareness, limited resources	Barriers that hinder reporting and effective intervention	"Victims are afraid to report because they depend on the abuser."
Strengthening Factors	Training, coordination, awareness campaigns, leadership support	Elements that improve effectiveness of interventions	"Continuous training helps us handle cases better."
Referral System Gaps	Delayed response, unclear procedures, weak coordination	Issues affecting efficiency of case handling	"Sometimes referrals take time because agencies are not well-coordinated."
Need for Support and Training	Counseling skills, legal knowledge, funding, tools	Capacity and resource needs of advocates	"We need more training on counseling and proper handling of victims."
Recommendations for Improvement	Monitoring systems, technology use, stronger partnerships	Suggested strategies for sustainability and improvement	"There should be a system to track cases and follow-ups."

The qualitative data clarifies the contextual factors that shape the implementation of Anti-VAWC initiatives in Ragay, Camarines Sur. A significant challenge that emerged is the underreporting of VAWC incidents, primarily stemming from victims' fear, societal stigma, and economic reliance on their abusers. This situation underscores the entrenched socio-cultural obstacles that impede the reporting of violence. These observations align with the World Health Organization's findings, which recognize underreporting as a persistent global issue in combating violence against women, especially within community environments characterized by social pressures and economic limitations. The study also highlights the importance of capacity-building and inter-agency coordination as key factors that strengthen VAWC prevention efforts. Respondents emphasized that continuous training enhances their competence and confidence in handling cases. This supports the findings of Jewkes et al., who assert that effective violence prevention requires sustained engagement, skills development, and collaboration across sectors. The presence of strong coordination mechanisms among barangay officials, law enforcement, and social services contributes significantly to the effectiveness of interventions.

Despite these benefits, the investigation reveals notable weaknesses in referral systems, particularly regarding delayed response times, unclear procedures, and inconsistent inter-agency cooperation. These identified flaws imply inherent structural inefficiencies that may hinder the timely delivery of services to those in need. The United Nations emphasizes the crucial role of a coordinated, survivor-centered referral system in ensuring that victims receive immediate and appropriate assistance.

Problems with this system could reduce trust in institutions and discourage people from reporting issues. Another important observation concerns the need for additional support and specialized training, specifically in counseling, legal procedures, and trauma-informed care. Although the participants demonstrated sufficient basic understanding, a distinct requirement for more advanced skills was evident, enabling them to effectively manage the intricate needs of survivors. Moreover, constraints in resources, including financial support, educational materials, and technological instruments, were recognized as impediments to successful execution. Therefore, improving institutional capacity requires not only training programs but also strategic investments in resources and infrastructure.

Participants provided practical recommendations for improving Anti-VAWC initiatives, particularly emphasizing the necessity of establishing monitoring and evaluation frameworks, incorporating technology-based reporting mechanisms, and strengthening collaborative partnerships among stakeholders. These suggestions highlight the importance of both long-term sustainability and systemic improvements. Monitoring is crucial, as existing research highlights the importance of tracking case outcomes. This helps ensure consistent care and the effectiveness of programs. From a theoretical perspective, the findings strongly support the Social Ecological Model, which explains that violence is influenced by multiple interacting factors at the individual, interpersonal, community, and institutional levels. For instance, underreporting reflects individual and interpersonal factors such as fear and dependency, while referral system gaps represent institutional-level challenges. This multi-level

interaction suggests that effective VAWC prevention requires comprehensive and integrated interventions.
The qualitative results carry important implications for both policy and practical application. Initially, mitigating underreporting necessitates the enhancement of community awareness initiatives and survivor-focused support structures designed to cultivate trust and diminish stigma. Furthermore, refining referral systems demands the establishment of standardized protocols and more robust inter-agency coordination strategies to guarantee prompt and effective service provision.
Furthermore, the augmentation of Anti-VAWC advocates' capabilities necessitates ongoing professional development initiatives, specifically focusing on counseling techniques, case management strategies, and trauma-informed care principles. Furthermore, Local Government Units (LGUs) are obligated to dedicate resources towards the development of strong monitoring and evaluation frameworks, integrating digital technologies to facilitate the tracking of case progression and the assessment of intervention effectiveness. The sustained success of Anti-VAWC programs, in the final analysis, hinges on fostering community engagement and collaboration across various sectors.
The qualitative data suggests that, despite the functional nature and robust advocacy surrounding community-based Anti-VAWC interventions in Ragay, substantial systemic obstacles persist. These challenges, specifically concerning reporting mechanisms, coordination among stakeholders, and the allocation of resources, constitute considerable impediments. Consequently, a comprehensive, multi-tiered strategy designed to address these issues is essential for improving the efficacy, responsiveness, and long-term viability of Anti-VAWC initiatives.

Proposed Intervention Framework

TITLE: Project SAFE: Strengthening Anti-VAWC Framework for Empowerment

Overview
The suggested intervention strategy aims to improve the effectiveness, long-term viability, and flexibility of community-based Anti-VAWC programs within Ragay, Camarines Sur. Grounded in the Social Ecological Model, this approach employs an Input–Process–Output (IPO) framework. Consequently, this structure facilitates a comprehensive, multi-tiered methodology for addressing VAWC.
Framework Components
1. Inputs
- Demographic profile of advocates
- Knowledge, Attitudes, and Practices (KAP) levels
- Existing policies (RA 9262, LGU ordinances)
- Available resources (human, financial, technological)

2. Processes (Core Interventions)
A. Capacity Building Program
- Training on VAWC laws, counseling, and trauma-informed care
- Skills development in case management and documentation

B. Strengthened Referral System
- Standardized referral protocols
- Inter-agency coordination mechanisms
- Establishment of a centralized reporting system

C. Monitoring and Evaluation System
- Development of case tracking tools (manual or digital)
- Regular monitoring and reporting of case outcomes
- Feedback mechanisms for continuous improvement

D. Community Awareness and Advocacy
- Information campaigns and community forums
- Gender sensitivity training at the barangay level
- Youth and community engagement programs

3. Outputs/Outcomes
- Improved referral system efficiency
- Enhanced gender responsiveness of services
- Increased reporting and reduced stigma
- Strengthened community participation
- Sustainable Anti-VAWC programs

Table 8. Proposed Implementation Strategy

Component	Key Activities	Expected Output
Capacity Building	Conduct quarterly training	Skilled and competent advocates
Referral System	Develop protocols and coordination meetings	Efficient and timely case handling
Monitoring System	Implement tracking tools	Improved case follow-up
Awareness Campaign	Conduct community programs	Increased awareness and reporting

Sustatinability Plan

For Project SAFE – Strengthening Anti-VAWC Framework for Empowerment – to make a real difference, several core components are absolutely necessary. Integrating the project into the structures already in place is the first step. Ongoing capacity building is also critical. Collaboration across different sectors is essential. A key step in this process involves including the program in the Local Government Unit's annual plans and financial resources. It guarantees steady financial backing for Anti-VAWC efforts, eliminating the unpredictability of short-term funding. Anti-VAWC advocates will continue to benefit from training and access to the latest resources. This ongoing support will enhance their skills in areas like case management, counseling, and providing gender-sensitive services.
Furthermore, strengthening connections among vital entities—local government, law enforcement, social services, educational institutions, and community organizations—will foster collaboration and a shared sense of responsibility.
In conclusion, although Anti-VAWC interventions in Ragay demonstrate overall efficacy, the fortification of monitoring systems, referral mechanisms, and capacity-building endeavors is crucial for enduring impact. The suggested Project SAFE framework offers a structured and practical model, designed to rectify identified deficiencies and augment the overall effectiveness of community-based Anti-VAWC programs.

Conclusion

The study's results lead to the following conclusions:
1. Anti-VAWC advocates in Ragay demonstrate robust foundational competencies, as indicated by their high levels of knowledge and positive attitudes, thereby facilitating the effective execution of community-based interventions.
2. Knowledge and attitudes exert a significant influence on practices, thereby validating the study's conceptual framework, which posits that KAP is crucial in determining the quality of Anti-VAWC interventions.
3. Community-based programs often show positive results, especially in raising awareness and encouraging community involvement. This highlights the effectiveness of grassroots approaches in addressing violence against women and children (VAWC).
4. However, systemic deficiencies persist, notably in the realms of monitoring, evaluation, and referral processes, which subsequently undermine the enduring viability and long-term effectiveness of these interventions.
5. The prevention of VAWC necessitates a multi-tiered and integrated strategy, as the Social Ecological Model suggests, wherein individual capabilities, institutional resources, and community participation jointly shape the resultant outcomes.
   Recommendations

Based on the findings and subsequent analysis, the following recommendations are put forth:
1. For Local Government Units (LGUs):
   a. Establish consistent procedures for the monitoring and evaluation of VAWC cases, complete with tracking and reporting mechanisms.
   b. Strengthen inter-agency coordination by implementing clear protocols and scheduling regular planning meetings.
   c. Ensure that Anti-VAWC initiatives and services are adequately funded and resourced.
2. For Anti-VAWC Advocates and Practitioners
   a. Engage in ongoing training, especially in areas like counseling, trauma-informed care, and case management.
   b. Improve how you document and follow up, so survivors get consistent support.

c. Run community awareness campaigns to tackle underreporting and the stigma surrounding these issues.

3. For Educational Institutions

a. Incorporate gender sensitivity and awareness of Violence Against Women and Children (VAWC) into both curricular and extension programs.
b. Collaborate with local government units (LGUs) and civil society organizations to implement community outreach and training initiatives.

4. For Policy Makers and Stakeholders

a. Formulate policies that facilitate the digitalization of referral and monitoring systems.
b. Bolster collaborative frameworks across various sectors to ensure a unified approach when addressing cases of violence against women and children.

5. For Future Researchers

a. Conduct longitudinal studies to assess the long-term impact of Anti-VAWC interventions.
b. Explore comparative studies across municipalities to identify best practices.
c. Investigate the role of technology-based interventions in improving reporting and monitoring systems.

Problematic Social Media Use as a Persistent Concern: Reflections from Two Cohorts of Norwegian Teachers

Beata Joanna Godejord

Nord University, Norway

Abstract

The rapid expansion of social media use continues to shape communication, education, and society at large, raising persistent questions about its pedagogical, psychological, and ethical implications. Building on last year's investigation into teachers' reflections on the informational and educational dimensions of social media [1], this follow-up study examines how a new cohort of participants in the Nord University course Informational and Educational Aspects of Social-Media engages with these issues. As in the previous study, participants produced reflective blog posts as part of their coursework, and content analysis was used to identify recurring themes, concerns, and potential shifts in perspective. In line with last year's findings—where "Problematic Social Media Use" and concerns about youth mental health dominated reflections—this year's data continues to foreground the same thematic focus. Social media's influence on mental health remains a central point of concern. A comparison of the two cohorts reveals no substantive shift in professional concerns among Norwegian teachers, suggesting a stable pattern of perceived challenges across consecutive years and indicating that the profession's underlying stressors and role demands remain largely unchanged.

Taken together, these findings point to a consistent set of pedagogical needs. The stability of teachers' concerns underscores the importance of strengthening course components that address critical digital literacy and AI-augmented content ecosystems. By responding directly to the issues that persist across cohorts, the study contributes to ongoing discussions about how teacher education can more effectively prepare professionals to navigate the complexities of social media use in contemporary educational environments.

Keywords: *Problematic social media use, youth mental health, teachers' perspectives, critical digital literacy*

1. Introduction

Social media has become a defining feature of contemporary communication and education, prompting ongoing debate about its pedagogical value, psychological risks, and ethical consequences [2-4]. For teachers, these debates are not abstract: they intersect with daily professional responsibilities, expectations, and pressures. Educators must navigate students' digital behaviours, respond to concerns about wellbeing, and make informed decisions about how - or whether - to integrate social media into learning activities. As a result, teachers' reflections on social media are shaped not only by theoretical considerations but also by the practical realities of classroom management, safeguarding, and curriculum demands.

Last year's study of participants in the Nord University course *Informational and Educational Aspects of Social-Media* (IKT 1022) highlighted how concerns about problematic social media use - particularly its impact on young people's mental health - dominated teachers' reflections [1]. The present study extends this work by examining a new cohort enrolled in the same course and analysing their reflective blog posts through content analysis.

By comparing two consecutive cohorts, the study investigates whether teachers' perspectives on social media are shifting or stabilising over time. The findings indicate a striking continuity: concerns about mental health and problematic engagement remain central, suggesting that the profession's underlying stressors and perceived challenges have not substantially changed. This stability underscores the need for teacher education programmes to strengthen components related to critical digital literacy and AI-augmented content ecosystems, ensuring that training responds to the persistent issues teachers identify in their professional practice. In particular, the growing influence of AI in shaping digital content environments makes this an urgent priority. AI-driven recommendation systems, generative content, and automated amplification processes increasingly mediate what users see, how information is framed, and how social comparisons are intensified [5,6]. Without a clear understanding of how these systems

operate, both teachers and students may struggle to recognise manipulated, misleading, or emotionally triggering content.

2. Context

ICT1022 forms part of the continuing education programme *ICT and Learning 1*, which attracts practising educators from primary and secondary schools, as well as instructors and trainers working in both public and private organisations. The programme is designed to strengthen participants' digital competence and pedagogical understanding of technology-rich learning environments, with a particular emphasis on the critical, ethical, and instructional dimensions of digital media.
Within their assignment work, students are required to produce reflective blog posts in which they engage with course literature, current debates, and their own professional experiences. These blog posts serve a dual function: they operate as a pedagogical tool that encourages metacognitive reflection, and they provide a rich source of qualitative data for examining how educators conceptualise the informational and educational aspects of social media. Because participants come from diverse institutional and professional backgrounds, their reflections offer insight into how social media is perceived across different segments of the Norwegian educational landscape.
The present study draws on these blog posts to explore how teachers articulate opportunities, challenges, and concerns related to social media use.

3. Methodology

3.1 Data

This study examines blog posts produced by students enrolled in the course *Informational and Educational Aspects of Social-Media* during the autumn semester of the 2025/26 academic year. In research on digital learning environments, blog posts can function either as data in themselves or as sources that generate additional data through interactions such as comments, hyperlinks, or embedded media. In the present study, the analytical focus is limited to the content of the posts as standalone artefacts. The analysis therefore centres on the topics, sentiment, and key terms expressed in the students' reflections, rather than on extracting further information from comment threads or factual material included within the posts. Accordingly, the blog posts are treated as data, not as providers of data.
Students created their blog posts within a Confluence workspace, a platform commonly used for collaborative knowledge sharing, documentation, and project coordination. Access to the posts was shared with peers through links posted in the course's online classroom (Canvas LMS). The choice of Confluence served two pedagogical purposes: first, to support blogging as a collaborative reflective practice; and second, to familiarise students with professional digital platforms that can be used for communication and knowledge sharing in work-related contexts. A total of 23 students completed the blogging assignment (N = 23).

3.2 Analytical Framework and Procedure

The data were examined using qualitative content analysis, a method widely applied to diverse forms of human communication, including both linguistic and non-linguistic texts [7]. Written reflections such as blog posts are particularly well suited to this approach, as they provide structured yet naturally occurring material for identifying patterns of meaning.
To establish the analytical framework, the data were coded and meaning was subsequently developed through interpretive engagement [8, 9]. The analysis followed an inductive logic: no predefined coding scheme was applied. Instead, assumptions and conceptual categories emerged directly from the material, with codes constructed on the basis of meaning attributed to the students' reflections. Understanding participants' perspectives from their own standpoint was central to the process, aligning with principles associated with grounded theory [10].
The organisation and interpretation of the material unfolded in two stages. First, the blog posts were segmented into smaller units of meaning and assigned initial codes. Second, these codes were reviewed and grouped into broader categories that captured recurring themes across the dataset.
The coding process was supported by NVivo, a qualitative data analysis software (CAQDAS), which facilitated systematic organisation, retrieval, and comparison of coded segments.

4. Results

Although participants acknowledged several positive aspects of social media use - such as opportunities for social contact, access to information, and creative expression - the prevailing part of their reflections centred on its negative impact on well-being. Through iterative coding and subsequent consolidation, six overarching themes were identified.

Psychological Distress

This was the dominant theme in the dataset and was primarily driven by the code *Anxiety & depression*. It emerged from the consolidation of the codes *Anxiety & depression* and *Pressure*, which consistently clustered around participants' descriptions of emotional strain. Notably, *Anxiety & depression* was both more frequent and more widely distributed across the material than *Pressure*, appearing in 18 files and 31 references compared to 9 files and 11 references for *Pressure*. Together, these codes captured a broad spectrum of affective responses, including heightened anxiety, mood deterioration, and a persistent sense of psychological burden linked to digital environments (see Figure 1 for the NVivo coding structure underlying this theme).

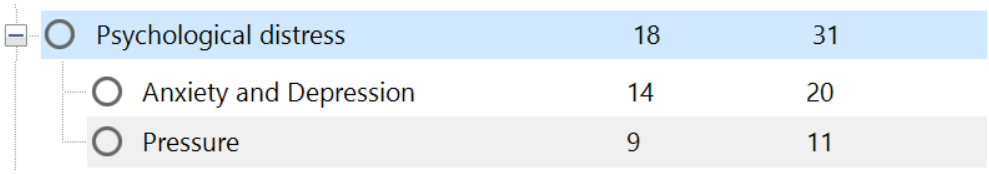

Fig. 1. NVivo coding structure for Psychological Distress

Digital Appearance Pressure

The second theme, *Digital Appearance Pressure*, was primarily driven by the code *Social comparison*. It was formed by collapsing the codes *Body image/self image*, *Digital flexing*, and *Social comparison*, which shared a common mechanism of self-evaluation shaped by online visibility. Among these, *Social comparison* was the most prominent, appearing in 11 files and 18 references. Participants highlighted how performative displays, together with continual comparisons to peers or influencers, operated as mechanisms that heightened concerns about physical appearance and personal adequacy (Figure 2 presents the NVivo structure for Digital Appearance Pressure).

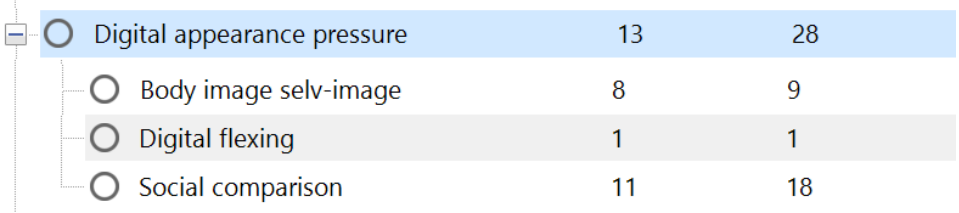

Fig. 2. NVivo coding structure for Digital Appearance Pressure

Social Harm and Isolation

The third theme, *Social Harm and Isolation*, was primarily driven by the code *Mobbing & exclusion*. It emerged from the codes *Feeling of inadequacy*, *Loneliness*, *Mobbing & exclusion*, *Strangers*, and *Exclusion if NOT*, which collectively pointed to experiences of social disconnection and exclusionary dynamics. Among these, *Mobbing & exclusion* was the most frequently referenced, appearing in 7 files and 14 references. The theme captures both interpersonal harm (e.g., bullying, exclusion, unsolicited contacts) and the broader phenomenon of social isolation amplified by online interactions (Figure 3 illustrates the NVivo coding structure supporting this theme).

Social harm and isolation	12	24
Excl. if NOT	1	1
Feelings of inadequacy	3	3
Loneliness	3	4
Mobbing & Exclusion	7	14
Strangers	2	2

Fig. 3. NVivo coding structure for Social Harm and Isolation

Curated Digital Realities

The fourth theme, *Curated Digital Realities*, was primarily driven by the code *Perfect images*. It resulted from merging the codes *Carefully selected content*, *Perfect images*, and *Perfect world*, which together described the construction of idealized, unrealistic digital environments. Among these, *Perfect images* was the most frequently referenced, appearing in 9 files and 10 references. Participants emphasized how manipulated self-presentation and highly curated content contributed to distorted perceptions of everyday life, reinforcing unattainable standards and masking the complexities of real experiences (Figure 4 shows the NVivo coding structure for this theme).

Curated digital realities	10	19
Carefully selected content	3	5
Perfect images	9	10
Perfect world	3	4

Fig. 4. NVivo coding structure for Curated Digital Realities

Problematic Digital Engagement

The fifth theme, *Problematic Digital Engagement*, was primarily driven by the code *Addiction*. It was derived from the codes *Addiction* and *FOMO* (Fear of Missing Out), which represent different but related mechanisms - compulsive use versus fear-driven engagement. Among these, *Addiction* was the most frequently referenced, appearing in 5 files and 8 references. Together, these codes describe maladaptive behavioural patterns shaped by platform design, reward loops, and constant connectivity, reflecting a behavioural domain in which digital use becomes difficult to regulate (Figure 5 displays the NVivo coding structure for Problematic Digital Engagement).

Problematic digital engagement	8	12
Addiction	5	8
FOMO	4	4

Fig. 5. NVivo coding structure for Problematic Digital Engagement

Informational Landscape Risks

The sixth theme, *Informational Landscape Risks*, was primarily driven by the code *Exposure to extreme content*. It emerged from the codes *Echo chambers*, *Exposure to extreme content*, and *Fake news*, which converge on vulnerabilities created by the contemporary information environment. Among these, *Exposure to extreme content* was the most frequently referenced, appearing in 3 files and 8 references. Participants described how algorithmic filtering, misinformation, and exposure to harmful content shape understandings of the world and contribute to feelings of confusion, polarization, or threat (Figure 6 presents the NVivo coding structure for Informational Landscape Risks).

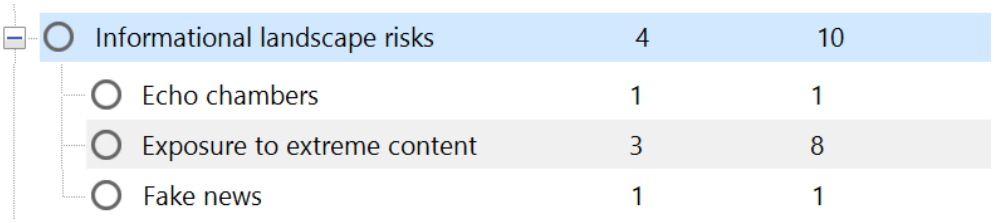

Fig. 6. NVivo coding structure for Informational Landscape Risks

5. Discussion

Taken together, the six themes identified in the analysis point toward a multilayered model of digital vulnerability that captures the complex ways in which social media environments affect young people. This model encompasses several interrelated dimensions: emotional vulnerability, identity vulnerability, social vulnerability, behavioural vulnerability, and informational vulnerability. Such a perspective aligns with broader scholarship emphasising that adolescents' online experiences are shaped not only by individual choices but also by the relational and structural dynamics of networked platforms [3,11].

Emotional vulnerability refers to experiences of psychological distress, including anxiety, insecurity, and diminished well-being - patterns that mirror evidence showing that digital environments can intensify emotional reactivity and fluctuations in mental health [12]. Identity vulnerability emerges through pressures related to appearance and the influence of highly curated and idealised representations of life, which may distort users' perceptions of themselves and others [13]. Social vulnerability involves risks associated with exclusion, negative interactions, and exposure to harmful or potentially dangerous individuals, echoing meta-analytic findings that online peer dynamics can amplify social tensions and hostile interactions [14]. Behavioural vulnerability is reflected in patterns of compulsive engagement, such as excessive use and fear of missing out (FOMO), which can reinforce dependency on digital platforms [15]. Finally, informational vulnerability highlights exposure to misinformation, algorithmically amplified content, and potentially extreme or harmful material resonating with analyses of how algorithmic curation shapes users' informational environments and can narrow or distort what young people encounter online [16].

Importantly, these layers do not operate independently. Rather, they interact dynamically, often reinforcing and intensifying one another. For instance, exposure to curated realities may heighten appearance pressure, which in turn contributes to emotional distress. Similarly, experiences of social exclusion can lead to increased and potentially problematic engagement with social media, while informational risks - such as misinformation or sensationalised content - may further exacerbate emotional strain.

Overall, these findings support a holistic understanding of digital well-being. Such an understanding moves beyond a narrow focus on individual behaviour to recognise the broader influence of social dynamics and platform design. This perspective aligns with the teachers' reflections, which implicitly acknowledge that students' online experiences are shaped not only by personal choices but also by structural and relational dimensions of digital environments.

6. Conclusion

This study examined teachers' reflections on the informational and educational dimensions of social media within the context of ICT1022, revealing how educators interpret digital platforms as complex environments that shape students' emotional, social, behavioural, and informational experiences. Across the six themes, teachers consistently framed social media not merely as a set of tools but as a socio-technical ecosystem that produces both opportunities and vulnerabilities. Their reflections highlight how psychological distress, appearance-based pressures, social exclusion, curated realities, problematic engagement, and informational risks intersect to influence students' well-being.

The findings demonstrate that teachers are acutely aware of the structural forces embedded in platform design and recognise their implications. Importantly, teachers do not view these challenges as peripheral to education. Instead, they position them as central to contemporary digital competence and as areas requiring explicit pedagogical attention.

Within the ICT1022 framework, these insights underscore the need for digital literacy education that extends beyond technical skills to include emotional resilience and critical media analysis. Teachers' reflections show that they are ready to engage with these broader dimensions, but they also signal the

need for continued professional development that equips educators to navigate and teach within increasingly complex digital environments.
Ultimately, this study contributes to a growing body of research emphasising that digital well-being, critical information literacy, and social media pedagogy must be integrated into teacher education. As digital platforms continue to shape the conditions of learning and social life, teachers' capacity to understand, interpret, and mediate these environments will remain essential.

Translating Sustainability Strategies into Pedagogical Practice in Higher Education

Masoumeh Shahverdi[1], Tatiana Aleksandrovna Iakovleva[2], Nora Gravdal[3] Stine Lindanger[4]

[1,2,3,4]University of Stavanger, Norway

Abstract

Higher education institutions are increasingly expected to play an active role in advancing sustainable development through education, research, and institutional governance. This study examines how sustainability-oriented strategies are translated into pedagogical practice and how they are experienced by students and educators within a university setting, drawing on perspectives from education for sustainable development and student engagement theory. Using a mixed-methods approach, the research combines survey data from 175 students with semi-structured interviews conducted with educators, student representatives, and members of the university administration. In addition, institutional strategy documents were systematically analyzed to explore the relationship between strategic intentions and everyday teaching practices. The findings indicate that although sustainability is clearly articulated at the strategic level, its integration into teaching and learning remains uneven. Student awareness and engagement vary considerably, while educators describe structural constraints, limited pedagogical support, and challenges related to interdisciplinary teaching. These results suggest that sustainability education risks remaining fragmented unless it is supported by coherent pedagogical frameworks, clearer communication, and curriculum-level integration. The study contributes to education theory by offering empirical insight into how institutional strategies, pedagogical conditions, and student engagement intersect in practice, and by highlighting factors that influence the educational effectiveness of sustainability initiatives in higher education.

Keywords: *sustainability education, education for sustainable development, student engagement, pedagogical practice, higher education.*

1. Introduction

Higher education institutions are increasingly expected to play a central role in addressing global sustainability challenges through education, research, and institutional governance [1], [2]. In recent decades, sustainability has become a strategic priority for universities worldwide, reflected in institutional policies, mission statements, and international frameworks such as the United Nations Sustainable Development Goals [1], [5]. Universities are not only seen as sites for knowledge production but also as key actors in shaping future generations' competencies, values, and behaviors related to sustainable development [3], [6]. As a result, the integration of sustainability into higher education has moved beyond symbolic commitment toward expectations of meaningful educational impact [2], [4].

[1] Despite this growing emphasis at the strategic level, a persistent challenge remains in translating sustainability ambitions into pedagogical practice [4], [7]. While universities often articulate strong sustainability goals in institutional strategies and policy documents, the extent to which these commitments are reflected in teaching and learning processes is less clear [2]. Previous research has highlighted that sustainability initiatives in higher education frequently remain fragmented, with limited integration into curricula and inconsistent engagement among students and educators [7], [1], [8]. This gap between institutional intention and educational practice raises important questions about how sustainability is enacted within the everyday realities of teaching and learning [10], [7].

Education for Sustainable Development (ESD) provides a useful framework for understanding these challenges [1], [6]. ESD emphasizes the development of competencies that enable learners to critically engage with complex sustainability issues and to contribute to societal transformation [6]. However, achieving these outcomes requires more than the inclusion of sustainability content; it demands pedagogical approaches that actively engage students and foster interdisciplinary learning, critical thinking, and real-world application [6], [10]. At the same time, student engagement theory suggests that meaningful learning is closely linked to students' active participation, perceived relevance of content, and interaction with educators and peers [9]. From this perspective, the effectiveness of sustainability

education depends not only on institutional strategies but also on how these strategies are experienced and enacted within the learning environment [6], [9].
Existing literature has explored sustainability in higher education from various perspectives, including policy development, curriculum design, and institutional transformation [2], [4]. However, less attention has been given to the process through which sustainability strategies are translated into pedagogical practice and how this process is shaped by the interaction between institutional structures, educators, and students [4], [10]. In particular, there is a need for empirical research that examines both the strategic intentions of universities and the lived experiences of those involved in teaching and learning [10]. Understanding this translation process is essential for identifying why sustainability initiatives often fail to achieve their intended educational impact [7], [10].
This study addresses this gap by examining how sustainability-oriented strategies are translated into pedagogical practice within a higher education context. Focusing on the University of Stavanger as a case study, the research adopts a mixed-methods approach combining survey data from students, semi-structured interviews with educators, student representatives, and administrative staff, and an analysis of institutional strategic documents. By integrating multiple sources of data, the study provides a comprehensive view of how sustainability is positioned at the strategic level and how it is experienced in practice.
The aim of this paper is therefore to explore the relationship between institutional sustainability strategies and pedagogical practice, with particular attention to student engagement and educator perspectives. More specifically, the study seeks to understand (1) how sustainability is articulated in institutional strategies, (2) how these strategies are reflected in teaching and learning practices, and (3) how students and educators experience and interpret these processes. By doing so, the paper contributes to research on education for sustainable development by offering empirical insight into the conditions that shape the effectiveness of sustainability education in higher education. To better understand how sustainability strategies are translated into pedagogical practice, the following section presents the theoretical perspectives that guide the analysis, with particular attention to Education for Sustainable Development and student engagement.

2. Theoretical Framework

The integration of sustainability into higher education is commonly framed within Education for Sustainable Development (ESD), which emphasizes the role of universities in preparing students to address complex global challenges [1], [6]. ESD focuses on the development of competencies such as critical thinking, systems thinking, and the ability to engage with real-world problems, requiring pedagogical approaches that are participatory, interdisciplinary, and practice-oriented [6].
Despite this emphasis, sustainability integration in higher education often remains uneven [7]. While many institutions have adopted sustainability as a strategic priority, its implementation in teaching and learning is strongly influenced by individual educators and disciplinary contexts. This highlights a gap between institutional sustainability commitments and educational practice, suggesting that strategic commitment alone is insufficient to ensure meaningful sustainability education [7], [10]. Student engagement theory provides a complementary lens for understanding this gap. Engagement is closely linked to active participation, cognitive involvement, and perceived value and relevance of learning [9]. In sustainability education, this is particularly important, as students must connect theoretical knowledge with practical and societal applications [6]. Active and experiential learning approaches are therefore associated with higher levels of engagement and deeper understanding [12], [9].
These perspectives highlight the importance of pedagogical design in shaping how sustainability is experienced by students. Educators play a central role as mediators between institutional strategies and classroom practice, but their ability to integrate sustainability is influenced by institutional conditions such as pedagogical support and opportunities for interdisciplinary collaboration [10], [7]. In the absence of coordinated support, sustainability integration often remains fragmented [7], [4].
The relationship between institutional strategies and pedagogical practice can therefore be understood as a process of translation rather than direct implementation. Institutional policies articulate sustainability intentions, but these must be interpreted and enacted within teaching contexts [10]. This process is shaped by the interaction between institutional conditions, pedagogical practices, and student engagement, resulting in varying degrees of alignment between sustainability goals and learning outcomes [10], [6], [9].
Building on these perspectives, this study examines how sustainability strategies are translated into pedagogical practice in higher education, with a focus on the conditions that influence this process and its implications for student engagement and learning.

3. Methodology

This study adopts a mixed-methods approach to examine how sustainability-oriented institutional strategies are translated into pedagogical practice within a higher education context. The study combines three sources of data: a student survey, semi-structured interviews, and institutional document analysis (see Figure 1). Data were collected during Spring 2024 at the University of Stavanger. The mixed-methods design was selected to provide both breadth in understanding student perspectives and depth in exploring institutional and pedagogical experiences. Semi-structured interview guides and a survey instrument were developed in alignment with the study's research questions and theoretical framework, with interview prompts adapted to different participant groups. [2]

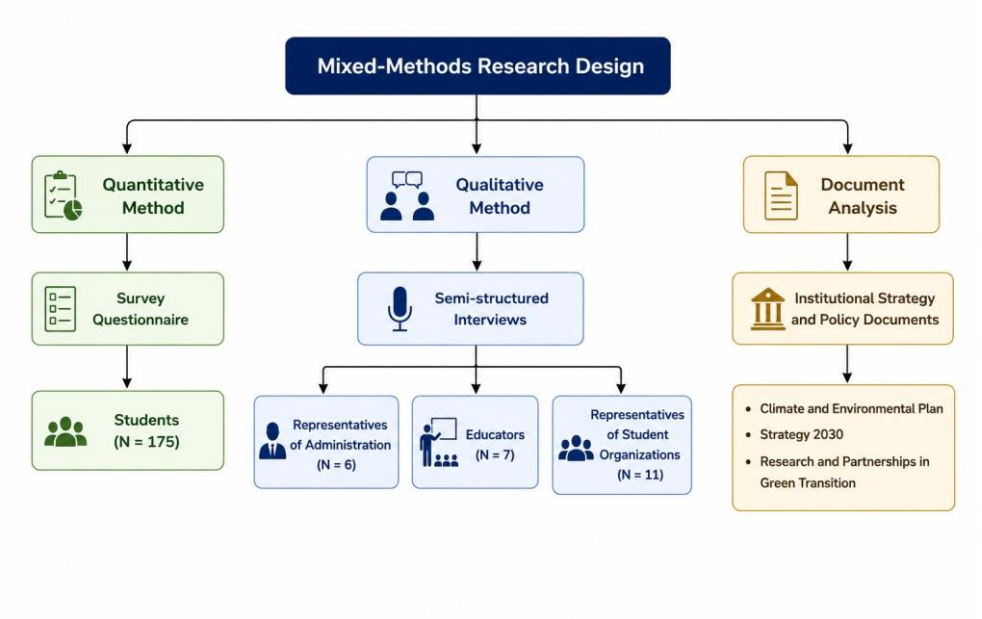

Fig. 1. Overview of the mixed-methods research design

An overview of the study's data sources, participants, and analytical approaches is presented in Table 1.

Table 1. Overview of data sources and analytical approaches

Data source	Participants / Material	Purpose	Analysis method
Student survey	175 UiS students	Explore sustainability awareness, educational exposure, and engagement	Descriptive and exploratory statistical analysis
Semi-structured interviews	24 informants	Explore pedagogical and institutional experiences	Thematic analysis
Institutional documents	Strategy and policy documents	Examine sustainability discourse and institutional priorities	Qualitative document analysis

A total of 182 responses were initially collected, of which 175 valid responses from University of Stavanger students were retained for analysis. Quantitative data were collected through a survey distributed to students across different study programs at the University of Stavanger. The demographic characteristics of the survey participants are presented in Table 2.

Table 2. Demographic characteristics of survey participants (N = 175)

Variable	Category	n (%)
Gender	Women	111 (63.4)
	Men	64 (36.6)
Age	19–21	59 (33.7)
	22–25	82 (46.9)
	26–29	22 (12.6)
	30+	12 (6.9)
Study level	Bachelor programs	95 (54.3)
	Master programs	76 (43.4)
	Other	4 (2.3)
Largest field representation	Economics and Law	62 (35.4)
	Health Sciences	39 (22.3)
	Teacher Education	23 (13.1)

The structure of the survey instrument is presented in Table 3.

Table 3. Structure of the survey instrument and question categories

SECTION	EXPLANATION
A	Demographic information and control questions were measured using five single-choice format questions.
B	General knowledge about sustainability, survey questions included one closed yes/no question, three single-choice questions, and one question using a five-point Likert scale (1 = “I completely disagree” to 5 = “I completely agree”).
C	The five competencies were measured as follows: • Systems Thinking was measured with four items using one closed question each. • Anticipatory Competence was measured with four items using a five-point Likert scale ranging from 1 = “I completely disagree” to 5 = “I completely agree”. • Normative Competence was measured with four items using a five-point Likert scale ranging from 1 = “I completely disagree” to 5 = “I completely agree”. • Strategic Competence was measured with four items using a five-point Likert scale ranging from 1 = “I completely disagree” to 5 = “I completely agree”. • Interpersonal Competence was measured with four items using a five-point Likert scale ranging from 1 = “I completely disagree” to 5 = “I completely agree”.
D	Customized questions were measured with six items using a five-point Likert scale (1 = “I completely disagree” to 5 = “I completely agree”).

The survey explored students’ awareness of sustainability, their exposure to sustainability-related education, perceptions of institutional sustainability efforts, and engagement with sustainability initiatives. The survey data were analyzed using descriptive and exploratory statistical methods to identify patterns and variations in students’ sustainability awareness and engagement across educational contexts.

Qualitative data were obtained through semi-structured interviews with 24 informants: six representatives from administration/top management, seven educators, and eleven student organization representatives. The interviews were conducted between 23 April and 8 May 2024, either face-to-face on campus or digitally via Microsoft Teams, depending on participant availability. Different semi-structured interview guides were developed for each participant group in alignment with the study’s research questions and theoretical framework.

The interviews focused on participants’ experiences with sustainability in teaching, institutional priorities, and perceived challenges in integrating sustainability into pedagogical practice. The interview data were transcribed and analyzed using thematic analysis to identify recurring patterns and key themes.

In addition, institutional strategy documents were examined through qualitative document analysis to

explore how sustainability is articulated at the policy level and how these strategic intentions relate to educational practices. The combination of survey data, interview insights, and document analysis enables a comprehensive understanding of the relationship between institutional strategies and pedagogical implementation.

4. Results

The findings are structured around three key dimensions: (1) the relationship between institutional sustainability strategies and pedagogical practice, (2) student awareness and engagement, and (3) educators' experiences and perceived constraints.

4.1 Strategic Commitment and Pedagogical Practice

The analysis of institutional documents shows that sustainability is clearly positioned as a strategic priority. The university emphasizes its role in contributing to sustainable development through education, research, and societal engagement, with explicit alignment to the United Nations Sustainable Development Goals. The document analysis was based on three institutional sources: the Climate and Environmental Plan, Strategy 2030, and UiS material on research and partnerships in green transition, all of which repeatedly connected sustainability to educational development, research activity, institutional operations, and societal transformation.

However, this strategic commitment is not consistently reflected in pedagogical practice. While sustainability is present in some courses and programs, its integration appears uneven and largely dependent on individual initiatives. Interview findings suggested that sustainability integration often depended on individual educator initiative rather than systematic curriculum design. As one educator explained, "Yes, It's quite free, in that sense, to organize the teaching. In that sense, the organization doesn't interfere much with the content of the teaching".

These findings indicate inconsistencies between institutional sustainability strategies and their implementation in teaching practices. Although sustainability is well articulated at the policy level, its translation into pedagogical practice lacks coherence, resulting in fragmented implementation across disciplines.

4.2 Student Awareness and Engagement

Survey findings indicate variation in students' awareness and engagement with sustainability. This variation was particularly visible in students' reported exposure to sustainability-related content across different study programs. While many students recognize the importance of sustainability, a substantial proportion report limited exposure to sustainability within their formal education. Perceptions of the visibility and consistency of the university's sustainability efforts also varied among respondents.

Students reported differing experiences regarding how sustainability was integrated into teaching and learning. While some participants experienced sustainability as visible within courses and educational activities, others perceived sustainability integration as limited or inconsistently addressed across programs. As one student representative stated, "I would have appreciated more sustainability in all study programs".

Perceptions of the visibility and consistency of the university's sustainability efforts also varied among respondents. Some participants considered current sustainability efforts sufficient, while others perceived sustainability integration as limited across educational contexts. As one participant noted, "I think the university could have even more focus on integrating sustainability into teaching and research". This variation indicates that student engagement is shaped not only by institutional strategies but also by how sustainability is integrated into learning experiences.

4.3 Educator Perspectives and Constraints

Interviews with educators and administrative staff reveal several challenges in integrating sustainability into teaching. While sustainability is widely recognized as important, its implementation is constrained by structural and pedagogical factors.

A key issue identified is the lack of structured pedagogical support. Although sustainability is emphasized at the strategic level, many educators described limited pedagogical guidance and insufficient institutional support for integrating sustainability into course design. As one educator explained, "Yes, it's quite free, in that sense, to organize the teaching. In that sense, the organization

doesn't interfere much with the content of the teaching". The analysis further revealed that "educators usually have great freedom to determine the curriculum content themselves", resulting in sustainability integration often depending on individual initiative rather than coordinated institutional practice.
Interdisciplinary collaboration was also highlighted as both necessary and difficult. One educator described this challenge by stating, "We do try, but it's difficult in an organization like this to make it happen… There are quickly tensions because there are silos here that are working towards their own interests, which means they don't want to let go of any of their resources. So, there is a desire for it, but I think it's quite difficult to achieve".
The thesis additionally notes that "the lack of clear guidelines and sufficient resources, combined with the expectation gap between students and educators, contributes to difficulties in encouraging student involvement in sustainability beyond the classroom". Interdisciplinary collaboration was also highlighted as both necessary and difficult. Educators acknowledged the importance of cross-disciplinary approaches but noted that institutional structures and disciplinary boundaries often limit collaboration.
In addition, tensions between academic autonomy and institutional direction contribute to variability in implementation. While educators have considerable flexibility in course design, the absence of coordinated institutional support contributes to uneven integration of sustainability across teaching practices and programs.

4.4 Summary of Findings

Overall, the findings reveal inconsistencies between institutional sustainability strategies and their implementation in teaching and learning practices. While sustainability is strongly represented within institutional policies and strategic priorities, students and educators described uneven integration across courses and programs. Variations in student engagement, limited pedagogical support, and challenges related to interdisciplinary collaboration emerged as key factors influencing how sustainability was experienced within the educational environment.

5. Discussion

From an education for sustainable development (ESD) perspective, the results suggest that the presence of sustainability at the strategic level does not automatically lead to effective pedagogical integration [11], [7]. While the university demonstrates a clear commitment to sustainability in its policies and strategic documents, this commitment is not consistently reflected in teaching and learning practices. This supports existing research indicating that sustainability initiatives in higher education often remain fragmented when not supported by structured pedagogical frameworks [7], [10]. The findings therefore reinforce the view that sustainability education requires more than institutional endorsement; it depends on the conditions under which teaching is designed and delivered [6], [11].
A key contribution of this study lies in highlighting the role of pedagogy as a mediating factor between institutional strategy and educational outcomes. The variation observed in student engagement suggests that learning experiences are shaped by how sustainability is integrated into the curriculum rather than by the existence of institutional strategies alone. In particular, the results indicate that students are more engaged when sustainability is approached through applied and practice-oriented methods, such as project-based learning and real-world problem solving. This aligns with student engagement theory, which emphasizes the importance of active participation and perceived relevance in promoting meaningful learning [12], [9].
At the same time, the findings draw attention to the structural and institutional constraints that shape pedagogical practice. Educators' experiences reveal that, despite recognizing the importance of sustainability, they often lack the necessary support to integrate it effectively into their teaching. The absence of clear guidelines, limited access to pedagogical resources, and challenges related to interdisciplinary collaboration contribute to inconsistencies in implementation. These findings suggest that the translation of sustainability strategies into practice is not solely an individual responsibility but is influenced by broader institutional conditions [10], [13].
[3] The tension between academic autonomy and institutional coordination in sustainability implementation further complicates this process. While flexibility in course design allows educators to adapt content to their disciplines, it also results in variability in how sustainability is addressed. Without coordinated efforts to support integration at the curriculum level, sustainability remains dependent on individual initiative rather than being embedded systematically across programs. This reinforces the need for institutional mechanisms that facilitate collaboration, provide pedagogical support, and ensure coherence in sustainability education [10], [13].

Taken together, the findings indicate that sustainability education in higher education is shaped by the interaction between institutional strategies, pedagogical practices, and student engagement. This interaction highlights the importance of viewing sustainability not only as a strategic priority but as an educational process that requires alignment across multiple levels of the institution. The results therefore contribute to education theory by demonstrating how institutional intentions are mediated by pedagogical and structural factors, influencing the extent to which sustainability becomes meaningful in students' learning experiences [14], [12].

6. Conclusion

This study examined how sustainability-oriented institutional strategies are translated into pedagogical practice within a higher education context. The findings indicate inconsistencies between institutional sustainability ambitions and their implementation in teaching and learning practices. Although sustainability is clearly emphasized within institutional strategies and policy documents, its integration into pedagogical practice remains uneven across courses and programs. Variations in student engagement, limited pedagogical support, and structural constraints experienced by educators were identified as important factors influencing this process.

The findings further suggest that institutional commitment alone is insufficient to ensure meaningful sustainability education [7]. Instead, the educational impact of sustainability initiatives depends on how sustainability is integrated into teaching and learning environments. Students reported different experiences regarding sustainability integration, while educators highlighted challenges related to limited guidance, insufficient resources, and difficulties associated with interdisciplinary collaboration. The study also indicates that students experience sustainability as more meaningful when it is visible and connected to their educational experiences.

From a theoretical perspective, the study contributes to research on education for sustainable development by illustrating how institutional strategies, pedagogical practices, and student experiences interact in shaping sustainability education within higher education. The findings support previous research suggesting that sustainability implementation is influenced not only by strategic priorities, but also by the institutional and pedagogical conditions through which these priorities are translated into practice [12].

The findings additionally have implications for policy and practice in higher education institutions. Strengthening sustainability education requires clearer pedagogical support, stronger curriculum-level integration, and improved opportunities for interdisciplinary collaboration. Greater coordination and communication across institutional levels may further contribute to more coherent sustainability implementation and more consistent student experiences.

Future research could further explore how sustainability integration differs across disciplinary contexts and educational levels, as well as how different pedagogical approaches influence students' sustainability engagement and competencies over time.

Sustainability and Community Tourism in the Amazon Region. The Experience of “Santa Helena Del Ingles”. Collective and Individual Dynamics and the Role of Education

Giovanna Campani

Comparative Cultural Studies, Universidad Pablo de Olavide, Spain

Abstract

While the Amazon biome can be divided into several Amazons, either by social, economic, cultural and environmental characteristics, in the area near Manaus, sustainable and community-based tourism is becoming an important resource for the "ribeirinha communities" (communities, whose members are of mixed origin- called "caboclos"). The main activity of these communities was woodcutter, until this region became a Sustainable Development Reserve (RDS) in 2008. Since the creation of this reserve, the communities had to find other activities. The paper follows the experience of the community of Santa Helena del Ingles (Saint Helen of the English) that, with the support of the Foundation for Amazon Sustainability, progressively developed other means of economic activity, such as sustainable tourism (they built a community hostel), handicrafts, production of natural products to sell the tourists. The opening of the community hostel has created at the same time collaborative dynamics and individual entrepreneurship, when some members have themselves opened new structures for hosting tourists. This new shift, which has seen women as the main actors, has been accompanied by specific university training that has represented an important achievement for people who had never considered this possibility. The paper describes the context and analyses the conditions for the community empowerement. Among the conditions, we underline the participation to a pioneering initiative, implemented by the Nilton Lins University, a graduation in Tourism Management, which began in 2022 in partnership with the Amazon Sustainable Foundation, and offers the course remotely, through distance education, making professional training more accessible to students far from large urban centers. It also includes scholarships. The Nilton Lins course focuses on empowering traditional communities for the development of community-based tourism and fostering local entrepreneurship. Students are guided to explore business opportunities, especially in the areas of accommodation, tours, restaurants, and other services already offered informally.

Keywords: *Sustainability, Empowerment, Tourism, Community*

Introduction

In November 2025, I did a fieldwork on women's participation in the management of sustainable tourism, as part of a project on sustainability in the Amazon region, in the Rio Negro Comunidade Santa Helena do Inglês, located in the municipality of Iranduba, about 40 km. from Manaus. This article starts from that experience, the article develops some theoretical reflexions about traditional communities, sustainability and ecological issues, processes of modernization/globalization and profit/capitalist logics.

Fig. 1. Community House at Santa Helena, where meetings are held

Santa Helena do Inglês is located within the Rio Negro Sustainable Development Reserve (RDS), established in 2008 for the protection of the Amazon rainforest. The creation of the Rio Negro Sustainable Development Reserve (RDS) brought about major transformations for the 19 communities within the area, whose populations, in addition to fishing and mini-agriculture, lived by selling forest firewood. Following the new territorial statute, and, for ecological reasons, the obligation of stopping with wood extraction, nine communities developed activities related to tourism and crafts.

Fig. 2. View of the Rio Negro from the Pousada (Guesthouse)

My fieldwork focused on women's participation in the management of sustainable tourism, as part of a project on sustainability in the Amazon region. In fact, women seemed particularly favorable to the reconversion imposed for ecological reasons. Most people in the *riberinha* communities were loggers spending their life deep in the Amazon rainforest. "*Before, we lived off logging; it was our only income. But in 2008 logging was prohibited, so it became very difficult for all the communities. Many people left for the capital in search of work. That's when the idea of community-based tourism emerged*," says Adriana, who has been the first manager of the community guesthouse Vista Rio Negro and now has opened her own place. Women became very active in the new activity, which gave them a prestigious role and allowed the contact with very different people.
Moreover, during the field work, I got to know the specificities of the *ribeirinha* community life, based on a strong idea of collective work and solidarity principles. According to the traditional community life, the decisions are always taken collectively in popular assemblies. This pattern fully worked in the passage from logging to the activity of community tourism.
The project of sustainable/community tourism was introduced and developed with the help the Fundação Amazônia Sustentável (FAS) that suggested as well other alternative activities. The community members opted for tourism because, in the meantime, other communities in the reserve had been working with tourism. The opening of a pousada (red and breakfast) Vista Rio Negro has been a collective work and profits have to be beneficial for the whole community.
The collective choice of tourism is so far seen in a very positive way by the community- as a form of exchange with the foreign people who come to visit and as the best way to preserve their lifestyles and the nature of the forest, accepting the abandon of wood extraction. The experience shows an interesting articulation between the preservation of the traditional way of life, the ecological sustainability and market principles. The article concludes on the conditions that can allow this positive articulation to continue.

The Riverside Communities/*Comunidades riberinhas* in the Amazon Region

The Brazilian Amazon is composed of a variety of indigenous peoples and ethnicities, and a population resulting from miscegenation, called "*caboclo*", a consequence of the colonization and occupation process that occurred in the region (Arenz, 2000). Miscegenation was then shaped through the settlements of missionaries and in the villages of colonists, from the 17th to the 19th centuries.
From 1850 onwards, the *caboclo* population increased due to an intense migration process, mainly from people from the Northeast of Brazil, at a time when the extraction of latex in the rubber plantations (raw material for rubber production) represented a moment of great wealth for the region.
These new residents settled along the riverbanks, giving rise to the term "ribeirinhos" (river dwellers). "*At every mouth of streams and rivers with resources and possibilities for exploitation, there was a post or trading post whose function was to channel the agro-extractive production brought from the interior lands and to drain it to the ports and larger cities*." (CASTRO, 2008, p. 17-18). Even when, after 1910-20, rubber exports declined due to English competition in the Asian colonies, resulting from the smuggling of the seed of the Brazilian rubber tree, the *caboclo* migrants didn't go back and stayed in the Amazon region.
The term "riverside dweller", then, seeks to identify a sociocultural profile of *caboclo* groups that settled on the banks of rivers, in a dynamic space that articulates the relations of sociability and culture within the particularities of that space, where the mark of this configuration can be seen in behaviors, in the way of life, in their food, in their beliefs, in their religiosity, etc., specific to that space. Nowadays the term "*ribeirinha*" community refers mainly to *caboclo* population. In fact, starting in the 1990s, when residents began to identify themselves as indigenous, they replaced the term community with "aldeia" village.

Fig. 3. Adriana is explaining the medical plants

Even marginalized, the “Ribeirinha” communities managed to resist total assimilation, preserving the main axes of their ancestors' culture: economic aspects (integration with nature, plant extraction), social aspects (autonomous living in small communities and work collectively, as many activities, such as fishing, agriculture, and housing construction, are carried out in communal work), and religious aspects (syncretism between Catholicism and practice of shamanism). According to Arenz, they consider that "*the Portuguese language and the Catholic religion are 'bridges' to the world of the 5'whites,' but they did not determine or fully express the social and cultural autonomy of the riverine communities*" (ARENZ, 2000, p. 12). They also have specific legends and specific mythological beings, as the curupira and the mapinguari or ishnashi, forest’s monstera and, at the same time, forest’s guardians.

Women's participation plays a prominent role in the communities. They actively contribute to family income and are involved in numerous activities. They have also the knowledge of the herbal treatments and they have the role of “curandeiras” (See picture, woman from Santa Helena, explaining the plants that are cultivated and that are used for different treatments).

The role of women was promoted in this new phase when the activities shifted from wood extraction to sustainable and community tourism. Abandoning their main economic activity—logging—wasn't easy and migration eventually occurred. That’s why the idea of community-based tourism, proposed by the Fundação Amazônia Sustentável (FAS) appeared as way of saving various communities on the river. That’s what happened in Santa Helena. Adriana, who first managed the guesthouse Vista do Rio, among many difficulties, as it didn’t always generate enough income, and then has opened her own space, insists on the positive aspects, repeating what she has learned in a training course online she followed at the University Nilton Lins in Manaus: “*Community-based tourism is a way of experiencing a destination from the perspective of those who live there. In practice, this means experiences led by the communities themselves, valuing local culture, generating income, and respecting the Amazon rainforest and way of life.*”

The community of Santa Helena de l'Ingles and the Building of the Posada Vista Rio Negro

The community that nowadays is composed by around 400 people, was founded in 1969 by Demétrio Vidal de Mendonça, father of ten children: "*When I arrived here it was all forest. I arrived single, worked for a year and then got married. I built a family, built a house and started planting crops, but my main activity was logging. I have many stories to tell*," he recalls. Other families (parents and friends), followed from the Northern part of the Rio Negro, in order to be closer to the city of Manaus, and the community got larger. An Englishman with his wife settled there for a few years, sharing the life of the community. For this reason, Santa Helena became Santa Helena de l'Ingles.
A logger, Demetrio had to stop the activity when the area became protected, as part of the Rio Negro Sustainable Development Reserve, and the community had to live only from planting crops and fishing. The production of the mandioca flour was good, but it was difficult to find a market. With the development of tourism, it became also easier to sell agricultural products. In fact, with tourism being developed, the economy was also boosted by selling what they plant. "*The main difference between the time of deforestation and now is that today we already have someone to sell flour to, we can sell fish, there is a market here, especially for tapioca starch and cassava. Back then, only wood brought in money. We live like this, there is no longer a need to cut the wood that we used to cut, it was very hard work*."
The shift to tourism took place in 2014, with the opening of the guesthouse, with the support of the Sustainable Amazon Foundation (FAS), created in 2008, a non-profit civil society organization that promotes sustainable development in the Amazon. Recognized as a social assistance entity, FAS works to guarantee the rights of traditional populations in riverside communities, indigenous peoples, quilombola communities, and peripheral areas through a systemic approach, contextualized action, social empowerment, development, and innovation.
FAS's work in tourism focuses on Community-Based Tourism (CBT), a modality that promotes authentic experiences, values local knowledge, and generates direct income for families, helping to protect the forest. The goal is to empower forest entrepreneurs. The aim is that people understand, when they start having an awareness focused on tourism, that the forest is much more valuable standing than actually cut down. As for the tourists, they are enchanted by the hospitality, simplicity, and wisdom of the riverside caboclos. This exchange is really appreciated as well by the community dwellers.
The community guesthouse was built in 2014 as a collective work. The community has a president, but all the decisions are taken collectively in democratic debates. The FAS found the grant for the guesthouse and the community built the place, the workers were paid three days and gave two days of work free. The manager and the personnel were chosen in open meetings
The income from the guesthouse was shared collectively. A part of the income remained for ensuring the future functioning of the guesthouse.

Fig. 4. The Pousada Da Dri

Adriana was the first manager, for five years. Now a new person -always woman- was chosen. And finally, Adriana has decided to open her own guesthouse, the Pousada Da dri, after a long collective discussion in the village meetings, and, even if the guesthouse is private, the all community has to benefit.

The Nilton Lins University and the Role of Education

The passage of Adriana from employee by the community to self-employed was facilitated by the opportunity to take courses on Tourism at the Nilton Lins University, located in Manaus. The Nilton Lins University's mission is "Educating the Amazon," and this mission is reflected in an education focused on sustainability with strong Amazonian roots, established for about four decades in the heart of the Amazon. Internationally recognized the University frequently receives exchanges and visits from international tourism students especially interested the local ecotourism.
The University offers programs focused on the tourism sector, including a three years degree in Tourism with a strategic focus on the vocations of the Amazon region. The course qualifies professionals to work as managers, guides, and travel agents, with a strong emphasis on ecotourism, sustainability. and hotel management. A part of the program is consacrated to Sustainable Tourism. A tourism professional can work in hotels and restaurants; in airlines and cruise lines; in event organization; in the management of inns, travel agencies and tour operators, transportation, events and leisure, consulting and advisory firms in the area of creation and analysis of tourism projects. They can also specialize in marketing actions aimed at the sector and the management of public policies for the segment.
More, in 2021, recently, always in partnership with the FAS an innovative Tourism Management Technology course, the "University Students of the Forest" program in partnership with FAS, the only one in the country with an Amazonian identity and training for sustainability has been introduced, focusing on training Amazon residents through distance learning. The "University Students of the Forest" program won 2nd place in the National Tourism Award from the Ministry of Tourism in 2025.
Finally, in 2022, in partnership with FAS, the Nilton Lins has opened a new course, offered in the distance learning modality, making professional training more accessible to students far from large urban centers: it is aimed to empowering traditional communities for the development of community-based tourism and fostering local entrepreneurship. Combining higher education with practical experiences, the course guides the students to explore business opportunities, especially in the areas of accommodation, tours, restaurants, and other services that are already offered informally. The program also includes also includes scholarships. Adriana was one of the first beneficiaries of the program, which, she says, changes her professional perspectives and also her vision or herself and her community: “I would have never dreamt, in my best dreams, to go to University and an academic training.” She says.
This initiative is practically transforming the educational and socioeconomic landscape of traditional communities in Amazonas with the graduation, at the end of 2024, of the first class of 20 residents from the Rio Negro and Uatumã Sustainable Development Reserves in Tourism Management. João Emanuel, professor and coordinator of the Tourism course at Nilton Lins, highlights the power of education as a tool to empower and create opportunities for the Amazonian population and the importance of qualification for the communities involved.
"In addition to the skills to manage tourism ventures and provide a solid economic base in the medium term, resulting in the creation of new jobs, the training promotes the appreciation of the rich cultural traditions of the communities."
The professor also emphasizes that the course addresses the need for environmental preservation. "Activities that are major attractions for visitors, such as artisanal fishing, forest walks, and river and beach tours, are only possible with respect for fauna, flora, and sustainability," he points out.
The course curriculum covers fundamental subjects, including hotel design, team management, entrepreneurship, art, culture and heritage, as well as event management. With the graduation of the first class approaching, the coordinator reveals that the goal is to expand the initiative to other traditional communities in the interior of the state.

Conclusions

The way of life of the riverside communities, whose daily lives are directly influenced by the river flows and by the forest, has undergone social, political, economic, cultural, and territorial transformations.
Considering the perspective of the territory used, it is appropriate to reflect on the use of the Amazonian territory in the context of the globalized world. For Santos (2001), globalization is, in a way, the apogee of the internationalization process of the capitalist world. The new world order, which he calls perverse

globalization, is sustained by a dominant ideology that overvalues the market and encourages consumption, competitiveness, and individuality, to the detriment of solidarity and morality. "*An overwhelming market, said to be global, is presented as capable of homogenizing the planet when, in fact, local differences are deepened*" (SANTOS, 2001, p. 19).

Regarding the Amazon region, Hurtienne (2009) states that the Amazon has always been considered by global society as one of the last frontiers for the exploitation of resources in the expansion of the world economy, an economic space for the accumulation of national and international capital. However, from an ecological point of view, it is considered one of the last biological reserves, an immense deposit, a climate stabilizer, a patrimony of global society that needs to be cared for.

These two dimensions that make up this discourse, the economic and the ecological, are opposite and contradictory, since the dominant model of globalization is based on the exploitation of non-renewable and difficult-to-recycle resources.

However, some local experiences seem to be able to combine ecology and improvement of local populations. The case of sustainable tourism in Santa Helen of the Ingles seems one. The experience shows an interesting articulation between the preservation of the traditional way of life, which is also put in value by the education process through the work of the University Nilson Lins, the ecological sustainability and income generation activities. This positive articulation is possible as far as the collectivity and solidarity principle inside the community is preserved: this seems to be the case so far and is even reinforced by the growing role of the women; however, the continuous support of the FAS and, more recently, the role of the University in training the local people are also a condition for this positive articulation. The University shows the power of education as a tool to empower and create opportunities for the Amazonian population and the importance of qualification for the communities involved. The FAS organizes as well training course to develop other activities of crafts and natural cosmetics. Together with the FAS, national and local governments have also given support with the introduction of solar panels that represent an important resource both for everyday life and tourism. Finally, the type of tourism -community tourism- that is promoted is practiced by a very specific type of public that is interested in exchange with people and connection with nature more than leisure and luxury. All these aspects contribute to preserve the experience by a logic of profit and exploitation.

Fig. 5. Solar Panels

Abstract

In the context of the 2030 Agenda, natural parks are increasingly recognized as spaces that mediate between science, society, and nature, contributing to the promotion of Sustainable Development (SD). This study focused on analysing institutional perceptions regarding the contribution of the Gaia Biological Park (PBG) to the promotion of SD, specifically examining interview results obtained from directors of the Department of Environment and Urban Parks of the Municipality of Vila Nova de Gaia. The research followed a qualitative case study approach, using semi-structured interviews conducted with directors directly involved in the management of the PBG. The sample comprised three directors (n=3), corresponding to 60.0% of the department's leadership. Results reveal institutional consensus concerning the role of the PBG as a space promoting sustainable development, with all interviewees (n=3; 100.0%) stating that the park's activities predominantly align with this domain. All participants (n=3; 100.0%) also demonstrated familiarity with the Sustainable Development Goals (SDGs) and identified SDGs 4 (Quality Education), 11 (Sustainable Cities and Communities), 12 (Responsible Consumption and Production), and 15 (Life on Land) as the most represented within park activities, indicated by two interviewees (n=2; 66.6%), while one director (n=1; 33.3%) explicitly added SDG 13 (Climate Action). In terms of institutional governance, all interviewees (n=3; 100.0%) stressed the importance of strengthening collaboration between municipal departments and developing partnerships with universities, companies, and the local community, also recognizing the need for strategic instruments ensuring continuity of activities. An optimistic perception regarding the continuity of park initiatives despite political changes also prevails among all participants (n=3; 100.0%). The findings indicate that the PBG is institutionally recognized as a relevant agent for local sustainability promotion, contributing to environmental literacy, visitor diversification, and reinforcement of territorial identity associated with conservation and environmental education. These results reinforce the role of natural parks as strategic instruments of local governance for sustainability and highlight the importance of Science Communication in consolidating environmental citizenship practices.

Keywords: *Science Communication; Case study; Natural Parks; Sustainable Development; Environmental Literacy; Institutional Perceptions.*

1. Introduction

The implementation of the 2030 Agenda and the Sustainable Development Goals (SDGs) has reinforced the urgency of promoting pro-environmental behaviours capable of reducing environmental impacts and supporting more sustainable development pathways. The 2030 Agenda establishes a broad and ambitious framework that integrates multiple dimensions of Sustainable Development (SD), while encouraging social responsibility, justice, and effective citizenship practices. Achieving these goals depends not only on political and institutional action but also on the active participation of citizens and changes in individual behaviour patterns [1].
Voluntary Local Reviews (VLRs), supported by the *European Handbook for SDGs Voluntary Local Reviews* [2], have improved local monitoring capacities and strengthened cities' abilities to assess their progress towards the SDGs while supporting governance and long-term planning processes. Nevertheless, the transition towards sustainability largely depends on public engagement and behavioural transformation. Current anthropogenic systems continue to encourage unsustainable

lifestyles characterised by excessive consumption and environmentally harmful practices, particularly in industrialised societies. Citizens therefore require adequate knowledge and awareness to address contemporary environmental challenges such as climate change, biodiversity loss, excessive resource exploitation, plastic pollution, and emerging environmental risks.
Education for Sustainable Development (ESD) and Science Communication (SC) have been recognised as essential tools for promoting environmental literacy and encouraging more sustainable practices [3]. Previous studies suggest that although individuals frequently demonstrate positive attitudes and knowledge regarding environmental issues, these do not necessarily translate into behavioural change [4]. Human behaviour often remains resistant to change, even when environmental risks are widely recognised. Moreover, modern urban and industrial lifestyles may weaken the individual's connection with the natural world, reducing opportunities for developing stronger environmental awareness.
In this context, natural parks and SC centres may play a relevant role by creating opportunities for reconnecting individuals with nature and fostering experiences that encourage environmental learning and behavioural transformation. The Gaia Biological Park (Parque Biológico de Gaia – PBG), the first permanent environmental education centre established in Portugal, appears to have evolved into a space promoting ESD and implementing SC activities designed to increase environmental awareness and encourage pro-environmental actions.
Considering the potential role of natural parks as agents of sustainability promotion, this study aims to explore institutional perceptions regarding the contribution of the Gaia Biological Park (PBG) to SD. Specifically, it seeks to understand how institutional actors perceive the role of SC activities in promoting sustainability practices and environmental citizenship.

1.1 Environmental Education and Education for Sustainable Development

The discussion surrounding the relationship between environmental limits and human development has evolved considerably over the past decades. Early concerns regarding the capacity of Earth's finite resources to sustain continuous population growth emerged with the Malthusian population theory, which suggested that population growth could eventually exceed the availability of natural resources [5,6]. Subsequently, global environmental concerns intensified during the twentieth century, particularly following the publication of *The Limits to Growth* by the Club of Rome in 1972, which highlighted the potential consequences of unrestricted economic and demographic expansion.
The same year, the United Nations Conference on the Human Environment held in Stockholm represented a turning point in international environmental policy, promoting a closer relationship between environmental concerns and development processes [7]. However, the concept of Sustainable Development (SD) only gained broader international recognition through the report *Our Common Future*, published by the World Commission on Environment and Development (WCED), where SD was defined as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (CMMAD, [8], p. 46).
This understanding of SD was further strengthened through international initiatives such as Agenda 21, the Millennium Development Goals (MDGs), and later the SDGs integrated into the 2030 Agenda (United Nations, 2015). The SDGs introduced an integrated framework addressing environmental, social, and economic dimensions while promoting collective responsibility towards a more sustainable future.
Within this context, education has increasingly been recognised as a fundamental mechanism for achieving sustainability. Initially, Environmental Education (EE) focused primarily on ecological issues and environmental awareness. Over time, however, broader perspectives emerged, incorporating social, economic, and cultural dimensions into educational approaches. This evolution led to the development of ESD, formally introduced through international discussions promoted by UNESCO [3].
The emergence of ESD generated considerable debate among researchers and educators. Some scholars argued that ESD represented a continuation and expansion of EE, while others questioned the replacement of EE terminology, arguing that EE had already incorporated social and environmental dimensions [9,10,11,12]. Despite these discussions, ESD gradually became established as a broader educational paradigm, aiming to equip individuals with the knowledge, competencies, values, and critical thinking skills necessary to address complex sustainability challenges.
According to UNESCO [3], ESD is characterised by an interdisciplinary perspective, lifelong learning principles, contextual relevance, and participatory educational practices. Furthermore, ESD seeks to empower individuals and communities to make informed decisions and adopt sustainable lifestyles capable of contributing to long-term societal transformation.

Current perspectives increasingly consider ESD as an evolutionary stage of EE rather than a replacement of it [13]. Consequently, education plays a central role in developing sustainability competencies and fostering active citizenship, becoming an essential pathway towards achieving the SDGs and promoting societal change.

1.2 Science Communication and the Promotion of Pro-environmental Behaviours

SC has progressively evolved from traditional deficit-based models, centred primarily on the transmission of scientific information, towards more participatory and interactive approaches that emphasise dialogue and public engagement. Earlier perspectives such as *Public Understanding of Science* (PUS) focused mainly on increasing scientific knowledge among citizens, assuming that higher levels of knowledge would naturally lead to more informed decisions and behavioural change. More recent approaches, including *Public Engagement with Science and Technology* (PEST), recognise that communication processes should involve interaction, participation, and co-construction of knowledge between scientific institutions and society [14,15].

Within the context of SD, SC has become increasingly relevant as a mechanism for enhancing environmental literacy and encouraging active citizenship practices. Beyond merely disseminating information, SC may contribute to the development of critical thinking skills, environmental awareness, and greater public participation in sustainability-related issues. Effective communication strategies can therefore support individuals in understanding complex environmental challenges and motivate them to adopt behaviours that contribute to sustainability goals.

However, previous research suggests that increasing scientific knowledge alone does not necessarily result in behavioural transformation. Knowledge and positive attitudes towards environmental issues frequently coexist with limited behavioural action, highlighting the existence of a gap between awareness and actual practice [4]. Consequently, SC initiatives increasingly seek to provide more experiential, participatory, and contextualised learning opportunities capable of influencing both cognitive and affective dimensions associated with environmental action.

Natural parks and non-formal educational environments may offer particularly favourable conditions for these approaches because they facilitate direct contact with nature and allow visitors to engage with real-world environmental contexts. Such spaces can create meaningful experiences that strengthen emotional connections with the environment while simultaneously fostering scientific understanding and promoting sustainable behaviours. Research has demonstrated that direct interaction with natural environments may positively influence environmental attitudes and strengthen individuals' willingness to engage in conservation practices [16].

In this regard, the PBG represents a relevant example of a SC environment that combines EE, biodiversity conservation, and non-formal learning experiences. Through activities specifically designed to engage diverse audiences, the Park creates opportunities for visitors to develop knowledge and awareness regarding sustainability issues while encouraging reflection about everyday environmental practices.

Considering the growing recognition of SC as a potential catalyst for behavioural change, the present study examines the role of PBG activities in promoting pro-environmental behaviours for SD. Specifically, the study seeks to understand whether SC initiatives implemented within a natural park context can contribute to influencing visitors' knowledge, attitudes, and behavioural intentions towards sustainability.

2. Methodology

This study adopted a qualitative case study approach to explore institutional perceptions regarding the contribution of the PBG to the promotion of Sustainable Development (SD). The case study design was considered appropriate as it enables an in-depth understanding of a contemporary phenomenon within its real-life context and facilitates the examination of participants' experiences and perspectives.

Data collection was conducted through semi-structured interviews with directors from the Department of Environment and Urban Parks (DAPU) of the Municipality of Vila Nova de Gaia. Semi-structured interviews were selected because they allow flexibility during data collection while ensuring that predefined themes relevant to the research objectives are addressed. The interview script included questions focusing on participants' perceptions of the Park's role in promoting SD, its contribution to the SDGs, institutional articulation and governance, and the potential impact of SC activities on environmental awareness and citizenship practices.

The study sample comprised three directors (n = 3), corresponding to 60.0% of the department's leadership positions. Participants were selected based on their direct involvement in the management, planning, and implementation of activities developed within the Gaia Biological Park, ensuring that they possessed relevant institutional knowledge and decision-making experience.
Data analysis followed a qualitative content analysis approach. Interview responses were transcribed, coded, and organised into thematic categories previously established according to the study objectives and interview structure. The analysis process aimed to identify recurrent patterns, shared perspectives, and institutional understandings concerning the role of the Park as a local sustainability agent.
This methodological approach enabled a detailed examination of institutional viewpoints and provided insights into how SC activities developed within a natural park context may contribute to strengthening environmental literacy and promoting SD practices.

2.1 Sample Characterisation

The study sample comprised three directors (n=3) from the Department of Environment and Urban Parks (DAPU) of the Municipality of Vila Nova de Gaia (Portugal), representing 60.0% of the department's leadership structure. Participants were selected through purposive sampling based on their direct involvement in the management, planning, and implementation of activities developed within the Gaia Biological Park (PBG).
The inclusion of participants occupying leadership positions was considered particularly relevant because of their institutional responsibilities and strategic roles in decision-making processes associated with environmental management, educational initiatives, and sustainability-related activities. Their professional experience and organisational responsibilities provided a comprehensive institutional perspective regarding the role of the Park in promoting SD and implementing SC initiatives.
The sample aimed to ensure access to informed perspectives concerning the Park's educational, environmental, and governance dimensions, allowing an in-depth exploration of institutional perceptions regarding the contribution of PBG to sustainability promotion and environmental citizenship practices.

2.2 Data Collection Instrument

Data were collected using a semi-structured interview guide specifically designed according to the objectives of the study. Semi-structured interviews were selected because they provide a balance between consistency across participants and flexibility for exploring emerging topics and obtaining deeper insights into participants' perspectives.
The interview guide included open-ended questions organised into thematic dimensions related to the role of the Gaia Biological Park (PBG) in promoting SD. Specifically, the questions explored: (i) participants' perceptions regarding the contribution of PBG activities to Sustainable Development; (ii) the relationship between park activities and the SDGs; (iii) the contribution of the Park to environmental awareness and environmental literacy; (iv) institutional articulation and governance processes; and (v) perspectives regarding the continuity and future development of sustainability-related initiatives.
The structure of the interview guide aimed to ensure that all participants addressed the same central themes while allowing opportunities for clarification, additional explanations, and the emergence of new relevant issues throughout the interview process. This approach facilitated the collection of rich qualitative data and enabled a more comprehensive understanding of institutional perceptions regarding the Park's contribution to sustainability promotion.

2.3 Procedure and Ethical Considerations

The interviews were conducted individually with the selected participants at previously agreed times and locations, ensuring suitable conditions for discussion and minimising external influences on the interview process. Prior to data collection, participants received information regarding the aims and procedures of the study and were informed about the intended use of the collected data.
Ethical principles guiding research involving human participants were strictly followed throughout the study. Participation was entirely voluntary, and informed consent was obtained from all participants before the interviews were conducted. Participants were informed of their right to withdraw from the study at any stage without any consequences. To ensure privacy and protect participants' identities, anonymity and confidentiality procedures were implemented during all stages of the research process. Personal identifiers were removed from interview transcripts and participants were assigned codes during data analysis and reporting procedures. All collected information was treated confidentially and

used exclusively for research purposes. Following participants' consent, interviews were recorded to ensure the accuracy and completeness of the collected information. The recordings were subsequently transcribed and prepared for content analysis through coding and categorisation procedures aligned with the research objectives.

2.4 Data Analysis

The interview data were analysed using qualitative content analysis, allowing for the systematic identification, organisation, and interpretation of recurring themes emerging from participants' responses. This approach was selected because it enables the examination of meanings, perceptions, and patterns within textual data while preserving the contextual richness of participants' narratives.
Following the interviews, audio recordings were transcribed verbatim to ensure an accurate representation of participants' statements. The transcribed material was then subjected to a coding process based on predefined analytical categories established according to the study objectives and the thematic dimensions included in the interview guide. These categories addressed aspects such as perceptions of SD, the contribution of the Gaia Biological Park (PBG) to the SDGs, environmental literacy, institutional governance, and future perspectives regarding park activities.
Subsequently, responses were grouped into thematic units and analysed to identify common patterns, similarities, and differences across participants' perspectives. Frequency analysis of recurring themes was also considered to support the interpretation of institutional perceptions and provide a clearer understanding of the relevance attributed to different dimensions of sustainability promotion.
The analytical process aimed to ensure consistency and coherence in data interpretation, enabling a comprehensive understanding of the institutional role of the Gaia Biological Park as a local agent contributing to SD and environmental citizenship practices.

3. Results and Discussion

The interview findings revealed a strong institutional consensus regarding the role of the Gaia Biological Park (PBG) as a strategic space for promoting Sustainable Development (SD). All participants (n = 3; 100.0%) considered that the activities developed by the PBG are predominantly associated with SC, recognising its role in making scientific knowledge accessible and meaningful for different audiences. Although participants acknowledged characteristics associated with both formal and non-formal educational approaches, they identified SC as the dimension that most strongly characterises the Park's initiatives.
One participant emphasised this perspective by stating that the Park seeks to "reach the public with the more complex aspects of science and make science simple" (P1). This statement suggests an understanding of SC as a process extending beyond the transmission of information and involving the adaptation of scientific knowledge to different audiences and contexts. Contemporary approaches to SC increasingly emphasise participation, accessibility, and dialogue rather than one-directional dissemination models. Within this perspective, natural parks may act as mediating environments where individuals engage directly with scientific knowledge through experiential and contextualised activities.
The findings also indicate that participants perceive PBG as a space capable of fostering environmental awareness and promoting more meaningful interactions between society and environmental issues. Previous research suggests that direct contact with natural environments may strengthen emotional attachment to nature and contribute positively to the development of pro-environmental attitudes and behaviours. Consequently, SC activities implemented in natural settings may provide opportunities not only for increasing knowledge but also for encouraging behavioural reflection and environmental responsibility.
Regarding the contribution of PBG activities to the SDGs, results indicate that all interviewees (n = 3; 100.0%) demonstrated familiarity with the SDGs and recognised their integration within the Park's activities. Participants identified SDG 4 (*Quality Education*), SDG 11 (*Sustainable Cities and Communities*), SDG 12 (*Responsible Consumption and Production*), and SDG 15 (*Life on Land*) as the goals most strongly represented within educational and environmental initiatives developed at the Park, mentioned by two participants (n = 2; 66.6%). One participant (n = 1; 33.3%) additionally highlighted SDG 13 (*Climate Action*) as an important dimension associated with Park activities.
These findings suggest that institutional actors perceive the Park as contributing to sustainability through an integrated and multidimensional perspective, extending beyond traditional biodiversity conservation practices. Rather than focusing exclusively on ecological preservation, participants recognised educational, social, and behavioural dimensions associated with sustainability promotion. Such

perceptions align with ESD principles, which advocate interdisciplinary approaches capable of integrating environmental, social, and economic dimensions while promoting active citizenship and critical thinking.
The interviews also highlighted the relevance of governance and institutional collaboration mechanisms for ensuring the effectiveness and continuity of sustainability initiatives. Results reveal that all participants (n = 3; 100.0%) stressed the importance of strengthening cooperation among municipal departments and establishing partnerships involving universities, private organisations, and local communities. Participants additionally emphasised the importance of implementing strategic planning instruments capable of ensuring the long-term continuity and development of Park activities.
The emphasis placed on collaboration suggests that participants recognise sustainability promotion as a multidimensional process requiring coordinated actions across different institutional actors. Previous studies have identified collaborative governance structures as important mechanisms for improving the effectiveness and societal impact of educational and environmental programmes. The present findings therefore indicate that the perceived impact of the PBG does not rely solely on activities conducted within the Park itself but also on broader institutional networks capable of strengthening its educational and social role.
Participants also demonstrated optimistic perceptions regarding the continuity of Park activities despite possible political or administrative changes. All interviewees (n = 3; 100.0%) considered that the PBG possesses a sufficiently established institutional identity to maintain its mission and activities over time. This perception may indicate that the Park is viewed not simply as an isolated municipal initiative but rather as an institution with a recognised educational and environmental identity embedded within the local community.
The data indicate that the Gaia Biological Park is institutionally recognised as a relevant local agent for sustainability promotion, contributing to environmental literacy, visitor diversification, and the reinforcement of territorial identity associated with environmental conservation and educational practices. Furthermore, the results reinforce the potential of natural parks as strategic instruments for local governance and support the role of SC as a mechanism capable of promoting environmental awareness and strengthening sustainability-oriented citizenship practices. The prominence of SDG 4 is unsurprising considering the educational mission of PBG. However, the simultaneous identification of SDGs related to urban sustainability, responsible consumption, and biodiversity conservation suggests that participants perceive the Park as contributing to sustainability through interconnected dimensions rather than isolated environmental actions.

4. Conclusion

This study explored institutional perceptions regarding the role of the Gaia Biological Park (PBG) in promoting Sustainable Development (SD), focusing on the perspectives of directors from the Department of Environment and Urban Parks of the Municipality of Vila Nova de Gaia. The findings revealed a strong consensus among participants concerning the relevance of the Park as a local agent for sustainability promotion and as a space capable of connecting EE, SC, and active citizenship practices.
Interviewees consistently recognised SC as one of the main characteristics of the activities developed within the Park, highlighting its capacity to translate scientific knowledge into accessible experiences for diverse audiences. Participants also demonstrated familiarity with the SDGs and identified several goals associated with Park activities, particularly SDG 4 (*Quality Education*), SDG 11 (*Sustainable Cities and Communities*), SDG 12 (*Responsible Consumption and Production*), and SDG 15 (*Life on Land*). These findings suggest that institutional actors perceive the Park as contributing to sustainability through an integrated and multidimensional perspective.
The results further emphasised the importance of institutional collaboration, strategic planning, and governance mechanisms for ensuring the continuity and effectiveness of sustainability initiatives. Partnerships among municipal departments, educational institutions, and local communities were recognised as essential factors for strengthening the social impact of Park activities and increasing their contribution to local sustainability objectives.
Although the study provides valuable insights into institutional perspectives regarding the contribution of PBG to SD, some limitations should be acknowledged. The reduced sample size and the exclusive focus on institutional actors limit the generalisation of findings. Future studies may expand the analysis by incorporating perspectives from visitors, educators, and other stakeholders involved in Park activities.

The findings reinforce the potential of natural parks as strategic instruments for local sustainability governance and highlight the importance of SC as a mechanism for promoting environmental literacy and encouraging behaviours aligned with SD principles.

A Systematic Literature Review Mapping Evidence on Generative AI, Self-Directed Learning and Open Education

Dorothy Laubscher

Research Unit Self-Directed Learning, Faculty of Education,
North-West University, South Africa

Abstract

Generative AI (GenAI) is reshaping education. It influences how learners access knowledge, create content and receive feedback. At the same time, Open Educational Resources (OER) and Open Educational Practices (OEP) continue to expand opportunities for equitable access and the co-creation of knowledge. The importance of self-directed learning (SDL) has become even more crucial in an educational context that is constantly changing due to innovations such as GenAI and open education. Yet the links between GenAI, SDL, and open education are not well consolidated across recent scholarship. Facilitators and institutions face uncertainty about what is known, what is contested and where the gaps in the research lie. This paper presents a systematic literature review (SLR) of peer-reviewed journal articles and book chapters published between 2022 and 2026 that examine the relationships among GenAI, SDL and open education. Following a Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) approach, searches were conducted across major education and interdisciplinary databases using a systematic search strategy. After screening 425 initially identified texts, 11 texts were included in the final corpus and coded using ATLAS.ti. Data analysis involved thematic analysis, identifying recurring patterns related to the concepts of the study. The review mapped how GenAI is conceptualised in relation to SDL and how OER and OEP are positioned in GenAI-enabled learning environments. The findings suggest that GenAI may support SDL and open education through feedback, explanations, personalised support, OER adaptation and co-creation. However, the corpus also highlights risks related to overdependence, inaccurate outputs, hallucinations, bias, academic integrity, weak contextualisation, licensing, attribution and quality assurance. The paper contributes a synthesis of emerging evidence and proposes implications for teaching practice, OER design and policy guidance in GenAI-rich open learning environments.

Keywords: *Generative artificial intelligence (GenAI), self-directed learning (SDL), open educational resources (OER), open educational practices (OEP), systematic literature review, learner agency.*

1. Background and Motivation

Generative artificial intelligence (GenAI) is changing how users access information, generate text [1], receive feedback [2] and engage with open educational resources [3]. These developments create opportunities for personalised learning, feedback and resource adaptation, but also raise concerns about accuracy, bias, academic integrity and overdependence.

These matters are particularly relevant to open education. Open education emphasises access, sharing, adaptation and co-creation [4]. In principle, GenAI may support open education by assisting with the revision, remixing, localisation and adaptation of OER. However, GenAI does not automatically strengthen openness. Questions about licensing, attribution, transparency and quality assurance complicate its relationship with open education [5]. Self-directed learning (SDL) is central to this discussion. In GenAI-rich and open learning environments, SDL requires learners to identify learning needs, select appropriate tools, evaluate information, monitor progress and make informed decisions. Li et al. [6] describe ChatGPT-integrated SDL as an iterative process of planning, monitoring, adapting and evaluating learning, while [7] emphasise the need for learners to critically evaluate information in AI-saturated environments. This means that critical thinking, AI literacy, ethical awareness and reflective judgement become central to SDL. Although GenAI can support SDL through feedback, explanations, learning pathways and resource recommendations, it may also weaken SDL if learners become dependent on AI-generated outputs. Navas Bonilla and colleagues specifically warn that excessive AI use may reduce autonomy, critical thinking and independent decision-making [8].

The relationship between GenAI, SDL and open education is still emerging and is still quite fragmented due to the newness of GenAI in the academic space. A systematic review of these concepts is needed

to map what has already been researched, what is known and where the gaps in the literature remain. The main research question that is explored in this paper is: *What evidence exists on the relationship between GenAI, SDL and open education?*

2. Conceptual and Theoretical Framework

2.1 Generative AI in Education

Artificial intelligence (AI) is no new phenomenon. Generative AI has attracted worldwide attention with the release of Chat Generative Pre-trained Transformer (ChatGPT) in late 2022 [9]. Since then, several large language models and GenAI tools have become visible in education, including ChatGPT, Claude, DeepSeek, Microsoft Copilot, Google Gemini and DALL·E. Generative AI can generate human-like multimodal content such as text, audio, images and video [9]. This has brought both challenges and opportunities in various fields [9; 10], including education.
Generative AI has assumed different roles in the education space, such as that of a tool [11], a learning partner [12], a tutor system [13], a means of providing feedback [14], a content generator [15] and assistant to adapt resources [3]. These roles indicate that GenAI operates along a spectrum of support. It may assist with producing, adapting and organising learning materials, while also supporting more personalised and responsive forms of engagement.

2.2 Self-directed Learning

Self-directed learning is described by Knowles [16] as a "process in which individuals take the initiative, with or without the help of others, in diagnosing their learning needs, formulating learning goals, identifying human and material resources for learning, choosing and implementing appropriate learning strategies, and evaluating learning outcomes" (p. 18). This definition remains useful because it foregrounds learner responsibility, goal setting, resource identification, strategy selection and evaluation. In the context of GenAI, SDL becomes even more crucial than before because students need to exercise even more agency in these environments. Students need to find relevant information, decide which technology tools are suitable, reliable and appropriate, evaluate their outcomes and know how to integrate this into their learning process [6]. Because GenAI is prone to bias, errors and weak contextualisation, students must now apply critical thinking more rigorously than ever. They need to interrogate the accuracy, relevance and trustworthiness of AI-generated material. Li and colleagues [17] highlight hallucinations and inaccuracies as major challenges, while Ma et al. [7] contend that students must critically appraise information in an AI-permeated environment. GenAI thus demands greater SDL, yet it can also undermine SDL if students become overly reliant on AI outputs.

2.3 Open Education

Open education is described in broad terms in the literature and extends beyond only the use of open educational resources (OER). It is associated with learning innovations and learning quality [18], using resources, tools and practices to improve access to education [19]. The Cape Town Open Education Declaration [20] also presents open education as broader than OER, including open technologies, collaborative learning, flexible learning and the sharing of teaching practices. Stracke's [18] definition presents the quality-oriented dimension by describing open education as follows: "Open Education is designing, realising, and evaluating learning opportunities with visionary, operational, and legal openness to improve learning quality for the learners" (p. 184). This definition is useful because it links openness with design, implementation, evaluation and learning quality. Open education is therefore not only about making content available, but also about how learning opportunities are created, adapted, shared and improved.
OER remain central to open education because they support reuse, revision, remixing, redistribution and retention. However, open education also includes OEP. Cronin [21] defines OEP as "practices that include the creation, use and reuse of open educational resources (OER) as well as open pedagogies and the open sharing of teaching practices" (p. 18). For this paper, open education is understood as an educational approach that uses open resources, technologies and practices to widen access, support adaptation, encourage collaboration and improve learning quality.

2.4 Integrating to A Conceptual Framework

There is a mutual relationship between these concepts. Generative AI may support open education by helping facilitators and learners revise, remix and localise OER. It may support SDL by assisting with feedback, finding resources, planning and self-evaluation. So too, open education may support more responsible GenAI use. Tlili et al. [3] contend that OER can help mitigate hallucinations by providing AI systems with openly licensed educational materials that have been created, updated, or adapted by subject-matter experts and facilitators. This review is guided by the assumption that GenAI, SDL and open education intersect around the need for self-directed, critical and ethical learning.

3. Research Design and Methodology

Interpretivist approaches are “useful in understanding the subjective experiences, social phenomena, and complex human interactions” [22] (p. 2314). This study is located within an interpretivist paradigm because it seeks to understand how the selected texts conceptualise and report the relationship between GenAI, SDL and open education. The purpose was not to measure the effectiveness of GenAI, but to interpret patterns, meanings and relationships across the coded corpus.
A qualitative systematic literature review (SLR) was used to identify, screen, code and synthesise peer-reviewed literature related to the main topic under investigation. An SLR is a method used to locate, assess, and integrate all existing studies that are relevant to a specific research question, subject area, or phenomenon of interest [23; 24]. Scholars describe different ways in which an SLR can be conducted, but most acknowledge that certain steps or phases take place in the process [25]. These phases include formulating research questions and inclusion criteria [24], searching, screening and selecting texts [26], data extraction and coding [27] and synthesising the findings.
In this study, the texts were obtained from established databases, including Scopus, ScienceDirect, and Web of Science. Different variations of keywords such as “self-directed learning”, “generative AI” and “open education” were used in the searches. The study followed the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework [28]. Figure 1 presents the PRISMA flow diagram for this study.

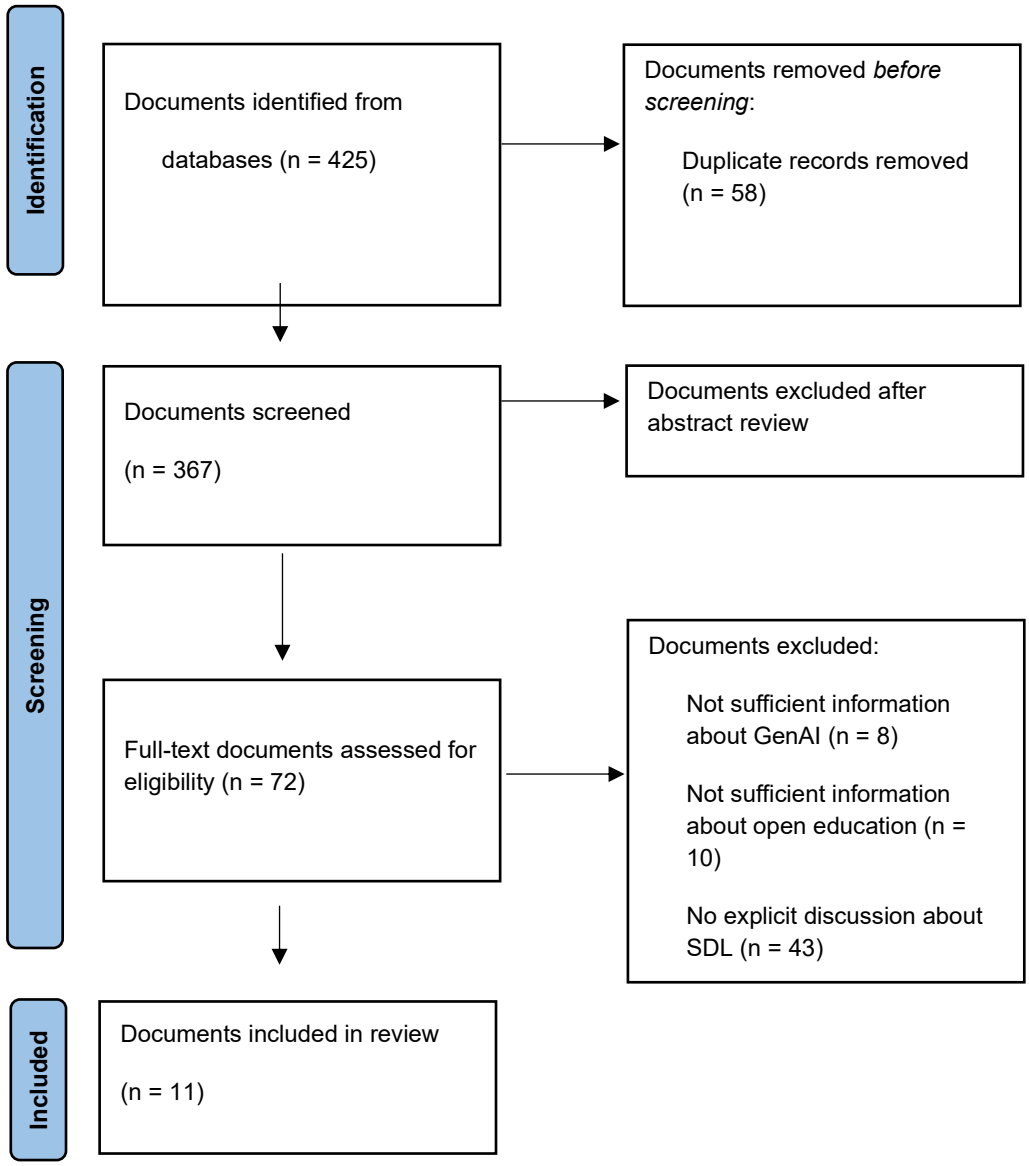

Fig. 1. PRISMA flow diagram of this study

The inclusion criteria focused on texts that were i) peer-reviewed book chapters and research articles, ii) publications dated from 2022 to 2026; iii) texts which specifically discuss all three main themes (SDL, open education and GenAI); iv) English texts; and v) review papers, conceptual work and empirical research. Eleven texts resulted from the search and screening process, which were coded and analysed using ATLAS.ti. A total of 425 texts were identified in the initial searches. After unsuitable texts and duplicate records were removed, 11 texts remained for coding.

A thematic analysis approach was used to categorise the selected texts using the six-phase process outlined by [29]. This process allows the researcher to identify and report recurring themes from the qualitative data and thereby provides insight into the topic under study. Inductive coding was used to discover emerging themes while coding the texts [30]. The findings and discussion that emerged from the review follow in the next section.

4. Findings and Discussion

4.1 Profile of the Corpus: Research Designs, Data Sources and Contexts

The corpus reflects a variety of methodologies. As illustrated in Table 1, the coded texts are situated mainly in higher education, open and distance learning, online language learning and open education contexts. The corpus includes formal educational settings, such as Sri Lankan state universities and a

South African ODeL university, and more open digital learning spaces, such as YouTube-based language learning communities.

Table 1. Profile of the corpus

Text	Research design	Data sources	Educational context
Ahmadfart [31]	Structured literature review and thematic synthesis	Database search and reviewed literature	Open education Interactive open educational resources (iOER)
Biyiri et al. [32]	Quantitative, deductive survey study	Online questionnaire; 627 undergraduate responses	Sri Lankan state universities
Bosch and Kruger [33]	Conceptual paper	Literature-based conceptual discussion	SDL, student agency and AI chatbots as OER
Bunt and Bunt [34]	Analytical autoethnography	Reflection on the design of *Prosper*	Sustainability education Game-based learning
Laubscher et al. [35]	Theory-synthesis	Literature-based synthesis	OEP, 4IR and SDL
Li et al. [6]	Qualitative phenomenological study	Interviews with 19 YouTubers who are experienced, self-directed language learners	Self-directed language learning (SDLL)
Li et al. [17]	Qualitative study	Semi-structured interviews were conducted with 14 facilitators of online language courses	Online language facilitators
Maphalala [36]	Qualitative phenomenological study	Interviews with four academics and focus group discussions involving ten fourth-year BEd students	South African ODeL
Navas Bonilla et al. [8]	PRISMA-based systematic review	Scopus and Web of Science; 77 studies	AI and SDL
Ruiz-Rojas and Acosta-Vargas [37]	Qualitative exploratory study	Interviews, observation and student-created artefacts	MOOC development
Tlili et al. [5]	Scenario and conceptual contribution	OEP-based scenarios	Open education and GenAI

Table 1 shows that the corpus includes review-based, conceptual, qualitative and quantitative contributions. Review-based texts, such as Ahmadfard [31] and Navas Bonilla et al. [8], provide broader mappings of iOER, AI and SDL. Conceptual and theory-synthesis texts, such as Bosch and Kruger [33], Laubscher et al. [35], and Tlili et al. [25], help clarify the relationships between SDL, OER, OEP, AI and digital transformation. The qualitative studies provide insight into participant experiences, while Biyiri et al. [32] offer survey-based evidence on undergraduate acceptance and use of ChatGPT for SDL.
The data collection methods also varied. They included structured database searches, online questionnaires, semi-structured interviews, focus groups, observations and student-created artefacts. This variety of data sources provides a broad evidence base for this review. However, the most common data source is that of reviews, conceptual work, perception-based studies and exploratory qualitative research. There is less evidence of longitudinal studies or sustained observation of actual GenAI-supported SDL practices over time. Also, the limited number of quantitative studies shapes the nature of the evidence presented in this review. This suggests that the field is still developing and that future research should move beyond perceptions and conceptual arguments towards studies that examine how learners and facilitators use GenAI in practice.

4.2 Conceptual Links Between Generative AI, Self-Directed Learning and Open Education

Due to the inclusion criteria, the corpus does not present GenAI, SDL and open education as isolated concepts. Instead, the texts show several points of connection. Open education is framed as more than access to resources alone. Ahmadfard [31] positions iOER as “a next-generation direction” (p. 1) within open education, where openly licensed resources include interactive features such as “simulations, branching scenarios, formative assessments, feedback mechanisms and adaptive digital features” (p. 2). These shifts open education from the dissemination of content towards more purposeful instructional design. Bosch and Kruger [33] also connect OER to access, adaptation and sharing, while Laubscher

et al. [35] emphasise that OEP and SDL connect strongly where learners become active co-creators of knowledge.
Bosch and Kruger [33] refer to Knowles' definition of SDL. They further associate SDL with initiative, independence, persistence, self-discipline, curiosity and confidence. They also argue that learners need opportunities to make choices about what and how they learn. Bunt and Bunt [34] link SDL to "autonomy, exploration and ownership of learning" (p. 37) in the design of the educational game *Prosper*. Li et al. [6] place SDL in the context of ChatGPT use, arguing that learners can explore the tool, experiment with conversational strategies and evaluate whether it supports their learning goals.
The strongest conceptual connection across the corpus is learner agency. Bosch and Kruger [33] clearly portray the relationship between SDL, OER, and AI as an environment in which learners are able to co-create learning materials, define their own objectives, and actively design their educational experiences. Ahmadfard [31] similarly argues that GenAI can enhance open pedagogy when it is woven into learning activities that require reflection and learner agency. Tlili et al. [5] extend this idea by arguing that OEP can support the safe and effective adoption of GenAI. Their contribution is important because it does not only ask how GenAI can enhance open education, but also how open education can enhance GenAI use. GenAI may support SDL and open education when it strengthens learner agency, participation, reflection and responsible use. However, it may undermine these aims when it is used merely to generate answers or when learners become dependent on automated outputs.

4.3 Roles and Capabilities of Generative AI Tools

The corpus presents GenAI as a multifunctional educational tool. Ahmadfard [31] describes GenAI as useful for drafting content quickly, translation, summarising and adapting OER while remaining sensitive to the context. This matters in open education because fixed resources are frequently difficult to adapt for local contexts, revise, customise, or integrate into more complex pedagogical designs. In this sense, GenAI is used as a tool for both the creation and adaptation of resources.
ChatGPT is the most commonly used GenAI tool in the corpus. Biyiri et al. [32] investigated university students' acceptance and use of ChatGPT for SDL. They reported that performance expectancy and social influence shaped their behavioural intention. They also found that both behavioural intention and facilitating conditions determined students' actual use. Navas Bonilla et al. [8] also identify ChatGPT as the most widely used conversational assistant in the studies they reviewed. They explain this by pointing to its ease of use, broad range of applications, and consistent, well-structured answers.
The corpus further shows that GenAI tools support several learning processes. Navas Bonilla et al. [8] identify several learning processes into which GenAI has been incorporated. These processes include feedback, tutoring and mentoring, assessment and self-assessment, learning design, practical application, and research and exploration. Maphalala [36] reports that AI tools in ODeL settings supported personalised feedback, the finding of resources, increased engagement, language development and self-evaluation. In that study, ChatGPT and Notion AI were used for writing support, content clarification, note organisation, feedback and the summarising of content.
GenAI also appears as a tool for open pedagogy. Tlili and colleagues [5] suggest that teachers and students collaboratively write prompts, run them, evaluate the outputs and compile the prompts as OER. This is a practical example of how GenAI, SDL and open education connect with each other. Learners are not simply consuming AI-generated responses. They are participating in prompt development, evaluation and sharing. Tlili et al. [5] also propose the construction of an OER-based GPT model, where evidence-based information from OER could be integrated into a more directed system that can be updated over time.
The reported benefits in the corpus, therefore include personalisation, feedback, learner agency, collaboration, inclusivity, participation, adaptation and co-creation. Ahmadfard [31] indicates that iOER can foster learner agency, collaboration, and inclusivity by means of interactive elements, adaptive technologies, multimedia resources, and integrated assessment tools. Biyiri et al. [32] add that because younger students are more technologically adaptable, they might not experience ease of use as a major barrier to ChatGPT adoption.

4.4 Challenges and Tensions

The corpus also reports several challenges that complicate the relationship between GenAI, SDL and open education. Regarding open education, Ahmadfard [31] observes that traditional OER have enhanced both access and affordability, yet their static format tends to constrain learner engagement, adaptability, and personalisation. The move toward iOER addresses this constraint, but also brings new

challenges, such as ensuring digital access, institutional preparedness, and faculty development. Institutional capacity is a recurring concern. Ahmadfard [31] reports that the development of high-quality interactive materials requires expertise in the creation of content, instructional design, programming and graphics. This may lead to substantial development expenses and added complexity, especially for institutions that have limited resources. Bosch and Kruger [33] also identify facilitator-related challenges, including different levels of proficiency in the use of technology, possible misalignment with pedagogical principles and limited awareness of AI capabilities. They also mention ethical and privacy concerns and the need for professional development in these areas.

The GenAI-related challenges are closely linked to SDL. Navas Bonilla et al. [8] warn that overreliance on AI has a negative impact on learner autonomy and critical thinking. These authors also assert that the dependence on technology can lead to cognitive overload and could cause students to become disconnected from their own learning process. They also note that when students delegate their decision-making to algorithms, this may limit their ability to "develop independent judgement, initiative, and creativity" (p. 14). Maphalala [36] reports similar concerns in the ODeL context, where participants raised issues of over-dependence, academic dishonesty, unreliable AI-generated information and reduced social interaction and critical thinking.

Reliability is another important challenge. Li et al. [17] report that hallucinations and inaccuracies are problematic in language learning because learners may encounter incorrect factual information or wrong explanations of the language system. The same text also notes that AI-generated content can be monotonous, repetitive and lacking in cultural or linguistic specificity. These findings suggest that GenAI can only support SDL if learners develop the capacity to question and verify AI outputs.

The corpus also raises concerns about openness itself. Tlili et al. [5] caution against "open-washing" (p. 406), where a tool is said to be open while still being based on restricted access and private profit. This is important for open education because free access is not the same as openness. Openness also requires transparency, adaptability, reuse, participation and collaboration.

4.5 Recommendations and Future Research Directions

The recommendations in the corpus emphasise that GenAI-supported SDL and open education require intentional, ethical and human-centred implementation. Ahmadfard [31] argues that realising the potential of iOER requires institutional investment, the training of facilitators and the development of scalable infrastructure. The same text also stresses the need to address digital equity, especially access to devices and connectivity. Maphalala [36] likewise advocates for well-defined institutional policies and support systems to promote fair access and ensure digital preparedness.

AI literacy is another recurring recommendation. Tlili et al. [5] argue that teachers should introduce the responsible use of GenAI before integrating it into learning activities. Li et al. [6] describe prompt engineering as a strategy that can enable learners to use ChatGPT more effectively in support of SDL. Across these texts, learners need support to use GenAI critically, responsibly and purposefully. Open pedagogy is also recommended as a practical way to integrate GenAI, SDL and open education. Tlili et al. [5] suggest that teachers and students can co-develop prompts, assess GenAI outputs and share prompts as OER. This positions learners as active participants in the teaching and learning process. It also links AI literacy to open knowledge creation.

The corpus further recommends collaboration and quality assurance. Ahmadfard [31] emphasises the importance of ongoing feedback from both teachers and students, as well as cooperation between subject-matter experts, instructional designers, and media professionals. Tlili et al. [5] recommend collaboration across fields such as computer science, psychology and design. These recommendations suggest that GenAI-supported open education cannot be left to individual facilitators or learners alone. It requires coordinated institutional and interdisciplinary support.

Future research suggestions in the corpus confirm that the field is still developing. Ahmadfard [31] notes that the research base remains fragmented, with many studies being discipline-specific, small-scale or limited in methodological rigour. Biyiri et al. [32] call for qualitative research on students' experiences and perceptions of ChatGPT to support SDL. Maphalala [36] advocates using larger, more heterogeneous samples that span various disciplines, institutions, and educational stages. He recommends further research on structured AI literacy programmes for students and staff, as these programmes can foster critical thinking and collaborative learning. Li et al. [6] recommend triangulating data with observations of learners' SDL processes and conducting longitudinal studies on the long-term impact of AI-integrated SDL.

The future research directions also point to the need for more context-sensitive work. Navas Bonilla et al. [8] recommend research across educational levels, disciplines and cultural contexts. Maphalala [36]

explicitly highlights the necessity for models that account for AI-mediated SDL within digitally unequal environments, particularly in regions like the Global South. Overall, the corpus suggests that future research should move beyond tool adoption and examine how GenAI, SDL and open education can be integrated in ways that are ethical, inclusive, pedagogically sound and responsive to context.

4. Conclusion

This systematic literature review mapped evidence on the relationship between GenAI, SDL and open education. The corpus shows that GenAI may support SDL through feedback, explanations, resource discovery, learning planning and personalised support. It may also support open education by assisting with the revision, remixing, localisation and adaptation of OER. However, the relationship is not automatically positive. The corpus also highlights risks related to overdependence, inaccurate outputs, hallucinations, bias, academic integrity, weak contextualisation, licensing, attribution and quality assurance. These risks are especially important because SDL depends on learner agency, critical thinking, reflection and informed decision-making. The review therefore suggests that GenAI can contribute to SDL in open education when it is used ethically, critically and in pedagogically sound ways. Its value depends on AI literacy, facilitator guidance, institutional support, digital equity and quality assurance. Future research should move beyond tool adoption and examine how learners and facilitators use GenAI in practice, especially in diverse and digitally unequal contexts.

Epistemic Asymmetry in Adolescent Democratic Deliberation: Teacher Facilitation, Participatory System Design, and Initial Role Reconfiguration Insights from the SAUFEX Interdemocracy Pilot

Onno Hansen-Staszyński[1], Beata Staszyńska-Hansen[2]

[1,2]DROG Group, The Netherlands
[2]Fundacja Citizen Project

Abstract

This conceptual paper examines the rationale and preliminary pilot outcomes of the educational dimension of the Horizon-funded EU project SAUFEX, which seeks to democratize and decentralize decision-making processes related to Foreign Information Manipulation and Interference (FIMI). It argues that the inclusion of non-state experts alone is insufficient for democratization, as meaningful responsiveness to citizens and implementability of policies require structured public participation beyond expert advisory mechanisms. Drawing on diverse theories, the paper conceptualizes the conditions under which broad participation can contribute to resilience rather than devolve into illiberal or purely procedural forms of democracy. It contends that educational institutions provide a uniquely suitable environment for approximating these conditions, both logistically and normatively, through synchronized participation, cognitive diversity, and early democratic socialization. The paper presents Interdemocracy as a didactical framework through which adolescents can participate in structured consultation while developing citizen skills. A core challenge in adolescent democratic deliberation is epistemic asymmetry between teachers and students, which risks distorting authentic student participation. In response, Interdemocracy reconceptualizes the teacher's role from epistemic lead to non-epistemic facilitator of procedural integrity, student self-realization, and student self-correction.

Keywords: *facilitation, democratic deliberation, participation, epistemic asymmetry, autopoiesis*

Introduction

The Horizon-funded EU project SAUFEX has two broad aims. The first is to standardize and expand understanding of Foreign Information Manipulation and Interference (FIMI); the second is to decentralize and democratize decision-making processes and quality assurance related to FIMI. While the first aim is primarily technological, the second incorporates an educational dimension. This conceptual paper examines the rationale underlying the educational component and explores its implications. While educational institutions provide a promising setting for participatory democratic experimentation, they are structurally marked by epistemic asymmetry: teachers occupy institutionally sanctioned positions of epistemic authority, while student contributions are typically treated as epistemically subordinate. This asymmetry creates a tension between educational hierarchy and democratic participation.

The project's focus on education emerged through a gradual and incremental process. It developed from the formal inclusion of non-state experts in decision-making procedures. The mechanism chosen for this inclusion was the so-called "Resilience Council" [1], an institution designed to enable representatives from NGOs and academia to contribute their expertise across all phases of governmental FIMI management - from detection, classification, grading, and reporting to the formulation of responses. The first formal Resilience Council was established to advise the Polish Minister of Foreign Affairs, and a second is planned as an advisory body to the forthcoming Polish DSC. While the inclusion of non-state experts constitutes a step toward the decentralization of decision-making processes and quality assurance, it remains an initial step only. By focusing exclusively on expert participation, Resilience Councils do not facilitate the inclusion of the general public. As such, they fall short of increasing state institutions' responsiveness to citizens – a key democratic feature [2] - and therefore do not reduce the risk of undemocratic liberalism, a paternalistic tendency within liberal democracies that prioritizes institutions and procedures over citizen well-being [2]. Indeed, limiting participation to experts may instead reinforce a meritocratic bias, whereby the existing hierarchical status quo is viewed as the morally justified endproduct of education and effort [3]. Thus, rather than

broadly advancing decentralization and democratization, stopping at this first step would risk merely confirming existing patterns of exclusion while extending participation to a limited cohort only.

Participation

Setting up participatory processes seems straightforward. Besides establishing how much influence the participants should have, as measured on Arnstein's ladder, the big choice seems to be whether to use a representative method of participation (in which representatives are selected by vote or by lottery) or a referendum-style mechanism. There is a caveat though: participation without a focus on the well-being of all of its participants could turn into a potentially rigged zero-sum game in which the end goal is exerting influence. Decision-making in that scenario, in its ultimate form, risks devolving into a Hobbesian-style contest over influence and democracy risks being seen as a mechanism for allocating influence only. In the case of undemocratic liberalism, democracy as procedural frame becomes an intrinsic good in itself, whereas under illiberal democracy – responsiveness to the in-group citizenry as defined by populist criteria - outweighs the importance of procedures and democratic institutions [2] - it becomes contingent and instrumental. In neither case does the well-being of the whole of the general public constitute the central normative commitment.

Participation Conceptualization

To involve the whole of the general public in fair decision-making means concretely conceptualizing the engagement of not just experts or an in-group as well as positioning citizen well-being as a frame.
Lewandowsky et al. [7] provide a starting-point for conceptualizing citizen engagement. He distinguishes two discourses that are essential in a democracy: "fact-speaking" and "belief-speaking". While "fact-speaking" establishes accuracy as the correspondence between an opinion and evidence gathered in the external world, "belief-speaking" prioritizes accuracy between an opinion and one's inner world. Although "fact-speaking" may excel in getting the facts right and creating a shared understanding of reality, "belief-speaking" is essential for the implementability of policies – without public support evidence-informed decision cannot be effective. This does not mean that the general public should be seen as incapable of fact-speaking; rather the take-away is that both discourse types should be covered by participation mechanisms. Limiting participation to experts and focusing on "fact-speaking" misses out on an essential discourse type thereby risking turning participation into a top-down instrument.
Surowiecki [8] supplies the conditions under which "wisdom" rather than herd folly can be extracted from a crowd. His key insight is that when individual perspectives are aggregated correctly, crowds consistently outperform even knowledgeable individuals across three types of problems: cognition, coordination, and cooperation. For individual perspectives to be aggregated viably, participants need at least some relevant information about the subject. In addition, according to him, there are three preconditions to be met. The first precondition is diversity, understood not in sociological terms, but in conceptual and cognitive terms. Suitable crowds need to encompass a range of perspectives among their participants. The second precondition requires independence in thinking. Participants must make decisions without interference from others: there is to be no communication among individuals, no negotiation, and no compromising during the process of formulating their perspectives. The third precondition emphasizes decentralization. Individuals should draw on their local, specific knowledge and tacit understanding.
In Saufex, citizen well-being is positioned as an intrinsic system quality relevant in the context of information distortions: resilience. Citizen well-being is conceptualized as the experience of autonomy, belonging, and achievement [4]. If these experiences are absent or near absent, a state of dislocation occurs [5]. This condition is so excruciatingly painful that those experiencing it "become susceptible to the lure of pills, gang leaders, extremist religions, or violent political movements – anybody and anything that promises relief" [6]. Resilience in this state is minimal, rendering democracy vulnerable to external and internal destructive pressures.
The underlying image of citizens in this view is autopoietic - autopoiesis is used here in an applied sense to denote that citizens maintain, realize, and correct themselves within a context provided. If the context is destructive and leads them into dislocation, they adapt by self-correction. The same holds good for contexts that enhance their experience of autonomy, belonging, and achievement.

Education

With the conceptualizations in place, the question is: what does this have to do with education? The answer is partially logistical: implementing Surowiecki's second precondition presents significant challenges. In order to prevent consultation between participants when presenting their perspectives, a setting must be created in which a crowd of citizens receives a question simultaneously and responds individually, without an opportunity for discussion or coordination. In order to approximate Surowiecki's preconditions, including the second one, a carefully designed process is needed.
Currently in project Saufex, it is not clear yet how to translate the preconditions into a setting suitable for the whole of the general public. However, for at least one group a potentially compatible setting does exist adolescents within the educational system. Relative to many other administratively available cohorts, educational settings provide substantial cognitive diversity. They also offer an obvious frame for introducing relevant subject information. And, importantly, its central planning allows for simultaneously presenting a question to a cohort. In addition to logistical feasibility, the educational setting also provides a normative advantage: by providing a constructive context by enabling young citizens to experience structured democratic engagement, it allows democratic participation skills to be developed early. Yet the very institutional structure that makes schools logistically suitable for synchronized participation also introduces a complication: educational settings are organized around entrenched epistemic asymmetries between teachers and students, requiring procedural safeguards if authentic student expression is to be preserved.

Interdemocracy

Within project Saufex a promising didactical intervention was identified: Interdemocracy. Interdemocracy is an established didactical format and method. The format was recommended by the European Commission in its original *Guidelines for teachers and educators on tackling disinformation and promoting digital literacy through education and training* (2022). The implementation of the format and method was endorsed by the European Commission in the *Final report* of the Commission expert group on tackling disinformation and promoting digital literacy through education and training. Prominent representatives across diverse professional communities, including policy-makers, academics, and practitioners, positively reviewed a book on Interdemocracy's format and method and its theoretical foundations [9], while Interdemocracy pilots were positively vetted by representatives of the Polish Ministry of Foreign Affairs and the Pomeranian Center for Teacher Education.
Interdemocracy is seen as promising since it enables the distillation of wisdom from groups within a participatory process as well as individual autopoiesis – autonomous self-realization and self-correction. It stipulates a context in which all individuals autonomously formulate their perspectives on one central question simultaneously in parallel, without interaction.

The Interdemocracy Participation Process

The Interdemocracy participation process is designed to operationalize large-scale citizen input while preserving the conditions necessary for independent judgment and meaningful aggregation of perspectives. The method structures participation across multiple classrooms in parallel in several stages that combine autonomous individual input, collective reflection, and institutional response.
The process starts with a short, evidence-informed introduction by the teacher in the classroom followed up by a central question that is directed to students. Each student then formulates an individual response. The responses are submitted directly to a central server, ensuring that contributions are recorded simultaneously and independently. Once collected, the responses are analyzed transparently through an artificial intelligence system operating under human supervision. The system clusters similar responses and identifies recurring themes in the students' perspectives. This clustering does not replace human judgment but assists in organizing large volumes of input in a transparent and manageable way. To avoid potential bias multiple clustering procedures are followed including two-step digital content forking.
On the basis of the clustered responses, a group of older students, referred to as the Youth Resilience Council, develops a set of preliminary recommendations. The Council performs bounded deliberation constrained by aggregated student input and subject to iterative student ratification; it operates as a translating layer that structures the aggregated input into policy-relevant recommendations. It reviews the aggregated perspectives of the participating students and formulates proposals that reflect the concerns, arguments, and values expressed in the responses. The recommendations are then returned

to the participating students for evaluation. These students, in turn, indicate whether they agree or disagree with the proposed recommendations and provide a short explanation for their position. These reflections are submitted to the central server. The second round of student input is subsequently analyzed using the same AI-supported clustering process under human supervision. The resulting analysis allows the Youth Resilience Council to assess how the broader group of students perceives the proposed recommendations and whether important concerns or perspectives have been overlooked. Based on this feedback, the council considers whether revisions are necessary and, if required, adjusts the recommendations accordingly. After this deliberative step, the council formulates the final set of recommendations. The final recommendations are then transmitted to relevant public institutions, which are invited to respond to them. The institutional responses are communicated back to the participating students, closing the feedback loop and ensuring that participants are informed about how their contributions have been received and what potential impact they have had.
Through this structured process, Interdemocracy seeks to combine independent individual input, large-scale aggregation of perspectives, youth deliberation, and institutional accountability within a single participatory framework. Adolescents are not taken as proxies for the general public; they only give voice to their own age cohort. Therefore, this set-up presents not more than a first step in engaging all citizens.

The Interdemocracy Autopoiesis Process

Alongside the participation mechanism, Interdemocracy incorporates a structured process designed to regulate how communication takes place during the classroom participation stages. The aim of this process is to create conditions in which participants can articulate their views independently while experiencing attentive listening and exposure to multiple perspectives. Within the framework, the teacher assumes a strictly procedural role as facilitator. The teacher does not evaluate the content of students' contributions or intervene in the substance of the perspectives uttered. Instead, their responsibility is limited to ensuring that the communication directives governing the process are correctly implemented and followed.
Several communication directives structure the process. First, students are required to formulate their perspectives using first-person statements. Each participant expresses their view from their own standpoint rather than speaking on behalf of others or in abstract generalizations. This requirement encourages personal responsibility for one's perspective and reduces the tendency to frame arguments in adversarial or groupish terms. Second, interaction among students is prohibited during the formulation of individual perspectives. Participants develop their responses independently, without discussion, negotiation, or coordination with others. This rule preserves independence in thinking and prevents the convergence of viewpoints through peer influence thus fulfilling Surowiecki's second precondition of independent judgment in raw input collection. Third, students formulate their perspectives in three successive steps. They first write their response on paper, then submit it in digital form, and finally read their statement aloud while recording it as an audio contribution. This sequence encourages reflection during formulation and personal responsibility when presenting perspectives publicly. Fourth, each spoken contribution must conclude with the phrase "thank you." This small procedural element functions as a symbolic closure of the statement and reinforces a respectful communication environment. Fifth, the order of read-out student contributions is determined randomly. Randomization prevents the emergence of implicit hierarchies in speaking order and ensures that no participant is structurally advantaged or disadvantaged in presenting their perspective. Sixth, responses to the perspectives of others are not permitted during this phase of the process. Students are expected to listen without commenting, challenging, or endorsing the statements of their peers. In line with this rule, the teacher maintains a neutral stance and refrains from evaluative reactions. Finally, all students are invited to participate in each activity under identical conditions. No participant is excluded from the process, and no individual receives preferential treatment. The procedural framework therefore ensures equal access to participation.
Together, these communication directives establish a stable and psychologically safe launchpad for participation. They encourage students to articulate their views more authentically, while also allowing them to experience that others listen with sustained attention. At the same time, participants are exposed to a range of different perspectives, fostering an experiential awareness of plural viewpoints within the group.

Interdemocracy and Student Autopoiesis

The independent articulation of their thoughts by students and the experience of being listened to by others without judgment in the Interdemocracy setting is to foster student self-realization. The exposure of students to plural perspectives formulated by their fellow-students is to foster student self-correction. A key challenge to student autopoiesis is the traditional epistemic asymmetry between teachers and students that hierarchically enforces student correction, rather than stimulates self-correction. This is a major reason why in Interdemocracy teachers assume a different role.

Teachers as Facilitators

Within Interdemocracy teachers fulfill the role of facilitators. This role is strikingly different from their regular role as teachers. As teachers, their basic task is to transfer curriculum-defined knowledge and skills to students; they function as subject-bound epistemic leads with a mission. Their focus is predominantly on "fact-speaking"; they impose the educational system as the default context for autopoiesis. This leads to benevolent interventions, aimed at nudging students towards a predefined subject-specific direction within the boundaries of the curriculum, while the teacher's inherent mission adds a layer of emotional care. At a cognitive level, this dynamic is underpinned by naïve realism: the implicit assumption that one's own perceptions and interpretations correspond directly to objective reality, while those of others are comparatively subjective or distorted. In the educational context, this cognitive tendency interacts with role-based authority to help produce an epistemic hierarchy in which teacher-speaking is tacitly construed as superior "fact-speaking," while student-speaking is more readily classified as inferior "fact-speaking" or mere "belief-speaking." Because teachers experience their own judgments as objective rather than interpretive, this classificatory process typically remains invisible to them. Consequently, interventions in student expression appear not as exercises of epistemic power, but as necessary and morally justified corrections. Naïve realism thus renders influence epistemically invisible to the influencer while making restraint feel like professional negligence.
The role of facilitator is based on very different requirements. The facilitator is to observe in an epistemically neutral fashion, not intervene benevolently. Their primary responsibility is to safeguard the procedural integrity of the process, ensuring that students can express their perspectives with minimal external barriers or constraints. The epistemic foundation is content-agnostic, not domain specific, whereas the boundaries are legal rather than the curriculum. Lastly, the teacher's mission is not to be translated into emotional care but into ethical care – as responsibility, not guardianship.

Teachers as Facilitators - Experiences

Between November 2025 and March 2026, a small-scale Interdemocracy pilot was conducted in ten primary schools in the Pomeranian Voivodship (Poland) within the framework of the Saufex project. Fourteen teachers conducted four ninety-minute sessions in sixteen classes. The pilot was co-organized with the Pomeranian Center for Teacher Education and was supported by the Polish Ministry of Foreign Affairs. It was anticipated that teachers would face significant challenges in fulfilling the facilitator role due to the profound shift in attitude it entails.
The pilot results did not confirm this expectation. Teachers quantitatively reported increasing comfort with the facilitator role across sessions. After sessions two, three, and four, teachers indicated on a Likert-5 scale how much they agreed with the following statement: *Compared to the previous session, I felt more comfortable in the role of facilitator*. The average results were positive. The average score was 4.17 after session 2; 3.8 after session 3; and 3.56 after session 4.
The quantitative results indicate that teachers continued to report increasing ease in facilitation across sessions, although the magnitude of perceived improvement diminished over time. Qualitative data offers insight into teachers' internal journey, suggesting that what appears as ease in practice may in fact reflect a deeper transformation in professional identity. Facilitators also reported noticeable shifts in their own professional experience during the sessions.
Many teachers described a sense of becoming "unburdened" during facilitation. Once they accepted that they were not expected to provide the correct answers or to resolve every situation, they were able to concentrate fully on maintaining the process itself. They reported feeling more at ease as they were no longer positioned as controllers of classroom outcomes. This change reduced their performance anxiety and allowed them to adopt a more observational role. Subsequently, teachers became more aware of underlying classroom dynamics. By stepping slightly aside from their usual authoritative role, they were able to observe patterns of peer influence, subtle social pressures, and individual strengths

of students who typically remain quiet in conventional lessons. Many facilitators also reported that guiding the process helped them further develop soft competencies, including mindfulness, conflict moderation, and emotional self-regulation.
At the same time, the shift in role occasionally proved challenging. In situations in which student engagement declined or in which participants expressed resistance, the facilitator's task was not to intervene or push the discussion toward a particular outcome but simply to maintain the communicative framework - ensuring time boundaries, procedural fairness, and a safe environment. Several teachers indicated that "guarding the frame" rather than attempting to produce immediate results required a different form of professional patience, and for many this represented the most demanding aspect of the transition into the facilitator role.

Other Types of Facilitation

While Interdemocracy facilitation in the classroom involves facilitating students to formulate their perspectives and listen to other students' perspectives without judgment or reaction, facilitation in the Youth Resilience Council concerns in addition what Bauman calls "citizen skills": "the skills of interaction with others – of conducting a dialogue, of negotiation, of gaining mutual understanding and of managing or resolving conflict". [10] This shifts the focus of facilitation even further towards an ethical care stance. [11; 12]
Within the Saufex project, deliberations are ongoing on how to apply facilitation to curriculum subjects that lean heavily on a teacher transfer of knowledge and skills. A preliminary option could be to devise a deterministic, policy-constrained AI system, compliant to all EU and national regulations, that dynamically generates exercises and provides first-line formative assessments. Teacher facilitation would then consist of providing second-line formative assessment support, helping students interpret the feedback, clarifying procedural misunderstandings, supporting metacognition and self-correction, and ensuring accessibility and legal and ethical compliance.

Conclusion

Within SAUFEX, the educational dimension of democratizing FIMI governance emerges not as an auxiliary component but as a practical and normative necessity. Educational settings provide an institutional environment suited for approximating the procedural conditions required for structured large-scale citizen participation while simultaneously cultivating some of the democratic competencies needed for future public engagement. Through Interdemocracy, schools appear capable of functioning not merely as sites of knowledge and skills transfer, but as safe environments in which adolescents practice independent thought and expression, experience plural perspectives, and participate in structured processes of collective voice formation. As such, education could function both as a mechanism for implementing participatory resilience-building and as a formative space for democratic socialization.
This potential reorientation carries significant implications for the professional role of teachers. Within the SAUFEX framework, facilitation is conceptualized not as a minor pedagogical adjustment but as a distinct professional stance requiring the temporary suspension of conventional epistemic authority in favor of procedural neutrality, ethical care, and frame-guarding. Early pilot findings suggest that teachers seem capable of adopting the role of facilitator and may experience it as professionally transformative although challenging. If facilitation is further extended into additional educational and curricular contexts, the teacher's role may increasingly evolve from knowledge and skills transmitter toward facilitator of student self-realization, self-correction, and democratic participation. Possibly, the educational strand of project SAUFEX could point not only toward new participatory mechanisms, but toward a broader reconceptualization of education and teacher professionalism in democratic societies.

Market Resilience in Crisis: Post-Pandemic Enrollment Shifts and Sector-Based Performance in U.S. Higher Education, 2019–2024

Ali Akbari

California Lutheran University, United States

Abstract

The COVID-19 pandemic disrupted the traditional stability of the U.S. higher education market, exposing distinct vulnerabilities across different institutional types. Rather than a uniform decline, enrollment data from 2019–2024 reveal a fragmented landscape where student choice shifted significantly based on sector responsiveness. Using national enrollment percentage-change data drawn from the Integrated Postsecondary Education Data System (IPEDS), the analysis evaluates sector-specific differences and assesses whether institutional sector is significantly associated with changes in enrollment. Statistical methods, including ANOVA and non-parametric alternatives, are used to test the significance of observed differences. Both the categorical analysis (Chi-Square) and the continuous analysis (ANOVA) converge on the same finding: Institution Sector is a critical determinant of enrollment trends. The Chi-Square test reveals a strong dependency where PAB and Public 2-year sectors are disproportionately represented in the "Extreme Decrease" category, while private sectors dominate the "High Increase" category. Results indicate substantial variation across sectors, with for-profit institutions showing growth while public two-year and Public Associate-Dominant (PAB) institutions experienced the steepest declines. The study argues that for public institutions to recover, they must move beyond traditional enrollment management and integrate the more aggressive, consumer-oriented recruitment tactics utilized by their private competitors.

Keywords: *Post-Pandemic Enrollment Trends, Enrollment Strategy, Market Segmentation and Sectoral Inequality, Student Recruitment, Higher Education Marketing, Regional Divergence, Private Institutions, Public Institutions, Public Two-year Colleges.*

Introduction

The COVID-19 pandemic disrupted higher education globally, leading to shifts in student behavior, institutional operations, student recruitment and enrollment patterns. In the United States, early pandemic years saw widespread declines in undergraduate enrollment, particularly within community colleges and public institutions. As pandemic effects receded, questions emerged about long-term structural changes in enrollment by institutional sector.

This paper examines the post-pandemic effect of COVID-19 on U.S. student enrollment by institutional sector from 2019–2024. The goal is twofold: (1) to document sector-specific enrollment changes using descriptive analysis, and (2) to evaluate whether institutional sector is statistically associated with enrollment change.

Review of Literature

The COVID-19 pandemic caused unprecedented disruption in U.S. higher education, producing sharp enrollment declines across sectors from 2020–2022, followed by uneven regaining patterns since 2023. Research clearly shows sectoral disparities, leadership and policy challenges, and changing student preferences regarding flexible and career-oriented education. Several studies show that U.S. higher education enrollment dropped significantly during the pandemic. However, in fall 2024, undergraduate enrollment rates increased for the first time since before the pandemic. According to the National Student Clearinghouse Research Center (NSCRC), "Undergraduate enrollment increased across major institutional sectors, with community colleges (Public two-year and Public PABs) seeing the largest growth (+5.4%, +288,000)".

Enrollment Fluctuations and Recovery Dynamics

While the *Current Term Enrollment Estimates* (CTEE) show a macro-level "rebound" in total undergraduate enrollment for 2024, micro-level findings suggest that this recovery is fragile. Vaterlaus et al. (2024) indicated that “based on college student responses, pandemic recovery was a multidimensional process” and suggested that “future studies should also monitor how college student pandemic recovery changes over time”.
Earlier analysis by Carmean, Kil, and Baer (2021), utilizing data from 12.6 million students, confirmed that enrollment loss was concentrated in community colleges and regional public institutions. This was further supported by the NSCRC (2021), which provided regular updates on the widening gap in student success during the pandemic onset.

Sectoral Shifts and Long-Term Trends

Francis and Goodman (2025) utilized longitudinal data from Massachusetts—mirroring broader national trends—to examine enrollment patterns five years after the initial pandemic disruption. Their research challenges the assumption of a universal "return to normal," instead identifying "sustained effects" on both the size and demographic composition of the student body. They demonstrate a sustained sectoral shift; as of Fall 2024, they show that “relative to pre-pandemic trends, fall 2024 enrollment is down 2% in local public schools, up 16% in private schools, and up 50% in home schools”.
In California, Fairlie and Bulman (2022) explored how the pandemic impacted enrollment patterns and academic outcomes within the community college system, concluding that “enrollment changes were substantial across a wide range of fields and were large for both vocational courses and academic courses that can be transferred to four-year institutions”. Cummins (2025) later used system mapping in California to visualize these long-term educational pipeline effects, identifying a structural "post-pandemic onset" enrollment contraction driven by a confluence of demographic shifts and "pandemic-induced mobility" that has not reversed.

Structural Changes and the "Next Normal"

The post-pandemic classroom has also exposed deep inequities in access, digital readiness, and persistence, which Whitson and Brazeal (2022) argue have reshaped enrollment behaviors and expectations. As a result, scholars like Glantz et al. (2021) propose that the use of new practices and tools should take hold as changes to institutional procedures are incorporated into the "next normal".
Although final data on student enrollment for 2025 had not been published at the time of this research, initial estimates from the CTEE (2025) indicate that total postsecondary enrollment is up 3.2% in 2025 compared to 2024. While undergraduate enrollment grew to 15.3 million, it remains 2.4% below pre-pandemic levels. Conversely, graduate enrollment is now 7.2% higher than in 2020. Despite these gains, Schueler and Miller (2024) found substantial variation in public school and college enrollment in Virginia, suggesting that mobility patterns continue to affect higher education pipelines.

Method

Data Source

The Integrated Postsecondary Education Data System (IPEDS) is a system of 12 interrelated survey components conducted annually. It covers approximately 5,819 U.S. postsecondary institutions eligible for Title IV federal student aid and gathers data from every college, university, and technical and vocational institution that participates in federal student financial aid programs.

Variables

- **Dependent Variable:** Percentage change in student enrollment from 2019 to 2024.
- **Independent Variable:** Institutional sector, categorized as:
    - All Private, For-Profit Institutions
    - Private, Not-for-Profit, 4-year
    - All 4-year Institutions
    - All Private, Not-for-Profit Institutions
    - Public, 4-year

- Overall
- All Public Institutions
- Public PAB (primarily associate degree-granting baccalaureate institutions)
- All 2-year Institutions
- Public, 2-year
- All PAB Institutions

Statistical Approach

Descriptive Statistics - Enrollment data were derived from IPEDS, representing national enrollment counts by institutional sector for the years 2019 and 2024. The percentage changes in student enrollment for major institutional categories were calculated for each region. For each region, as well as at the national level, changes in student enrollment were analyzed by institutional sector to identify which sectors were most and least affected by the COVID-19 pandemic

Test of Significance - Because the dependent variable is continuous (percentage change) and the independent variable is categorical (institutional sector), an Analysis of Variance (ANOVA) was selected as the standard method for evaluating differences across multiple groups.

Two complementary statistical approaches were employed:

1. **Chi-Square Test of Independence:** To analyze the association between sector and categorical enrollment impact.
2. **Analysis of Variance (ANOVA):** To test for significant differences in mean percentage enrollment change.

Results

Analysis of Change in Student Enrollment by Institution Sector and Region National Overview (United States, 2019–2024)

Nationally, student enrollment in higher education declined by an overall 3.16% between 2019 and 2024. The disaggregated data reveal that public institutions experienced the sharpest declines (–4.71%), particularly within two-year colleges (–9.69%) and public programs of primarily associate degree-granting baccalaureate institutions (PABs) by –7.99%. By contrast, private for-profit institutions exhibited modest growth (+5.12%), suggesting that their flexible, online-oriented models may have absorbed some displaced students.

Across the four-year sector, enrollment remained relatively stable (+0.27% overall), masking divergent patterns between private not-for-profit four-year colleges (+0.36%) and public four-year universities (–0.72%). These figures indicate that while the U.S. higher education system is rebounding unevenly, institutional type remains a critical determinant of post-pandemic recovery, with for-profit providers emerging as net beneficiaries of shifting student preferences toward career-aligned and accessible learning pathways.

Table 1. Percentage Change in Student Enrollment — United States, 2019–2024

Institution Sector	% Change (2019–2024)
Overall	-3.16%
All 4-year Institutions	0.27%
All PAB Institutions	-10.61%
All 2-year Institutions	-9.18%
All Public Institutions	-4.71%
All Private, not-for-profit Institutions	0.17%
All Private, for-profit Institutions	5.12%
Public, 4-year	-0.72%
Private, not-for-profit, 4-year	0.36%
Public, PAB	-7.99%
Public, 2-year	-9.69%

Midwest Region

In the Midwest, enrollment declined more sharply than the national average, with an overall decrease of 4.46%. Public institutions experienced notable contractions (–4.69%), driven primarily by declines at two-year colleges (–4.94%) and public PAB institutions (–22.55%). Private institutions did not offset these losses, as both private not-for-profit (–5.10%) and for-profit (+1.54%) sectors posted weak or marginal growth.
The broad-based downturn in both public and private four-year institutions (–3.43%) may suggest that demographic stagnation and limited population growth in the Midwest have compounded the pandemic's impact. The Midwest thus reflects a pattern of institutional retrenchment and limited diversification, with community and applied institutions being particularly vulnerable.

Table 2. Percentage Change in Student Enrollment — Midwest Region, 2019–2024

Institution Sector	% Change (2019–2024)
Overall	-4.46%
All 4-year Institutions	-3.43%
All PAB Institutions	-26.04%
All 2-year Institutions	-4.97%
All Public Institutions	-4.69%
All Private, not-for-profit Institutions	-5.10%
All Private, for-profit Institutions	1.54%
Public, 4-year	-3.83%
Private, not-for-profit, 4-year	-4.12%
Public, PAB	-22.55%
Public, 2-year	-4.94%

Northeast Region

The Northeast shows the most severe enrollment contraction across all U.S. regions, with an overall decline of 4.46% but disproportionately large losses among public and two-year institutions. Specifically, public institutions fell by 10.83%, two-year colleges by 15.20%, and public PAB programs by an extraordinary 68.19%. In contrast, private not-for-profit institutions registered modest growth (+3.78% overall; +3.06% among four-year colleges), reflecting the region's strong concentration of elite and well-endowed universities capable of weathering enrollment volatility.
This sharp dichotomy underscores a deepening structural inequality between selective private universities and underfunded public systems in the Northeast, where demographic decline and rising tuition costs may further constrain access to public higher education.

Table 3. Percentage Change in Student Enrollment — Northeast Region, 2019–2024

Institution Sector	% Change (2019–2024)
Overall	-4.46%
All 4-year Institutions	-0.24%
All PAB Institutions	-45.99%
All 2-year Institutions	-15.20%
All Public Institutions	-10.83%
All Private, not-for-profit Institutions	3.78%
All Private, for-profit Institutions	-6.60%
Public, 4-year	-5.38%
Private, not-for-profit, 4-year	3.06%
Public, PAB	-68.19%

Institution Sector	% Change (2019–2024)
Public, 2-year	-15.54%

South Region

In the South region, enrollment trends are comparatively more stable, with only a 2.04% overall decrease—a smaller decline than in other regions. The four-year sector shows resilience, with both public and private not-for-profit universities posting modest gains (+1.72% and +3.05%, respectively). However, the two-year sector remains weak, showing a 10.44% overall decline, suggesting that the community-college pipeline remains fragile despite the region's strong population base. Public PAB institutions (–1.43%) and for-profit providers (–2.41%) also declined, albeit mildly.
The South's relative stability indicates regional resilience, likely supported by higher in-migration, population growth, and the strong presence of large state university systems that retained enrollment through hybrid and online options.

Table 4. Percentage Change in Student Enrollment — South Region, 2019–2024

Institution Sector	% Change (2019–2024)
Overall	-2.04%
All 4-year Institutions	2.36%
All PAB Institutions	-5.87%
All 2-year Institutions	-10.44%
All Public Institutions	-2.77%
All Private, not-for-profit Institutions	1.72%
All Private, for-profit Institutions	-2.41%
Public, 4-year	1.72%
Private, not-for-profit, 4-year	3.05%
Public, PAB	-1.43%
Public, 2-year	-10.31%

West Region

The Western region presents a mixed recovery, with an overall enrollment decline of 2.34%, but substantial growth in private for-profit institutions (+11.15%). This surge suggests that market-driven, online-oriented education providers capitalized on post-pandemic demand for flexible learning. Traditional institutions exhibited mild improvement, with public four-year universities (+1.62%) and private not-for-profit institutions (+1.24%) recovering slightly. Nonetheless, two-year institutions (–7.88%) and public PAB programs (–7.66%) experienced ongoing declines, reinforcing the nationwide trend of weakening enrollment in short-cycle education.
Overall, the West exemplifies a dual recovery trajectory—a modest rebound in four-year enrollment coupled with continued attrition in public and sub-baccalaureate programs.

Table 5. Percentage Change in Student Enrollment — West Region, 2019–2024

Institution Sector	% Change (2019–2024)
Overall	-2.34%
All 4-year Institutions	2.17%
All PAB Institutions	-8.19%
All 2-year Institutions	-7.88%
All Public Institutions	-4.32%
All Private, not-for-profit Institutions	1.24%
All Private, for-profit Institutions	11.15%

Institution Sector	% Change (2019–2024)
Public, 4-year	1.62%
Private, not-for-profit, 4-year	0.61%
Public, PAB	-7.66%
Public, 2-year	-9.64%

Comparative Regional Analysis

The regional breakdown confirms that the post-pandemic enrollment recovery in U.S. higher education has been geographically uneven. For-profit institutions recovered more strongly than any other sector, particularly in the West. Private not-for-profit universities displayed relative resilience in the Northeast and South. Conversely, public two-year institutions remain the most vulnerable nationwide, reflecting their dependence on in-person enrollment, local economies, and state funding structures. Primarily associate degree granting baccalaureate (PAB's) programs experienced sharp declines across all regions, indicating a contraction in career-technical education pathways
These findings point to a reconfiguration of the higher-education landscape, where private and market-oriented institutions are expanding their relative share of enrollment, while public two-year and PAB programs continue to bear the brunt of post-pandemic disruptions. The new landscape recognizes a new pattern of market segmentation and a clear need for innovative enrollment strategy by higher education institutions in the US.

Table 6. Comparative Regional Analysis of Enrollment Change

Region	Overall Enrollment Change	Strongest Sector	Weakest Sector
United States	–3.16%	Private, for-profit (+5.12%)	Public 2-year (–9.69%)
Midwest	–4.46%	Private, for-profit (+1.54%)	Public PAB (–26.04%)
Northeast	–6.60%	Private not-for-profit (+3.78%)	Public PAB (–68.19%)
South	–2.04%	Private, not-for-profit 4-year (+3.05%)	Public PAB (–10.44%)
West	–2.34%	Private, for-profit (+11.15%)	Public 2-year (–8.19%)

Testing the Relationship Between Sectoral Inequality and Regional Divergence

To investigate whether institutional sector is significantly associated with percentage change in enrollment, appropriate statistical tests must be selected based on data characteristics.

Association Between Sector and Enrollment Impact Categories

To examine the relationship between institution sector and student enrollment changes, data were analyzed across 11 distinct sectors and four U.S. regions. Two complementary statistical approaches were employed: a non-parametric analysis of enrollment impact categories and a parametric comparison of mean percentage changes.

Chi-Square Test of Independence

First, percentage changes in enrollment were recoded into a five-level ordinal measure of enrollment impact: *High Increase* (> +2%), *Mild Increase* (0% to +2%), *Mild Decrease* (0% to −5%), *Substantial Decrease* (−5% to −15%), and *Extreme Decrease* (< −15%).
A Chi-square test of independence was conducted to determine if the distribution of these impact categories differed by institution sector. The relation between these variables was significant, $\chi^2(40, N = 44) = 72.33$, $p = .001$. To assess the strength of this association, Cramer's V was calculated. The result indicated a very strong association ($V = .64$), suggesting that institution sector is a robust predictor of the severity of enrollment changes. Specifically, Public Bachelor's (PAB) and Public 2-year institutions

were disproportionately represented in the "Extreme Decrease" category, while Private For-Profit institutions appeared most frequently in the "High Increase" category.
This confirms that knowing the institution sector provides substantial predictive power regarding the severity of enrollment changes. Specifically, Public Bachelor's (PAB) and Public 2-year institutions were disproportionately represented in the "Extreme Decrease" category.

Analysis of Mean Enrollment Change (ANOVA)

A one-way analysis of variance (ANOVA) was conducted to test whether the mean percentage change in enrollment differed significantly by sector. Preliminary assumption testing revealed a violation of the normality assumption (Shapiro-Wilk, $W = .86$, $p < .001$), though homogeneity of variance was technically preserved (Levene's test $p = .052$).
Given the violation of normality, both Welch's ANOVA (robust to unequal variances) and the Kruskal-Wallis H test (non-parametric) were conducted alongside the standard ANOVA to ensure the validity of the results. All three tests confirmed a statistically significant difference in enrollment changes between sectors:

- **Standard ANOVA:** $F(10, 33) = 3.73$, $p = .002$
- **Welch's ANOVA:** $F(10, 10.9) = 3.05$, $p = .031$
- **Kruskal-Wallis:** $H(10) = 33.84$, $p < .001$

Post hoc comparisons using Tukey's HSD test indicated that the **All PAB Institutions** sector experienced significantly steeper declines ($M = -28.6\%$) compared to **All Private, For-Profit Institutions** ($p = .003$) and **Private, Not-for-Profit, 4-Year Institutions** ($p = .011$). These findings confirm that while private sectors generally maintained stability or slight growth, public 2-year and public bachelor's institutions faced severe enrollment contractions across all regions.
Both the categorical analysis (Chi-Square) and the continuous analysis (ANOVA) converge on the same finding: **Institution Sector is a critical determinant of enrollment trends.** The **Chi-Square test** reveals a strong dependency where PAB and Public 2-year sectors are disproportionately represented in the "Extreme Decrease" category, while private sectors dominate the "High Increase" category. The **ANOVA** confirms that these differences in mean enrollment change are statistically significant, driven primarily by the severe declines in Public Bachelor's and Public 2-year institutions.

Discussion and Conclusion

The post-pandemic enrollment landscape reveals a clear market segmentation across sectors. For-profit institutions recovered more strongly than any other sector, while public institutions—especially two-year and PAB institutions—suffered significant losses. The regional breakdown confirms that the post-pandemic enrollment recovery in U.S. higher education has been geographically uneven.
These findings underline a reconfiguration of the higher education landscape, where private and market-oriented institutions are expanding their relative share of enrollment, while public two-year and applied programs continue to bear the brunt of post-pandemic disruptions. Such pattern clearly requires reassessment of old enrollment strategy by higher education institutions in the US.

Conclusion

This study documents substantial sector-level variation in post-pandemic enrollment changes between 2019 and 2024. Two-year and PAB institutions absorbed the largest enrollment declines, reflecting their higher concentration of low-income, first-generation, and adult learners. In contrast, for-profit institutions may have leveraged flexible online offerings to attract displaced students.
These findings highlight a clear market segmentation and the deepening stratification of postsecondary opportunity in the post-pandemic era and underscore the need for differentiated enrollment strategy responses to support the sectors most adversely affected.
At the time of this writing (December 2025), the final enrollment figures for spring and fall 2025 had not been published by IPEDS. These figures are expected to be released in early 2026, which will require further analysis to confirm the findings of this study. Such analysis will strengthen the empirical foundation for sector-specific policy interventions aimed at enrollment recovery.

Digital Travel Narratives and the Reconfiguration of Intercultural Competence in Higher Education

Denisa Celami[1], Aida Ciro[2]

[1]University of Vlora, Albania
[2]Independent PhD Researcher, Albania

Abstract

Travel narratives in times of contemporary digital culture are no longer confined to printed memoirs or documentary formats. They circulate constantly through social media platforms, blogs, vlogs, and algorithmically curated feeds, blending text, image, and video into immersive representations of place. For many students, these multimodal narratives, although fragmented, constitute their primary encounter with foreign cultures. The result is a subtle, but powerful transformation in the way cultural knowledge is produced, consumed, and internalized. What appears as a window onto global diversity may, in fact, operate as a mediated familiarity shaped by curated aesthetic filtering, selective framing, and platform logics that prioritise visibility over complexity. This paper considers the pedagogical implications of this shift. How should higher education respond to a context in which perceptions of cultural "others" are increasingly formed through curated, at times misleading, digital travel content? Drawing on Michael Byram's model of Intercultural Communicative Competence (1997), particularly the capacities of interpreting and relating and the dimension of critical cultural awareness, and engaging with Darla Deardorff's (2006) processual understanding of intercultural development, the paper argues that digital travel narratives demand a reconceptualization of intercultural pedagogy. Competence in this environment cannot be reduced to linguistic proficiency or exposure to diversity; it requires the ability to interrogate representation, to recognize subjectivity, and to situate oneself reflexively within systems of cultural meaning. Rather than treating digital narratives as supplementary teaching materials, the paper proposes approaching them as sites of critical analysis through which students can develop interpretive depth, reflexive awareness, and resistance to algorithmically reinforced stereotyping. In doing so, it contributes to ongoing debates on the future of intercultural education in an era where culture is increasingly encountered through screens and curated "representations" rather than lived experience.

Keywords: *Travel narrative, digital, higher education, intercultural competence*

1. Introduction

The digital shift has fundamentally transformed the conditions through which cultural knowledge is produced, encountered, and interpreted. The digital ecosystem, including Instagram reels, TikTok travel content, YouTube vlogs, blogs, and algorithmically, allow *users* to access, circulate, and engage with representations of places, communities and cultures at a scale and frequency of their own choosing, before ever having to physically cross an actual border. What all these processes share in common, is the lack of direct experience, direct observation and direct engagement with the subjects portrayed. For people, particularly young people, these highly curated and processed representations constitute a primary source of knowledge and "mediated" experience of foreign cultures, shaping their perceptions, and assumptions long before any direct intercultural interaction takes place. Recent studies from Pew Research Center (2025) indicate that social video consumption for news and information globally increased from 52% in 2020 to 65% in 2025, while 44% of young adults aged 18–24 identify social media and video platforms as their primary source of news and information [1], [2]. In this type of ecosystem, introduction with a particular culture is achieved through screens, where swiping and scrolling have substituted the actual physical processes of acquiring contextual depth and critical understanding [3].

This transition is taking place against a backdrop of expansion of travelling as a phenomenon, at an estimated 1.52 billion international tourist arrivals worldwide in 2025. In addition to marking the highest level ever recorded, it also marks a record in terms of digital travel content created and consumed, as well as fundamental changes in the way the actual experience of travel itself happens, and is subsequently portrayed in some literary form. Consumption of travelling as an experience and its almost instantaneous documentation happens fast, in what seems more a quest to *conquer by sight and visual*

documentation rather than understanding the visited subjects. Recent studies indicate that 83% of travellers use social media for travel inspiration, while travel-related content on TikTok alone has accumulated hundreds of billions of views through hashtags such as #travel and #travelvlog [5], [6]. This has a direct impact on cultural exchange, cultural knowledge and perception of cultural differences, as travel narratives, despite their form, have played an important role in mediating perceptions of cultural difference. From travel memoirs and literary accounts resulting from lengthy exposures and direct observation and engagement with the documented subjects, to documentaries and televised travel programs, representations of distant places have long contributed to how societies imagine and interpret cultural "others" [7] and to the emergence of public pedagogy.

In contrast, digital travel narratives differ significantly from the traditional travel writing earlier forms. Unlike the inherited body of travel literature, which was characterised by physical presence, engagement, observation and some form of processing or reflection, i.e. the case of Edit Durham's works or Margaret Hasluck, digital narratives circulate through fast-paced multimodal environments shaped by platform logics and algorithmic visibility [3], [8]. Documentations of cultural realities are presented in the form of processed images, short videos, and other curated products meant for instant consumption and sharing, carrying limited knowledge weight for the ones who consume it. As a result, representations of culture are frequently filtered through performative authenticity, selective framing, and visual simplification [9].

The implications apply to higher education in relation to intercultural education scholarship also. Existing approaches to intercultural competence have largely emerged from frameworks that prioritised direct interaction, mobility, dialogue, and immersion as the primary conditions through which intercultural understanding develops [10], [11]. Today, students approach intercultural encounters with already *influenced* views by what they have *consume*d digitally, giving rise to a conflict between what they perceive and what the context actually is. As Byram argues, intercultural competence requires not only knowledge of other cultures, but also "the ability to decentre and take up the perspective of another" [10].

From the intercultural education scholarship perspective, the challenge for higher education is therefore, no longer simply how to expose students to the inter-cultural discourse, but how to ensure critical interpretation of mediated representations through which cultural knowledge is generated and *consumed.* This is particularly important given that digital travel *content is* characterised by a sense of *proximity and familiarity* with the context, which does not necessarily correspond to deep understanding. Exposure to visual diversity alone does not automatically foster reflexivity, critical awareness, or the capacity to engage with cultural complexity. In some cases, repeated digital representations may even reinforce stereotypes, flatten differences, or encourage superficial forms of cultural consumption masked as intercultural openness [12].

This paper focuses on the pedagogical implications of this shift: how should higher education respond to a context in which perceptions of cultural "others" are increasingly formed through curated, at times misleading, digital travel content? Drawing on Michael Byram's model of Intercultural Communicative Competence [10], particularly the capacities of interpreting and relating and the dimension of critical cultural awareness, and engaging with Darla Deardorff's [11] processual understanding of intercultural development, the paper argues that digital travel narratives demand a reconceptualization of intercultural pedagogy. Competence in this environment cannot be reduced to linguistic proficiency or exposure to diversity; it requires the ability to interrogate representation, to recognize subjectivity, and to situate oneself reflexively within systems of cultural meaning.

Rather than treating digital narratives as supplementary teaching materials, the paper proposes approaching them as sites of critical analysis through which students can develop interpretive depth, reflexive awareness, and resistance to digitally reinforced stereotyping. In doing so, it contributes to ongoing debates on the future of intercultural education in an era where culture is increasingly encountered through screens and curated "representations" rather than lived experience.

2. Digital Travel Narratives and the Transformation of Cultural Mediation

Despite these transformations in modes of cultural encounter, the importance of intercultural competence cannot be disputed. To the contrary, the increased inter-cultural interactions has further accentuated the importance of better understanding cultures. Literature on intercultural competence has traditionally emphasised dialogue, immersion, direct engagement, and reflective interaction as central conditions for intercultural learning [10], [11]. Such frameworks generally assume that sustained exposure to cultural difference and the *observer's capacity* to critically observe and interpret unfamiliar contexts play a fundamental role in the development process of intercultural understanding. At the same

time, the role of travel narratives has been explored in relation to the shaping of public understandings of foreign cultures and its subsequent contribution to various forms of public pedagogy [7]. These approaches to intercultural competence, although differing in emphasis and disciplinary perspective, converge on a number of aspects.

According to Deardorff, intercultural competence refers to "the ability to communicate effectively and appropriately in intercultural situations based on one's intercultural knowledge, skills, and attitudes" [11]. Whereas Byram, furthers the definition on intercultural competence, focusing on the ability to interpret and relate cultural meanings, critically evaluate perspectives, and develop what he describes as "the ability to de-centre and take up the perspective of another" [10]. In exploring the concept through his *Developmental Model of Intercultural Sensitivity* framework, Bennet looks at intercultural competence as a developmental shift in the way individuals perceive and respond to cultural difference, moving from ethno-centric perspectives toward greater intercultural sensitivity and ethno-relativism [12]. What stands out is his emphasis on the importance of understanding foreign cultures relative to their own context rather than through the standards of one's own culture. Notes of ethnocentric perspectives are present in numerous travel narratives, such as in Lord Byron and John Cam Hobhouse depictions of Albania.

Kramsch identifies interpretation of symbolic meaning as crucial to intercultural understanding. She further argues that intercultural understanding requires the ability to interpret symbolic meaning and recognise the cultural positioning embedded within communicative practices [13], contrary to the digital travel narratives, where cultural, social and historical elements are presented as visual consumable cultural experiences, while their deeper symbolic meaning from a social or cultural perspective, remain unexplored. Similarly to Kramsch's approach to exploring meaning beyond what is obvious, Edward Hall also focuses on the understanding of

culture as a system of implicit meanings and hidden dimensions that extend beyond immediately observable behaviour [14]. For Hall, intercultural understanding is conditioned by one's ability to recognise the often-invisible structures that shape communication, social interaction, and perception, which would require in-depth observation, analysis and interpretation of the observed context.

Intercultural understanding is presented as a complex process requiring sustained observation, contextual interpretation, and reflection on multiple layers of meaning, including symbolic and implicit cultural dimensions [10], [11], [13], [14]. Across the various definitions, meaningful intercultural learning is conditioned by the ability to adopt an ethno-relativist approach and recognise layers of cultural meaning rooted in broader social, historical, and cultural contexts [12]. These competencies cannot be reduced to mere exposure, as they require interpretive depth, sustained interaction, reflexivity, and the capacity to engage with ambiguity and complexity in encounters with cultural difference [15], [16]. Contemporary digital travel environments increasingly challenge these preconditions, as they are characterised by fast-paced consumption, selective and fragmented representation, algorithmic mediation, and instant visibility.

These perspectives on intercultural competence highlight also how the contemporary digital environment conditions how these competences are formed and exercised. As travel narratives shift from elaborate and interpretative, to brief, primarily visual accounts based on short exposure to the foreign context, broader questions of observation, authority, authenticity, representation, and meaning-making arise. The following table summarises some of the major structural transformations characterising contemporary digital travel narratives and considers their implications for the development of intercultural competence.

Table 1. Structural Transformations in Digital Travel Narratives and Their Implications for Intercultural Competence

Dimension	**Classical Travel Narratives**	**Contemporary Digital Travel Narratives**	**Implications for Intercultural Competence**
Temporality	Extended embedding, slower observation, delayed narration and publication	Instant documentation, real-time sharing, accelerated circulation of experiences shaped by processes of "time-space compression" [17]	Reduced time for reflection, contextual interpretation, and gradual intercultural understanding

Narrative Structure	Linear, reflective, descriptive, and contextually grounded narratives	Fragmented, modular, multimodal, and non-linear forms of storytelling characteristic of digital narratives [18], [19]	Weakening of sustained interpretive engagement and coherent contextual understanding
Representation	Textually mediated interpretation emphasising explanation and contextualisation	Visually dominated and highly aestheticised representations shaped by simulation and spectacle [20], [21]	Increased visual familiarity without corresponding interpretive depth or symbolic understanding
Cultural Engagement	Direct observation, dialogue, immersion, and prolonged interaction with local communities	Accelerated symbolic consumption through short-form and algorithmically curated exposure	Reduced opportunities for reflexivity, ambiguity tolerance, and ethno-relativist interpretation [10], [12]
Symbolic Meaning	Attention to cultural context, symbolism, social relations, and historical interpretation	Simplification of cultural practices into consumable visual experiences detached from deeper symbolic meanings	Limited engagement with implicit meanings and deeper cultural logics [13], [14]
Authority and Knowledge Production	Authorial authority grounded in prolonged experience, linguistic engagement, and contextual observation	Authority increasingly dispersed across audiences, engagement metrics, platform visibility, and algorithmic circulation [3], [22]	Instability of interpretation and weakening of contextual reliability and epistemic depth
Authenticity	Search for contextual and experiential authenticity through immersion and interpretation	Curated, staged, and performative authenticity shaped by platform aesthetics and audience expectations [23]	Blurring of distinctions between lived experience and constructed representation
Audience Relationship	Readers positioned primarily as receivers of interpretation	Interactive audiences participating in circulation, validation, and meaning construction within participatory digital cultures [24]	Cultural meanings become fluid, unstable, and increasingly engagement-driven
Platform Logic	Narratives shaped primarily by authorial intention and editorial structure	Visibility determined by algorithms, virality, engagement metrics, and platform optimisation [3], [25]	Cultural exposure filtered through algorithmically reinforced visibility structures
Purpose and Orientation	Interpretation, contextualisation, documentation, and knowledge generation	Visibility, performance, audience engagement, and symbolic consumption increasingly prioritised within digital culture [21], [26]	Shift from intercultural interpretation toward performative interculturality
Pedagogical Implications	Supports slower observation, contextual learning, and interpretive intercultural engagement	Encourages rapid recognition, symbolic familiarity, and surface-level exposure	Necessitates critical digital literacy, reflexive interpretation, and critical engagement with representation [11], [27]

From the comparison, it becomes evident that the transformation is not simply about form, but about fundamental reshaping of the conditions through which intercultural understanding occurs. Classical travel narratives were generally characterised by extended, sustained observation and direct interaction with the local context, as opposed to digital travel narratives primarily relying on immediacy, visibility and curation. These transformations become particularly visible when comparing historical and contemporary representations of specific cultural contexts, such as Albania in British travel narratives across time.

3. Comparative Perspectives on Albania in Historical and Digital Travel Narratives

Albania represents a particularly relevant case through which to examine the transformation of travel narratives and their implications for intercultural understanding. Historically approached as a remote, unfamiliar and culturally different, Albania attracted numerous travel writers including including Lord Byron, John Cam Hobhouse, Edith Durham, and Margaret Hasluck, whose works contributed significantly to the production and circulation of knowledge about Albanian society within broader European audiences [7]. They generally relied on prolonged observation, embedding in the local context, direct and sustained interaction with local communities, and analytical reflection in constructing their narratives. Contemporary digital representations of Albania, by contrast, increasingly emerge through accelerated and visually mediated environments structured by platform visibility, aesthetic circulation, and audience engagement.

Observation vs Visibility

Historical travel narratives on Albania frequently emerged from extended engagement with the local context. Durham's accounts, for example, relied on prolonged interaction with communities, detailed observation of customs and social structures, and attempts to interpret symbolic dimensions of everyday life. Hasluck similarly engaged with language, folklore, and customary law as means of understanding Albanian society beyond surface appearance. Contemporary digital travel narratives, however, increasingly privilege visibility over observation. Much contemporary travel content presents Albania through rapidly consumable visual markers including beaches, mountains, hospitality rituals, affordability, and "hidden gem" aesthetics circulated through blogs, destination platforms, reels, and short-form travel narratives [28], [29], [30], [31].
Interpretation vs Symbolic Consumption
While classical travel writers frequently attempted to contextualise the cultural and historical dimensions of Albanian society, contemporary digital narratives often reduce cultural practices to symbolic consumable experiences. Hospitality, food traditions, mountain life, affordability, Riviera tourism, and local customs are frequently presented as aesthetic and emotionally engaging visual fragments detached from broader historical or social interpretation [28], [29], [30], [32], [33]. Contemporary representations of Albania increasingly rely on recurring visual and symbolic motifs such as "Europe's last hidden gem", "the Maldives of Europe", inexpensive coastal tourism, and "untouched" landscapes circulated through blogs, travel platforms, and international media coverage. Consequently, digital familiarity with Albania may develop through repetition of symbolic imagery rather than through deeper engagement with cultural complexity.

Duration vs Acceleration

The temporal conditions under which representations are produced have also changed substantially. Historical travel writing often emerged through journeys lasting months or years, allowing writers time for observation, reflection, contextual immersion, and interpretive processing. Durham, Hasluck, Byron, and Hobhouse spent extended periods travelling through and observing Albanian territories, producing narratives grounded in prolonged engagement with local communities and everyday life. Contemporary travel narratives, by contrast, are increasingly produced in real time within accelerated digital environments that reward immediacy, novelty, and rapid circulation [17]. Much contemporary travel content on Albania is structured around short-term and highly consumable experiences, including "weekend escapes", Riviera tourism, affordability, visual landscapes, and rapidly circulating destination recommendations shared through blogs and digital travel platforms [28], [29], [30], [31]. Under such conditions, travel becomes simultaneously an experience and a performative act of documentation, limiting opportunities for the slower interpretive processes associated with intercultural understanding. The comparison between historical and contemporary travel narratives on Albania therefore illustrates

broader transformations in the conditions through which cultural knowledge is produced and consumed. While classical travel writing was often grounded in prolonged observation, interpretive narration, and contextual engagement, contemporary digital representations increasingly privilege visibility, immediacy, aestheticisation, and symbolic accessibility. This transformation does not necessarily eliminate intercultural exposure, but it fundamentally alters the depth, temporality, and interpretive conditions through which intercultural understanding is formed. Rather than encouraging sustained engagement with cultural complexity, many contemporary travel narratives operate through accelerated visual familiarity and emotionally accessible representations designed for circulation within digital attention economies.

Conclusion

This paper examined how the concept of intercultural competence in relation to higher education has transformed as a result of the digital shift. Intercultural competence frameworks from numerous researchers were analysed, including Byram, Deardorff, Bennett, Kramsch, and Hall, helping identify a number of elements associated with traditional intercultural learning, such as sustained direct observation, interpretation of symbolic and implicit meanings, and engagement with the local context. Through the analysis of contemporary digital narratives, it became evident that conditions under intercultural learning happens, including noticeably shorter periods of time to observe, engage and interpret, a tendency to share visual, at times processed representations of the intercultural experience. The paper used a comparative analysis approach to identify how the transformations of the conditions impact not only travel narratives, but most importantly intercultural understanding and the knowledge production process. The differences between traditional travel writing and digital narratives are evident with the traditional approach particularly favouring elements of depth of understanding and interpretation, the search for symbolic or implicit meanings and attempts to contextualise the unfamiliar. The paper argued that exposure to a foreign context alone does not produce intercultural understanding or meaning, giving rise to narratives that remain detached from their historical context, social complexity, and interpretive depth.

The paper used a comparative analysis approach to identify how the transformations of the conditions impact not only travel narratives, but most importantly intercultural understanding and the knowledge production process. The differences between traditional travel writing and digital narratives are evident with the traditional approach particularly favouring elements of depth of understanding and interpretation, the search for symbolic or implicit meanings and attempts to contextualise the unfamiliar. The paper argued that exposure to a foreign context alone does not produce intercultural understanding or meaning, giving rise to narratives that remain detached from their historical context, social complexity, and interpretive depth.

Ultimately, the paper concludes that the challenge facing intercultural education today is not the disappearance of intercultural encounter, but its transformation. In a context where cultures are increasingly encountered through screens, curated representations, and algorithmically structured visibility, intercultural competence may depend less on the quantity of cultural exposure available to students than on their capacity to critically interpret the representations through which cultural difference is made visible.

Exploring Barriers to the Implementation of Inclusive Teaching Practices in Moroccan Context

Fadel Naciri[1], Asmae Ourdi[2]

[1]Abdelmalek Essaadi University, Morocco
[2]Moulay Ismail University, Morocco

Abstract

Years after the implementation of the National Program for Inclusive Education in Morocco, many difficulties are still facing the education of students with disabilities in mainstream classrooms. This research aimed to explore cultural barriers to developing inclusive teaching practices to guarantee quality learning for all students. We conducted a series of focus groups with teachers in three inclusive schools, located in the West-East of Morocco, we adopted a content analysis, and we found out that teachers were (1) adopting cultural background to a disability, (2) and they were not able to develop inclusive teaching practices based on human right's approaches, (3) consequently, they were unprepared to teach students with severe or mental disabilities, (4) However, they have promoted social abilities in school. Our research may help to design a contextualized training program for future inclusive teachers.

Keywords: *Inclusive education, disability, Inclusive teachers, inclusive practices.*

1. Introduction

Despite all the efforts to fulfil all students' right to quality education in Morocco to achieve the 4th Sustainable Development Goal 2015/2030, there are still many difficulties, some are related to the social perception of disability and others to teachers' professional training, which affected the nature of teaching practices within inclusive classrooms and consequently impacted the quality of learning of students with disabilities in mainstream schools.
In this research, we investigated the barriers that hinder the implementation of teaching practices in inclusive classrooms in poor arias. We chose the South-East of Morocco, and we focused on Zagora territory, especially three schools situated in three different villages. These schools contained the highest number of students with disabilities in mainstream classrooms, in some classrooms; they represented the third of all students. Teachers within the three schools have adopted a philanthropic background to disability and promoted social abilities, among students, to accept differences and diversity. However, they have not been able to teach students with disabilities, which led us to explore their background in disability and the way it affected their teaching practices.

2. Literature Review

Inclusive education is recognized as a fundamental human right for everyone (Ainscow 2021), it provides all learners with an equitable learning environment' and quality educational outcomes. In this perspective, inclusive education requires more than placing children with disabilities in mainstream classrooms; rather, it focuses on the socio-emotional and academic development of every learner. The implementation of inclusive education necessitates a paradigm shift in educational practices, including developing the non-academic skills of all learners as well as exploring diverse perspectives related to school contexts, such as parents' voices and contributions (Schwab et al. 2020). In Morocco, children with disabilities have enrolled mainstream schools after the ratification of the Incheon convention in 2016. However, many challenges impeded the implementation of adequate inclusive teaching practices in schools, like the blurred conceptualization of the inclusion in school context, the limited or partial inclusion of learners with disabilities, the poor quality of the training provided to principals and teacher, as well as the technical and financial constraints, and the lack of stakeholders' involvement, including parents. However, parental involvement is a crucial factor contributing to developing any academic inclusive system.
Additionally, Good and Trusting relationships between the family and school staff emerge when they see each other as trustworthy partners and allies, and when the family have multiple opportunities for

purposeful engagement in its child's education (Hanssen N and Erina I 2022), which enhances learning, positive behaviour and decreases achievement gaps between students, including the ones with disabilities. Furthermore, Good parents and school staff partnerships lead to the improvement of teachers' efficacy, family satisfaction and parenting skills. However, many parents have expressed concerns about the quality of teachers' instruction, classrooms' inclusive management, peers' bullying behaviour, social isolation (Lalvani 2015), teachers' and school staff's negative attitudes towards disability. Moreover, mainly teachers and school staff focused on informing parents instead of building a profitable relationship, which created different perceptions of what constitutes meaningful parent involvement.

Indeed, the contribution of parents of learners with disabilities to evaluate the effectiveness of inclusive practices is important to ensure a successful evaluation and reform toward inclusive education, since parents are considered important actors and agents in the school context and should be involved in developing inclusive education.

We aim to bring to the fore parents' voices, exploring their view of the relationship between them and teachers on inclusive education for their children with disability Inclusive education is recognized as a fundamental human Right, it provides all learners with an equitable learning environment and quality educational outcomes. Furthermore, inclusive education requires more than placing children with disabilities in the mainstream classroom and focuses on the socio-emotional and academic development of every learner. The implementation of inclusive education necessitates a paradigm shift in educational practices, including developing the non-academic skills of all learners and exploring diverse perspectives related to school contexts, such as parents' voices and contributions. In Morocco, children with disabilities have enrolled mainstream schools after Moroccan ratified the Incheon convention in 2015 (UNESCO 2015a). However, many challenges have impeded the implementation of adequate inclusive teaching practices, like the poor quality of teacher training, technical and financial constraints, and the lack of parental involvement(CSEFRS 2019a), even though, it is a crucial factor contributing to developing any academic inclusive system (Connolly and Gersch 2016).

Good and Trusting relationships between the parents and school staff emerge when they see each other as trustworthy partners and allies and when the family maintain multiple opportunities for purposeful engagement in school life, which enhances learning and positive behaviour and decreases achievement gaps between students, including the ones with disabilities. Furthermore, Good parents and school staff partnerships lead to the improvement of teachers' efficacy, family satisfaction and parenting skills. However, many parents have expressed concerns about the quality of teachers' instructions, classroom management, peers' bullying behaviour, social isolation, and teachers' negative attitudes towards disability. Moreover, they have confirmed that teachers and school staff focus on informing instead of building a profitable relationship, which produced distinct perceptions of what constitutes meaningful parent involvement.

Indeed, the consent and contribution of parents of learners with disabilities to evaluate the effectiveness of inclusive practices are critical. Therefore, parents are considered important actors and agents in the school context and should be involved in developing inclusive education.

We aim to bring to the fore parents' voices, exploring their view of the relationship between them and teachers on inclusive education for their children with disability.

3. Research Problem

Inclusive teaching practices require the removal of discrimination on the grounds of disability felder, 2019, the promotion of a positive school climate (Cohen, J. & Brown 2013), the modernisation of teaching approaches (Hulgin and Drake 2011), to removal of barriers to all learners' participation (Dovigo 2017), the improvement of the quality of the interventions with students and families (Heyer 2021), and the exploration of every learner's needs within the society's context (Ainscow 2020; Al-Shammari, Faulkner, and Forlin 2019).

Analogously to the 4th article of the united nation's convention on the rights of persons with disabilities (U.N 2006), the Incheon Declaration and Framework for Action for the implementation of Sustainable Development Goal 4 (UNESCO 2015b), and the Moroccan Framework Law 51-17 (sgg.gov 2020), Morocco has engaged to include students with disabilities in mainstream schools (MEN and UNICEF 2019). However, without adjusting the infrastructure and teachers' training required for inclusion (CSEFRS 2019b), and without empowering teachers as agents of change (UNESCO 2020), able to visualize what can be achieved after removing barriers Ainscow 2020, 2021. This led us to question the barriers that hinder the development of the adequate teaching practices within inclusive classrooms.

4. **Research Methods**

To explore the impact of the implementation of an inclusive education program in Morocco, we focused on inclusive teaching practices by conducting a series of focus groups with 24 teachers from three different schools in the south-East (Draa Tafilalete Academy) with the permission of the local educational board. We chose the schools with the highest number of students with disabilities within mainstream classrooms. We met the participants in schools, during the break, and we questioned them about their cultural background and understanding of inclusion, their teaching practices to include all learners, and their reflections on the inclusion of all learners in their schools. All the participants (19 males and 6 females) have not been engaged in any voluntary or mandatory training about inclusive education or inclusive pedagogy. However, they were open to talking about their attitudes, knowledge, skills, and readiness to teach in inclusive classrooms. After conducting the focus groups, we adopted a content analysis to extract the different barriers (cultural, institutional and technical) that hinder the implementation of a genuine inclusive teaching practice in mainstream classrooms in this area.

5. Results

After analysing the content of the teachers' focus group statements, we concluded that all teachers welcomed the access of children with disabilities to the local schools for the following reasons:
Firstly, they believed that the access of children with disabilities to mainstream classrooms was the consequence of the paucity of special educators and special education classrooms in their region, and they also expected that the education board will assign special educators to teach, separately, students with disabilities. This attitude, conveyed by teachers, uncovered the real and the concealed motives to accept students with disabilities in their classrooms, in other words, teachers couldn't refuse or criticize the official instructions and they considered the situation transient. This showed that they have not been sensitized or familiarized enough with the principles of inclusive education; and consequently, they have not felt the professional or ethical obligation to challenge and develop their current teaching practices.
Secondly, teachers' discourse about disability was predominated by both philanthropic background medical approaches to disability. Thus, such attitude prevented teachers from approaching disability as a social construct jones 1996 and exploring the diverse personal potential of all students regardless of their impairment le (Le Fanu 2014). This conclusion aligns with what (Winzer 2007) said about disability and philanthropic perspective and which considered the charitable action to people with disabilities as an opportunity to give alms and to please God; such attitudes maintain the inferiority with few rights for people with disabilities (Winzer 2007).
Thirdly, all teachers, in the three schools, have been promoting social abilities for all students based on religion as a component of the school curriculum; the aim is to enable students to accept each other regardless of differences, and to avoid labelling according to physical, ethnic or social circumstances. However, despite teachers' efforts, they were facing the uncooperative attitudes of families and the floundering decisions of the education board towards the conceptualisation and the operationalisation of inclusive education.

6. Discussion

Teachers' intentions to include all learners within mainstream classrooms couldn't change the fact that teachers were struggling to manage inclusive classrooms, which increase the gap between the discourses about inclusive education and the existing inclusive teaching practices within classrooms. Furthermore, teachers of the three schools confirmed their unpreparedness to teach learners with disabilities, especially the ones with severe or mental disabilities. Besides, they were all the time under pressure to deliver the official curriculum at a restricted timetable, which forced them to focus on "abled students" and to marginalize the ones with disabilities by keeping them busy (drawing or coloring) or silent to avoid the disturbance or interruption of the courses. However, at the end of the school season, and to prevent the school failure of "disabled students", teachers would elevate them to the next level and so on. Which, often, led to a poor quality learning, limited the learning opportunities, and established low expectations (OHCHR 2016).
In our research, teachers confirmed that the adoption of philanthropy as a background to disability was the result of a cultural legacy and the lack of genuine training based on humanistic and right-based approaches. Additionally, they revealed that they have been trained to promote standards of excellence, by increasing competition between students based on ableism and similarity instead of exploring students' potential and differences. Indeed, the focus group's discussions were an opportunity for

teachers to reflect on the problem of learners' marginalisation in schools and on the need to challenge and change ableism-based standards in schools and societies. Moreover, the analysis of the results showed that teachers' failure to teach all students lowered their self-esteem, their preparedness to manage inclusive classrooms, and their ability to explore the strengths of all students, which aligned with other researches' findings about the attitudes toward disability, self-esteem (Byra and Domagała-Zyśk 2021) and workplace wellbeing (Agran et al. 2020).
Furthermore, teachers were facing different barriers related to the feasibility of inclusion in rural schools, the adequate support for all students, the degree and quality of knowledge and skills required to, effectively, manage inclusive classrooms (Botha and Kourkoutas 2015). Consequently, some teachers criticised these requirements because of the uncertainty about what they need to believe, know and do to be able to support inclusive and equitable education for all (Florian 2014, 2021). Therefore, new teaching approaches are needed to respond to the differences in inclusive classrooms and to narrow the gap between teachers' knowledge and practices within their classrooms (Florian 2021). In other words, teachers need different values, beliefs, knowledges, understandings, skills, and abilities to be effective with diverse groups of students (EADSNE 2012; Florian 2021). They also need a framework to bridge coursework and practicum experiences about inclusive education as a way to synergize both of them (Rusznyak and Walton 2019), which means that teachers and researchers need to work collaboratively to develop context-based inclusive practices, which will, constantly, vary according to the individuality of the learners and the school context (Florian and Pantić 2017).
Indeed, Teachers in Morocco need to be aware of the cultural, institutional, and technical barriers that prevent them from changing their attitudes toward differences in mainstream classrooms. Furthermore, they need to critically analyze the injustice in the schooling system's structure (Tomlinson 2017), develop the habits of the head, hand, and heart linked to the core values of inclusive pedagogy (Florian 2021), and include the use of technology to and new methods to respond to students' different needs (Hardman 2019) (Magyar et al. 2020), (Mohamed 2018).

.

7. Conclusion

Morocco is engaged in including all learners in mainstream schools. However, some barriers are still hindering the achievement of this goal.
We have explored and examined those barriers from teachers' perspectives. We concluded that some of them are related to teachers' cultural background that forges their attitude to differences in general and to disability in particular, other barriers linked to the institutional conceptualization and operationalization of inclusive education in general and inclusive teaching practices in particular, and some barriers are related to the material and technical situation of schools. However, teachers have to manage inclusive classrooms without being prepared, which affected their practices and their expectations from all learners regardless of their ability.
Indeed, the access to mainstream classrooms is not enough to guarantee all students right to quality education in Morocco, there is a need for the implementation of a genuine contextualized training program that takes in consideration the newest theoretical and practical research, on one hand, and the convictions and engagement of teachers, researchers, families, the educational board, the stakeholders and the local community, in another hand.

Supporting Learning in Contexts of Disruption by Natural Disaster, War, and Communal Violence: A Comparative Case Study of Scalable Strategies from Four Settings

Alan Bruce

Unibersal Learning Systems, Ireland

Abstract

Educational continuity amid civil strife, forced migration, or severe climate events is an urgent global concern. Increased frequency of such disrution calls for fresh and innovative approaches. This paper synthesizes evidence from mixed-methods field studies, program evaluations, and policy research analyses across diverse settings—including Hurricane Katrina (Louisiana, 2005), protracted communal violence in Northern Ireland, recent traumatic disruptions in Gaza, and a 2024 disaster-management e-learning initiative in Saudi Arabia led by ULS—to identify scalable strategies for supporting educators and learners experiencing disruption. We conceptualize disruption as a multidimensional process—physical displacement, infrastructure loss, psychosocial trauma, and institutional breakdown—and examine how these dimensions interact to undermine access, quality, and equity in education. We explore potential pathways of risk management and amelioration. Employing a comparative case-study design, data were drawn from rapid assessments, semi-structured interviews with educators and learners, classroom observations, and monitoring data from interventions implemented between 2018–2024, including outcomes from the ULS e-learning policy preparation for continuity management in Saudi Arabia. Findings show hybrid delivery models that combine low-tech solutions, community-based learning hubs, protected learning spaces, and context-tailored e-learning platforms achieve higher short-term retention and modest gains in foundational skills versus standard relief distributions. The ULS initiative demonstrated how disaster-management integration and rapid e-learning deployment can maintain instructional continuity for displaced and remote learners when paired with local support structures. Trauma-informed teacher training and flexible, modular curricula improved psychosocial wellbeing and classroom engagement.

Keywords: *Disruption; traume; disaster management; continuity; displacement; risk assessment*

1. Introduction

Educational continuity during civil strife, forced migration, or severe climate events has become an urgent global concern. Over the past decade, the frequency and intensity of such disruptions have risen sharply. According to the United Nations Educational, Scientific and Cultural Organization (UNESCO, 2023), more than 224 million school-aged children are now affected by crises annually, many experiencing prolonged interruptions to their formal education. Traditional humanitarian responses have rightly prioritized physical safety, food, and shelter, but educational continuity has often been treated as a secondary or long-term recovery goal. This delay creates lasting harm: lost learning compounds over time, psychosocial trauma remains unaddressed, and displaced learners may never return to formal schooling (Burde et al., 2017; Winthrop & Anderson, 2019).

Existing research tends to examine individual disruptions in isolation—hurricanes, wars, or pandemics as separate categories. Few studies compare how different types of disruption shape educational outcomes and responses. Furthermore, scalable strategies that bridge emergency relief and long-term system resilience remain underdeveloped. In particular, the interplay among physical displacement, infrastructure loss, psychosocial trauma, and institutional breakdown is rarely analyzed as a multidimensional process. We conceptualize disruption as a multidimensional process and examine how these dimensions interact to undermine access, quality, and equity in education. We explore potential pathways of risk management and amelioration.

This paper addresses three specific gaps in the literature. First, it offers a cross-contextual comparison of educational disruption mechanisms across natural disaster, war, and communal violence. Second, it integrates quantitative retention data with qualitative teacher and learner perspectives in a single mixed-
