method design. Third, it proposes a pragmatic, actionable framework linking scalable delivery models to governance and equity. To achieve this, we synthesize evidence from four distinct settings:
Findings show hybrid delivery models that combine low-tech solutions, community-based learning hubs, protected learning spaces, and context-tailored e-learning platforms achieve higher short-term retention and modest gains in foundational skills versus standard relief distributions. The ULS initiative demonstrated how disaster-management integration and rapid e-learning deployment can maintain instructional continuity for displaced and remote learners when paired with local support structures. Trauma-informed teacher training and flexible, modular curricula improved psychosocial wellbeing and classroom engagement. Local governance and community-led resource mobilization consistently predicted program sustainability. The role of EU sypport in Northern Ireland is referenced with regard to sectarian divisions and mutual hostility. Persistent barriers include fragmented funding, weak outcome measurement systems, and limited pathways for credentialing disrupted learners.
We propose a pragmatic framework for policy and practice integrating: (1) context-sensitive modality selection, (2) adaptive assessment and credentialing, and (3) investments in policy capacity and governance. Recommendations emphasize flexible funding, interoperable data systems, mediation supports, post-trauma counselling and pre-positioned contingency curricula. Centering equity and local agency, the framework aims to strengthen education system resilience and ensure learning continuity amid severe disruption.
The context of this orientation is to address the challenges posed by emergencies that may disrupt traditional modes of education delivery. Natural disasters, pandemics, and other crises can make it challenging to continue education using traditional methods. Therefore, there is a pressing need for many governments to have national plans in place that enable a rapid and effective transition to digital learning to ensure uninterrupted education in such situations. This aims to provide a strategy for educational institutions and stakeholders to overcome the challenges of emergencies and ensure continuity of learning for learners. The central research questions are:

1. How do physical displacement, infrastructure loss, psychosocial trauma, and institutional breakdown interact to undermine educational access, quality, and equity?
2. Which hybrid delivery models achieve higher short-term retention and foundational skill gains during disruption?
3. What barriers and enablers shape program sustainability across different disruption types?

2. Conceptual Framework

The analysis is based on the reports and findings of UNESCO, OECD, OLC, World Bank, NELC and other relevant sources which, in recent times, have specifically discussed the impact of the Covid-19 pandemic on education and the various national responses that have been implemented to try to ensure continuity of education under crisis situations. Preparedness in providing distance learning opportunities under emergency conditions is also included in the focus.
This growing impact and integration of new technologies has created a new paradigm in educational systems. Traditional educational models have also incorporated various advanced technologies and digital tools in their systems. In the same way, fully digital online systems have incorporated direct workshops and community learning approaches.
Globalization has given a special flavor to these developments. In many ways, it is a short journey from collaborative partnerships to a set of special interests and capacities which need to be protected in an atmosphere where there is increasing competition for scarce resources. Educational Institutions find themselves subject to huge competitive pressures in everything from comparative league tables to outsourcing, institutional amalgamation and rationalization. The spread of the knowledge economy (itself accelerated by vastly improved and sophisticated communications technologies) has been paralleled by significantly increased student and faculty mobility.
Underlying this vast and often unsettling process, as we have seen, is an increasing level of integration between learning systems or educational institutions and the world of industry and enterprise. At a societal level, education therefore plays an important balancing role between stability and change. It both integrates the current and future members of society in a collective system and enables social change and development in this collective system. This inner contradiction generates a tension that produces different forms of educational systems in each era and in each social context. Throughout all these processes, we are left with the critical importance of both *communication* and *community*. This has assumed huge importance as we look at the role of education systems and the generation of innovation and responses to the pressing social needs of a globalized era. It also assumes huge

importance when we look at the potential impact of disruption, emergency and or social crisis on provision of educational resources and student support in times of crisis.
Disruption interferes directly with this balance of tensions. The assumed stability of the education sector is as vulnerable to disruption and destruction as any other. Therefore, the specific conditions and characteristics of the process and the responses to it assume great importance in both planning for and responding to disruption. These issues are examined from various perspectives including, for example, pedagogy, educational technology, resources, capacities.
Based on current data available, the planning of continuity of education at the national level is characterized by the experience of the Covid-19 pandemic. Apart from anything else, this means that many of the planned actions are aimed at recovery rather than long-term sustainability. This "reactive" and rather short-sighted approach to continuity planning typically focuses on immediate actions and "what is possible under given circumstances". Findings from various national contexts, however, report critical gaps or weaknesses in how teachers and principals are supported in distance education modalities.
There are also critical gaps and weaknesses in how pedagogical approaches have been adapted to the needs of the specific sector of distance education. The fourth UNESCO report focusing on education transformation from the basis of Covid-19 experiences makes a critical point on this issue by stating:
The evidence is overwhelming that structured pedagogy programs – including supporting teachers with teachers' guides, structured lesson plans, student materials and teacher training – leads to improved learning outcomes. (UNESCO Institute for Statistics et al., 2022)
Many of the given issues impact teacher well-being which may have long-lasting consequences. The transformation process to distance education has to take place with adequate planning and strategic thinking, as well as sufficient support and resourcing (Vuorio et al 2021).
It is possible to conceptualize disruption as a complex multidimensiona process. In this analysis we see disruption comprising four interacting dimensions.

1. Physical displacement: this refers to the forced relocation of learners and educators away from their normal school communities.
2. Infrastructure loss includes the destruction of school buildings, electricity, internet connectivity, and learning materials.
3. Psychosocial trauma encompasses fear, grief, hypervigilance, and loss of routine experienced by both children and adults.
4. Institutional breakdown involves the collapse or severe weakening of governance systems, including assessment, credentialing, teacher payroll, and ministry oversight.

These dimensions do not operate in isolation. In practice, they interact, influence and amplify one another. For example, trauma reduces attendance and concentration, which in turn weakens institutional oversight when schools do eventually reopen. Infrastructure loss makes displacement more prolonged and the actual impact more concrete and seemingly long-lasting. As a result, this in turn increases trauma. The followuing table illustrates how each dimension is manifested across our four settings.

Table 1. Manifestation of Disruption Dimensions Across Five Settings

Disruption /Case	**Hurricane Katrina (2005)**	**Northern Ireland (1970s–1990s)**	**Gaza (2023–26)**	**Saudi Arabia (ULS, 2024)**
Physical displacement	Widespread (evacuation to 48 states)	Moderate (internal, localized)	Severe (repeated displacements)	Moderate (remote learners)
Infrastructure loss	Severe (schools flooded/destroyed)	Mild (schools standing but segregated)	Severe (bombardment of schools)	Mild (connectivity gaps)
Psychosocial trauma	High (loss, family separation)	Severe (sectarian fear, hostility)	Severe (direct violence exposure)	Low (disaster preparedness context)
Institutional breakdown	Severe (district closure)	Moderate (parallel systems)	Severe (ministry functions collapse)	None (preparedness initiative)

We trace two types of pathways in our analysis: risk management pathways (mitigation, preparedness, response, recovery) and amelioration strategies (psychosocial support, flexible curricula, community learning hubs). This framework guides the methods and interpretation that follow.

3. Methodology

We employed a comparative case-study design (Yin, 2018), treating each disruption setting as a bounded case. This design allows systematic comparison across heterogeneous contexts while retaining contextual depth. It is particularly suited to studying complex, real-world interventions where randomization is impossible or unethical.
Employing a comparative case-study design, data were drawn from rapid assessments, semi-structured interviews with educators and learners (n=82), classroom observations, and monitoring data from interventions implemented between 2018–2024, including outcomes from the ULS e-learning policy preparation for continuity management in Saudi Arabia. Quantitative measures include enrollment, attendance retention, and foundational learning maintenace outcomes; qualitative analysis explores community adaptation, teacher decision-making, shared learning in contested socio-political societies experiencing violence and informal learning pathways.
In the following sections, we focus on selected national approaches which were designed to aim at continuity of education in challenging and disruptive circumstances caused by emergency conditions. The purpose is to provide an overview of different approaches and ways to support continuity of education and student support on a national level as well as to analyse in a more detailed way why certain strategies were implemented and what they aim at. There were several UNESCO national reports produced focusing on education responses to Covid-19 from Finland, the Republic of Korea (South Korea) and China which have been useful as main sources of information and associated themes. South Korea and Finland are both well-recognized countries in education with high PISA rankings over the past times. China represents a different, highly centralized and very scalable approach to education with a particularly high ranking in mathematics and science subjects. Findings which are found relevant for the scope of this paper have been included as examples and recommendations for further investigation as we consider the four primary examples.
The settings and specific cases under review and researched are summarised in Table 2.

Table 2. Settings and Cases

New Orleans, Louisiana	Natural disaster (hurricane, flooding, displacement)	2005–2008	Displaced students, relocated teachers
Northern Ireland	Protracted communal violence (sectarian)	Retrospective: 1972–1998	Cross-community education initiatives
Gaza, Palestine	War and traumatic disruption (active conflict)	2023–2026	School-based and shelter-based learning
Saudi Arabia	Disaster management e-learning preparedness	2024	E-learning policy, displaced/remote learners

The Saudi Arabian case was unique in that it involved a planned disaster-management integration strategy and plan led by ULS, rather than an acute emergency response. This strategy was to examine the state of emergency response and planning in eLearning in the Kingdom of Saudi-Arabia in order to propose a model for a national Emergency Remote Learning Plan focusing on K-12 education, Technical and Vocational Training and Higher Education. A framework was proposed and developed with recommendations and concrete actions to prepare for emergencies in advance, to manage them as they occur and for rapid recovery from such disruptions.
Data were drawn from five sources:

- Rapid assessment reports from humanitarian and government agencies (n = 12 organizational documents).
- Semi-structured interviews with educators and learners (n = 82 total; Katrina n = 24; Northern Ireland n = 18; Gaza n = 22; Saudi Arabia n = 18).
- Classroom observations (n = 34 sessions across active and post-disruption phases).

- Monitoring data from interventions implemented between 2018 and 2024, including ULS e-learning program logs.
- Policy and program evaluation documents from the European Union (Northern Ireland) and especially the EU Peace II program, and the Saudi Arabian Ministry of Education.

Quantitative measures included: enrollment rates (pre- and post-disruption), attendance retention at 4 and 12 weeks, and foundational learning maintenance measured by brief literacy and numeracy screenings (adapted from the ASER tool; Pratham, 2020).
Qualitative measures explored: community adaptation strategies, teacher decision-making under stress, shared learning in contested socio-political societies, and informal learning pathways such as home-based and peer tutoring.
Quantitative data were analyzed using descriptive statistics and, where pre- and post-disruption data were available, paired t-tests. Qualitative data were transcribed and analyzed using thematic analysis (Braun & Clarke, 2006), with initial coding followed by theme development and cross-case synthesis. Triangulation occurred across data sources and researchers.
Ethical approvals were obtained from the institutional review boards of the author's home institution and, where applicable, local research ethics committees in each setting. Informed consent was obtained from all interviewees. Pseudonyms are used for any direct quotes. In the Gaza case, additional safeguards were implemented to avoid identifying participants under active conflict conditions.

4. Issues Arising

The findings and results are organised into four subsections:

1. Quantitative results comparing hybrid versus standard models
2. Qualitative themes from interviews
3. Cross-case patterns
4. Persistent barriers.

Quantitative Results: Across all four settings, hybrid delivery models - defined as combinations of low-tech solutions (radio, printed packets), community-based learning hubs, protected learning spaces, and context-tailored e-learning platforms - consistently outperformed standard relief distributions (which typically provided only food, shelter, and basic supplies, with no structured educational component).
In the ULS Saudi Arabia case alone the initiative maintained instructional continuity for 89% of displaced or remote learners when paired with local support structures (teacher mentors and community Wi-Fi hotspots). E-learning platform usage peaked at 7,200 daily active users during the second month of disruption, with average session duration of 23 minutes.
Qualitative Themes: Four major themes emerged from interviews and observations.
Theme 1: *Community adaptation as the primary resilience mechanism.* In all settings, communities that self-organized learning spaces - mosques, community centers, tents - before external aid arrived had significantly better outcomes. A teacher in Gaza explained:

> *We did not wait for the ministry. Parents took turns teaching in shelters. The youngest learned letters; the older ones did math on rubble walls. It was not perfect, but it kept them from staring at destruction all day.* (Interview, Gaza, 2023)

Theme 2: *Teacher decision-making under stress shifts from coverage to care.* Teachers consistently reported rationing their emotional energy and prioritizing psycho-social safety over curriculum coverage. A Katrina respondent recalled:

> *I stopped caring about fractions. I cared about who was crying and who had not eaten. The curriculum became secondary to survival.* (Interview, Houston relocation center, 2006)

Theme 3: *Shared problem-solving reduces hostility in contested societies.* In Northern Ireland, EU-supported cross-community education programs reduced mutual hostility not through mere contact but through structured, sustained, shared problem-solving (e.g., joint community mapping and restoration projects). Respondents described this as building procedural trust before emotional reconciliation.
Theme 4: *Informal learning pathways are safety nets that widen equity gaps.* When formal schools closed, peer tutoring, family-led instruction, and self-directed digital learning filled gaps. However, equity worsened: learners with educated parents or stable internet access fared much better. A Saudi program coordinator noted: '*We saw children of university graduates thrive on the e-learning platform. Children of hourly workers without Wi-Fi at home—they disappeared from our data.'* (Interview, Riyadh, 2024
Cross-Case Patterns

Table 3. Enablers and Barriers Across Five Settings

Factor	***Katrina (2005)***	***Northern Ireland***	***Gaza***	***Saudi Arabia (ULS)***
Trauma-informed teacher training	Present but weak	Strong (EU-supported)	Emergent, improvised	Strong, pre-planned
Flexible/modular curricula	Limited	Strong	Strong (improvised)	Strong
Local governance & community-led mobilization	Mixed	Strong	Weak (external constraints)	Strong
Fragmented short-term funding	Yes	Yes	Severe	No
Weak outcome measurement systems	Yes	No (strong local research)	Yes	Partial
Limited credentialing pathways for disrupted learners	Yes	Historical yes	Minimal	No (planned)

Persistent Barriers Across Settings: Despite localized successes, three barriers appeared consistently across all settings:

1. **Fragmented funding** – Short-term humanitarian grants (typically 6–12 months) prevented multi-year planning, teacher retention, and sustainable partnerships.
2. **Weak outcome measurement systems** – Few settings had real-time data on learning (viz. attendance). Most relied on proxy indicators like food distribution counts or shelter enrollment.
3. **Limited pathways for credentialing disrupted learners** – Lost transcripts, unrecognized informal learning, and bureaucratic inertia blocked grade progression, certification, and transition to higher education.

5. Themes

The findings confirm that hybrid delivery models outperform single-modality relief. This aligns with recent guidance from the Inter-Agency Network for Education in Emergencies (INEE, 2024), but adds evidence from both natural disaster and active war settings. Notably, the advantage of hybrid models persisted even when internet connectivity was low, provided that low-tech components (printed materials, community hubs) were well designed.

Trauma-informed teacher training and flexible, modular curricula improved both psychosocial wellbeing and classroom engagement. This suggests that pedagogical adaptations are not separate from mental health support—they are intertwined. A teacher trained to recognize trauma responses and adjust lesson pacing effectively delivers psychosocial first aid while teaching literacy (Bragin et al., 2022).

Local governance and community-led resource mobilization consistently predicted program sustainability. External actors who bypassed local structures—for example, directly rebuilding a school without consulting community education committees—saw higher dropout rates when they departed. This finding echoes the broader development literature on local ownership (Andrews et al., 2017).

Relevant issues in the scope of this work, include an analysis of national responses and emergency learning planning actions. This study, like most other global reports and sources identified, focuses on K-12 education. This is logical because the global K-12 population of learners is considered among the most vulnerable when disruptions to education occur. Younger pupils are generally less capable of taking responsibility for their own learning than students in higher levels of education meaning that more teacher support is needed. Although many K-12-specific strategic approaches and proposed actions are relevant and transferable to the context of higher education, it is important to understand the differences between them. This is clearly seen, for example, in issues around learner autonomy and student support needs and requirements. This may require substantially different approaches when distance education is considered. OECD´s *"Policy Responses to Coronavirus"* report provides a practical insight to this:

While tertiary education institutions are largely used to delivering online courses and have a rich bank of online materials, this is less systematically true in primary and secondary education.

The *Economic Commission for Latin America and the Caribbean* (ECLAC) examined strategies for continuing education through distance learning modalities in 2020 in its report *"Education in the time of COVID-19"* (August 2020). This study provides insights from its specific cultural/geographical context which may help understand some differences and requirements that should be considered when aligning the plan to the needs of a national education system. This is particularly relevant given the geographic dispersion of many countries in this region (especially isolated islands in the Caribbean) and the high prevalence of natural disasters such as hurricanes.

The European Union's support for cross-community education in Northern Ireland is widely credited as a factor in reducing sectarian hostility (Smith, 2010; Hughes & Campbell, 2017). Our analysis suggests that EU funding was effective not merely because of financial resources, but because it was designed with specific conditions: long-term commitment (more than 10 years), mandatory cross-community collaboration for grant eligibility, and pairing of funding with mediation and dialogue training. Short-term aid without these conditions—as seen in the early Katrina response—failed to reduce tension and sometimes exacerbated competition for scarce resources.

Conclusions

This study has several limitations. First, four case studies cannot represent all disruption types; slow-onset climate displacement or pandemic-related school closures may operate differently. Second, retrospective data from Northern Ireland may suffer from recall bias, as interviews occurred decades after the events described. Third, the Gaza sample was constrained by active conflict; some interviews were incomplete, and follow-up was impossible. Fourth, we had no control group; causal claims are therefore cautious, and we present associations rather than definitive causation.

A pragmatic framework for supporting learning in disruption can be based on:

1. Content sensitive modality selection – matching delivery (radio printed packets, hubs, e-learning) to connectivity, security, cultural norms and available infrastructure
2. Adaptive assessment and credentialing - Micro-credentials, portfolio-based assessment, portable digital learner records (offline-capable)
3. Investments in policy capacity and governance - Pre-position contingency curricula, train local education cluster coordinators, embed education in disaster risk reduction plans

Specific recommendations from this framework:

Flexible funding: Shift from 6–12 months humanitarian grants to multi-year, unearmarked education-in-emergencies funding.

Interoperable data systems: Deploy lightweight, offline-capable learner tracking systems (open-source platforms such as OpenEMIS or Tangerine).

Mediation supports: Train teachers in conflict-sensitive communication and basic mediation for communal violence settings.

Post-trauma counselling: Integrate into teacher professional development, not only as pull-out services for learners.

Pre-positioned contingency curricula: Develop modular, grade-agnostic skills packs covering literacy, numeracy, and social-emotional learning that can be deployed within 72 hours.

Longitudinal tracking of credentialing pathways for disrupted learners over five to ten years.

Cost-effectiveness comparisons of hybrid versus standard relief models across different disruption types.

Controlled studies of AI-assisted offline learning tools in active conflict zones where connectivity is intermittent or absent.

Educational continuity amid severe disruption is achievable, but not through technical fixes alone. It requires governance, trauma awareness, community leadership, and flexible systems that treat learning as a lifeline, not a luxury. The evidence from these five settings suggests that waiting for stability before investing in education is exactly the wrong strategy—by then, too many learners have already been left behind.

While it would appear that a good majority of countries have implemented some kind of continuity plan, when concrete actions are concerned, technology seems to be the primary driver. Courses are made available using existing channels and services such as TV and video streaming services. These studies reveal significant gaps in terms of learning **content** (both exclusive and OER) and teacher support. Both these elements stand out from more in-depth examinations of national emergency learning strategies. A central observation therefore is that the point of this analysis is not simply to have a plan. It is even

more important to have a strategic sense of *priorities* and *actions* that enable the aspirations of a plan to be implemented in practice.

Listening to Children's Voices in War: A Study on Emotions, Coping, and Needed Support

Wafa A. Mohammed Ashour[1], Imelda Graham[2]

[1]Ministry of Education and Higher Education, Palestine
[2]Universal Learning Systems, Ireland

Abstract

This paper addresses the consequences of the psychological traumas experienced by a focus group of children from Gaza, aged 5-9 years old, from their own perspectives, during the current war in Palestine, who have been identified through a previous study as experiencing post-traumatic stress syndrome. ***Section 1*** *establishes the context for the study, the theoretical background, previous studies, and sets out methodologies used in the research; the difficulties and complexities of gathering the information are identified, with an example of interview methods and ethical considerations for children are illustrated. In* ***Section 2,*** *the consequences of the effects of trauma from living in an ongoing conflict situation are examined; comparisons are made with other types of distressing situations such as natural disasters; the factors that impact on recovery and resilience are explored with implications for recommendations such as focusing on supporting close family attachments.* ***Section 3*** *recounts the narratives of the children interviewed, structured into various categories of responses and effects, such narratives revealing profound psychological, emotional, and developmental impacts; the emergent themes are identified, with the children's accounts reflecting a deep disruption of safety, attachment, and normal childhood functioning.* ***Section 4*** *includes detailed analysis of the* findings*, which demonstrate that children's psychological distress cannot be separated from the structural and material conditions, the ongoing nature of the bad conditions prevent a return to normal functioning for the children. These recommendations should determine steps to be taken to alleviate suffering and long-term damage, by providing comprehensive support and treatment for the children, in particular supporting effective family functioning. Finally, recommendations and suggestions are proposed for short-, medium- and long-term interventions and supports.*

Keywords: *Trauma, Recovery, Resilience, Children, Conflict*

1. Introduction

Children are among the most vulnerable populations in times of war. Their direct voices are, however, rarely centred in research or humanitarian programme design [6, 21]. Most studies focus on diagnosed pathology and rely on adult intermediaries – parents, teachers, or aid workers – to interpret children's experiences, effectively denying children agency in issues that directly affect them.

This study addresses that gap. It builds on an earlier research study [2] conducted with 387 parents and carers of children aged 5–9 in the Gaza Strip, which identified PTSD in 87% of the children studied. In this second study, the children themselves speak.

Twenty-four children, selected from families who had participated in the earlier study, were interviewed in October 2024 whilst the conflict continued. A phenomenological/narrative inquiry methodology was employed. The Lundy Model [12] provided the ethical and methodological framework, ensuring children were given Space to express their views; Voice in a supported setting; Audience through systematic analysis; and Influence through recommendations directed to relevant actors. Three core areas were addressed: the emotional and physical impact of the war; coping mechanisms employed by the children; and identified support needs. Twenty of the twenty-four children were accompanied by both parents at the time of interview. This cohort of children does not appear to have suffered major physical injuries such as limb loss; recommendations nonetheless address support for injured children, given that Gazan children have the world's highest rate of limb amputations.

2. Children and Trauma

2.1 Listening to Children's Voices

Involving children in decisions and research that affects them is their right [20]. The Lundy Model [12], rooted in Article 12 of the UN Convention on the Rights of the Child, provides a practical framework for gathering children's perspectives authentically and ensuring those perspectives carry influence. The four elements – Space, Voice, Audience, and Influence – are of equal weight; without Influence, the process risks becoming tokenistic.

Fig. 1. Lundy Model of Child Participation

2.2 Children in War and Natural Disasters

Children in conflict zones face profound psychological harm, including PTSD, depression, and anxiety disorders [1, 19]. Research comparing war-affected children with those exposed to natural disasters is instructive. Studies of children following earthquakes and tsunamis show that, with appropriate post-disaster supports, many children demonstrate recovery or significant symptom reduction [10, 17, 22]. In the context of a protracted, ongoing conflict, however, conditions are fundamentally different: there is no stable recovery period, no reliable reconstruction, and no end point to the suffering [7]. Research on Gaza prior to the current conflict already documented significant associations between ongoing war trauma and PTSD, depression, and intergenerational harm [19]. Gaza's children face uniquely sustained exposure, placing them at elevated and persistent risk.

2.3 Recovery and Protective Factors

Several factors influence recovery from trauma: secure attachment [5, 11, 15, 16]; caregiver emotional regulation [5, 11]; social support [3, 13]; and structured psychosocial or therapeutic interventions [4, 8]. Research by Perry [14] demonstrates the beneficial impact of relational health and strong attachment in the early years on children's capacity for recovery from adversity. The HOPE model [18] – Health Outcomes from Positive Experiences – proposes four building blocks for mitigating trauma: safe and supportive Relationships; stable Environments; social and civic Engagement; and Emotional Growth. These building blocks, alongside evidence-based interventions such as Narrative Exposure Therapy [8], inform the recommendations in Section 4.

3. Children's Voices: Analysis of Interviews

3.1 Overview

The children's responses reveal profound psychological, emotional, and developmental impacts associated with prolonged displacement, exposure to violence, loss of basic needs, and the absence of any visible recovery. Qualitative analysis identifies seven inter-related themes arising consistently across the responses. Representative quotes, translated from Arabic, are included throughout.

3.2 Anticipatory Grief and Existential Terror

The children's accounts describe not imagined fears but realistic threat assessments based on lived experience. Recurring dreams of bombing, of planes "wanting to kill us," of being buried under rubble, and of relatives dying under destruction reflect daily reality. One child described the drones as "on the back of our heads all the time." Crucially, these responses indicate not only PTSD but ongoing traumatic stress – the threat has not passed. The children are not recovering from a traumatic event; they remain inside it.

3.3 Ambiguous Loss and Complicated Grief

Many losses remain unverified. Relatives described as "under the rubble" leave young children uncertain whether those people are dead, particularly when children have also witnessed people being recovered alive. This ambiguity disrupts the normal grief process: without ritual or closure, mourning becomes suspended, increasing the risk of long-term psychological damage. One child described: "I always see my Uncle when he was taken out from under the destruction, his hair was white and every face was blood and dirty clothes."

3.4 Cognitive Disruption and Educational Impediments

The children speak repeatedly of lost concentration: "I can't focus on anything, I think all the time about my father and mother and sisters." This is neurologically predictable. When the brain's threat-detection systems remain chronically activated, the prefrontal cortex – responsible for executive function, concentration, and learning – is effectively offline [9]. This is not a choice; it is automatic physiology occurring during critical developmental periods. Without intervention, the long-term effects on educational and cognitive development are substantial.

3.5 The Obliteration of Safety and Stability

The most consistent theme across all testimonies is the simultaneous destruction of every element of a child's world. "I am alone without my sisters and without mum and dad and also without a house and without games and without my school – all these things make me very angry." Home, toys, school, friends, relatives, and routine have been lost not sequentially but all at once, and without any clear prospect of return.

3.6 The Inversion of Childhood Roles

The children describe standing for hours in queues for water, bread, and food – roles normally belonging to adults. They are required to perform adult survival tasks whilst being held to the emotional standards of childhood. The resulting dysregulation is evident throughout: multiple children describe wanting to "break everything," fighting with siblings over "the simplest things." "When I am mad I start screaming and hitting and I want to break everything in front of me. We are humiliated in queues and this makes me mad all the time." This reflects a nervous system in survival mode, not moral failure.

3.7 Betrayed Expectations and Shattered Trust

A foundational element of early child development is the establishment of basic trust – the understanding that the world is predictable and caregivers reliable. "They told us that I will stay in the tent for a couple of days and then I will go back home, so I did not bring our toys or nice clothes or books with us, but I have 7 months in the ugly tent." When this trust is systematically violated, children face a cognitive dissonance that is difficult to resolve: they cannot fully trust the adults they depend upon for survival, yet have no alternative. Dreams of being "in a dark place and no one is helping me" and of "screaming and no one hears me" reflect this specific experience of abandonment.

3.8 Fragile Resilience and Conditional Coping

Many children cannot articulate resilience because they do not feel resilient. "I don't want to live in this situation, it is very hard for us without food or clothes or friends or grandfather and grandmother." Those who describe coping refer to parental encouragement, sibling cooperation, or prayer – survival strategies

rather than recovery. A meaningful distinction exists between resilience – returning to baseline functioning – and adaptation under duress: finding ways to survive that compromise long-term wellbeing for short-term survival. These children are in the latter category.

4. Findings and Recommendations: A Framework for Support

4.1 Findings and Implications

The findings demonstrate that children's psychological distress cannot be separated from structural and material conditions. The ongoing nature of the conflict prevents any return to normal functioning, whilst chronic shortages of food, water, shelter, and stability exacerbate emotional suffering and undermine any fragile coping. If unaddressed, the documented emotional, cognitive, and behavioural impacts carry lasting consequences: impaired emotional regulation, disrupted attachment, poor educational outcomes, and a significant risk of intergenerational trauma transmission.

4.2 Recommendations

Child Protection and Safe Environments: Creation and maintenance of child-friendly spaces providing physical safety, routine, and emotional containment; strengthening of family unity and reunification; dedicated supports for unaccompanied minors; training for communities, educators, and professionals to identify and respond to protection risks including emotional abuse, neglect, and peer violence; and safe reporting and monitoring mechanisms.
Mental Health and Psychosocial Support (MHPSS): Scaling up of child-focused MHPSS services; implementation of Psychological First Aid (PFA) using age-appropriate, culturally relevant methods including play, music, art, and storytelling; establishment of referral pathways for children requiring specialist care; integration of grief and loss interventions; and regular sleep and stress-regulation activities to address nightmares and sleep disturbance.
Cognitive and Educational Recovery: Re-establishing structured learning routines in formal or informal settings as early as possible; integrating social-emotional learning and psychosocial activities within educational programmes; adopting flexible, trauma-informed teaching approaches that accommodate reduced concentration and memory difficulties; and supporting religious and cultural learning activities – such as Qur'an memorisation – in low-pressure ways that restore a sense of competence.
Family and Community Interventions: Parenting support programmes equipping caregivers with trauma-informed skills; practical tools for emotional regulation and positive communication; encouragement of family-based coping strategies including shared routines and play; inclusion of caregivers within MHPSS programming to address their own distress; and community-led activities that promote collective coping and mutual assistance.
Basic Needs, Coordination, and Policy: Improving access to food, water, shelter, and clothing, recognising their direct impact on psychological wellbeing; reducing the burden of long and undignified queues through better aid distribution; minimising repeated displacement with honest family communication; and integrating MHPSS and child protection as core components of humanitarian response planning, with sustained funding for long-term psychosocial recovery beyond immediate emergency relief.

Conclusion

This study, conducted through direct engagement with twenty-four children in the Gaza Strip during the ongoing conflict, demonstrates that children's experience goes far beyond what traditional assessments or adult narratives capture. The war has produced profound disruption to their psychological, social, and cognitive lives – disruption that is structurally linked to harsh living conditions, repeated displacement, and the complete absence of any stable recovery.
The application of the Lundy Model provided a methodological framework enabling children to express their views clearly within a safe space, ensuring their voices reach an audience with the capacity to influence policy and practice. This approach addresses a significant gap in the literature: children's direct voices in conflict-affected environments are rarely heard.
The findings underscore the need for multi-level psychosocial interventions responding to immediate needs whilst building towards long-term recovery, and for strengthening the role of family, school, and community as foundations of resilience. They also highlight the urgent need for policies that protect

children, provide stable environments, and work to reduce the intergenerational transmission of trauma. This study offers a knowledge base for designing intervention programmes, promoting informed policies, and directing future research towards approaches that genuinely centre children's perspectives in decision-making.

The Challenges of Educational Change in a Learning Organization in Slovakia

Veronika Strížencová

Trnava University in Trnava, Slovakia

Abstract

While changes in education are often analyzed through abstract sociological frameworks, this study bridges the gap between theory and practice by examining the internal organizational transformation of a selected Slovak elementary school. Based on concepts of transformational leadership and school culture, the study goes beyond the framework of top-down policy implementation and analyses how a school's internal mechanisms can actively combat institutional inertia.
Using a qualitative case study approach, we examine practical interventions implemented by the school administration and teaching staff to bridge the gap with the local marginalized community. These measures included direct personal visits by teachers to the excluded community, local awards for student attendance, and school community service projects aimed at engaging parents. Initial results indicate a significant empirical impact: over a two-year period, school attendance among children from the marginalized community increased by more than 20%. Furthermore, these interventions have successfully stimulated parental involvement and fostered unprecedented sociocultural ties between families from the marginalized community and families from the majority population. At the same time, a unique phenomenon has emerged —based on the initiative of the school's management and governing body, a proposal for the division of new school districts was introduced and implemented by the Ministry of Education of the Slovak Republic as part of the new school reform starting from September 2026, placing the school examined in this research in an unquestionably unique situation within the Slovak educational landscape.
The study thus also has a political-urban dimension in the context of the new municipal school policy. Ultimately, this study demonstrates that the sustainable transformation of education depends not only on well-thought-out internal changes within the educational institution, but also on local cultural reorganization and proactive, community-driven synergy.

Keywords: *educational change, school culture, education policy transfer, school leadership*

1. Introduction

In contemporary pedagogical and sociological theory, the concept of educational change represents a multifaceted phenomenon that cannot be reduced to the mere implementation of new curricular goals or organizational adjustments. Educational change is, at its core, an ontological process that affects the deep structures of institutions and the professional identity of their actors. As Fullan (2007) notes, the essence of change lies in the process of seeking and attributing new meaning to educational activity. However, this process is inevitably confronted with institutional inertia and social mechanisms, which Bourdieu (1990) defines through the concept of "habitus." In the school environment, habitus functions as a set of deeply rooted dispositions that predetermine the behaviour of actors and often act as an unconscious but powerful filter against any external innovative efforts.
Conceptualizing educational change requires an understanding of the historical and professional context of teaching (March, 1994). In his classic analysis, Lortie (1975) points out that educators are shaped by long-term socialization within the traditional school system, which creates a conservative framework resistant to change. This professional isolation is reinforced by the specific organizational structure of the school, which Mintzberg (1979, 1989) characterizes as a professional school bureaucracy. In such an environment, power is dispersed among autonomous professionals, leading to a phenomenon that Weick (1976) defined as "loose coupling." A critical understanding of educational change must therefore consider the micropolitical reality of schools. Blase (1991) and Ball (2015) emphasize that the school is not a monolithic unit, but an arena of constant struggles for influence, resources, and recognition. In this sense, educational change is not merely an administrative act but the result of complex negotiation and strategic action. If change does not reflect these power relations, it falls into a cyclical repetition that Cuban (1990) critically describes as "reforming over and over again" (p.1). The successful

implementation of educational changes and the subsequent transformation of the school therefore requires not only a change in structures within the educational institution, but above all the building of the school's capacity as a learning community (Stoll, 1999), where school leadership does not act in a directive manner, but as a catalyst for collective development (Leithwood and Jantzi, 1999; Ullah and Muslim, 2025).

1.1 Traditional and Contemporary Paradigms of Educational Change

The traditional paradigm of educational change, based on the work of Lewin (1947), was grounded in a linear model of social equilibrium. This approach assumed that the educational system is a stable entity that can be transformed into a new, fixed state through controlled intervention. In this context, reforms were viewed as "top-down" approaches to educational change (March, 1994). On the other hand, however, as Cuban (1990) points out, such an approach often led to a cyclical repetition of reforms initiated at the ministerial level, which, while recurring, affect only superficial structures and rarely penetrate the core of pedagogical interaction in the classroom. Cuban (1990) refers to this phenomenon as persistent stability within a network of proclaimed changes.

The current paradigm of educational change reflects the complexity of school systems through the concept of "loosely coupled systems," introduced into organizational theory by Weick (1976). In this understanding, the school is not a monolith; what happens at the level of administration or ministerial policy often has only a weak connection to what occurs in classrooms. This perspective explains why formal changes in education are often implemented only pro forma. In response, theories emphasize the importance of school culture and its changes in terms of the dynamics of the educational environment and institutions. Hargreaves (1995) and Stoll (1998) argue that real change must address the deep-seated beliefs and norms that constitute a school's cultural identity.

Shifting the focus from external management of change to the internal transformation of organizational culture, Connolly, James, and Beales (2011) bring a critical perspective to the discussion, distinguishing between culture as a management tool (functionalist view) and culture as a deep social reality (an interpretive view). Their case study suggests that changing school culture is not a linear process, but a complex interaction between the organization's formal requirements and the informal subcultures present in school life. This perspective corresponds with the work of Schein (2010), who notes that ignoring invisible cultural patterns and subcultures leads to the failure of implementing educational change or reform in the school environment.

A significant shift in the current paradigm is the emphasis on the concept of the learning organization and school leadership, through which Schein (2010) notes that organizational culture and school leadership are two sides of the same coin; leaders must be able to diagnose cultural barriers and transform them in a targeted manner. Senge (2006) expands this perspective to include the disciplines of systems thinking and collective learning. From his perspective, educational change should not be dictated but rather emerge as the result of a shared vision and the continuous development of all stakeholders within the educational institution, based on collective learning and regular reflection. Leithwood and Jantzi (2005) and Fullan (2007), who point out that effective change in an educational institution depends on leaders' ability to delegate power and support the professional autonomy of those experiencing educational change.

2. School As an Organization in the Process of Educational Change

In current scholarly discourse in the fields of educational sciences and sociology, a paradigmatic shift is occurring in the view of the school institution. The school is no longer perceived as a rigid bureaucratic institution, but as a complex, adaptive, and internally differentiated organizational system (Trinidad, 2024). Educational change in the school environment thus does not represent merely an isolated event or the mechanical implementation of a reform but becomes an intrinsic feature of the institutional existence within a given educational institution under the conditions of an evolving reality (Connolly, 2011; Fullan, 2007). The success of this transformation depends on a deep understanding of the synergy between formal structures, the physical environment, and the layers of the naturally evolving culture of the educational institution in question.

2.1 School Culture in the Process of Educational Change and the Risk of "Pseudo-Change"

Kruse and Louis (2009) define school culture as an essential prerequisite for the sustainable improvement of an educational institution. They develop the idea of the school as a "Professional

Learning Community," where a key element is the "deprivatization" of pedagogical practice. This refers to the transition from learning in isolation to an open, collaborative culture. Part of "deprivatization" involves the mutual sharing of experiences, planning and evaluating the educational process, and teachers observing each other's classes, thereby making practice a public and shared endeavour aimed at the collective growth of teachers not only as individuals but also as an educational organization (Aldridge and McLure, 2024). However, this process required a profound shift in the perception of the teacher's identity - from the teacher as an "autonomous ruler of the classroom" to the teacher as a "member of a collaborative team." According to Kruse and Louis (2009), the shift from individual to organizational responsibility is a fundamental hallmark of successful school culture change. In this context, Fullan (2007) notes that cultural transformation is the most difficult phase of educational change because it affects teachers' professional self-confidence. It requires a high degree of mutual trust, which the organization needs to build over the long term, as well as an effective feedback mechanism (Fullan, 2007; Bellei, 2016).

This social perspective is complemented by Engeström's (2001) concept of expansive learning, which emphasizes the need to overcome systemic contradictions within work activities, thereby making learning a tool for the active transformation of the school itself as a workplace. The school as a learning organization thus integrates teachers' individual mastery with social learning, and this approach must also be reflected at the micro-level of the classroom (Sarason, 1990), where Watkins (2005) proposes building classrooms as autonomous learning communities.

A key mechanism for overcoming these barriers and activating the potential of a learning organization is a specific type of leadership that goes beyond the administrative level of implementing educational changes. Leithwood and Jantzi (1999, 2005) identify transformational leadership as an essential prerequisite for changing organizational conditions and increasing the engagement of faculty members. Transformational leaders not only articulate a shared vision but also provide teachers with intellectual stimulation and individual support, thereby building the school's capacity for sustainable improvement. The overall success of the school as a learning organization is thus contingent on the synergy between a clear structural concept, the cultivation of a collaborative culture, and the ability of leaders to navigate the school through the complex micro-politics of power, conflict, and cooperation, as elaborated in detail by Blase (1991).

Connolly, James, and Beales (2011) also highlight the risks associated with the absence of this synergy and the closely related superficial change in school culture. They distinguish between culture as a variable (something an organization "has") and culture as an essence (something an organization "is"). Their research revealed that a so-called "pseudoculture," in which teachers outwardly declared their agreement with the new vision, but in the privacy of their staff rooms continued to practice old routines and maintained a cynical and dismissive attitude toward the administration and any efforts at improvement on their part.

In this context, Connolly, James, and Beales (2011) caution against viewing school culture as a variable that can be simply programmed and implemented in a simplistic manner. It is primarily the result of systematic listening and an understanding of deeply rooted traditions, values, and beliefs, some of which are common to all schools, while others are unique and closely tied to the history and location of a specific school (Krusa and Louisa, 2009; Hargreaves, 1995).

3. Changing School Culture in the Process of Educational Change and School Stakeholders

School culture in the process of educational changes and the subsequent transformation of the school is not merely a passive target of change, but an active force that determines whether a new educational policy will be assimilated, marginalized, or completely rejected (Liddicoat, Scarino, and Kohler, 2018). To gain a deeper understanding of this phenomenon, it is essential to employ the concept of "recultivation," which Fullan (2007) defines as the process of challenging and subsequently transforming the fundamental beliefs and habits that shape educators' everyday reality. Unlike "restructuring," which changes only the formal arrangements (schedule, roles, school regulations), recultivation addresses what Schein (2010) refers to as "basic tacit assumptions." If educational change requires, for example, a transition to inclusion, it may encounter a deeply rooted cultural assumption that students with different needs should be educated separately. Profound change in school culture therefore occurs only when this mental model is replaced by a new, shared belief in the value of diversity (March, 1996; Schein, 2010).

3.1 The Dialectic of Resistance and Cognitive Dissonance in School Culture Change

Profound change in school culture is inevitably linked to the phenomenon of cognitive dissonance and the emotional labour of the actors involved (Kruse and Louis, 2009). Ball (2015), within his micropolitical theory, emphasizes that cultural change is not a consensual process but the result of negotiation and resistance. Teachers' resistance to cultural change is often not a sign of laziness but a defence of professional integrity in an environment that is increasingly dominated by the logic of performativity. If school culture is transformed by external pressure to constantly measure results in any given area (the globalization pressure analysed by Rizvi and Lingard, 2009), a rift emerges between the teacher's humanistic mission and the technocratic demands of the school's governing body. This process can lead to the erosion of the original culture and its replacement by a culture of "reporting," where authentic relationships are replaced by auditable outputs (Stoll, 1998; Deal and Peterson, 2002).

For cultural change to become permanent, it must be institutionalized into daily routines and rituals. According to the concept of professional learning communities (Kruse & Louis, 2009), the key mechanism for deep change is the de-privatization of practice. In traditional school culture, teaching is a private act behind closed doors. Profound transformation requires changing this cultural code into a culture of "radical transparency." This process is also supported by Engeström's (2001) theory of expansive learning, in which an organization overcomes internal contradictions by creating a new, broader object of its activity.

Woolner et al. (2018) also argue that the physical layout of a school is "petrified" culture. If a school professes a culture of collaboration and innovation, yet its spaces continue to reproduce a hierarchical and isolated arrangement, cultural change is materially blocked. A profound transformation of school culture therefore requires a physical reconfiguration that physically prevents a return to old patterns of behaviour and compels educational actors to adopt new, innovative forms of interaction.

Changing school culture through educational reforms is thus not a linear adaptation, but a profound ontological struggle over the institution's identity. It requires a shift from isolation to networking (Trinidad, 2024), from administrative management to transformational leadership (Leithwood & Jantzi, 2005), and at the same time the courage of stakeholders to navigate a period of uncertainty until new patterns of behaviour become established as the new cultural norm (Bellei, 2016).

3.2 School Stakeholders and Their Influence on the Implementation of Educational Changes in the Context of School Culture

The relationship between an organization's structure and its culture is realized through the interactions of key stakeholders, namely teachers, school administrators, and school founders (Schein, 2010). Each of these groups enters the process of educational change with its own interests and degree of power, thereby actively shaping the final form of the organizational culture (Takayama, 2013; Stolp, 1994). School leadership plays the role of a key mediator in this process. As documented by Leithwood and Jantzi (2005), the application of transformational leadership principles is an essential prerequisite for the successful restructuring of cultural patterns. Transformational leaders, unlike transactional managers, do not operate solely through rewards and sanctions, but actively stimulate teachers' intellectual development, formulate a compelling shared vision, and provide individualized support (Ullah and Muslim, 2025). Analysing the leadership of school, Stolp (1994) states that the principal's role does not lie in micromanagement, but in the ability to interpret external changes so that they align with the institution's internal values.

According to Stoll (1998), teachers are the immediate implementers and, at the same time, the strongest guardians of school culture. In his classic sociological study, Lortie (1975) highlighted the conservative nature of the teaching profession, which is shaped by years of socialization in isolated classrooms. Ball (2015) examines teachers' attitudes toward educational changes in this context in detail through the lens of school micropolitics. He debunks the myth of the school as a harmonious community and reveals it as an arena of power struggles, where teachers resist reforms that threaten their professional autonomy, working hours, or established methodological practices (Ball, 2015). School culture thus bears the hallmarks of a defence against external demands for change. On the other hand, Biesta (2015) emphasizes that without teachers' full professional ownership of change, any reform is merely an administrative act. Teachers need to perceive change as meaningful for their own educational goals; otherwise, what Hargreaves (1994) refers to as "forced collegiality" occurs—that is, a state in which teachers mechanically fulfil requirements for teamwork and innovation solely to satisfy external oversight.

Schein (2010) identifies school founders and the broader political apparatus as the third key actor exerting macro-structural pressure on school culture. School funders are the agents of both global and national education policies, which permeate schools through mechanisms such as funding, standardized testing, and inspection activities (Leitwood and Jantzi, 2005). Ball (2012) and Rizvi and Lingard (2009), in their theories on global education policy and neoliberal discourse, note that external actors often impose pressure on schools to prioritize performance and the measurability of outcomes. These demands directly challenge the traditional humanistic culture of schools and force them to transform into data-driven organizations. The school's governing body thus shapes the parameters within which culture can develop, but the actual translation of these macro-level requirements into daily practice is always subject to the institution's local specifics (Portnoi, 2016; Venger, Fontdevila, and Zancajo, 2016).

4. Methodology

This research is based on the classic organizational case study design (Berg 1968), which, however, relies on the researcher's active participation within the organization as a member experiencing a change in organizational culture, as noted by Connolly et al. (2011), with the addition of the methodological framework of the organizational sociology of education (Trinidad, 2024). This involves supplementing the structure of the school environment analysis through a three-level methodological framework for the study of schools, which allows for viewing the organization from multiple complementary perspectives.

4.1 Methodological Framework and Theoretical Basis of the Research Paper's Case Study

In the social sciences, a case study represents a specific research design that focuses on an in-depth examination of a bounded system within its real-world context (Denzin and Lincoln, 2018). According to Stak (1994), cited by Connolly et al. (2011), a case study is not merely a methodological choice but, above all, a selection of what is to be examined - that is, the case as an integrated system. The process of constructing and "creating" a case study consists of precisely delimiting the phenomenon in time and space and subsequently collecting complex data through data triangulation.
The methodological design of Connolly et al. (2011) is defined as an instrumental and longitudinal case study that charts an eight-year period of transformation at a secondary school in South Wales. The data collection itself was based primarily on Beales's (2006) doctoral dissertation and includes a wide range of semi-structured interviews with fifteen teachers, seven students, school governors, and school administrators.
According to Trinidad (2024), integrating his three complementary perspectives perspectives into the methodological framework allows a deeper analysis of how structural constraints and network dynamics within the school respond to factors in the external environment.
The way in which Connolly et al. (2011) structure the case analysis and create individual research areas departs from the traditional chronological description (Lewin, 1947) and moves toward a multi-perspective analytical framework (Beales, 2006). The individual areas of the case study emerged through a deductive-inductive process in which theoretical concepts of organizational culture were systematically applied to empirical data collected at the school. It operates on several interconnected levels that allow for a comprehensive understanding of the dynamics of educational change. At the individual level, the research examines individual teachers' perceptions of change and their emotional responses to new leadership practices (Schein, 2010). The group level focuses on the formation of subcultures and tensions between opponents and supporters of change within the teaching staff. The organizational level subsequently captures changes in the school's structure itself and in systems for monitoring student progress, while the societal (literally, environmental) level considers the influence of broader political pressures and national standards on the internal life of the institution.
The theoretical foundation of the study and its connection to previous research demonstrate a deep grounding in the discipline of organizational theory. A key starting point for the case study by Connolly et al. (2011) was the work of Smircichová (1983), who distinguishes between culture as a variable and culture as a metaphor. Connolly et al. (2011) also draw on the classic models of Schein (2010), whose levels of culture help clarify shifts in the mindset of the teaching staff. The research by Connolly et al. (2011) is also influenced by Alvesson's (1993, 2002) studies on the ambiguity of culture and directly builds on the theme of school improvement represented by Fullan (2007) and Stoll (1998). Weick's (1976) work on schools as loosely coupled systems also contributes to an understanding of transformation processes.

Connolly et al. (2011)'s contribution, compared to these predecessors, lies in the integration of diverse perspectives into a single coherent whole, which demonstrates that successful school change requires simultaneous engagement with reality, interpretation, and power relations within the community. We therefore view the methodological approach of the case study by Connolly et al. (2011), supplemented by the organizational sociology of education (Trinidad, 2024), as suitable for the methodological grounding of the research in our dissertation. At the same time, it provides us with a suitable framework for potentially incorporating areas that will be characteristic of the educational environment and context of the selected school.

4.2 *Case Study – Elementary School Description and Research Findings*

This case study focuses on the transformation of the Alma Private Elementary School (hereinafter referred to as SZŠ Alma), which was established through the process of separating the original public elementary school located at 1 Jilemnického Street in Zvolen, Slovakia. From a regional perspective, it was a catchment-area institution in the Sekier district, established by the City of Zvolen. The school had long faced the stigma of being a segregated institution with a high proportion of students from marginalized Roma communities (MRC), which led to a dramatic decline in enrollment and the local government's consideration of its possible closure due to financial unsustainability.
The formal transfer to the CEEV Živica as the new school sponsor in 2024 was the result of a strategic agreement with the city, intended to save the school from closure. With this step, the new founding body took over not only the infrastructure but also the accumulated financial debts and the school's complex emotional history. Given the starting point, the sponsor decided to implement changes using a "small steps" methodology - gradually and slowly, with an emphasis on continuously fine-tuning what proves effective in practice.
The preparatory phase in the 2023/2024 school year required a more profound intervention in the school's teaching staff, which can be described as a "purge of the teaching staff." During the change process, more than 50% of the original teaching staff left, as their mindset was incompatible with the school's new paradigm and vision. Despite the arrival of new teachers, research observations identified a risk of so-called "teacher isolation." A tendency toward professional isolation and resistance to activities beyond basic duties emerged among some of the new staff. According to the data collected so far, this phenomenon represents one of the main managerial challenges in building a proactive organizational culture, which SZŠ Alma continues to address even after September 2024.
In September 2024, at the time of the official launch of operations under the new identity and the commencement of the research study, SZŠ Alma was in a state of formative dynamics. The school successfully managed its first intake of freshmen, with more than double the number of freshmen enrolling in the first year compared to previous years (34 freshmen in 2024 versus 13 freshmen in 2023). The data collected so far show that active engagement with the community is a fundamental prerequisite for changing the school environment. SZŠ Alma is building a network of relationships with parents and partners in the city of Zvolen through events such as the Education Festival and parent clubs, which are also open to parents of future students. This outward openness helps SZŠ Alma not only transform the school's culture from within but also successfully integrate the school into the city's local ecosystem.
Through informal conversations and our time at the organization, we have so far identified, via structured observation, the key characteristic of implementing educational changes: working with teachers and the school's vision, which is shifting from a traditional structural perspective to an open, collaborative model of cooperation and openness between the teaching staff and school management. Teachers at the school are thus changing over time along with the school's evolving dynamics. Together, they are working on a vision that unites the entire educational organization—so that every child at this school can fulfil their own potential.

4.3 Research Analysis

This case study focuses on the profound transformation of the Alma Private Elementary School (SZŠ) in Zvolen, which was established through the process of separating the original public elementary school on Jilemnického Street in the Sekier district. The implementation of changes was based on a "small steps" methodology, characterized by gradual and empirically verified fine-tuning of processes in practice. As part of the management reconfiguration, two key participatory governance bodies were established: the Board of Directors and the School Council, which ensured expert oversight and transparency of processes.

A quantitative analysis of the data collected to date demonstrates the gradual formative impact of the measures implemented. In September 2024, the school saw a significant increase in interest in enrolment, with 34 first-year students entering the first grade—more than double the 13 first-year students in the previous year, 2023. This success validates the effectiveness of the marketing strategy and the promotion of the institution's new vision to the public. The most significant empirical shift occurred in school attendance among students from the marginalized neighbourhood of Pustý hrad. Over the two-year period under review, there was an average increase in attendance among these students of more than 20%. This shift was achieved through a combination of proactive micro-political interventions, which included regular in-person field visits by teachers directly in the community, localized recognition of students for attendance carried out in their natural environment, and community volunteer projects. These interventions demonstrably stimulated the participation of families from the local marginalized community and led to a 15.5% increase in parental involvement in the school's informal activities, thereby laying the groundwork for breaking down sociocultural barriers between the minority and majority populations.
However, a qualitative analysis of internal networks revealed significant staffing challenges. The preparatory phase in the 2023/2024 school year required a radical overhaul of the teaching staff, during which more than 50% of the original employees left, as their mindset was incompatible with the new inclusive paradigm. Despite the recruitment of new teachers, the phenomenon of professional isolation (*teacher isolation*) was identified through structured observation and informal interviews. A tendency toward isolated professional practice and a certain resistance to activities extending beyond the scope of basic teaching duties emerged among some of the new staff. Building a proactive organizational culture and eliminating this isolating behaviour thus represent the main managerial challenge that school leadership faces even in the implementation phase of educational changes after September 2024.

5. Discussion

The results achieved in the transformation of SZŠ Alma confirm the theoretical postulate that sustainable educational change is not a mechanical product of top-down bureaucratic directives, but the result of a complex institutional reconfiguration in which the organization transforms into a learning community gradually capable of self-reflection (Fullan, 2007; Liddicoat, Scarino, & Kohler, 2018). Research findings to date demonstrate a shift from a traditional structural perspective to an open, collaborative model of cooperation between the teaching staff and school management.
The turnover of teaching staff (over 50%) illustrates deep institutional inertia and the limits of organizational stability. As Schein (2010) notes, organizational culture rests on hidden assumptions that individuals internalize. The departure of half the faculty confirms that school transformation often requires the destruction of the original institutional habitus that hindered innovation. On the other hand, the identified phenomenon of professional isolation (*teacher isolation*) among newly hired teachers reveals the limits of adaptation to change. Teachers facing the emotional baggage associated with the school's historical stigma and high demands on community work tend to retreat into the safety of their classrooms. This mechanism correlates with March's (1994) warnings against formal administrative adaptation that does not touch deeper professional identities. Overcoming this insularity requires a transition toward the thorough de-privatization of pedagogical work, where reflection becomes the collective property of the organization.
Empirical success, in the form of a more than 20% increase in attendance among children from the Pustý hrad community and a 15.5% rise in parental engagement, attests to the importance of connecting the school with its local ecosystem. This approach stands in direct contrast to the neoliberal discourse of performativity (Ball, 2012, 2015), which reduces school success to quantifiable performance testing. Instead, SZŠ Alma focused on cultural reengineering and building social capital directly in the field. As Trinidad (2024), Woolner et al. (2018), and Bellei (2016) emphasize in their synthesis, a successful school turnaround requires the simultaneous synergy of three dimensions: structural coherence, material support, and cultural depth. If measures remained merely on paper, the institution would likely revert to its original state after the initiators' departure, confirming the importance of embedding changes in organizational memory and structures (Biesta, 2015).
The significant contribution of the study in the context of education policy is the demonstration of a causal trajectory from local micro-success to macro-legislative change. While theoretical models of policy transfer (Phillips & Ochs, 2004; Steiner-Khamsi, 2014) often criticize "contextual blindness" in the adoption of global reforms, the case of SZŠ Alma documents the opposite, endogenous process. The school administration's initiative and its practical desegregation outcomes sparked a nationwide professional discussion on equal opportunities in education. This pressure led to an unprecedented

step, in which the Slovak Ministry of Education, at the initiative of the Alma School Board, incorporated a new adjustment of school districts directly into the national reform, effective September 1, 2026. This legislative amendment serves as a systemic measure against the segregation of Roma children and students from socially disadvantaged backgrounds throughout Slovakia. The case study thus provides empirical evidence that local transformational leadership (Leithwood & Jantzi, 2005), supported by effective micro-practice, can reconfigure not only the internal culture of an institution but also national education policy.

6. Conclusion

A deeper look into the "turnaround trajectory" reveals that successful schools in the context of educational reforms in socially disadvantaged environments did not succeed thanks to a single miracle method, but rather due to the coherence of a system comprising multiple measures. Bellei et al. (2016) describe a school that radically transformed its results by implementing a system of intensive feedback based on "coaching techniques and questions" (Instructional Coaching). In this model, each teacher received brief but highly specific weekly feedback from an experienced colleague based on direct observation of teaching in their classroom. The data showed that effective educational change must be supported by specific micro-practices that are integrated into the daily routine of teachers' lives at school. The transformation of a school as an organization thus represents a dialectical process between stability and change. As research by Trinidad (2024), Woolner et al. (2018), and Bellei (2016), successful school transformation requires simultaneous attention to three dimensions: structural coherence, material support, and cultural depth. Without an understanding of the interconnections between physical space, informal networks (relationships), and professional identities in the broader context beyond the school, attempts at educational change in the context of school transformation remain merely at the level of formal administrative change—without a real impact on the quality and sustainability of the educational process (March, 1994; Schein, 2010).
True school change is therefore a process of comprehensive institutional reconfiguration in which the organization becomes a learning community capable of mutual reflection, feedback, and self-transformation at the level of human and teaching capital (Liddicoat, Scarino, & Kohler, 2018; Fullan, 2007).

Intercultural Communication Models Revisited: The Richard Lewis Model, the Generation Alpha, and Beyond

Julia Huisman

NHL Stenden University of Applied Sciences, The Netherlands

Abstract

This paper examines the contemporary relevance of traditional intercultural communication frameworks, focusing on the Richard Lewis Model, in understanding the emerging cultural dynamics of Generation Alpha and future Generations. Developed in the 1990s, the Lewis Model categorizes national cultures into linear-active, multi-active, and reactive behavioural types, offering a practical and widely used tool for interpreting cross-cultural communication patterns. Despite its continued value in explaining communication tendencies grounded in stable national contexts, the model faces limitations when applied to Generation Alpha, whose cultural formation is profoundly shaped by digital immersion. Their communication behaviours further diverge from traditional cultural categories due to the influence of online ecosystems. While the Lewis Model retains relevance in contexts involving intergenerational interaction or institutions structured around pre-digital cultural paradigms, its explanatory power is limited when interpreting Gen Alpha's microcultures. These emerging cultural formations are transnational, dynamic, and often detached from the nation-based behavioural stereotypes foundational to the model. As such, this paper argues that future adaptations of the Lewis framework should integrate digital-native dimensions, to more accurately capture the intercultural realities of digital-era generations, and *address the identified gap by critically reassessing the Richard Lewis Model through the lens of Generation Alpha while incorporating the conceptual contributions of the Mirror Model proposed by J. Huisman.*

Keywords: *Cross-cultural Communication, Intercultural Models, Gen Alpha, R. Lewis Model, the Mirror Model*

Introduction

Cross-cultural communication models have long served as foundational analytical tools for understanding differences in values, behaviours, and interaction styles across national and organizational contexts. Since the late twentieth century, influential frameworks such as Hofstede's cultural dimensions, Trompenaars and Hampden-Turner's cultural dilemmas, Erin Meyer's *Culture Map*, and Richard Lewis's cultural typology have shaped both academic inquiry and professional practice in international management, education, and global collaboration. Developed in an era characterized by comparatively stable national cultures, face-to-face interaction, and institutionally bounded learning environments, these models reflect social conditions that preceded widespread digitization and platform-mediated communication.

Hofstede's model conceptualizes culture through empirically derived dimensions such as individualism–collectivism, power distance, and uncertainty avoidance, offering a comparative national lens grounded in large-scale organizational data. Trompenaars and Hampden-Turner extend this approach by framing culture as a series of value-based dilemmas through which societies negotiate universalism versus particularism and achievement versus ascription. Building on these traditions, Erin Meyer translates cultural differences into pragmatic managerial axes, including low- versus high-context communication and egalitarian versus hierarchical leadership styles. Despite their conceptual and practical contributions, these frameworks share a common assumption: culture is predominantly shaped by nation-state socialization and remains relatively coherent and stable across generations.

Richard Lewis's Model of Cross-Cultural Communication diverges from dimension-based approaches by emphasizing observable communicative behaviour. By categorizing cultures as linear-active, multi-active, or reactive based on interaction styles, time orientation, and conversational flow, the model offers an intuitive and behaviourally grounded framework. Its practical appeal has led to widespread adoption in diplomacy, international negotiation, and corporate training. However, the Lewis Model remains deeply anchored in national cultural typologies and implicitly assumes continuity of communicative norms within national boundaries—an assumption increasingly challenged by contemporary sociotechnical conditions.

The emergence of digitally native generations, most notably Generation Alpha (born approximately from 2010 onwards), raises critical questions regarding the continued applicability of traditional intercultural frameworks. As the first generation socialized entirely within digital ecosystems, Generation Alpha's cultural formation is shaped less by national institutions and more by global platforms, algorithmic curation, peer-driven content creation, and participatory online communities. Their communicative practices evolve within gaming environments, social media platforms, and short-form video cultures, where meaning is compressed, symbolic, rapidly shifting, and often detached from geographic or national reference points. These conditions complicate the assumption that cultural behaviour can be reliably inferred from national affiliation alone.

While existing literature acknowledges the transformative impact of digitalization on communication, comparatively little attention has been paid to how generational change disrupts nation-based intercultural models, particularly those—such as the Lewis Model—that rely on behavioural typologies rooted in pre-digital social structures. This constitutes a notable gap within intercultural communication and international management research. The challenge is not merely one of updating examples, but of reconsidering whether nation-centric explanatory logics remain sufficient for interpreting communication in digitally mediated, transnational, and generationally fragmented contexts.

In response to this limitation, recent conceptual developments—such as the Mirror Model proposed by J. Huisman—seek to extend traditional intercultural frameworks by incorporating competencies that reflect the realities of digital-native generations. The Huisman Mirror Model complements the Lewis typology by introducing a corresponding set of dimensions focused on internal, adaptive, and future-oriented capacities, including self-reflection, digital communication, collaboration, creativity, and ethical citizenship. Rather than replacing nation-based models, this mirrored approach reinterprets intercultural communication as a dynamic interplay between externally observable cultural behaviours and internally developed competencies shaped by digital environments and globalized experiences.

This paper addresses the identified gap by critically reassessing the Richard Lewis Model through the lens of Generation Alpha while incorporating the conceptual contributions of the Huisman Mirror Model. It argues that although the Lewis framework retains relevance in intergenerational interactions and institutionally structured environments shaped by pre-digital norms, its explanatory power is limited when applied to platform-centric, algorithmically mediated microcultures. By foregrounding generational dynamics, digital mediation, and fluid identity formation—and by integrating the mirrored competency-based perspective proposed by J. Huisman. This study contributes to ongoing debates on the future of intercultural communication theory and proposes conceptual directions for extending the Lewis framework to better capture the realities of digital-era generations.

1. Reassessing the Richard Lewis Model in the Context of Gen Alpha

The Richard Lewis Model of Cross-Cultural Communication has been widely used to interpret intercultural interaction by categorizing national communication styles into linear-active, multi-active, and reactive cultural types (Lewis, 2006). Its behavioural emphasis and practitioner-oriented design have made it particularly influential in international business, diplomacy, and cross-border collaboration. However, the emergence of digitally native generations—most notably Generation Alpha—raises important questions regarding the model's contemporary explanatory power, particularly in increasingly digital, transnational, and generationally fragmented communication environments.

1.1 Explanatory Capacity of the Lewis Model for Gen Alpha

The Lewis Model retains limited but context-dependent relevance for understanding Generation Alpha's communication behaviours. In institutional and intergenerational settings—such as formal education systems, family structures, and traditional organizational environments—communication norms continue to reflect national cultural patterns transmitted by older generations (Hofstede et al., 2010). In these contexts, Lewis's behavioural typologies remain useful for interpreting expectations related to hierarchy, conversational rhythm, and interactional etiquette.

However, when applied to Generation Alpha's peer-based and digitally mediated communication, the model's explanatory scope is significantly constrained. Lewis's framework presupposes relatively stable national cultures and prioritizes face-to-face interaction, synchronous dialogue, and linear conversational flows (Lewis, 2006). By contrast, Generation Alpha's communication is predominantly asynchronous, multimodal, and shaped by platform affordances rather than rather than national conventions (Boyd, 2014; Danesi, 2017). Consequently, while the Lewis Model can explain inherited and institutionalized communication behaviours, it is insufficient as a standalone framework for

interpreting the communicative practices emerging among digital-native cohorts. communicative identity among Generation Alpha is fluid and situational. Individuals frequently shift styles depending on platform, audience, and algorithmic context, resulting in communicative behaviours that cannot be consistently aligned with a single national-cultural profile (Jenkins, 2006; Boyd, 2014). These dynamics fundamentally challenge the nation-centric assumptions underpinning traditional intercultural models.

1.2 Towards a Theoretical Extension of the Lewis Model: The Mirror Model

Generation Alpha's communication behaviours are more strongly shaped by digital platform cultures than by national cultural affiliation. While national culture continues to influence communication within formal and institutional settings, digital platforms increasingly function as primary sites of communicative socialization. This suggests that intercultural frameworks privileging nation-based explanations without integrating digital and generational dynamics risk misrepresenting the communicative realities of emerging generations.

The Mirror Model proposed by J. Huisman can be understood as a contemporary extension and critical reframing of the Lewis cultural typology, which originally categorized national communication styles into linear-active, multi-active, and reactive orientations based primarily on observable behavioural and interactional norms (Lewis, 2006). While the Lewis model has been influential in intercultural communication studies, critics argue that its reliance on relatively stable national profiles does not fully capture the fluid, hybridized, and digitally mediated identities emerging in the 21st century (Holliday, 2011). Huisman's Mirror Model addresses this gap by introducing complementary dimensions that reflect the competencies and socio-cultural conditions shaping Generation Alpha, a cohort growing up in an environment characterized by digital connectivity, globalization, and rapid knowledge exchange. In this mirrored framework, traditional dimensions such as task orientation, emotional expressiveness, and listening styles are balanced by internal and reflexive capacities including followship, self-reflection, and ethical awareness, suggesting a shift from externally observable cultural patterns toward internalized, adaptive capabilities.

Followship, for instance, repositions individuals not only as leaders or communicators but as responsive participants within distributed networks, aligning with contemporary leadership theories that emphasize shared responsibility and collaborative agency (Uhl-Bien et al., 2014). Self-reflection becomes crucial in navigating complex identity constructions, particularly in digital environments where individuals continuously curate and renegotiate their presence (Turkle, 2015). Furthermore, digital communication competence is foregrounded as a core dimension, recognizing that intercultural interaction increasingly occurs through mediated platforms requiring multimodal literacy and sensitivity to algorithmic contexts (van Dijck, 2013). The inclusion of cultural and ethical citizenship reflects the growing importance of global responsibility, sustainability awareness, and digital ethics in shaping how individuals engage across cultural boundaries (Ribble, 2015). Creativity and critical thinking are positioned as central cognitive skills that enable individuals to move beyond cultural stereotypes and engage in innovative problem-solving, thus countering the deterministic implications often associated with static cultural models (Deardorff, 2006). Collaboration and life skills further emphasize adaptability, resilience, and interpersonal competence, highlighting that effective intercultural actors must operate within dynamic, interdisciplinary, and often virtual teams.

Importantly, the Mirror Model suggests not replacement but augmentation: the original Lewis Model remains a useful for understanding macro-level cultural tendencies, while the mirrored dimensions capture micro-level, developmental, and future-oriented competencies. This dual-layer approach aligns with calls in intercultural scholarship to move beyond essentialist frameworks toward more processual and competency-based models (Spitzberg & Changnon, 2009). In this sense, Huisman's model reflects a paradigm shift from "culture as fixed profile" to "culture as evolving practice," acknowledging that generational change, technological integration, and global interdependence necessitate new analytical tools. By embedding skills such as critical thinking, creativity, and ethical engagement within the intercultural framework, the Mirror Model not only updates the Lewis paradigm but also reorients it toward education, youth development, and lifelong learning in a digitally interconnected world. Consequently, this approach provides a more holistic and future-relevant understanding of intercultural competence, particularly suited to Generation Alpha's lived realities and the demands of an increasingly complex global society.

2. Discussion and Conclusion

This paper set out to reassess the contemporary relevance of the Richard Lewis Model of Cross-Cultural Communication in light of the emergence of Generation Alpha as the first fully digital-native generation. The analysis demonstrates that while the Lewis Model remains conceptually robust for interpreting communication in institutionalized and intergenerational contexts, its underlying nation-centric assumptions limit its explanatory power in digitally mediated environments.

One key contribution of this study lies in highlighting generational socialization as a critical but underdeveloped dimension in intercultural communication theory. Existing models—including those of Hofstede (2010), Trompenaars and Hampden-Turner (2012), Meyer (2014), and Lewis (2006)—implicitly assume cultural continuity across age cohorts. The findings presented here challenge this assumption by illustrating how Generation Alpha's communicative practices are shaped less by national cultural heritage and more by participation in global digital ecosystems. In this context, the Huisman Mirror Model provides a useful conceptual extension by explicitly incorporating generationally shaped competencies—such as self-reflection, digital communication, and collaboration—that are largely absent from traditional frameworks.

Furthermore, the results underscore the importance of platform cultures as emergent cultural units. Unlike national cultures, platform-based microcultures are fluid, transnational, and algorithmically shaped, producing communicative norms that evolve at a pace incompatible with static cultural typologies (Boyd, 2014; Couldry & Hepp, 2017). This insight extends prior discussions of digitalization in communication studies by explicitly situating platforms as cultural environments rather than neutral channels. Huisman's Mirror Model aligns with this perspective by recognizing digital platforms not only as contexts of communication but also as formative environments that shape competencies such as multimodal literacy, ethical awareness, and adaptive interaction.

From a theoretical perspective, the proposed extension of the Lewis Model—operationalized through the Huisman Mirror Model—offers a way forward that avoids both cultural determinism and technological reductionism. Rather than privileging either national culture or digital context, the mirror framework conceptualizes communication behaviour as the outcome of an interaction between external cultural patterns; captured by the Lewis typology and internal, adaptive competencies captured by Huisman's Mirror Model dimensions. This dual-layered approach preserves the strengths of Lewis's behavioural focus while addressing the realities of contemporary intercultural interaction, where individuals operate simultaneously within inherited cultural frameworks and rapidly evolving digital environments.

By proposing a conceptual extension in the form of the Huisman Mirror Model, this paper responds directly to calls for updated intercultural frameworks capable of addressing contemporary global communication realities. The mirror model complements the Lewis typology by integrating generational dynamics, platform-based microcultures, and digitally shaped competencies, thereby offering a more holistic and future-oriented analytical lens. It emphasizes that intercultural communication in the digital era must be understood not only through observable behavioural patterns but also through reflective, adaptive, and cognitively embedded capacities.

Further research could also integrate AI-mediated communication, including human–AI interaction and algorithmically scaffolded learning environments, as Generation Alpha's communicative landscape will increasingly involve non-human interlocutors. In this context, the Huisman Model provides a useful foundation for exploring how competencies such as critical thinking, ethical awareness, and adaptive communication evolve in hybrid human–machine environments.

Finally, interdisciplinary collaboration between intercultural communication, digital sociology, and human–computer interaction research will be essential to further develop and empirically validate integrated models such as the Lewis–Huisman framework. Such efforts will strengthen the theoretical and practical relevance of intercultural communication models in an increasingly complex, digital, and generationally dynamic world

Metaphors: Vocabulary of Success and Failure in Career Guidance

Maria Theodosopoulou[1], Tmumen Raghad[1], Allison Cole-Stutz[1]

[1]Richmond, The American University London, United Kingdom

Abstract

Language both reflects and constructs social reality. As Ludwig Wittgenstein observed, "the limits of my language mean the limits of my world," underscoring the role of language in shaping perception. In the context of work, evolving terminology reveals shifting understandings of careers, success, and failure. Metaphors are central to this process, offering accessible frameworks through which complex career theories and practices are communicated and interpreted. Common metaphors such as "lane," "path," "journey," and "ladder" frame careers as linear or progressive trajectories, while "theatre" and "roles" emphasize performance, adaptability, and identity across the lifespan. In contrast, metaphors such as the "glass ceiling" and "glass cliff" draw attention to structural barriers and unequal advancement opportunities [1]. These linguistic constructs do more than describe career development; they actively shape how individuals interpret experiences, assess achievement, and respond to setbacks. This presentation examines how success and failure are constructed and negotiated through widely used career metaphors and theoretical perspectives, including Chaos Theory of Careers [2]. By analysing the language embedded in both popular discourse and career theory, it highlights how metaphor influences meaning-making in career development in an increasingly complex and uncertain world.

Keywords: *metaphors, success, failure, career theories, career development*

1. Introduction

There are many metaphors related to career development and progression. Some of them show how much people can advance, others refer to how well employees can do. All of them try to define success and failure and set the boundaries within which one can move. Inkson [3] has seen metaphors as an appealing way to present career issues to different groups of people and analysed the different perspectives of looking at careers as legacy, craft, seasons, matching, path, network, theatre, economic, narrative. In this paper, we will refer to some of the common phrases related to what people see as next step in their career experiences and see how certain career theories translate their supposed meaning. Career theories offer us perspectives on how the world of work operates, how we can prepare for it, what gives us job satisfaction [4]. Career management in the past was mostly seen as an organisational task, but by the late 20th century the shift was moved to the individual endeavours, to self-direct their career navigation although the circumstances might often be stressful, such as the COVID period, that often hides the organisational traps [5]. Some career theories have a central position on the discourse and have influenced the way career practitioners approach career guidance and counselling. We will also try to combine the key features of these metaphors to show an outline of competencies that an employee would find beneficial in their career development.

2. Road to Progression: Career Ladder and Individuals

Finding the best possible fit between individual vocational interests and jobs is considered one of the basic points of career decision and planning [6]. Beginning with determining the personality type (Realistic, Investigative, Artistic, Social, Enterprising, Social), understanding the skills related to each one of those types and matching them to occupations helps clarify a clear progression route. Looking at such a linear progression, advancing within an organisation is often compared as climbing a ladder. It is one of the most common references showcasing a linear advancement, implying that everyone starts at the bottom and remains static until reaching the next rung in the ladder in an always linear route towards the top. There is a sequence of steps within a hierarchy, and this is clearly denoted in the job title, for example 'trainee', manager, partner. To follow this traditional career road, it makes sense to employees to find an institution that aligns to their values and remain in the same organization perhaps until retirement [8].

2.1 Career Ladders and Institutions

But if individuals can move up the ladder, then we assume that there must be a ladder in the first place set up by the organisations. Although organisations, such as Higher Education Institutes, present clear pathways of upward career advancement with job titles denoting it, the questions that arise are how the organisations make the ladder accessible and whether there is only one career ladder for all employees in an organisation. Beyond individual characteristics and skills advancing in the career ladder could be an institutional/organisational issue, as there could be organisational barriers that make it difficult for employees to progress. Although this is an issue that has been dealt through affirmative actions and legislation, trying to protect people from biases and make room for them to be judged on the basis of competence and efficiency rather than personal characteristics, establishment malfunctions show the existence of stereotypes. First, noticed in 1970s [8] and then as the feminist movement grew stronger more widely researched in the following decades, the research of the invisible barriers that women employees face in advancing their career beyond middle management, known as the glass ceiling [9]. It showed that despite the wider entrance of women in the workforce, vertical advancement in the career ladder was not easy and this also obstructed by glass walls, as women were usually segregated within specific roles in their organisations, such as working at HR departments, and could not move to other roles -lateral ones- which would give them experience and skills to progress into top management roles. Even when women took leadership roles, often there were extraordinary circumstances, such as an organization in crisis and a high risk of failure involved [10]. It has often been said ‘think managers – think men’, ‘think crisis – think women’, implying either that the soft skills of women could be more beneficial in times of crisis or that women leaders could embrace change more easily [11]. Closely related was the sticky floor term, describing how employees were stuck in entry jobs without many career promotion opportunities. Later, these terms involved to show not only barriers in promotion but also low wages and salaries across the whole workforce organization and how individuals might need constrained to ‘stay in their lane’.

3. Cycles of Career Development

Looking at the next steps in work experiences is not only a matter of opportunities but a combination with the life stage that people are, as career development cannot be viewed as separate from self-development. As Super [12] proposed in his Career Development Model, self-concept develops through time and experiences and distinguished five stages: growth, exploration, establishment, maintenance, decline. Highlighting the importance of change over time, vocational maturity is not defined to a certain chronological time, as individuals move through these stages at career transitions. One could argue that careers are like cycles or seasons in which change is not only inevitable but should also be welcomed in a life cycle of continuous learning. As sometimes, individuals will make great strides in growth, while others won’t, skills such as flexibility, resilience and adaptability will help them grow in those cycles.
The Kaleidoscope Career Model (KCM) [13] shows the fluidity of the needs of people and that decisions are based on three parameters: authenticity showing the alignment between the individual’s values and the employing organisation’s values; balance between work and non-work demands, such as family, carer’s role and leisure time; challenge showing the desire of increased responsibilities and advancement. At a given point of time, more emphasis could be placed on one of the elements while another might play more important role in other career decisions. Although these differences refer to individuals, research between the career needs of different generation can show the different career needs, it can also be used to examine generational career needs in the workplace [14].

4. Life Storytelling

When the next step is not as obvious as a promotion, it is often an individual task to create a framework within which to visualize their next steps. A different perspective focusing on how individuals construct their careers is presented by the Career Construction Theory [15]. Instead of thinking of career as a linear activity progressing through stages, career construction theory is more interested in how individuals build and cross bridges between personality and career. Career is better seen as a journey as the pathway may be unknown, but the destination is clear as you are progressing towards a goal. In the journey, one might find curves that set them back and hide the destination, shortcuts that may lead to the destination faster or lead to a dead end and then one must find their way back. Adaptability becomes a key skill to help individuals choose and make sense of their job, adapt to the environment.

Pathways as a metaphor show the many choices that one has in front of them, adding dynamic to the career journey, where strategy has a key role to play. Advancement does not need to be vertical, as it could be lateral and to navigate it a map is important. The destination of a path could be unclear as there are so many choices and therefore uncertainty and loneliness could be severe disruptions to this journey.
A powerful way of understanding the motivation and the meaning behind choices comes through storytelling as individuals try to restructure their past experiences, traumas and career transitions. Through these stories the individual creates a narrative that tells how education, experience, connections and work converge and how the past not only shapes the present and the future, but also how the present becomes a catalyst of understanding of the past. Therefore, the past does not dictate the future, but the perception of the past, the present and the future can be constructed by the person, and the narrative of the story can change directions.
Storytelling is as unique as every individual and is built on their own inspiration and interests and career is one of the components that brings meaning to the whole life story. Savickas [16] using life designing counselling explains the importance of moving from the self-concept to the identity co-construction, where the individual becomes not only actor and agent in their life, but an author. On the other hand, as storytelling is not always a narration of actual events, but the interpretation of events, the individual projects a subjective rather than an objective understanding of events and situations.

5. Openness to the Unexpected

If we compared career planning as an equation, with the hope of handling all the variables so that the trajectory of a career could be organized and turned around as imagined in advance, there would be the variable of life situations that would make the result totally unpredictable. The theory of Planned Happenstance (PH) [17] recognises that chance events are inevitable and serendipity can impact career planning. However, luck is not a determining factor, it is sustainable key traits that make individuals turn chance into career opportunities: curiosity to explore new learning opportunities; risk-taking in pursuing action even when the outcomes are unsure; persistence to overcome obstacles; flexibility to adapt to new situations and change attitudes; optimism in seeing the potential of new experiences.
Knowing the right people and building a network or a web does not necessarily mean that these connections will be tools that can be used in advancing an individual's career. As a person's network grows over time and so do their skills, contacts and expertise. Making connections, asking questions, learning from other people's experiences and curiosity along with risk-taking can turn chance events into turning points. Although such an approach highlights the importance of readiness to make the most of unexpected events, it leaves a big margin to things beyond one's control and potentially more things for people to self-blame, if they don't have or can't have opportunities for advancement.
Although each one of the PH skills is important, synergy between them relies upon other variables. For example, optimism allows people to understand that there are endless possibilities and therefore revisiting past and present experiences helps to make connections between roles and experiences, but if people perceive barriers, then their curiosity diminishes [18].
The complexity of the modern world with global connectivity is also central in the Chaos Theory of Careers (CTC) [19]. It acknowledges the many factors that influence career choices and the constant interaction between individuals and environments invites us to think outside the traditional career development practices that try to predict long-term planning and get prepared to handle unplanned events. It rejects the idea that typical career pathways follow a straight upward line and resemble them more to a drunken man's stagger' [20]. Therefore, seeing patterns and being ready to see them change is a way not to be afraid of complexity but work with it by cultivating an adaptability mindset, understand failures and see the positive things they hide. This moves individuals from long-term planning to planfulness, which is a process of constant reviewing and tailoring of plans, consisting of devising, revising, abandoning, pausing, re-launching, finessing, and adapting them. We would expect that the agency that CTC gives to individuals to make the most of any situation could be at the same time empowering and overwhelming, as it demands individuals to be constantly alert and ready to change course.

6. Synthesising Metaphors

Trying to make sense of the metaphors we presented (Fig.1), we would say that individuals should know themselves and have a toolkit of skills that they can use as it seems fit Having a careers toolkit is a metaphor used both for employees as well as career practitioners. It relates to a wide range of skills and

competences that we need to succeed. Like a handyman does not reply to one or two tools but uses a combination depending on the task, the employees should develop an array of skills, which will be used on their own or in combination with others. Beginning with their intrinsic motivation is essential to know their values and actively see how they align with the values of the organisation they work for or want to work for. Being motivated with the purpose of their work can lead to job satisfaction and successful transitions during their life.

They should also be reflective, taking stock and trying to analyse their past experiences not on a self-reprimanding or blaming way, but in a constructive way to see the influences of people and events in their decisions and visualise their future aspirations. Trying to plan everything is almost impossible because the environment changes, personal factors interfere, as life is totally unpredictable. Constant revision of the initial plans to match the data at any given time is more sensible but requires constant awareness of opportunities and may be beyond the comfort zone at some times.

Individuals need also to understand that it is not only way to success or that qualifications that matter and that their work experience and achievements can never be seen objectively. There will always be subjective interpretations, and that they need to approach their work life as holistically as they can. Work cannot be detached by personal life, as work life is an organic part of the self-concept. Accepting that in the work life there will be ups and downs, detours, stagnation periods, toxic environments and other problems, but they should see all these with optimism and find the inner resources to turn them into opportunities for meaningful career moves. Resilience and adaptability are positive concepts on how to handle failure and feeling less fearful at the face of failure seems to be not just a personality trait that some have more in abundance of others, but a teachable feature.

From the side of organisations, it shows that they should take into account stressful situations and how they affect their employees. HR departments should take into serious consideration the employees' wellbeing, mental health, as well as being proactive in embracing inclusion and diversity [21]. Organisations should therefore address their responsibility in career advancement of individuals and provide multiple opportunities for career professional development, networking and advancement.

7. Discussion – Points to Consider

This paper is not an extensive analysis of metaphors in career development, but focuses on metaphors related to transitions, which can describe mobility, unexpected events and decisions. In different times of our life and career phase, different metaphors might be more appropriate than others. It is important to see whether these metaphors link to a growth mindset or whether they trigger self-limiting beliefs and are closer to the fixed mindset. Using language that supports development of personal agency where reflection and lifelong learning are highlighted as part of success and part of turning failure into success. At the same time, it is not only individuals but also systems that enable success or failure. It should not be only the individuals who should be invited to move from thinking of restrictions, but organisations as well, which should change into a more enabling approach. Preparing for the unexpected, adapting to diverse contexts and rewriting the life story are attitudes that could help individuals understand success and failure not as terminal points, but as parts of the cycle.

Expanded Payoff Matrices and Drawing: Design Methods for Creating Value through Positive Sum Design

Ian Gonsher[1], Racheal Arewa[2], Zoey Zhang (Zhiyu)[3], Charlene Chen[4]

[1,2,3,4]Brown University, United States

Abstract

Creativity can be characterized as a process that produces novel and useful outcomes. Positive Sum Design seeks to harness this kind of creativity in order to generate the greatest aggregate value for all stakeholders, eschewing scarcity in favor of abundance, and overcoming zero sum bias. Collaborating with undergraduate design engineering students, these design principles were workshopped into a set of design methods. These design methods enhanced the creative process by supporting divergent thinking - the ability to generate many different outcomes. Participants were able to generate an impressive range of possibilities through iterative sketching, as they mapped those possibilities in relation to each other through the use of an expanded payoff matrix (based on the traditional payoff matrices taken from Game Theory). Participants were given a scenario involving a limited resource (an umbrella). When first encountered, the conditions seemed unable to support the needs of all stakeholders. However, through the implementation of these Positive Sum Design methods, participants were able to create positive sum value and generate diverse solutions to the given problem.

Keywords: *Positive Sum Design, Design Process, Divergent Thinking, Design Education, Game Theory*

1. Introduction

It is raining hard outside. You and a co-worker are about to leave the office to go home for the evening, but you both realize you did not bring an umbrella. As luck would have it, another coworker has left an extra umbrella that you can borrow. You have several immediate options. You can take the umbrella, which will keep you dry, but your co-worker will get wet. They can take the umbrella, which will keep them dry, but you will get wet. You can share the umbrella, but it is not big enough to keep both of you completely dry, although you will both get less wet than if you had nothing at all. Or, in the interest of fairness, you both agree that no one should have an umbrella. What would you do? We gave this scenario to undergraduates in order to initiate a discussion about the different design interventions that might be possible. The question has an implicit utilitarian premise. How might you produce the best possible outcome for the most people? In order to answer that question, one must consider who the players are, what their incentives are, and what the best strategies they might take to achieve what they all see as their best interest. The results could produce a zero-sum game, as would be the case if one or the other worker chose the umbrella for themselves at the expense of the other. But the question we are ultimately posing to the students is a matter of how the given situation might be reframed into a scenario where the needs of everyone can be met.

This logic is the foundation of a design approach called Positive Sum Design. Positive Sum Design asserts that good design seeks to create value between agents (positive sum), rather than simply re-allocate value (zero sum). The design methods presented herein reflect this ethical stance, which is to say, that design should be put in the service of producing positive outcomes for all stakeholders. The ethical question might be further simplified: Is it ethically permissible to pursue a zero-sum strategy when positive sum options exist? Or to put it even more prosaically: why allow losers when a bit more creativity can help everyone win according to differing incentives and context? These exercises attempt to frame that metaethical question, by demonstrating that options for win/wins do exist, even when not immediately recognized, if a proper framing is cultivated and applied. These design methods attempt to provide some of that framing or reframing, as the case may be. These design methods enhance the creative process, critiquing bias for competition and scarcity towards a preference for the design of affordances that foster cooperation and abundance, for the positive gains of everyone involved.

Two people under one umbrella may seem to be competing for limited space—but staying dry doesn't require standing under the same cover. What appears to be a zero-sum scenario can be reframed to uncover overlooked solutions that benefit everyone. This insight reflects the ethical shift at the heart of

Positive Sum Design: by rethinking constraints, questioning assumptions, and enabling collaboration, designers can uncover hidden value and create outcomes that serve all stakeholders.

1.1 Design Methods: The Sketch and the Pay-Off Matrix

Conventional design engineering often assumes scarce resources and emphasizes trade-offs. Positive-Sum Design (PSD) challenges this by broadening constraints and promoting cooperation to generate outcomes where all stakeholders benefit. This reframes design from local optimization ("my user wins") to maximizing system-wide utility ("the system wins"). In education, PSD fosters a shift from zero-sum thinking to collaborative, multi-party problem-solving.
This paper introduces design methods that help students create positive-sum solutions—those that enhance collective value. Developed through critical design workshops, these methods integrate sketching and payoff matrices to support divergent thinking and challenge assumptions of scarcity. Together, these tools help reframe context, incentives, and resource availability, making PSD more accessible and actionable in both academic and professional settings.
Beyond sketching with paper and pen, Positive Sum Design design methods stimulate divergent thinking by employing modes of representations taken directly from Game Theory. Workshop participants were encouraged to map out the possibilities identified through their initial drawings as a payoff matrix. A payoff matrix is a table that maps the outcomes for each player in a strategic game, given the combinations of strategies and incentives chosen by all players [16]. The payoff matrix enables a bird's-eye view of stakeholder interactions across contexts and incentives, complementing drawing's focus on specific solutions. Together, they reveal possibilities that may otherwise go unnoticed.
A payoff matrix maps out the possible incentives and outcomes of a strategic interaction between multiple players. It is a tool for visualizing how scenarios between different agents might interact and has been a foundational in economics and political science since its formalization by von Neumann and Morgenstern in Theory of Games and Economic Behavior [21]. In traditional Game Theory, the payoff matrix enables analysis of cooperation, competition, and strategic equilibrium, e.g. the Nash equilibrium [16]. These matrices clarify how individual strategies align or conflict with the outcomes of others, helping reveal zero-sum, negative-sum, or positive-sum scenarios. While game theory traditionally focuses on rational actors in simplified conditions, its models are increasingly leveraged in fields beyond economics, including sociology, evolutionary biology, and design [4].

1.2 Expanding Value through Divergent Thinking

Creativity can be characterized as a process that produces outcomes that are both novel and useful [20]. Positive Sum Design (PSD) fosters creativity, in part, by integrating traditional design methods with insights from Game Theory in order to reframe problems and maximize collective value. Using tools such as sketches and payoff matrices, PSD fosters creativity through divergent thinking—generating multiple varied possibilities and applying those possibilities to useful applications. In his American Psychological Association (APA) presidential address, Creativity, Joy Paul Guilford defined divergence as the moment when "the thinker must do much searching around, often in several directions at once, for ideas that are both numerous and varied" [10]. Subsequent work corroborates Guilford's claim that idea generation is an exercise of cognitive aptitude. Meta-analyses show that people who earn higher scores on divergent-thinking tests are, on average, more likely to achieve creative success later in life [13] and to have their work rated as more creative by expert judges [18]. While correlations between divergent thinking and creative success are moderate, they remain significant. Convergent thinking, by contrast, focuses on narrowing options to find the most effective solution. Both models are essential to creativity and can be strengthened through visual methods that make abstract thinking tangible.
Divergent and convergent thinking entered scholarly discourse through J.P. Guilford's 1950 APA address, where he argued that creativity consists of multiple cognitive processes. He later formalized these ideas in his Structure-of-Intellect model, identifying fluency, flexibility, originality, and elaboration as core divergent thinking skills. In the 1960s, E.P. Torrance translated Guilford's framework into practical tools by developing the Torrance Tests of Creative Thinking (TTCT). These tests, comprising verbal and figural tasks, evaluate creativity through Guilford's four dimensions and have demonstrated predictive validity in longitudinal studies [20]. One notable figural task involves transforming repeated circles into distinct objects, directly assessing flexibility and originality. This concept evolved into the 30 Circles Challenge, popularized by Stanford professor Bob McKim and later adopted by IDEO, serving as a rapid exercise to enhance creative fluency under time constraints. Whereas TTCT circles are scored analytically, the 30-Circles exercise is typically used formatively to help teams experience the

difference between idea quantity and quality. Ultimately, the exercise exemplifies Guilford's divergence and convergence axes of creativity.
Complementary tools capture other facets of creative cognition. Sarnoff Mednick's Remote Associates Test (RAT) taps convergent insight by asking solvers to discover one word linking three remote associates, emphasizing tight semantic closure rather than generative breadth [20]. Alternatively, Teresa Amabile's Consensual Assessment Technique (CAT) sidesteps psychometrics entirely. Panels of field experts rate real products for creativity, bringing domain specific standards into the evaluation process [20]. Collectively, these measures provide a multifaceted toolkit for studying how people navigate from many possibilities to a single, high utility solution.
Sketching stimulates and concretizes divergent thinking. Studies underscore that drawing actively expands the outcome space of possible solutions by leveraging the very cognitive traits that support divergent thinking [19] [13]. Sketching plays a vital role in fostering divergent thinking and creativity. Boldt and Strub [2] found a strong link between conceptual flexibility and drawing creativity, highlighting sketching as a pathway to novel ideas. In design engineering, sketching supports "value exploration" by revealing hidden needs and enabling shared understanding [11] [5]. Visual tools invite critique, spark analogies, and build trust—critical for Positive Sum Design. Even quick exercises like the Circles Test show how manipulating constraints visually encourages flexible, collaborative thinking.

1.3 Game Theory and Human-Centered Design

Designers are well accustomed to employing user scenarios to better understand what they are designing and who they are designing for. Human-centered Design (HCD) emphasizes empathy and iterative development to meet user needs [3]. Tools such as user journey maps and user personas are just some of the tools used in HCD to better understand who an individual user is and how they might navigate the circumstances and constraints of a proposed situation. As noted by Don Norman, one of the leading proponents of HCD, the aim of HCD is to create technology and products that are "usable, useful, and desirable" [15].
Traditional payoff matrices are useful because of the constraints they offer. They focus the scenario around a given number of possible players, strategies, and outcomes [1]. However, constraints also limit the kinds of behaviors and choices that can occur, and ultimately the utility or value that can be enjoyed by the players, albeit in varying proportion to one another. Constraints are useful in helping to define the design problem, which in turn can be iterated upon and further developed. Within the design process, it is often necessary or desirable to find a balance between thinking within the given constraints, and also thinking beyond them. Failure of imagination can result if the scope of the problem is too limited.
While Human-Centered Design focuses on individual users, Positive Sum Design shifts attention to multiple agents and how their interactions affect collective value. To support this broader perspective, we introduced an expanded payoff matrix—a tool that goes beyond the traditional game-theoretic model, which tends to converge on a single optimal outcome. Instead, our matrix encourages divergent thinking, helping designers explore a wider range of perspectives and outcomes. By mapping user behaviors, incentives, and interactions onto this matrix, designers can "reframe the game" to uncover new possibilities. This foundation supports visual ideation: sketching tangible interventions within richer, more nuanced scenarios. When combined with prototyping and refinement, this approach enables interventions that increase value for all stakeholders.

2. Workshop: Applied Positive Sum Design

To develop and evaluate Positive Sum Design (PSD) methods in practice, we conducted two complementary workshops at Brown University: a two-hour studio session involving 13 undergraduates and an asynchronous online workshop which welcomed participants from a wider range of academic backgrounds. Both formats led participants through a scaffolded sequence that moved them from zero-sum reasoning to win-win framing, demonstrating how structured play, visual ideation, and game-theoretic framing can foster creative, cooperative problem-solving in design education. The workshop followed a structured progression that blended brief concept overviews with interactive practice. After a short comparison of positive-sum and zero-sum frameworks, participants undertook a series of hands-on exercises designed to encourage divergent thinking and collaborative problem-solving.
First, a Haystack Exercise ("How would you find a needle in a haystack?") was used to measure divergent thinking, with responses scored for fluency, flexibility, and originality. Next, students tackled the primary Umbrella Scenario: they sketched solutions and mapped strategies on payoff matrices to design mutually beneficial outcomes. Creative outputs were evaluated using the Consensual

Assessment Technique (CAT) and Torrance Tests of Creative Thinking (TTCT). The session concluded with a group discussion and a reflection survey to gauge shifts in perception and strategy.
Throughout the session, the instructors highlighted the contrast between zero-sum assumptions and positive-sum possibilities, stressing how reframing constraints and employing divergent thinking can lead to integrative solutions. Students participated actively and collaboratively, frequently expressing surprise at the innovative win-win ideas that emerged and noting how these activities made abstract theory tangible, thereby deepening their understanding of PSD. In the first iteration of the expanded payoff matrix exercise, students ranked four introductory scenarios— keep the umbrella, give it away, share it, or decline it—and then translate these rankings into a traditional payoff matrix [Figure 1].
Explaining their choices allowed them to link quantitative rankings with qualitative reasoning. The cohort subsequently discussed varying incentives and explored possible Nash equilibria, each player's optimal strategy given the other's, highlighting how different frames influence cooperative outcomes.

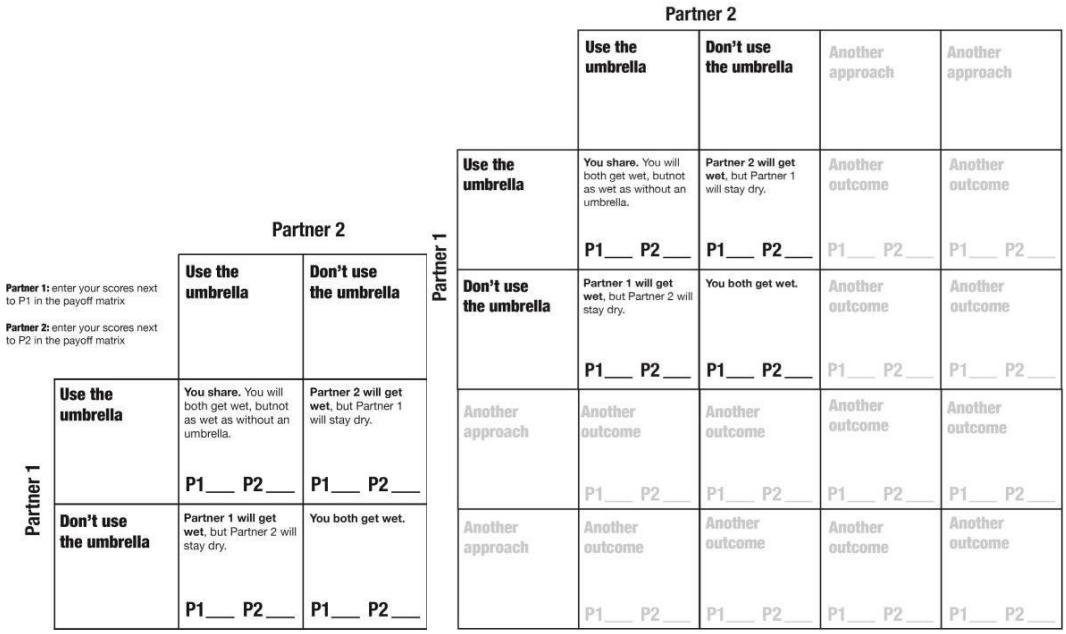

Fig. 1. Payoff Matrix vs Expanded Payoff Matrix

The second iteration introduced an expanded payoff matrix. Like the traditional version, this matrix uses rows and columns to assign values to different interactions between agents. However, whereas the traditional matrix focuses on convergent thinking, identifying a single optimal outcome, the expanded matrix encourages divergent thinking by reframing constraints and exploring possibilities beyond the initial conditions. Students first brainstormed additional options, then mapped these options onto the expanded matrix to visualize the broader set of potential outcomes. After a round of discussion and collaborative refinement by the entire cohort, students were asked to concretize and visualize their newly generated options, adding specificity and detail to each proposed design intervention. [Figure 2]

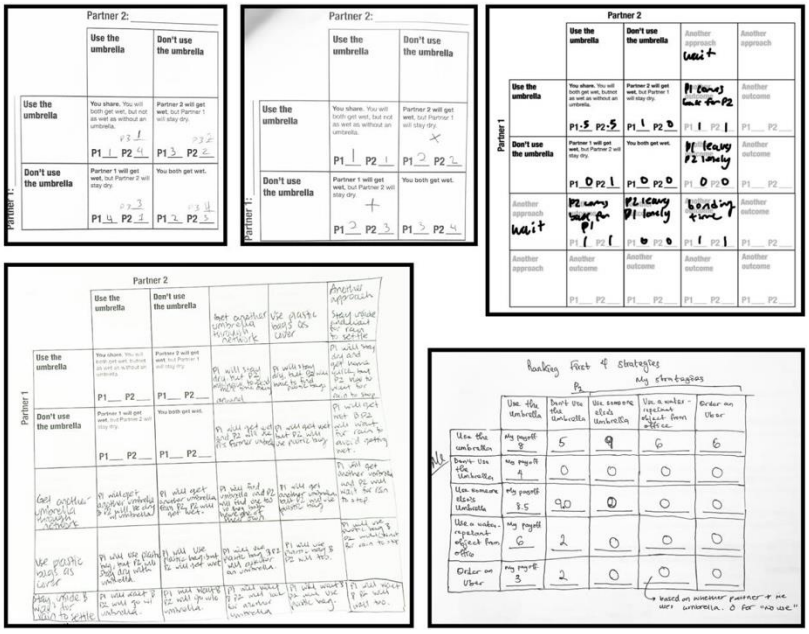

Fig. 2. Student Payoff Matrix

Drawing is a robust cognitive tool for exploring creativity and value generation. Recent studies have shown that drawing tasks activate divergent thinking pathways and allow creators to explore abstract concepts spatially and relationally [2]. In PSD contexts, drawing allows participants to test how a design might perform for multiple users, evolve with needs, and curate an intended experience. These sketches are not merely illustrations, but rather strategic moves within a game of collective gain.

To evaluate these drawn solutions, we can apply tools developed in developmental research [20]. The Consensual Assessment Technique (CAT) offers a method where experts evaluate individuals' creative performance on open-ended tasks. Domain expertise and contextual problem-solving ground the CAT method, distinguishing it from other scales of creativity. In the workshop's scenario, participants are tasked with proposing creative alternatives to the limited choices presented by the traditional zero-sum setup: either one person benefits or both incur partial losses.

To apply CAT rigorously, recruit a panel of independent judges familiar with design, creativity research, or human-centered problem-solving. Judges do not compare drawings to a fixed rubric, but instead rely on their respective understanding of creativity and social value. The strength of CAT is in capturing subjective yet consensus-driven assessments, allowing for nuance that rigid scoring schemes might miss. By applying CAT to these sketches, researchers and facilitators can simultaneously identify which ideas are "creative" and which foster a positive sum outcome. This, in turn, allows for an empirical yet holistic way to populate a new kind of payoff matrix– one in which outcomes are optimal, collectively meaningful, and adaptable.

To complement CAT, the Torrence Tests of Creative Thinking (TTCT) offer a structured framework for assessing participants' creative thinking during the workshop. Originally developed by E. Paul Torrence, TTCT evaluates four dimensions of creativity: fluency, originality, flexibility, and elaboration. In the context of our design workshop, TTCT provides a structured way to assess the creative output of participants as they engage in divergent thinking activities, such as sketching prototype solutions. This standardized test is therefore highly relevant in the workshop context as an objective means to evaluate the creativity of the design solutions generated, offering a benchmark for creative performance beyond subjective judgment.

Within the TTCT dimensions, fluency is measured by the number of distinct ideas a participant produces, indicating their ability to think beyond conventional solutions. Flexibility refers to the diversity of conceptual approaches reflected in their sketches, particularly in how they address PSD principles. Originality is assessed by the uniqueness of a solution within the pool of responses. Ideas that appear infrequently or diverge significantly from the norm are marked as more original. Elaboration evaluates

the depth and clarity of the participant's thinking, rated on a scale from minimal to comprehensive, based on the extent of explanation and contextualization provided.

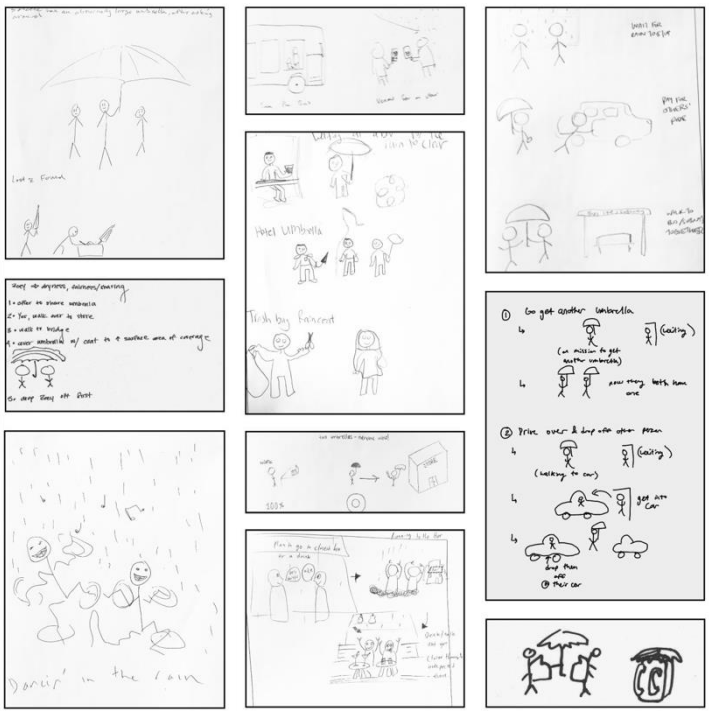

Fig. 3. Selected student sketches for the umbrella scenario

Together, these dimensions offer insight not just into how creative a response is, but how effectively it addresses the real-world challenge at hand. Divergent thinking, in this context, is not measured in isolation but in terms of its capacity to produce value, relevance, and mutual benefit.

3. Discussion

Despite the modest size of the workshops, participants proposed a thoughtful range of creative strategies, grouped thematically into several categories. Some participants attempted to redesign the object itself, proposing technical design solutions such as double umbrellas or a portable drone system, for example. Others attempted to reframe the given constraints in order to discover new ways of addressing the need, such as shifting the functional fixedness of adjacent objects in order to adapt them to serve that desired utility. Participants discovered much ready material to work with by opening themselves up to other possibilities, such as protecting themselves from the rain with objects ranging from trashcans and trash bags to jackets and newspapers. And still others attempted to reframe the utility of the object by expanding the incentives beyond what was initially apparent. These participants not only asked, "What do I want and how do I get it?" but perhaps a more foundational question, "Why do I want what I want?" Some of these participants realized that staying dry might not be the best possible outcome at all. They discovered that it might be more desirable to enjoy the rain, for example (e.g. dancing in the rain) or use the circumstances as a ready reason to take a sick leave the following day.

The workshops occasioned a wide variety of approaches to the given problem, with most falling into these three categories. Some tried to improve the design of the umbrella itself. Others expanded the resources available to them by applying the given constraints to the broader context in which they found themselves. While still others fundamentally questioned the premise of the given goal in order to explore other ways to understand their needs. All of these strategies lead to the discovery of otherwise unrecognized value.

Nearly everyone's initial instinct was to share and avoid the "all wet" outcome, but altruism vs. self-interest varied by group. Weather severity, health, distance, and the relationship history of the participants could lead to a change in the ranking order. Buying, borrowing, waiting, splitting a cab, or improvising rain gear often transformed a competitive zero-sum dilemma into a cooperative win/win. Viewing the umbrella as a resource that can shift from a "rival" or "excludable" good to "public "good (by sharing or adding another umbrella) led stakeholders to constructive tensions, which ultimately

encouraged higher-value mutual solutions. Communication between stakeholders, including the use of visual representations such as rough sketches, were key to this shift. Drawing not only helped to generate new possibilities that were novel and useful to all stakeholders, but aided cooperation and coordination between those stakeholders as well.
Our analysis also compared traditional payoff matrices with expanded payoff matrices. The expanded payoff matrix helped stakeholders map out and visualize the available options, and helped stakeholders identify where reasonable trade-offs could be made. This allowed all stakeholders to shift from a zero-sum scenario, where wins come at the expense of losses, to positive sum games, by growing resources, reframing the constraints, and redefining the need.
In the initial zero-sum scenario, participants generally defaulted to solutions that maximized their own dryness at the expense of the other, mirroring the expected Nash equilibria. For example, Group A had two participants share the umbrella while the third member resorted to using a trash bag for coverage. One could argue that these outcomes extrapolate a focus on self-interest and resource scarcity. As a result, there are limited payoff options and minimal mutual benefit.
When prompted to use the expanded payoff matrix, the diversity and utility of ideas noticeably increased. Group B proposed supplementary factors to the scenario to bypass the initial constraints. Their ideation included collaborative solutions, such as using the umbrella by one member of the team to seek resources for the rest of the group, e.g. trekking to dry environments such as a nearby hotel to call an Uber or otherwise using the single umbrella to search for additional resources that allowed for coverage of all stakeholders.
Group C devised a systemic solution that went beyond the immediate scenario, designing a workforce umbrella-sharing program. Alternatively, Group F and E focused on technical improvements to the umbrella itself, sketching a dual umbrella prototype where the product adjusts based on height and circumference. The expanded payoff matrices reflected higher aggregate utility in all these scenarios. All parties stayed dry, or at least less wet, while also adapting resources and reallocating risk. Across the six teams, participants produced an average of 8–10 distinct ideas beyond the standard two options. Not all were sketched; however, in almost all cases, the act of drawing clarified assumptions, exposed contrasting features, and invoked more novel combinations, consistent with research showing visual ideation boosts flexibility and elaboration.
In our initial pilot evaluation, we focused primarily on the TTCT subscales of flexibility and originality, since these dimensions most directly mapped the PSD principles of mutability of constraints and multivalence of utility. However, fluency (the sheer number of ideas generated) and elaboration (the depth and detail of those ideas) are equally critical facets of creative potential. In future work, we hope to incorporate timed fluency tasks where participants produce as many illustrations as possible to capture how volume drives discovery. Likewise, the hope is to integrate elaboration prompts by asking participants to annotate or color-code their top ideas, documenting the “how” and “why” behind each solution. These richer artifacts can then be scored both for idea count and for the granularity of their execution, yielding a more holistic profile of divergent thinking. Integrating sketches and payoff matrices enabled participants to quantify and communicate differential gains. The use of sketches and payoff matrixes within the design process helped stakeholders generate and capture new value by developing unconsidered possibilities and mapping the outcomes of those possibilities against each other.

4. Conclusion

Drawing and mapping complement each other, the former allowing for the generation of varied, individual possibilities, with the latter allowing for a systemic view of how those possibilities relate to each other as a whole. Although the sample for these pilot workshops were small, the results offer promising evidence for the efficacy of these design methods in producing greater aggregate value for all stakeholders. The expanded payoff matrix, in conjunction with visual design methods such as sketching, can convert perceived scarcity into positive-sum outcomes.
The fundamental ethical question that PSD poses is to ask if it is permissible to play a zero-sum game when possibilities for playing positive sum game either already exist or can be developed by means of a creative engagement with the problem? Is there an ethical obligation to challenge one’s own bias towards zero sum framing? Is there an ethical obligation to overcome failures of imagination? Is there an ethical obligation to cultivate creativity? Is one compelled to think creatively in order to expand the available resources for all stakeholders, and facilitate cooperation and communication over direct competition?
PSD methods attempt to address this need. These design methods give designers and stakeholders a means by which they might visualize the complexities that arise from the differing incentives and

changing constraints between the interplay of multiple users within a given context. PSD offers designers tools for enhancing divergent thinking and expanding the available resources against assumptions of scarcity. These insights can then be further ideated and visualized and prototyped, as the design process culminates in the best possible solutions for all stakeholders.

Scenario-Based Teaching of Water-Stress Communication in Business Education: A Quasi-Experimental Study in Bulgaria

Teodor Daskalov[1], Neviana Krasteva[2], Aleksey Potebnya[3]

[1,2,3]Faculty of Economics and Business Administration,
Sofia University "St. Kliment Ohridski", Bulgaria

Abstract

Business education still lacks transferable instructional models for teaching low-salience sustainability risks that students do not readily recognize as immediate managerial and communication challenges. This paper presents and pilot-evaluates a competency-based instructional framework that uses water stress in Bulgaria as a context for teaching risk interpretation, stakeholder reasoning, and public communication before crisis conditions emerge. The Bulgarian case is instructionally relevant because official statistics show that 5.8% of the population experienced drought-related water-supply restrictions in 2024. A quasi-experimental design is implemented with two intact groups of fourth-year Business Management students. The comparison group follows an active debate-based case-learning format, whereas the intervention group completes a scenario-based sequence combining simulations, serious-game-inspired mechanisms, stakeholder role-play, and structured message mapping. The intervention is designed to strengthen engagement while integrating analysis, decision-making, and communication under uncertainty. The study examines two outcomes. First, it evaluates the quality of student discussion during structured deliberation on water-stress scenarios, focusing on argument quality, evidence use, stakeholder reasoning, and decision coherence. Second, it assesses applied communication competence through the quality of message maps and drafted public-facing statements, with attention to clarity, specificity, actionability, and trust-preserving framing. Results from the 24-protocol R1-scored corpus indicate high discussion quality in both conditions, mixed applied communication performance, and actionability as the clearest instructional bottleneck. The paper contributes an implementable teaching design, an assessment-oriented competency framework, and a transferable model for embedding sustainability-risk education in business curricula.

Keywords: *business education; sustainability risk; water stress; scenario-based learning; communication competence*

1. Introduction

Water stress is not only a hydrological condition but a governance problem that becomes socially consequential through coordination, credibility, and public-facing decisions. At the global policy level, water security is also framed as directly connected to prosperity and peace [1]. In low-salience settings-where aggregate resource availability and reservoir infrastructure can foster a narrative of adequacy-capability building is often delayed until late-stage restrictions or incidents occur. This makes early-stage communication and management decisions critical: they can either stabilize expectations and mobilize preventive action or accelerate escalation through confusion, mistrust, and stakeholder conflict.

The Bulgarian case is instructionally relevant because official environmental statistics report that in 2024, 5.8% of the population experienced water-supply regimes due to drought, including 5.0% under seasonal regimes and 0.8% under year-round regimes [2]. The same source reports substantial regional variation: the most affected districts were Lovech (56.3%), Pleven (51.1%), Targovishte (33.8%), and Pernik (17.8%) [2]. The national statistic is used here as an educational anchor rather than as a full hydrological diagnosis: it helps students interpret a low-salience sustainability risk as a managerial communication problem before a crisis becomes publicly visible.

In this paper, communication-management risk under water stress is defined as the coupled risk that (a) decisions under uncertainty fail to coordinate stakeholders, allocate responsibilities, and trigger timely preventive actions, and (b) communication choices reduce trust, invite misinformation, or fail to translate decisions into actionable public guidance-thereby increasing the likelihood and cost of escalation. This definition intentionally treats communication as a governance mechanism rather than a post-hoc public-relations activity.

The educational challenge follows directly: business management curricula train managerial decision-making under uncertainty, stakeholder coordination, reputational-risk assessment, and public-facing communication, yet water stress is often treated as a technical or environmental topic rather than a managerial communication problem. To make preparedness teachable in a low-salience context, instructional design must render latent risks cognitively salient and require assessable artefacts that demonstrate competence, not only attitudes.
The contribution of this paper is educational rather than hydrological. It offers and pilot-evaluates an artefact-based teaching design for making a low-salience sustainability risk actionable in business education. The model links scenario-based deliberation, stakeholder reasoning, decision mapping, and public-facing message production to transparent assessment criteria. The present findings are reported as pilot descriptive evidence from the complete 24-protocol R1-scored corpus and still require independent second-rater scoring before any confirmatory claim can be made.

2. Literature Review and Conceptual Framework

2.1 Low-Salience ("hidden risk") Communication for Drought and Water Stress

Slow-onset hazards such as drought and water stress are difficult to communicate because their onset is diffuse and often not readily perceived. Weitkamp et al. [3] argue that in "wet" climates drought risk may lack personal relevance and is filtered through heuristics and cultural expectations; they propose a framework for drought risk communication where publics may not perceive the risk. For education, the implication is practical: teaching must first establish interpretive frames-what to notice, what signals mean, and what actions are proportional-before competence can be expected.

2.2 Water Services, Trust, and Crisis Communication as Governance

Water services are uniquely trust-sensitive among utilities because they relate directly to health and daily life. Utility crisis communication guidance emphasizes clarity, transparency, empathy, and disciplined messaging to sustain public trust [4]. In the present framework, these principles are not treated as "soft" skills; they define performance criteria for applied risk communication: actionability, uncertainty disclosure, and decision-message alignment.

2.3 Simulation and Serious-Game-Inspired Learning for Water Governance

Scenario-based instruction is relevant to this design because it structures situated practice around realistic tasks and decision contexts in higher education [5]. Simulation and serious-game approaches are increasingly used to train water governance because they enable participants to practise coordination and decision-making under uncertainty, including stakeholder conflict and time pressure. In the water-governance literature, game-based approaches are proposed as tools to explore relational practices and complex system trade-offs [6], [7]. Recent serious-game work on drinking-water contamination emergency response explicitly models communication and multi-stakeholder coordination [8]. At European policy level, JRC guidance and training tools for water reuse governance further legitimize structured role-play and serious games as capacity-building mechanisms for risk-based planning [9], [10].

2.4 Constructive Alignment, Rubrics, and Artefact-Based Assessment

To meet education-conference expectations, the study follows constructive alignment: learning outcomes are mapped to learning activities and to assessment rubrics that score observable artefacts [11]. This assessment orientation is consistent with sustainability-competence education, which emphasizes integrated competencies and the challenge of assessing them through suitable tools [12], [13]. This alignment is important because the paper evaluates not only whether students discuss water-stress scenarios, but whether they produce evidence-aware decisions and public-facing messages that can be assessed consistently.
Analytic rubrics are appropriate for this purpose because they make criteria visible and allow separate scoring of complex performance dimensions. Jonsson and Svingby [14] conclude that rubric-based scoring can enhance reliability especially when rubrics are analytic, topic-specific, and supported by exemplars or rater training; however, rubrics do not guarantee valid judgment by themselves. Brookhart [15] similarly emphasizes that effective rubrics require criteria that match the intended performance and

meaningful descriptions of performance levels. These cautions inform the pilot framing of the present study: the rubrics are used diagnostically, while reliability and validity claims are deliberately limited at this draft stage.

Table 1. Competency-Artefact-Assessment Alignment

Competency domain	Student artefact	Assessment focus
Evidence-aware deliberation	Decision protocol, rebuttals, decision map	Argument quality, evidence use, uncertainty handling
Stakeholder coordination	Stakeholder analysis, decision package	Interests, constraints, responsibilities
Decision coherence	Decision package and map	Feasibility, timeline, trade-offs
Applied risk communication	Message map, CAP statement	Clarity, actionability, transparency, trust, alignment

2.5 Research Questions

Because the analysis uses a pilot R1-scored protocol corpus, the study is guided by descriptive research questions rather than confirmatory hypotheses:
RQ1: What patterns of discussion quality are observable in the 24-protocol R1-scored corpus?
RQ2: What patterns of applied risk-communication competence are observable in the 24-protocol R1-scored corpus?
RQ3: Which rubric dimensions reveal the clearest relative instructional bottlenecks for future teaching iterations?

3. Methods

3.1 Design, Setting, and Instructional Timeline

We used a pilot quasi-experimental teaching design with two intact sections in a fourth-year Business Management course (total N = 30 students), organized into six teams of five students. Each section included three teams, corresponding to the comparison group and the intervention group, respectively. Sections were treated as intact groups rather than randomly assigned; within each section, teams were formed to maintain comparable team size and functional diversity. The sequence was delivered across four consecutive approximately 90-minute sessions. Both conditions shared the same core pedagogy-debate with opposing viewpoints, written decision packages, plenary rebuttal, and decision mapping-which served as an active control. The intervention condition added simulation-enhanced and serious-game-inspired mechanisms, role constraints, timed checkpoints, information updates, and structured risk-communication outputs. In this manuscript, the design is treated as a pilot comparison of artefact quality and diagnostic instructional patterns, not as a confirmatory evaluation of intervention effects.

Table 2. Instructional Session Timeline

Session	Instructional focus	Common active-control activities	Additional intervention elements and artefacts
Session 1	Water-stress risk framing and evidence interpretation	Opposing-viewpoint debate; evidence and assumptions log; initial decision package	Scenario framing; stakeholder role cards; preliminary message map
Session 2	Stakeholder reasoning, responsibilities, and trade-offs	Rebuttal; stakeholder analysis; decision criteria and trade-off mapping	Role constraints; timed checkpoint; structured stakeholder-to-message translation
Session 3	Decision-making under evolving information and operational uncertainty	Updated decision package; feasibility review; responsibility allocation; revised decision map	Information update round; time-pressure checkpoint; separately captured Session 3 artefacts for full-corpus scoring
Session 4	Public-facing communication and decision-to-message alignment	Final decision map; communication output; plenary comparison of decisions	CAP-structured public statement; source-of-truth and update-cadence requirement

Because intact groups were used, the design should be interpreted cautiously. In education research, quasi-experimental designs require attention to baseline equivalence and selection risk [16]. The present draft-stage analysis does not claim confirmatory intervention advantages; it reports descriptive pilot evidence from the R1-scored protocol corpus.

3.2 Conditions: Active Control and Augmented Intervention

Opposing viewpoints as an instructional device. The use of two deliberately opposing positions was a pedagogical technique to surface assumptions, clarify criteria, and force trade-off articulation. To minimize the risk of a false dichotomy, positions were framed as analytic poles rather than normative extremes: teams were encouraged to identify hybrid options during reconciliation and to document accepted trade-offs explicitly in the decision map. Instructors monitored for caricatured or moralizing arguments and redirected teams to evidence-based constraints, stakeholder interests, and feasibility criteria.
Comparison group (CG): debate-based case learning. Students split into two opposing positions, produced written decision packages, engaged in rebuttal, and created a decision map capturing criteria, trade-offs, and expected outcomes. Communication elements were documented but not explicitly scaffolded through role constraints, timed checkpoints, or CAP-structured public messaging.
Intervention group (IG): augmented scenario-based sequence. The intervention retained the same debate structure but added (i) stakeholder role-play through role cards with objectives and constraints, (ii) decision checkpoints under uncertainty through timed rounds and information updates, including the Session 3 update round, and (iii) explicit production of risk-communication artefacts: a message map and a CAP-structured public statement oriented to clarity, actionability, transparency, and trust preservation.
CAP refers to a Caring-Action-Perspective structure: acknowledge concern, specify actions, and provide factual context including uncertainty and update cadence.

3.3 Data Source and Artefact Capture

Student protocols were collected at the end of each session and served as performance artefacts. The protocol template required evidence and assumptions, opposing viewpoints and rebuttals, stakeholder reasoning, a decision package with responsibilities, a decision map, and communication output. The full teaching sequence generated raw course materials, including session worksheets and supporting artefacts; however, the reportable corpus for the present draft comprises 24 consolidated, anonymized, and R1-scored team-session protocols from the scoring sheet. No values are inferred beyond the scored protocol records.

3.4 Outcomes and Rubric Scoring

Unit of analysis. The unit of analysis is the team–session protocol (one protocol produced by one team for one session). All rubric scores are assigned at the protocol level.
Two primary outcomes were assessed using analytic rubrics applied to student protocols. O1 Discussion quality included four criteria: argument quality, evidence use, stakeholder reasoning, and decision coherence. O2 Applied risk-communication competence included five criteria: clarity, actionability, transparency/uncertainty disclosure, trust-preserving framing, and decision-message alignment. Each criterion was scored on a 0-4 scale with calibration anchors for scores 0, 2, and 4; scores 1 and 3 represented intermediate performance.

3.5 R1-Scored Protocol Corpus and Analysis Plan

The analysis evaluates feasibility of artefact capture, rubric sensitivity, and diagnostic instructional patterns; it does not estimate intervention effects.
The scored corpus comprises 24 protocol-level observations and is used as a pilot artefact corpus rather than as a student-level dataset. Scores are analysed at the protocol level, and the same teams can contribute multiple protocols across sessions. The corpus therefore supports descriptive diagnostic analysis of artefact quality, but not independent-case inference or causal estimation.
At this draft stage, the rubric is used primarily as a diagnostic assessment tool to identify specific performance strengths and weaknesses, especially actionability, responsibility assignment, and decision-to-message alignment.

The instructional design generated 24 team-session observations (6 teams × 4 sessions). The R1-scored corpus comprises 24 protocol-level observations: 12 comparison-group protocols and 12 intervention-group protocols. Because the same teams can contribute multiple protocols across sessions, these observations are repeated team-level traces rather than independent cases; therefore, condition is treated only as a descriptive grouping variable.
The next strengthening step should report independent second-rater scoring, inter-rater reliability, baseline equivalence checks, and baseline-controlled comparisons where appropriate. Until that workflow is completed, the present results should be read as R1-scored pilot descriptive evidence.

3.6 Reliability and Scoring Workflow

The defensible workflow for stronger reporting requires two independent raters, calibration with rubric anchors, and reporting inter-rater reliability. At this draft stage, the 24 protocol-level observations were scored by one preliminary rater only. Inter-rater reliability is therefore not reported, and the findings are interpreted as descriptive pilot evidence. A second-rater procedure and inter-rater reliability estimates should be completed before the corpus is used for stronger claims. Rater blinding was not implemented at this preliminary stage; the condition labels remained visible in the working scoring file, so expectancy bias is treated as a limitation.

3.7 Ethics

Students were informed that protocol artefacts could be used for research in anonymized form; participation in research use was voluntary and did not affect course grading. Protocols were anonymized for research scoring, stored securely, and reported only in aggregate or through de-identified excerpts. Research scoring was separated from course grading, following informed-consent principles appropriate for educational research.

4. Results

Results are reported as descriptive patterns and should not be interpreted as causal intervention advantages. The condition labels are retained for transparency of artefact origin, not for estimating treatment effects. The current results report the complete 24-protocol R1-scored corpus used in this draft: 12 comparison-group protocols and 12 intervention-group protocols.

4.1 Pilot Descriptive Results

The Table 3 corpus comprises all 24 R1-scored team-session protocols (12 CG, 12 IG) and includes all four instructional sessions. Results remain descriptive because protocols are repeated team-level traces rather than independent cases.
The table below reports protocol-level descriptive statistics. O1 is the mean of four discussion-quality criteria; O2 is the mean of five applied risk-communication criteria. Condition statistics include n, arithmetic mean, sample standard deviation, and observed range.

Table 3. Pilot Descriptive Results and Diagnostic Interpretation (24 R1-scored protocols)

Dimension	CG	IG	Diagnostic note
O1 Discussion quality	n=12; M=3.17; SD=0.19; R=3.00–3.50	n=12; M=3.25; SD=0.28; R=2.75–3.75	High; small IG advantage.
O2 Applied risk communication	n=12; M=3.55; SD=0.26; R=3.20–4.00	n=12; M=3.45; SD=0.19; R=3.20–3.80	Mixed; no IG advantage.
A2 Evidence use	n=12; M=3.25; SD=0.87; R=2.00–4.00	n=12; M=3.50; SD=0.67; R=2.00–4.00	Modest IG advantage.
B2 Actionability	n=12; M=3.00; SD=0.60; R=2.00–4.00	n=12; M=2.83; SD=0.39; R=2.00–3.00	Main bottleneck.
A3 Stakeholder reasoning	n=12; M=3.75; SD=0.45; R=3.00–4.00	n=12; M=3.83; SD=0.39; R=3.00–4.00	High; possible ceiling.
B3 Transparency	n=12; M=4.00; SD=0.00; R=4.00–4.00	n=12; M=3.92; SD=0.29; R=3.00–4.00	Ceiling/near-ceiling.

Descriptive reporting note. M = mean; SD = sample standard deviation; R = observed range. Median values are omitted from Table 3 to reduce visual density; the analysis remains descriptive and protocol-

level. The table is based on 24 R1-scored protocols in the uploaded scoring sheet; the R2 scoring pack is not yet available, so inter-rater reliability and reconciled scores are not yet reportable.
Criterion-level inspection indicates strong stakeholder reasoning in both conditions and a ceiling or near-ceiling pattern in transparency/uncertainty disclosure. This may reflect effective task scaffolding, but it may also indicate a ceiling effect that should be addressed in future rubric refinement. The clearest relative instructional bottleneck was B2 Actionability: students were generally able to communicate clearly and acknowledge uncertainty, but needed more support in specifying concrete actions, responsibilities, time frames, and source-of-truth references.
The descriptive results answer the research questions as follows. RQ1: discussion quality is high in both conditions, with a small descriptive IG advantage in O1 and evidence use. RQ2: applied risk-communication competence shows a mixed pattern and does not support an intervention advantage in the 24-protocol R1-scored corpus, although decision-message alignment is descriptively higher in the intervention group. RQ3: actionability is the clearest relative instructional bottleneck, especially specification of responsible actors, concrete actions, deadlines, and a source-of-truth update channel. Overall, the R1-scored pilot results support the feasibility of artefact capture and rubric-based scoring. They also indicate where the instructional design should be strengthened: not primarily in general clarity or transparency, but in actionability and decision-to-message translation under scenario constraints. No causal claims are made from the pilot corpus.

5. Discussion

This pilot analysis explored whether simulation-enhanced and serious-game-inspired elements produced observable diagnostic patterns beyond a strong baseline pedagogy. A key observation is that debate-based case learning with opposing positions, written decisions, and decision mapping can already elicit robust deliberation in a low-salience risk topic. This matters for business education because the task approximates managerial work: interpreting incomplete evidence, coordinating stakeholders, weighing reputational consequences, assigning responsibilities, and translating decisions into public-facing guidance.
The intervention was designed to scaffold applied risk communication through message maps and CAP-structured public statements. However, the 24-protocol R1-scored corpus showed a mixed O2 pattern rather than a consistent intervention advantage. This finding is instructionally useful because it suggests that structured communication artefacts do not automatically improve public-facing communication unless actionability, responsibility assignment, and update cadence are enforced more explicitly and practised repeatedly.
The clearest diagnostic result concerns actionability. Across the pilot corpus, students more readily produced clear, transparent, and trust-preserving messages than concrete guidance specifying who should do what, when, and through which follow-up channel. Future iterations should therefore strengthen the CAP statement template by requiring explicit next-24-to-72-hour actions, responsible actors, update cadence, and source-of-truth references.
The paper's strongest contribution is therefore diagnostic: the artefact-based rubric identifies actionability (B2) as a recurring relative instructional bottleneck, especially in the translation from transparent messaging to operationally specific public guidance.
The design-oriented value is that the assessment criteria point directly to refinements that can be implemented in the next teaching iteration before a full-corpus evaluation is attempted.

5.1 Practical Implications

Actionability scaffolds (immediate classroom use):
• Require every public statement to include a 24-72h action line, responsible actor(s), a deadline/review point, and a single source-of-truth update channel.
• Use a micro-checklist for students: Actor-Action-Deadline-Update channel; if any element is missing, revise before submission.
Instructors can implement the approach with minimal infrastructure by adopting four components: (1) opposing-viewpoint debate to surface assumptions relevant to managerial decision-making; (2) written decision packages with explicit responsibilities and reputational-risk implications; (3) decision mapping to force coherence, stakeholder coordination, and trade-off documentation; and (4) message mapping plus a short public statement to operationalize transparency, trust, and public-facing communication. Rubrics enable assessment without audio/video recording, reducing logistical burden.

The pilot results suggest one refinement for immediate classroom use: the communication artefact should not merely ask for a clear public message; it should require a concise action line specifying actor, action, deadline, update channel, and next review point. This requirement would target the weakest observed O2 dimension without making the exercise substantially more complex.

5.2 Limitations and the Most Defensible Framing

The full 24-observation protocol corpus is represented in the R1-scored scoring file, and no values are inferred from missing or unscored artefacts. Nevertheless, the evidence remains pilot and descriptive because the unit is the protocol, not the student, and because repeated traces can be contributed by the same teams across sessions.
The main limitations are intact-group assignment, potential diffusion between sections, protocol-based measurement that captures traces rather than full interaction, and preliminary single-rater, non-blinded scoring. Small and uneven session-level cells limit interpretation to descriptive pilot evidence and prevent inferential testing.
Opposing-viewpoint structure may introduce a false-dichotomy risk if participants interpret analytic positions as the only legitimate options. This risk was mitigated by framing positions as heuristic poles, encouraging hybrid solutions in the final decision package, and requiring decision maps to document trade-offs and feasibility constraints.

5.3 Future Research and Strengthening Steps

Future iterations should ensure complete artefact capture across all teams and sessions, add independent second-rater scoring and inter-rater reliability, and incorporate delayed post-tests to examine durability. Where feasible, baseline equivalence checks and baseline-controlled analyses should be used. A component analysis could isolate which elements drive incremental gains, such as role-play, timed checkpoints, information updates, message mapping, or CAP-structured public statements. The complete protocol corpus should also use stored fidelity checklists and scoring audit notes to strengthen internal validity.

Cross-country Analysis of Women's Participation in the Labor Force and Political Representation in Middle East Countries

Nahid Anaraki

Fort Hays State University, United States

Abstract

This article offers an interdisciplinary review of women's constraints and opportunities in the Middle East and North Africa (MENA) using a quantitative cross-country analysis, while it implements econometric models to measure the constraints on female participation in the labor force and parliament presentation. Though there is a vast amount of literature on women's rights at individual country level, the literature lacks a cross-country analysis in the MENA region, particularly a quantitative analysis. This paper fills the gap in literature by using a cross-country analysis of 12 countries in the MENA region to find out the drivers of women's participation in the labor force, and political representation. We test three hypotheses; first what are the factors that have shaped women's participation in the labor force and what is the role of corruption in participation. Second, what are the factors that contribute to female political representation in the parliaments. Third, we test the hypothesis whether women's participation in the labor force and political representation has improved Post- Arab Spring.

JEL Classification: I24, J16, K38**,** Z10

Keywords: *Women's empowerment, Arab spring, gender equality, corruption, patriarchal culture, glass ceilings.*

1. Introduction

Women have had limited access to economy and polity in the Middle East and North Africa (MENA) for decencies. Even in countries with more modern legislations and institutions, due to traditions, customs, and patriarchal culture have observed limited ability to participate in economic activities and political decision-making. The combination of patriarchal attitudes and legal structures have placed women in a highly disadvantageous position in the social order (Kazemi, 2000).

Even if women's rights have been achieved in secularized environments, from a historical point of view, there is no connection between secularization and the promotion of women's rights, nor between secularization and the promotion of equal rights. The Arab Spring helped enormously to aiding democratization (in Tunisia) and heightened many areas of inequalities that has created a global Islamic feminism, in geo-political spere.

Women in MENA are doing worse in terms of political, economic, socio-economic indicators than any other parts of the world, even compared to developing countries (Felder & Vuollo, 2008). Indeed, gender gaps in the region has been exacerbated post-Arab spring despite all efforts of civil societies and legal reforms. The gender gaps have increased in the past decade due to political instability, inter-state wars, domestic conflicts, and civil wars. Some states in the region have restricted access to education for women including Afghanistan, Iraq and Pakistan due to traditional roles that women should play at home. Those states experiencing conflict and high numbers of refugees, for example Lebanon and Syria have limited education possibility due to the economic climate, stereotypes, and beliefs against women empowerment.

The Middle East and Arab region have made the slowest progress across several indicators compared to the rest of the world. The female labor force participation in the MENA region is the lowest in the world and has remined so for several decades (Felder & Vuollo, 2008). This paradox has been explained by discriminatory gender norms, patriarchal culture, and lack of constitutional support, among other factors. The economic participation of women in Arab states is 33.3 percent compared to 55.6 percent in the world. In addition, women only own 17 percent of entrepreneur (Felder & Vuollo, 2008). This data reflects the depth and severity of women's disadvantage in labor force in Arab states.

The poor performance in the MENA region can be attributed to high level of violence against women, discriminatory regulations, and lack of well-designed constitutions and legislations that endanger women's empowerment. But more importantly, one can refer to discriminatory traditions, customs, cultures, and taboos that have been conceptualized in brains of men and women for decades.

The rest of the paper is structured as follows. Section 2. presents the literature review on women's empowerment and its development in different aspects including labor force participation and political representation across different countries in MENA region. Section 3. discusses theoretical framework. Section 4. elaborates indicators, data and methodology used in this study. Section 5. analyzes the estimated econometric results of the cross-country analysis with panel data. Section 6. concludes and provides policy recommendations.

2. Literature Review

One of the important gaps in the literature in the MENA region is lack of research on women's participation in labor force and polity. Research suggests that women in several Middle East countries remain disadvantaged in employment and the society, in general (Seyd & Ali, 2019). To fill the gap in the literature, we first briefly review the situation of women's social status and their participation in labor force and political representation across 12 sample countries including Afghanistan, Algeria, Egypt, Iraq, Jordan, Kuwait, Lebanon, Morocco, Pakistan, Qatar, Saudi Arabia, and Tunisia. We selected these countries from the Greater Middle East, the Maghreb, Arab states and GCC.

i) Women's participation in labor force:

Importance of women to economic development has been highlighted in several studies (Pereira, 2020; Pereira & Bamel, 2021). Though women have advanced in management in Middle East, they have career and development constraints due to the strong gender inequality. More specifically, the number of women entrepreneurs in MENA region is lagging compared to men in many states (Bastin, Metcalfe & Zali, 2019). To address the issue of underrepresentation of women in the labor force, we briefly discuss the barriers women face in several MENA countries.

The gender gap in the labor participation rate is widest in Iraq and smallest in Kuwait and Qatar (EU parliament, 2014). Though in some countries such as Bahrain and Kuwait, families have started to rely more on women's financial support, still the gender gap overwhelmingly spreads throughout the countries in the region.

There is a huge gender gap in economic activities in Egypt, as women participation rate in the labor force does not exceed 20% (Hassan, 2015). Most employed women are in education and health care system. Women are presented in only 31.2% of management positions and there is a huge gap in women's wages with men in different sectors (Hassan, 2015). Lebanon is among the Arab countries that have allowed women to resume functions and responsibilities outside the traditional roles. Though women in Lebanon are increasingly recognized as full-fledged partners in the family economy, decision-making positions in Lebanon continue to be monopolized by men. According to the gender statistics released by the Economic and Social Commission for Western Asia (ESCWA), the number of women enterprise owners in Lebanon is significantly low, with women employers constituting only 1.5 percent of the female workforce (Jamali, Sidani & Safieddine, 2005).

The lack of opportunities for women in Jordan is manifested in low labor force participation of 15%, an unemployment rate of 23%, and a negligible entrepreneurship rate. (Ait Ali Silmane et al., 2020). Despite all the reforms in Jordan, women still have small participation in workplace and only 19% of businesses are co-owned by women. In 2018, only 4% of working women were employer or business owner, compared to 13% for men (Ait Ali Silmane et al., 2020).

Though women constitute 59% of labor force in Kuwait, and occupy 64% of educational system (Meyer, Rizzo, & Ali, 2005), the diminishing level of support for women's rights in Kuwait has been the focus of several studies in Middle East. Indeed, women's trivial presence in economic and political activities is attributed to cultural, institutional, and structural factors. Based on the results of Arab barometer survey, only 12% of respondents agreed that men are better political leaders compared to 30% in Tunisia, and 20% in Lebanon (Thomas, 2019). Female participation rate in labor force is only 23.5% compared to 70.3% for men, which highlights a huge gender gap for that country (Avis, 2017).

Female participation at workplace in Qatar is lower than anywhere else in the world (Al Attiyah & Naser, 2014). Based on a business approach developed by the World Bank, which measure 8 indicators with data that refers to the laws and regulations that are applicable to the business, Qatar stands 29 out of 100 (where 100 represents the highest possible score). The overall Qatar score is much lower than the average of MENA, 51.5 (World Bank, 2021). The most important barriers in Qatar include laws affecting women's pay, pregnancy and work conditions and gender differences in inheritance. However, Qatari women are beginning to attain higher level of education than men.

Only 15% of Saudi Arabia is composed of female work force (Alharbi, 2015). Combination of the economic need for women's investment in the private sector and participation in the workforce, and the

international political pressures for improving women's rights, as well as women's everyday solidarity practices have led to some advancements in women's rights toward equality, but still, there is a long way ahead of the country (Alkhaled, 2021).
Tunisia started early in its reforms and with a better health and education system and succeeded to create a more productive labor force compared to other states in MENA. Despite all reforms, Tunisian women still face several economic and social barriers, related to patriarchal attitudes that prevents them from accessing positions in many economic and political areas. Women represented only 37% of employees in public service in 2016, and 46% of the total workforce. Unemployment rate after the Jasmine revolution has been rising substantially; while unemployment for men stands at 14-15%, unemployment for women is almost twice as men as high as 26-28% (Voorhoeve, 2015).
In sum, it is estimated that MENA region loses USD 575 billion due to current gender-based discrimination in the labor force (World Bank, 2018). Unfortunately, the norms, traditions, and patriarchal culture have contributed to misperception of women about their rights. For instance, over 80% of Jordanians believe that when jobs are scarce, men should have higher rights, and over 70% believe that men make better business decisions than women. (Ait Ali Silmane, 2020).

(ii) Women's rights in political representation:
Women are underrepresented in decision making across the MENA region. For instance, in Egypt, the Supreme Council of Armed Forces (SCAF) appointed an all-male committee to draft constitutional principles for Referendum in March 2011. In addition, no women were appointed in the post 2011 cabinet and no women has ever become a governor (Hassan, 2015).
Iraq witnessed radical changes to its political system post 2003. These changes occurred after many wars, sanctions, and external occupation until it became one of the failed states. Despite introducing new articles in Transitional Administration Law (TAL) in 2004 to protect women and minorities, women have been absent from the front line of the political life. When national assembly was formed in 2004 only 20% of members were women. The share of women in Parliament between 2006 and 2021 has been above 25%. However, these numbers do not represent the real participation and voice of women in leadership and process of building state during the transition (Alwan, Qati, & Ali, 2021).
The amendment of the election law in 2005 opened the doors for women in Kuwait to vote and run for office and participate in parliamentary elections. In 2009 women succeeded to gain 8% of the seats in the election of the parliament. However, the rate decreased to 6% in 2012. And the Parliament did not have a single female candidate in 2013 (Shalaby, 2015). Since 2010 Lebanon has observed a consistent decline in its relative gender gap score, particularly in political empowerment. Only 3.1% of parliamentary seats are held by women in Lebanon (Avis, 2017).
Tunisia has been known for its modern legislations on women's rights. Tunisian females represent 60% of university students in different levels, but are underrepresented in decision-making and political positions (Ouanada, 2020). Gender based discrimination still exists in Tunisia, creating a glass ceiling that has limited women's access to high management and political positions.
Though there have been some reforms in advancing women's role in leadership and political roles in the region, there are still institutional and cultural barriers embedded in decision making and political participation in several MENA countries.

3. Theoretical Framework

As elaborately pointed out by several scholars including: Danon & Collins (2021); Seyed & Metcalfe (2017); Zulfiqar (2019), and Pereira et al. (2020) women in MENA have been faced with the key following challenges:

1. Women do not participate in the labor force to the same degree of women in other parts of the world even in developing countries (Danon & Collins 2021).
2. Women are poorly presented in legislative bodies, such as parliaments, compared to global averages (Avis 2017; Danon & Collins 2021).
3. It is perceived that women's participation in the labor force and political representation have deteriorated in several MENA countries since Jasmine revolution.

This study uses a quantitative approach covering 12 countries in the region to test three hypotheses: (i) does education matters to participation in the labor force and political presentation (ii) Does corruption index matter for female participation in the labor force and political presentation (iii) has Arab spring contributed or deteriorated the degree of women's participation in the labor force and representation in the political system.

4. Data and Methodology

4.1 Data

We use the data from the world development indicators of the World Bank website and from Congressional Budget Office to compare the situation of women among MENA countries. Table-1 indicates the highest female labor force participation is found in Qatar and Kuwait, while Iraq and Pakistan have had the lowest participation rate due to severe constraints on women's career development. We also use an index which reflects the misperception of women about their rights, women who believe men are justified in beating their wife. This index is highest for Afghanistan, Iraq, and Pakistan compared to other countries, outlining the dramatic patriarch culture, male dominancy, and lack of judicial protection for women, which has been exacerbated in post conflict states.

Table 1. Comparative analysis of women participation indicators in the Middle East (2021)

Country	Literacy rate among women (%)*	Labor force participation female (%)	Women married at age of 15 relative to 15-24 years old females	Women who believe men are justified in beating wife
Afghanistan	-	21.36	4.2%	80.2
Algeria	75.3	-	-	-
Egypt	65.5	18.49	2%	35.7
Iraq	79.9	11.41	7.2	51.2
Jordan	97.8	-	-	-
Kuwait	94.9	50.19	-	-
Lebanon	93.3	22.9	1.4%	9.7
Morocco	64.6	-	-	-
Pakistan	65.18	21.65	3.6%	41.1
Qatar	94.7	56.92	0%	6.6
Saudi Arabia	92.7	21.95	-	-
Tunisia	72.2	25.12	0%	30.3

World Bank, World Development Indicators.

Table 2. on gender index and seats held by women in parliament indicates that Kuwait, Afghanistan, and Pakistan have had the lowest share of women's participation in the parliament; however, Egypt, Iraq, and Tunisia have had the highest shares, mainly due to legislative reforms and more democratic societies run by relatively liberal regulations compared to other states.

Table 2. Comparative analysis of gender inequality in Middle East Countries (2019)

Country	Social Institution and Gender Index (1)	Constitutional provisions (2)	Share of seats held by women in parliaments (2)	Absence of Legal discrimination score (lower=more discrimination) (3)
Afghanistan	52.8%	NO	2.3%	38.1
Algeria	-	-	7.5%	-
Egypt	-	Yes	22.9%	45
Iraq	53.7%	Yes	26.4%	45
Jordan	57.3%	-	11.8%	-
Kuwait	-	No	1.5%	29
Lebanon	56.2%	No	4.7%	53
Morocco	50.8%	-	20.2%	-
Pakistan	58.7%	No	4.5%	55.6
Qatar	-	Yes	9.8%	29
Saudi Arabia	-	No	19.9%	80
Tunisia	47.6	Yes	26.3%	68

To find out the relationship between women's participation in labor force with independent variables, we use panel data for the period of 2005-2023. The data on women's labor force participation, tertiary education, GDP growth, Budget Deficit, Per-capita loan and financial development and share of seats held by women in parliaments are retrieved from the World Bank Indicators of the World Bank website, and data on corruption index is retrieved from International Transparency.

4.2 Methodology

We investigate the factors that contribute to low participation in labor force and underrepresentation in parliaments. The effects of advanced education on labor force participation have been emphasized by several scholars including (Dandan & Pereria Marques, 2017; Barsoum, 2018; Aziz Khan, 2019). Moreover, the correlation between women at work and corruption has been the focus of several studies including Dollar, Fisman, & Gatti (2001) who find the greater representation of women in parliament, the lower the level of corruption. Global Organization of Parliamentarians Against Corruption (GOPAC) investigate the effects of gender equality on corruption and find that an increase in the number of females in the Parliament tend to reduce official corruption. Samimi et al. (2013) use panel data for the period 2003-2010 for 27 selected Islamic states and find that with an increase in the rate of women's participation in labor force corruption has decreased dramatically.
Corruption is generally seen as a harmful element that contributes to business ethics glass ceiling. The glass ceiling develops because in reacting to corruption, small and medium-sized enterprises (SMEs) and small family firms remain opaque and unable to access financing outside the family network or traditional bank loans.
Our study is different from the previous studies, and it follows Bishara (2011) in the sense that causality runs from corruption to gender inequality because the corrupted governments leave fewer resources for private sector, through crowding out effect. As such, less space is left for women to participate in the labor market. We test the hypothesis that corruption has affected women's participation in labor force and representation in parliaments.
We also use a dummy variable for Arab spring post 2011 to find out whether there has been any improvement in women's right for access to labor market and seats held in the parliaments post-Arab spring.
We estimate equations 1. and 2. with panel data for the period of 2005-2023 for the 12 above-mentioned countries.

$$FLP = a_0 + a_1 \sum_{i=1}^{n} \sum_{j=1}^{k} Edu + a_2 \sum_{i=1}^{n} \sum_{j=1}^{k} Corrup + a_3 \sum_{i=1}^{n} \sum_{j=1}^{k} X_{ij} \qquad \text{Equation 1.}$$

$$PPR = b_0 + b_1 \sum_{i=1}^{n} \sum_{j=1}^{k} Edu + b_2 \sum_{i=1}^{n} \sum_{j=1}^{k} Corrup + b_3 \sum_{i=1}^{n} \sum_{j=1}^{k} X_{ij} \qquad \text{Equation 2.}$$

List of Variables
FLP represents female participation in labor force, *PPR* represents political presentation measured by seats held by women in the parliament, *Edu* refers to tertiary education at university level, *Corrup* is index of corruption measured by Corruption Index of Transparency International, and matrix *X* represents control variables or fixed effects across different countries, including GDP growth (GDPG), Budget deficit (BD), access to bank loans measured by per-capita loan (PCL), and level of financial development (FD) measured by private sector credit to GDP. We use two dummy variables; the first dummy (D1) equals 1 for the post Jasmine revolution (Arab spring in 2011) and the second dummy (D2) relates to the post war states. Finally, *i* represent the year and *k* represents the country.

5. Estimated Results

5.1 Estimated Results for Women Participation in the Labor Force

Table 3. indicates that all independent variables together can explain more than 85% of changes in women participation in the labor force. The coefficient on education is statistically significant at 5% and represents the elasticity of women's participation in labor force to tertiary education (since model is in logarithm form). This elasticity is estimated around 0.34 and indicates that one percent increase in the number of people in tertiary education increases the possibility of female participation in the labor force by 0.34 percent. Expectedly, the coefficient on corruption is negative and statistically significant, and indicates that one percent increase in the index of corruption reduces the possibility of women participation in the labor force by 0.12 percent. In other words, consistent with theory and indicated by some scholars including (Bishara, 2011) in a more corrupted society there is less chance for women to participate in the labor force. This result highlights the importance of reforms against corruption in the Middle East for women's participation in the labor market.

The coefficient on the dummy variable for Jasmine revolution (D1) is negative and statistically significant, indicating that the Arab Spring has exacerbated women's participation in the labor force. As emphasized by some scholars including Chamlou & Karshenas (2016); and (Battaloglu & Fassin, 2017), the post Arab Spring states are more conservative and have had serious threats that undermines the gains women had achieved over the past 20-30 years on economic and social fronts. Finally, the coefficient for the second dummy variable (D2) is negative and statistically significant, highlighting that post war states have had lower participation of women in the labor force.

Interestingly, the coefficients on GDP growth, private credit, and financial development as control variables are not statistically significant, indicating that women's participation in the labor force in MENA has not been shaped by business cycles and macroeconomic fundamentals, as there are several barriers to their career development, which emanate from legislations, customs, and patriarchal culture rather than macroeconomic environment.

Table 3. Women's education and corruption effects on women's labor force participation

Variable	Coefficient
Education	0.34 (0.02)
Corruption	-0.12 (0.03)
BD	0.14 (0.05)
D1	-0.17 (0.04)
D2	-0.13 (0.03)
GDPG	0.05 (0.04)
PCL	0.04 (0.07)
FD	0.12 (0.13)
R-squared	0.85
Adjusted R-squared	0.82
F-statistics	26.35
Durbin Watson	1.89

5.2 Estimated Results for Women Representation in Parliamentary Seats

The relationship between corruption and political presentation has been the focus of several scholars including Bishara (2011); Moghadam, (2015); Dandan & Periera Marques, (2017). In addition, education, and knowledge sharing promote human capital as emphasized by several scholars including Budhwar, et al. (2019); Preiera (2020); Budhwar et al. (2020); Bamel, Pereira, & Cappiello (2021); Pereira & Bamel (2021); Pereira & Mohiya (2021); Bamel, Pereira, Giudice, & Temouri (2022). Given

the importance of education and corruption in affecting political representation we use these two variables besides the dummy variables as independent variables in the regression models. Furthermore, we control macroeconomic conditions and business cycles by implementing control variables such as GDP growth, private sector credit, and degree of financial development.

The estimated results indicate that all independent variables together explain more than 87% of changes in women's participation in the parliaments. The elasticity of women's seats held in the parliaments to education is estimated 0.12, which indicates one percent increase in the number of females in tertiary education will increase women's participation in the parliament by 0.12 percent. Expectedly, the coefficient on the corruption is negative and statistically significant and equal to 0.17, which indicates one percent increase in the corruption index reduces the number of seats held by women in the Parliament by 0.17. The result is alarming and highlights the importance of anti-corruption reforms in the region for the empowerment of women and their participation in the parliament and political decision-making.

Again, the coefficient on the dummy variable for the Arab spring is negative and statistically significant, indicating that Arab Spring has adversely impacted women's participation in political representation and decision making. Indeed, though a few countries have been able to carry out reforms to improve women participation post Arab Spring, the net effect for majority of countries has been negative. Our result is consistent with the finding of Sinha (2012), and Battaloglu & Fassin (2017) who find Arab-Spring has deteriorated women's situation and participation in political activities. Finally, the dummy variable on the war states (D2) is negative and statistically significant, indicating that women in the post war states such as Afghanistan, Algeria, and Iraq have experienced lower participation in the parliament. And the coefficient on the dummy for war states is almost twice as the coefficient on Jasmine revolution. Indeed, the war states have experienced a worse situation for participation of women in the parliament and decision-making.

In addition, the post-Arab Spring political events indicate pressures on Middle East countries to democratize has been replaced by security cooperation and anti-terrorism measures as the top priority (Battaloglu & Fassin, 2017). This replacement has had severe negative consequences for women's participation in economic and political activities, undermining women's empowerment and promoting radicalism.

Finally, the coefficients on GDP growth, private sector credit and financial development are not statistically significant, indicating that women's participation in the parliaments have not been shaped by orthodox macroeconomic fundamentals. On the contrary, women participation in the parliament has been impacted by the level of corruption, jasmine revolution and post-war states.

Table 4. Women's education and corruption effects on female representation Parliament in MENA

Variable	Coefficient
Education	0.12 (0.03)
Corruption	-0.17 (0.05)
D1	-0.03 (0.01)
D2	-0.07 (0.03)
GDPG	0.04 (0.07)
PCL	0.01 (0.05)
FD	0.02 (0.03)
R-squared	0.87
Adjusted R-squared	0.84

6. Concluding Remarks

The whole MENA region faces severe challenges and lags economic and political participation compared to the rest of world even in developing countries. However, there are huge differences among the countries in the region. Though some countries have been able to carry out major legislative reforms, others have been left behind and there is a huge gap among these countries regarding women's participation in the labor force and political presentations. We contributed to the literature by using quantitative cross-country analysis and implementing econometric models with panel data to test the hypothesis of whether education and corruption has affected women's participation in the labor force and polity. We found that corruption plays a detrimental role in women's participation both in labor force and political representation. Therefore, anti-corruption reforms should be at the forefront in the region, not only by domestic governments, but also by the international donors and governments who provide foreign aid to the MENA region. Conditionality of foreign aids to anti-corruption measures is an instrument that can help women in the MENA region to achieve greater gender equality and empowerment.

We also used a dummy variable for Post-Arab Spring to find out whether women's participation in economic and political representation has deteriorated post Arab spring. Expectedly, and in accordance with several scholars we found that Jasmine revolution has had a negative impact on women participation in the labor force and polity. In addition, we found that, while macroeconomic fundamentals do not matter for women's participation, being in a post war state has limited participating in labor force and polity.

Challenges for improving the conditions of women in the Middle East include changing legislations with emphasis on women's rights, access to free education, constitutional reforms, and more importantly, fighting against corruption as a widespread phenomenon in the region. The old patriarchal culture, male supremacy, female misperception of their image, and internalizing external barriers are among the main impediments that hold back societies from moving toward a more democratic state with equal gender rights. Thus, there is a fundamental need for cultural reforms that fights against corruption, patriarchal culture, taboos, and traditions; without such reforms, moving toward a more democratic society, which respects the empowerment of women with equal gender rights under current dynamic interconnected barriers from culture, regulations, and governments seems inaccessible, if not impossible.

Avenues for Further Research

One of the areas that this research study can be developed in the future is to expand the sample to include more countries particularly north African countries that suffer from civil wars, domestic conflicts, and enormous level of government corruption. Another area for improvement is to use more control variables to capture macroeconomic differences among countries. For instance, interest rate, trade openness, and financial integration into global economy can crystallize the cross-countries fundamental differences more significantly. Another issue that can be addressed in the future is using different econometric techniques such as Two Stage Least Squared (2SLS) and Vector Auto Regression (VAR) model to control for missing variables and misspecification.

European Funding Opportunities in Higher Education: The Role of Erasmus+ in Fostering Institutional Growth and International Cooperation in Higher Education

Elisabetta Delle Donne

Pixel Firenze, Italy

Abstract

This paper presents a comprehensive overview of the Erasmus+ Programme as a strategic funding mechanism for higher education institutions (HEIs) and other organisations operating in the field of education and training. Drawing on Pixel's extensive experience as project coordinator, the paper examines the programme's key action lines most relevant to higher education: Cooperation Partnerships (KA2) and Capacity Building projects. The paper outlines the four horizontal priorities that cut across all sectors of the programme (Inclusion and Diversity, Digital Transformation, Environmental Sustainability, and Participation and Active Citizenship) and discusses how these priorities shape the design and evaluation of project proposals. A selection of nine approved Cooperation Partnership projects and six Capacity Building projects coordinated by Pixel is presented to illustrate the range of eligible activities, partnership configurations, and deliverables that characterise successful applications. These examples span topics from computational thinking in STEM teacher education, to the integration of artificial intelligence in language learning, to the promotion of intercultural dialogue and emotional intelligence in secondary schools. The paper then provides practical guidance on the formulation of competitive project ideas, emphasising the importance of needs analysis, innovation with respect to the state of the art, consistency between objectives, activities and results, and clear identification of target groups. Special attention is devoted to the Capacity Building strand, which funds cooperation between European HEIs and partner-country institutions across regions including Sub-Saharan Africa, the Middle East, Latin America, and the Western Balkans. The paper concludes by positioning the Erasmus+ Programme not merely as a funding source, but as a driver of systemic institutional change and international networking, and by offering concrete recommendations for institutions approaching the programme for the first time.

Keywords: *Erasmus+, higher education, cooperation partnerships, capacity building, European funding, internationalisation*

1. Introduction

The Erasmus+ Programme is the European Union's flagship initiative for education, training, youth, and sport. With a budget of approximately 26.2 billion euros for the 2021–2027 programming period which nearly double that of its predecessor, it represents the most significant multilateral investment in knowledge and human capital in European history. For higher education institutions, the programme opens a wide spectrum of opportunities that extend well beyond student and staff mobility: through its cooperation and capacity building strands, Erasmus+ funds the joint development of curricula, teaching methodologies, assessment tools, training packages, and policy recommendations, in partnership with institutions across Europe and the world.

This paper aims to provide practitioners such as researchers, lecturers, academic coordinators, and institutional leaders, with a structured understanding of how the programme works, what kinds of projects it funds, and how to translate institutional priorities into competitive proposals. The analysis draws on Pixel's direct experience managing Erasmus+ projects since the earliest programme generations, and on a curated set of recently approved projects that exemplify best practice across different sectors and geographic contexts.

2. The Erasmus+ Programme: Structure and Priorities

The current Erasmus+ Programme is structured around three Key Actions. Key Action 1 (KA1) supports learning mobility for individuals. Key Action 2 (KA2), the primary focus of this paper, funds Cooperation Partnerships and Capacity Building projects. Key Action 3 supports the development of policy and cooperation at the systems level.

Across all actions and sectors, four horizontal priorities are mainstreamed: Inclusion and Diversity, Digital Transformation, Environmental Sustainability, and Participation and Active Citizenship. These priorities are not optional thematic labels: they are embedded in the evaluation criteria and applicants are expected to demonstrate how their project contributes meaningfully to at least one of them.
The programme is open to a wide range of eligible organisations: higher education institutions, schools, vocational education and training (VET) providers, adult education centres, and youth organisations. Eligible countries include the 27 EU member states, EEA countries (Iceland, Liechtenstein, Norway), and a number of candidate countries. For Capacity Building projects, partnerships extend to third "partner" countries across the globe.

3. Cooperation Partnerships in Higher Education (KA2)

Cooperation Partnerships fund transnational projects that develop, transfer, and implement innovative practices in education and training. In the higher education sector, the programme specifically encourages proposals that stimulate innovative teaching and learning practices, develop STEM/STEAM curricula, support digital and green capabilities of HEIs, and promote innovation and entrepreneurship.
Projects receive grants of up to 400,000 euros and run for two to three years. The expected deliverables are concrete and transferable: joint curricula, training packages, teaching sources, assessment tools, guidelines, toolkits, case studies, and policy recommendations. The emphasis on tangible intellectual outputs distinguishes Erasmus+ Cooperation Partnerships from more general research grants and ensures that funded activities generate resources that outlast the project itself.

3.1 Examples of Approved Cooperation Partnerships

To illustrate the breadth of eligible activities, the following projects, which are currently coordinated by Pixel, have been selected as representative examples.
The Co-Think project (https://cothink.pixel-online.org/) targets the development of future STEM teachers' skills in computational thinking. Its main outputs include a framework for computational thinking teaching, a microcredentials-based course, and a suite of lesson plans and student assignments.
The DAI project (https://dai-project.eu/) addresses the integration of artificial intelligence in the teaching of Italian as a foreign language. Deliverables include a teacher training course on AI in language education, a repository of AI-based resources featuring a personalised chatbot, and a learner corpus derived from student interactions.
The EME4EU project (https://eme4eu.pixel-online.org/) promotes English-Medium Education (EME) as a lever for university internationalisation, producing a collection of good practices, decision-maker guidelines, and a teacher training package.
The BRIDGE project (https://bridge.pixel-online.org/) centres on intercultural dialogue in higher education, delivering a digital museum on integration, micro-credential training courses, and governance guidelines for HEIs.
The POEMS project (https://poems.pixel-online.org/) focuses on emotional intelligence in secondary education, producing self-assessment tools, training materials, and a research publication.
The READY project (https://readyreading.eu/) equips primary school teachers with tools to identify and address literacy disadvantages, including game-based intervention toolkits.
These examples demonstrate that successful Cooperation Partnerships share several structural features: a clearly identified gap in practice or policy, a transnational consortium with complementary expertise, a set of outputs designed for reuse beyond the project, and a robust dissemination and sustainability strategy.

4. Capacity Building in Higher Education

The Capacity Building strand of Erasmus+ (KA2 HED) is designed to foster structural cooperation and reform in higher education in third "partner" countries. Unlike Cooperation Partnerships, which operate among Programme countries, Capacity Building projects explicitly require partnerships between HEIs in EU member states and HEIs in partner regions.
The expected impact on partner-country institutions is wide-ranging: modernising HEIs, improving the quality and accessibility of higher education, promoting innovation and better governance, increasing digital competence for students and staff, strengthening links with the private sector, aligning academic provision with labour market needs, and enhancing employability and entrepreneurship.

4.1 Examples of Approved Capacity Building Projects

Pixel's Capacity Building portfolio spans multiple partner regions. In South Africa, the ProTELDE project (https://digitalskills.uj.ac.za/) equips HEI and TVET lecturers with skills to identify, use, and create digital teaching sources for business and economics education. The AFJ project (https://entrepreneurialskills.uj.ac.za/) targets the employability and entrepreneurial skills of graduates and the pedagogical capacity of educators in business disciplines.
The Ted-SOEP project (https://www.tedsoep.org/), also based in South Africa, promotes self-directed learning methodologies and the integration of open educational resources in STEM teacher education.
In Costa Rica, the EthicalAI project (https://www.ethicalaiucr.info/) establishes a regulatory framework for the ethical use of AI in university settings and develops training resources for higher education lecturers.
In the Palestinian context, the CARE project (https://care.edu.ps/) strengthens HEIs' capacity to deliver high-quality, practice-based Early Childhood Education and Care (ECEC) training, modernising curricula in line with EU standards and promoting EU-Palestinian institutional cooperation. These examples reflect the global reach of the Capacity Building strand and its potential to generate lasting structural change in partner-country higher education systems.

5. Formulating a Competitive Project Proposal

Irrespective of action line or sector, competitive Erasmus+ proposals are built on a rigorous process of project idea formulation. Based on Pixel's experience evaluating and coordinating applications, five stages are critical.
First, applicants must conduct a thorough analysis of programme objectives and priorities, ensuring that the proposed project is demonstrably consistent with the guidelines published in the relevant Call for Proposals and the Erasmus+ Programme Guide. The European Commission's Funding and Tenders Portal (https://ec.europa.eu/info/funding-tenders/opportunities/portal/) is the authoritative reference for this stage.
Second, a state-of-the-art analysis is essential. Project proposals should demonstrate awareness of previous initiatives, lessons learnt, and existing results in the field. The Projects and Results section of the Funding and Tenders Portal provides searchable access to previously funded projects and should be consulted systematically.
Third, target groups must be identified precisely. This entails defining the profile of intended beneficiaries, conducting or citing a robust needs analysis, and articulating the motivations that make these groups receptive to the proposed intervention. Erasmus+ explicitly values the bottom-up approach: projects should be driven by the real and documented needs of practitioners and learners, not by the interests of applicant institutions alone.
Fourth, project objectives must be consistent with identified needs, realistic within the timeframe and budget, and clearly outlined in measurable terms. The logical chain from needs to objectives, activities, and results must be internally coherent and transparent.
Fifth, activities must be detailed, sequenced, and directly traceable to the stated objectives. The definition of results and deliverables must reference quantifiable indicators and be fully consistent with the planned activities and partnership resources.

6. Conclusions

The Erasmus+ Programme represents a unique opportunity for higher education institutions to access substantial European funding, develop innovative educational resources, and build durable international partnerships. Its value, however, extends beyond financial support: participation in Erasmus+ projects positions institutions as active contributors to the European Education Area and generates systemic benefits in terms of staff development, institutional visibility, and curriculum innovation.
For institutions approaching the programme for the first time, the advice is practical: begin by identifying an authentic institutional need that aligns with programme priorities, invest in a thorough state-of-the-art analysis, build a partnership with genuine complementarity across national contexts, and design outputs that will be used and sustained beyond the project duration. For experienced applicants, the challenge is to push beyond incremental improvements and propose genuinely innovative approaches that reflect the evolving priorities of the European educational landscape — including the ethical integration of artificial intelligence, the transition to sustainable educational practices, and the deepening of inclusion agendas.

Against the Robotization of Education

Martin Laba

Simon Fraser University, Canada

Abstract

The Action Network BC—an amalgam of organizations and initiatives focused on organizing, advocacy, and community engagement in British Columbia, Canada-- recently sent out a petition for signatures of educators in support of a request that the provincial government put a "pause on generative AI in BC schools". Of course, the proverbial ship has sailed in terms of AI and a "pause" is daunting, if not impossible. The petition demonstrates the compelling concern with "AI dependency in young people" and the deleteriousness of this dependency in terms of the mental health of youth. This action arises from a deep anxiety among educators and education policymakers with the rise of AI and with the dramatic shift in educational practices, policies, and culture. The transformations wrought by AI are not unprecedented. Such decisive and profound social transformations have been in abundant evidence throughout the entire history of communication technological innovation and advance, and especially in the emergence of digital technologies in educational contexts. Almost 20 years ago, Nicholas Carr asked the provocative question, "Is Google Making Us Stupid?", an article in the Atlantic that was the foundation for his book, The Shallows: What the Internet is Doing to Our Brains. (Carr, 2020) [1] Carr's concerns with the internet were focussed less on the unprecedented availability and ubiquity of a digital avalanche and velocity of information, and more with how the very communicative form of the internet molds our understandings of self and society, and the priorities and assumptions we make about the world around us. The consequences have been profound and both cognitive and cultural in nature. Following advances in neuroscientific research, Carr offers an account of a particular neuroplasticity—how the brain changes with experience; that is, how our use of communication technologies alters our neuropathways to the extent that digital or screen addiction became an issue to be reckoned with. There is of course, a long history of concern and critical engagement around digital "addiction", or the compulsive use of digital devices and an excessive amount of screen time. This history for many critical observers culminated in the March 2026 ruling that Meta and YouTube were negligent and that these platforms were purposefully developed and designed to be addictive, thereby causing harm to the mental health of youthful users. The jury rejected Mark Zuckerberg's claim that Meta does not design apps to maximize screen time. This was a "rare verdict holding Silicon Valley accountable for its role in fueling a youth mental health crisis." (Allyn, 2026) [2] Compounding the complexity to this issue is AI-dependency and the cognitive offloading it affords that results in diminishing capacities of analytical acuity, critical and independent thinking, problem-solving, and more. This paper explores the complexities and contestations, the arguments and the fears around the "robotization of education".

Keywords: *AI dependency; cognitive surrender; digital addiction*

Introduction

While "disruption" has characterized the velocity and magnitude of change in higher learning's digital age, the word is rather less than adequate descriptor for the ongoing elaboration of AI. Indeed, AI has well and truly presented higher education with an existential moment in which centuries old forms of assessment are increasingly exhausted. An idealized notion of the traditional university has certainly been resilient rooted as it is in 11th to 13th century medieval approaches to education which include the lecture as the primary transmissive model and established forms of assessment that have been highly resistant to change. Now AI demands that higher learning requires nimbleness and a commitment to a formidable project of educational revision; and such continuous revision is the norm, now and in the future.

Stephen Marche has provocatively argued that AI has signaled the death of the traditional form of the long essay, the bedrock of evaluation in the arts and humanities. (Marche, 2022) [1] Indeed, for undergraduate students, AI rather unproblematically circumnavigates the demands and conventions of the university essay by bypassing the deep dive of research engagement and the crafting of an essay built on that research. AI serves up a text on any theme with immediacy and polish (robotic as the prose

may be). Dilkes goes further by identifying the need to challenge and change the very purpose of education; that is, if we continue to emphasize the objective of passing over learning, then student use, or misuse as it were of generative AI technologies "is nothing more than a rational action by a rational agent" [Diles, 2026) [2].
This question needs to be posed because AI has re-introduced us to an undeniably academic preoccupation--academic integrity. Indeed, plagiarism and other forms of academic dishonesty have long been a cause for hand-wringing distress among every teaching professional in higher learning; and this was a problem with the introduction of Chat GPT and other platforms of generative AI. An initial and clearly persistent institutional response focussed on containment of the technology over integration of the technology, and an attempt to contain the uncontainable is inevitably a pathway to failure.
This paper addresses the currents and controversies in what I call the "robotization of education". The purpose here is not to embrace or reject AI, both unviable directions and intentions. Educators are well-aware of the range and diversity of perspectives around AI—from contestation to accommodation, from the critical to the celebratory, from opposition to acquiescence, and more—and none of these perspectives is singular or autonomous. Instead, in the complexities of AI and its evolving relationship to educational policies and frontline pedagogical philosophy and practice, education needs to resist the uncritical accommodation of ongoingly emergent AI technologies. Instead, our educational strategy and vision must be to forge capacities, qualities, resources, and assets in relation to AI that serve and not lead pedagogical invention.

Brain Melt

Almost 20 years ago, Nicholas Carr asked the compelling question, "Is Google Making Us Stupid?". This was the title of his article in the *Atlantic* that formed the foundation for his book, *The Shallows: What the Internet is Doing to our Brains*. (Carr, 2020) Carr's concerns with the internet were focussed less on the unprecedented availability of a digital avalanche and velocity of information and more with how the very communicative form of the internet molds our sense of self and society, and the priorities and assumptions we make about the world. The consequences have been profound and both cognitive and cultural in nature. Following advances in neuroscience research, Carr offers an account of a particular neuroplasticity—how the brain changes with experience; that is, how our use of communication technologies alters our neuropathways to the extent that digital or screen addiction emerged as urgent and critical malaise in contemporary and likely future society.
In recent times there has been a spate of studies that have asked key questions about how we perceive, engage with, and depend on AI. These questions focus on the urgencies and themes of AI's potential impacts, including for examples: "Is AI making us stupid" (Kosmyna et al, 2025) [4] and is AI "reshaping" and diminishing human reasoning" in the process of "cognitive surrender" (Shaw and Nave, 2026) [5]. At issue is the ultimately damaging inclination to abandon critical thinking and to outsource thinking to AI technology. While we have been cognitive offloading for a rather long time—writing to stand in for memory, calculators for computation, GPS for mapping and navigation, search engines for quick answers, and more—cognitive surrender is an entirely different process. As John Nosta contends, (Nosta, 2026) [6] LLMs go well beyond memory and navigation; rather "they can offload the formation of thought itself." He refers to the diminution of the "friction of thought", not an extension of cognition but a replacement for cognition. What this looks like in education is that the technology has "bypassed the very processes that create understanding." Dialogism, the foundational principle of education since Socrates is not even a hint in the unidirectional process of cognitive surrender as the "user" is passive and muted.
AI dependency in the educational context is particularly problematic because it short-circuits rather than strengthens cognitive activation, the "friction of thought" that is foundational to learning. Such technology offers an irresistible prospect for the student predisposed to using it. Instead of the labour-intensive cognitive struggle, students turn to the ready-to-wear solution of the instantly retrievable, fluent, and perfectly adequate AI answer.
Neil Postman once mused on what he called the Faustian bargain of technology: "technology giveth and technology taketh away". This is a useful critical strategy of course that recognizes technological advance always has a cost, and a substantial one at that. The contestations of perspectives ranges from conceptualizing AI as a means, acceleration, and advantage in scientific research and innovation, for instance; and also, as tyrannical and ethically malleable as a technology that is never merely used but in fact as one that shapes society and therefore has massive consequences in the realms of politics and culture, social norms, ethics and morality, education and intelligence. Postman argued that technology is an "ecological" force that is not simply additive but in fact alters the very bases of human perception

and the environments in which we acquire knowledge, seek and find truths, understand and sustain social relations. (Postman, 1992) [7]
Technological advance and elaboration have always been determinative in education and pedagogical practice and priorities, and the accelerated pace of technological change outpaces our abilities to assess it, let alone make policies for it. Metaphorically speaking, the ground is shifting as we stand on it and herein lies the formidable challenge for higher education. As a vast industrial robotization transforms societies around the globe, from culture to business, from industrial strategy to everyday social life, from the operations of government to the operation of domestic space, how do we conceptualize the project, the vision, and the mission of higher education? The dilemma faced is how we revise, but more comprehensively invent teaching and learning around AI that go beyond lists of prohibitions and recognize the imperative of AI literacy and ethicality among our students.

Calls for "Pause"

In March 2023, more than 1000 tech industry leaders, AI researchers, and other AI technology experts signed an open letter that was published by the *Future of Life Institute*. (FLI). (FLI,2023) [8] They called for a six-month pause on the development of AI systems. This push for a moratorium arose from compelling factors of an existential nature. In particular, the letter offered a warning of social, economic, and political disruption, even crisis as AI enabled the acceleration of misinformation and elaborated the long-established threat of automation and the replacement of humans across every sector in society (jobs and the labour force, business and finance, education, governance, to law, and countless other societal institutions).
The advocacy for slowness, or even a moratorium in AI development and application is forcefully resonant in education. In Canada, the Action Network, British Columba—an open-source platform for grassroots advocacy around progressive causes—recently disseminated a petition for signatures of educators to support and mobilize for a "pause" in AI in all provincial K-12 and post-secondary schools. (Action Network BC, 2026) [9] The petition demands that students will not use generative AI in classroom, nor use generative AI for homework. With reference to major studies in the fields of education and psychology, the petition details the "harms" of AI use in schools including harms to learning, relationships and emotional development, and mental health.
This campaign is linked to a global organization, the influential PauseAI which engages in action to oppose the unrestrained adoption of AI, and is a nexus for websites, documentaries, research papers, and many other resources that are critical of AI's accelerated insinuation into and restructuring of societal systems and institutions. PauseAI is part of an expanding and organized intervention that defines the risks and threats posed by AI. Such threats include misinformation, polarization and the threat to democracy; deepfakes and scams; automated biases and discrimination; joblessness and social and economic inequities; isolation, digital addiction and mental health; surveillance and loss of privacy; environmental burden and harm of data centres; and more.
The cause for pause is persuasive and impelling, and calls to action are irrefutably evidence-based and philosophically sound and driven by ethical and moral motivations. The train of AI however, has left the station, to apply a common idiom; but the contestations over AI are motivated by a concern that this does not become a runaway train.

The Robots Are Coming for Our Jobs

The idea of the robotization of society identifies a radical and decisive transformation from industrial automation (itself a profound epochal social transformation) to the broad integration of robotics into society. The ethical risks of robotization are legion in number and clearly are the source of a deep and pervasive anxiety. As our daily interactions with institutions of government, business, education, medicine, law, entertainment, and much more are increasingly interactions with trained bots, the more pointed and vigorous the debates around AI have become.
For our students, even as they use AI as an extraordinarily resourceful academic servant, the complexity of AI compounds an already fraught and contingent world. This is a world beset with rancor; a world in which the young see their futures predetermined, even foreclosed in the incendiary state of the globe; a world in which technological advance creates waves of anxiety; a world in which the financial futures of the young look like a cul-de-sac as AI is transformative and foundational in defining these futures.
As widely reported, during graduation week in the US, "the emissaries of the nation's elite" (Heilweil, 2026) [11] made their appearances as invited commencement speakers at graduation ceremonies on campuses across the country. As Heilweil notes, "The problem this year, however, is that the news of

the day is artificial intelligence, and students just don't want to hear it." It probably wasn't the kind of viral attention she thought she might receive, but on May 8 Gloria Caulfield, a real estate executive and commencement speaker at the University of Central Florida was resoundingly booed by students as she offered a celebratory and effusively optimistic declaration of the beneficence of AI and its importance as the "next industrial revolution". In a similar vein, in May, Nashville-based Big Machine Records CEO Scott Borchetta (famous as the "discoverer" of Taylor Swift) gave a commencement speech to graduates at Middle Tennessee State University and was booed as he spoke glowingly of AI with a particular emphasis on the fact that AI was "rewriting production" at that very moment. In response he exhorted the students to "deal with it". And former Google CEO Eric Schmidt was booed by students at the University of Arizona's Graduation ceremonies at the mention of AI's impact on jobs and the future of graduates who need to adapt to a technology that will "shape the world." The question he asked is whether the students will "shape artificial intelligence". His question was not well-received, but he did utter a truth when he noted, "There is a fear in your generation".

It is noteworthy that co-founder of Apple, Steve Wosniak was cheered in his commencement address at Grand Valley State University in Michigan when he assured his audience, "You all have AI—actual intelligence." He assiduously avoided the inflated rhetoric of triumphalism that characterizes most of the discourse around AI as he encouraged students to use their innate creativity and curiosity, an emphasis on human traits, on creation over copying, on submitting to algorithms to define their lives and ultimate careers.

If the AI bots are coming, the members of Gen Z appear to not be joining the pep rally unreservedly. Amongst youth, there is prevailing skepticism around AI's effects and outcomes and anxiety about AI's negative impacts, especially automation and diminishing job prospects. The disgruntled students were understandably unreceptive to AI boosterism. Some AI proponents admonished students to get on board with a vision of a future defined, driven, and dominated by AI and automation when what those students **are feeling is unsettlement, anxiety, and anger.**

Conclusion: A Seismically Shifting Ground

Undeniably, young minds are fearful of and challenged by a future of AI ubiquity and its determinative power. Numerous studies and critical analyses have established this unsettled relationship between AI and the young (Brynjolfsson, et al., 2025) [12]; Williams, 2026[13]; Sonnenfeld, et al., 2026) [14]; Gallup, Walton Family Foundation, GSV, 2026) [15]. Gen Z, the predominant demographic population in terms of entering the workforce in the next decade, is characterized in the 2026 Gallop, Walton Family foundation study as "navigating a complex relationship with artificial intelligence (AI) that is marked by plateauing use, declining optimism and growing concern about its impact." A 2025 Harvard poll similarly pointed to "uncertainty about the future of work" among young adults who see "fewer opportunities, greater threats to job security, and diminished meaning in their careers." Indeed, the poll results indicated that by more than a 3:1 ratio, young adults believe that AI will reduce opportunities. (Institute of Politics, Harvard Kennedy School, 2025).[16]

Youth increasingly see their futures as predetermined dead ends. Our students are deeply anxious about AI-driven futures, automated societies, massive technical and economic shifts, joblessness and labour redistribution, social isolation, the erosion of creativity, the devaluation of educational degrees, the inability to think critically—all concomitant fears of increasing robotization. This prevailing state of uncertainty around AI needs to be addressed with a critical understanding of the complex milieu of digital life and culture, a milieu of digital distraction and compulsion compounded by a perpetually emerging AI. Inspired by Samuel Beckett, Paul Abela sees Gen Z as the "Godot" generation—a generation born of 21st century technology, a generation "fated to live in a perpetual state of waiting, eagerly anticipating a sound or vibration signalling the next fleeting message to be read quickly and as quickly forgotten." (Abela,2026) [17] Attention spans are shallow and evanescent and everyday life is one of perpetual distraction and boredom punctuated by alerts.

All true perhaps, but while this digital addiction is now inextricably connected to emergent AI, there is a restlessness afoot amongst our young students that is expressed in the echoes of boos—a robust protest against AI and the erosion of critical engagement, creativity, and original and independent thinking, or even thinking itself in the process of cognitive surrender. Paradoxically of course, these same students heavily use AI and the professoriate is clambering over a seismically shifting ground to try and save critical thinking.

That our students will be expected to be AI-fluent in the career fields they pursue is not debatable. How they learn to develop such fluency and apply AI strategically and productively, critically and ethically is the challenge of enormous consequence for higher learning, its institutions, policies and pedagogies.

Artificial intelligence policies are being crafted and published at an accelerated pace. [see UC Berkeley Law, 2026 for one of the most thorough and finely detailed policies)[18] Besides the inevitable litany of rules and prohibitions, such policies must proceed from a statement on educational philosophy, ethics and obligations for students, instructors, and administration, and the urgent need for the development of independent and critical cognitive skills which must come first in the practices, quality, and above all, the ethicality of AI.

A Six-Actor Managerial Framework for School Governance and Institutional Quality: Evidence from Field Research

Ioan Marius Câmpean

Lucian Blaga University of Sibiu, Romania

Abstract

This article develops a six-actor managerial framework to examine school governance and institutional quality, drawing on field data collected during doctoral research. The decision to keep six groups in the same analytical frame is deliberate. Principals, teachers, auxiliary and non-teaching staff, students, parents, and community actors often appear in separate institutional conversations, even though they interact with the same school from different positions. Here, governance is not reduced to leadership, regulation, or compliance. It is read through the lens of how participation, communication, transparency, accountability, collaboration, and trust are perceived by those groups. The empirical material comprises 901 valid responses collected through six actor-specific questionnaires. Overall, the responses are favorable but not flat. Communication is strong, especially for parents and community actors, while students and teachers point more clearly to tensions around influence, fairness, psychological safety, and centralized decisions. The framework is proposed as a practical reading tool for school leaders: it shows where arrangements work, where they remain mainly procedural, and where improvement should start.

Keywords: *school governance; six-actor model; institutional quality; field research; educational management; stakeholder participation*

1. Introduction

School governance is no longer only an administrative matter. For school managers, it has become a daily practical issue because schools must respond immediately to policy requirements, community expectations, internal quality assurance, and the ordinary pressures of institutional life [1], [2]. In this setting, governance is shaped not only by the management team or by formal bodies, but also by the circulation of information, the way decisions are explained, the seriousness of consultation, and the degree to which different actors understand their place in the school.

The problem can be stated plainly. A procedure may exist and still have little perceived force. A council may meet, a consultation may be announced, or a communication channel may be available, while some actors still feel that decisions have been made elsewhere. This is why the article keeps a distinction between formal governance arrangements and the lived experience of those arrangements.

The study uses a six-actor lens: principals, teachers, auxiliary and non-teaching staff, students, parents, and community actors. These groups do not have the same authority, and they do not encounter the school from the same position. That asymmetry is precisely why their perceptions are useful. Each group can reveal a different part of the institutional picture. The framework then connects these perceptions to institutional quality and identifies areas where leadership may need to explain, adjust, or redesign existing routines. The six-actor logic is summarized in Fig. 1.

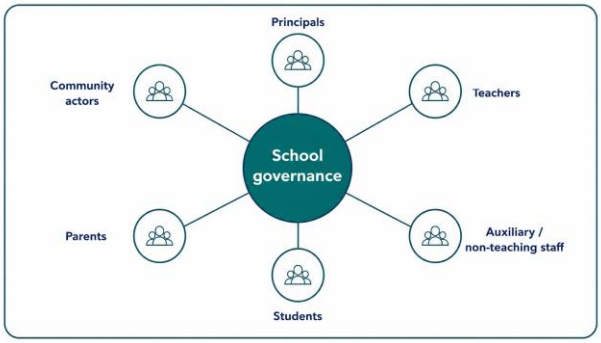

Fig. 1. Six-actor managerial framework for school governance and institutional quality

For this reason, the paper reads stakeholder perceptions as evidence that needs interpretation, not as isolated comments. Once the answers are collected in the same matrix and compared across groups, they become early warnings. They indicate where participation is felt as real, where communication already works, and where formal mechanisms have not yet produced a shared sense of influence, fairness, or trust.

2. Theoretical Background

One way to approach school governance is to focus on leadership, administrative coordination, and compliance with formal regulations [3]. This view is necessary, especially in systems where schools operate under detailed rules. It is not, however, sufficient. Schools are also social, professional, and community institutions. Decisions made inside them are interpreted, negotiated, applied, or resisted by several categories of actors [1], [4], [5].

A stakeholder-oriented reading widens the frame. Principals set direction and coordinate institutional priorities. Teachers carry policy and school decisions into classroom practice. Auxiliary and non-teaching staff maintain the daily operational conditions of schooling. Students experience the consequences of decisions directly, often before adults notice the effects. Parents bring expectations, feedback, and legitimacy from the family environment. Community actors connect the school to wider social and institutional networks. Looking at only one group would therefore leave part of the governance field outside the picture.

Institutional quality also means more than academic results or administrative compliance [2], [6]. It includes the quality of communication, the credibility of participation, collaboration, transparency, fairness, trust, and organizational culture. The distinction between formal and lived governance is useful here. Formal governance refers to written rules, structures, and procedures. Lived governance refers to what these arrangements become in practice: how they are understood, used, questioned, or trusted by those who meet them in everyday school life [7].

3. Research Design and Methodology

The empirical part of the research is based on a descriptive-interpretative quantitative design. Six questionnaires were used, each adapted to the institutional position of one actor group [8], [9]. The study did not aim to test a causal model. Its purpose was more modest and, for school management, more practical: to describe how key groups perceive governance-related dimensions and to identify differences that may guide managerial interpretation.

The instruments were developed around a common governance matrix. Even so, the wording was adjusted for each respondent category. A student, a teacher, a parent, and a community partner do not meet school governance from the same place. The main dimensions included participation and voice; leadership and decision-making; communication and transparency; institutional climate and trust; collaboration; inclusion; digitalization; and institutional support.

The questionnaires used five-point Likert-type scales. Since these data express ordered perceptions, the analysis relies on descriptive and comparative indicators, not on claims of objective measurement [10], [11], [12]. Negatively formulated items, including those referring to centralization, formal consultation, fear of contesting decisions, favoritism, or bureaucratic obstacles, were examined separately. When they entered synthetic scores, they were reverse-coded using the formula: adjusted score = 6 - raw score.

The final dataset includes 901 valid responses. It is not presented as nationally representative. Its value lies elsewhere: it allows the same school governance field to be read through several categories of experience, so that convergences and tensions become visible simultaneously.

Table 1. Respondent structure

Actor group	Number of responses
Students	282
Teachers	144
Parents	338
Principals	34
Auxiliary/non-teaching staff	71
Community actors	32
Total	901

4. Results

The respondent structure allows the governance field to be viewed from several institutional angles. Parents and students form the largest groups in the dataset. Principals and community actors are smaller groups, so their results must be read with more caution. Their presence is still important: governance is not experienced only by the most numerous actors. It is also experienced by actors who hold strategic or boundary positions in the school ecosystem.
The adjusted scores indicate a generally favorable view of school governance. Parents record the highest overall score (4.24). Teachers and principals have the same score (4.11), followed by auxiliary/non-teaching staff (4.09), community actors (4.07), and students (3.92). The students' score is still above the scale midpoint; however, it is the most reserved among the six groups and therefore warrants attention.

Table 2. Overall adjusted descriptive scores by actor group

Actor group	Overall adjusted score
Parents	4.24
Teachers	4.11
Principals	4.11
Auxiliary/non-teaching staff	4.09
Community actors	4.07
Students	3.92

4.1 Communication as a Strong Governance Dimension

Communication is one of the clearest strengths in the dataset. Parents describe communication channels as accessible and consider information about school rules generally clear. Community actors also evaluate communication with the partner institution positively, especially regarding available channels and the willingness to maintain collaboration.
At the classroom level, teachers and students both report favorable communication. Teachers mention encouraging questions and giving feedback, while students acknowledge classroom dialogue. This is a significant result, but it should not be overread. Communication shows that information and interaction are present; it does not, by itself, prove that stakeholders have influence over institutional decisions.

4.2 Formal Participation and Perceived Influence

The results also show a recurring distance between formal participation and perceived influence. Student councils, parent councils, administrative boards, and other representative mechanisms are visible in the institutional landscape. Their presence, however, does not always convince stakeholders that their contribution changes decisions.
Students provide the clearest signal. They value classroom dialogue and believe that students should be consulted when important school decisions are made. At the same time, weaker scores appear on items referring to actual influence, especially when decisions seem to be taken before consultation or when influence appears unequally distributed. Parents show a related pattern: communication with the school is strong, but consultation can still feel procedural rather than consequential.

4.3 Institutional Climate, Trust, and Psychological Safety

The institutional climate is assessed positively overall, but the picture is not without sensitive areas. Students usually report respectful relations with teachers. Auxiliary and non-teaching staff also report respect from students, parents, and teachers. Lower adjusted scores appear when the questions move from everyday politeness to impartiality, the possibility of contesting rules, and confidence that problems can be reported safely.
This distinction matters for governance analysis. Climate is not only about friendliness or polite interaction. It also includes psychological safety, the perception that rules are applied fairly, and the belief that disagreement can be expressed without negative consequences. These are the points where formal procedures must be connected to lived trust.

5. Discussion

The results support a multi-actor reading of school governance. Principals and teachers remain central, but they do not exhaust the whole institutional reality of the school. Students, parents, auxiliary/non-teaching staff, and community actors bring into view issues that a leadership-centered analysis could easily miss.

The first discussion point concerns formal and lived governance. The formal structures of participation are present and recognized, but their perceived force differs. Some stakeholders know representation exists, but still do not experience it as a genuine route to influence. For institutional quality, that difference is not marginal. A school does not improve simply by having structures on paper. It improves when those structures are understood, trusted, and connected to visible responses [1], [7].

The second point concerns communication. The data suggest that a school may communicate relatively well and still leave some stakeholders uncertain about influence. This is not a contradiction. Communication often carries information from the institution to the stakeholder. Participation requires one more step: the institution must show what happened after stakeholder input was received. For this reason, transparency needs feedback loops and evidence that consultation has consequences [1], [2].

The third point concerns teacher agency. Teachers report strong dialogic practices in classrooms, which suggests that participatory routines may be more visible in pedagogical interaction than in institutional decision-making [13], [14]. The fourth point concerns fairness and psychological safety. Lower scores on fear of contesting decisions, preferential treatment, and reluctance to report problems indicate that governance quality is tied to trust, not only to compliance [6].

6. Managerial Implications

The first implication is to move from formal participation to participation that leaves a trace. Councils, committees, and consultation moments should not only exist. Stakeholders should be able to see what happened to their proposals: whether they were discussed, accepted, revised, postponed, or rejected. Without this visible return, consultation can easily be read as a ritual rather than as a route to influence.

A second implication follows from the strong communication results. Because communication is already a relative strength, schools can use it as a base for deeper participation. Communication channels can become feedback channels, and information meetings can be linked to structured consultation. In practical terms, this may mean short reporting notes after consultations, accessible decision summaries, and recurring opportunities for actor-specific feedback.

Student voice requires particular attention. The data show that students experience classroom dialogue more positively than institutional influence. A practical response would be to strengthen student feedback forums, make student councils more visible, and consult students on decisions that directly affect their school experience [15].

Teacher participation also requires attention. Teachers should be treated not only as implementers of decisions, but as institutional contributors. Auxiliary and non-teaching staff should be included more clearly in consultation and resource-related discussions. Finally, school-community collaboration should be organized through stable communication channels, clear agreements, and realistic expectations, so that the partnership does not remain dependent on informal goodwill [1], [16].

7. Main Contribution of the Study

The main contribution of the article is the empirical grounding of a six-actor managerial framework for school governance and institutional quality. The model brings together principals, teachers, auxiliary/non-teaching staff, students, parents, and community actors within the same analytical frame.

The study contributes in three ways. Conceptually, it separates the existence of governance structures from the influence that stakeholders actually perceive. Empirically, it uses 901 responses collected from six actor groups. Managerially, it treats differences in perception as useful diagnostic signs, not as minor variations in opinion.

For school leaders, the framework offers a compact instrument of institutional reflection. It helps identify who perceives what, where formal procedures do not become meaningful participation, and which areas require intervention in communication, consultation, fairness, psychological safety, inclusion, or collaboration.

8. Conclusions

This article examined school governance and institutional quality through a six-actor managerial framework grounded in field research. The results are generally favorable, but they also show that governance is not experienced in the same way by all groups. Communication, classroom dialogue, and willingness to collaborate are stronger dimensions. The more vulnerable areas concern perceived influence, the distance between formal consultation and real participation, psychological safety, fairness, and transparency of resources.

The practical conclusion is straightforward: institutional quality does not depend only on adopting governance structures. It also depends on whether those structures are understood, experienced as meaningful, and linked to feedback and collaboration routines. Stakeholder perceptions can therefore work as an early diagnostic instrument. Differences between actor groups are not just statistical details; they can point to places where explanation, dialogue, or redesign is needed.

Although the empirical data are context-specific, the proposed framework may be relevant to European education systems concerned with stakeholder participation, institutional quality, and school-level governance.

The study has limitations. It relies on self-reported perceptions and should not be read as an objective measurement of governance quality. The sample is contextual and unevenly distributed, and smaller groups such as principals and community actors require cautious interpretation. Future research should combine questionnaires with interviews, focus groups, document analysis, and longitudinal validation in different school contexts.

ChatGPT's Performance and the Use of Argumentative Structures in Romanian Educational Contexts

Roxana Rogobete[1], Ana-Maria Radu-Pop[1]

[1]West University of Timisoara, Romania

Abstract

This study examines the performance of ChatGPT in generating argumentative essays for various levels of Romanian education, assessing its adherence to required argumentative structures and evaluation criteria. The research involves three sets of real-life writing tasks: the 8th-grade national assessment, the 12th-grade baccalaureate, and the Titularizare and Definitivat exams for teachers (Tenure Exam for Teachers, Final Teaching Qualification Exam). These tasks are processed by ChatGPT, and the resulting essays are analyzed in collaboration with MA students specializing in curriculum development for Romanian language and literature. By applying corpus linguistics methods, this study seeks to analyze the frequency, variation, and function of lexical bundles in ChatGPT-generated essays for Romanian exams. The aim is to determine whether AI writing displays the same level of syntactic and semantic variation as human writing or whether it follows predictable, repetitive structures, reinforcing concerns about its formulaic nature [1]. Additionally, the research focuses on the coherence and cohesion of AI-generated arguments, and the degree of conformity to the structural and stylistic expectations outlined in national evaluation standards. The findings of this study will provide insights into both the pedagogical implications of AI-assisted writing [2,3] and potential challenges in assessing AI-generated texts within standardized educational frameworks. By comparing AI outputs with human-graded essays, the research will contribute to the ongoing debate on the role of artificial intelligence in language education, assessment, and the development of argumentative competence in Romanian academic contexts.

Keywords: *AI-generated writing; AI-assisted writing; argumentative structures; writing evaluation; Romanian national evaluation standards*

1. Introduction: Use of AI in Educational Contexts (Writing Tasks)

In recent years, large language models (LLMs), such as Open AI's ChatGPT, Google's Bard, Meta's LLaMA, and Anthropic's Claude, have rapidly entered educational settings. These LLMs are all based on advanced transformer architectures and have raised both enthusiasm and concerns about their ability to support student writing and academic expression [4, 5], as well as the ethical implications of their use. Much of the existing research focuses on diverse global contexts. However, the Romanian educational system remains relatively conservative, emphasizing traditional pedagogical methods and strict compliance to formal academic standards. In this system, the ability to construct coherent, well-structured argumentative texts is considered a core competency essential not only in high school but also in university education. Argumentative writing is a core component of national evaluations and high-stakes examinations, particularly at the end of secondary and upper secondary cycles. These tasks typically require the structured articulation of a thesis, the development of coherent arguments supported by relevant examples, and clear conclusions. These criteria are explicitly outlined in the national curriculum and assessment rubrics.

This research explores the intersection of digital pedagogy, AI-assisted writing, and assessment literacy by analyzing how ChatGPT aligns with – or deviates from – these expectations. Previous research has shown that although AI-generated texts can exhibit high surface-level fluency, they often struggle with deeper discursive functions, such as argumentation, critical engagement, and contextual adaptation [6]. In the Romanian context, where evaluation criteria emphasize logical consistency, relevance, and clarity of argumentative progression, it is essential for educators, curriculum designers, and policymakers to understand the capabilities and limitations of such tools. This is particularly important since argumentative writing skills are evaluated through Baccalaureate exams, as well as key professional certification and recruitment tests, such as the Definitivat and Titularizare exams. These exams serve as gateways for teachers to enter the educational system.

This study uses a qualitative, rubric-based analysis of ChatGPT-generated essays aligned with Romanian school, Baccalaureate, and teacher certification standards to investigate the structural integrity of the outputs and the discursive strategies employed. Additionally, the study reflects on the implications of integrating LLMs into writing instruction, particularly in contexts where argumentative competence is closely tied to exam performance and broader educational outcomes.

Despite the growing international interest in corpus-assisted writing analysis and AI-based textual evaluation, Romania lacks a dedicated corpus of pre-university student writing, especially argumentative texts. Romanian corpus linguistics is underdeveloped in key educational areas and there is limited infrastructure for systematically analyzing student writing below the university level. While efforts such as the ROGER platform, the Corpus of Romanian Academic Genres, represent significant steps toward supporting undergraduate academic writing [7], no comparable learner corpus is currently available for secondary or high school writing. This absence hinders the empirical evaluation of how students perform in relation to national argumentative standards. Thus, this study examines ChatGPT's outputs and highlights the need for a corpus tailored to pre-university genres. Such a corpus would provide a more data-driven foundation for pedagogy and assessment.

In addition to the lack of a dedicated corpus for high school writing, recent research on university-level student writing reveals substantial discrepancies in writing pedagogy and student performance across educational transitions. In a larger research group, we conducted several corpus-based contrastive studies. One study examined how well-prepared Romanian high school students are for academic writing in higher education [8]. This study revealed notable discrepancies between the writing practices promoted in secondary education, which are often reproductive, prescriptive, and exam-oriented, and the expectations of university-level writing. University-level writing requires analytical, discipline-specific, and rhetorically competent production. Similarly, Crașovan and Rogobete [9] analyzed literary text analysis essays produced by third-year undergraduate students. They compared exam-based writing with texts written in a blended/online format and found that corpus tools can reveal structural, lexical, and discursive tendencies often overlooked in traditional assessment. These studies support the idea that there is an imperative need for enhanced pedagogical strategies and empirical resources that reflect the realities of student writing at multiple educational stages. In this context, evaluating how ChatGPT mimics or diverges from real student output can offer insight into its potential as a writing assistant.

2. Study Design and Research Steps

For this study, a group of MA students specializing in curriculum development for Romanian language and literature was divided into three teams, each focusing on a different level of Romanian educational assessment: the National Evaluation (8th grade), the Baccalaureate Exam (12th grade), and the Definitivat and Titularizare teacher certification exams *(Tenure Exam for Teachers, Final Teaching Qualification Exam)*. Each team was tasked with systematically gathering data from the past decade (approximately 2014–2025) and targeting all official exam items requiring argumentative or discursive essays. The students collected these materials from official educational platforms and archives, then compiled the essay prompts into a structured Excel database.

In the second phase, the teams identified and curated a set of human-written responses corresponding to the selected prompts. These sample essays were sourced from various publicly available materials, including educational anthologies and exercise books published before the advent of GenAI, older forum posts, personal collections, and texts shared among peers. This ensured that the samples represented authentic pre-AI writing practices reflective of real student performance across multiple years.

Next, the same prompts were entered into ChatGPT, and the model was instructed to generate responses mirroring the exam format. The AI-generated essays were then compared with the human-written to evaluate structural fidelity, argumentative coherence, lexical complexity, and alignment with national evaluative criteria.

After the data collection and generation phases, the task supervisors (tutors) manually processed the essay samples. Their goal was to synthesize a third category of responses: hybrid texts integrating elements from the human- and AI-generated versions. They created these mixed essays by carefully selecting and combining structurally relevant and stylistically coherent segments from each version. This ensured that the hybrid texts preserved argumentative integrity while reflecting realistic language use.

The triadic dataset, comprising original human-written responses, ChatGPT-generated essays, and manually curated hybrid texts, was then submitted to a new group of student participants (Group 1). This group consisted of prospective teachers who were not involved in the initial data collection or synthesis process. The students received the official national evaluation rubric corresponding to their exam level and were asked to assess all three versions of each essay simultaneously.

To ensure impartiality and eliminate bias, the participants were not informed about the origin of each text. All responses were anonymized and randomized so the raters could not identify whether they were assessing a human-, AI-, or hybrid-written text. This blind evaluation setup permitted a more objective analysis of how ChatGPT's writing is perceived compared to authentic student work, as well as how a human-AI collaboration model could affect assessment outcomes in Romanian educational contexts.
The evaluation results revealed a clear pattern across the three assessment categories. Specifically, ChatGPT-generated essays received lower scores than human-written essays at two out of three exam levels. Conversely, purely human-produced texts were consistently rated higher in these two categories, reflecting stronger adherence to the argumentative structures and evaluative criteria of the national rubric.
These results suggest that, while ChatGPT can generate coherent and contextually relevant essays, it may lack depth of argumentation, contextual appropriateness, and rhetorical sophistication. These results also underscore evaluators' ability to distinguish between human and AI writing in terms of meeting established academic standards in the Romanian educational context.
Interestingly, the third exam level showed a smaller scoring difference between human and ChatGPT essays, suggesting a potential convergence in performance or variation in evaluative stringency. These findings highlight the challenges of integrating AI-generated text into formal educational assessment frameworks and suggest areas for pedagogical intervention and AI model refinement to more effectively support the development of academic writing skills.
AI capabilities to enhance argumentative clarity, language sophistication, and overall coherence.
After a thorough evaluation, which will be analyzed later in this study, the same focus group was given an additional assignment. They had to use ChatGPT to create an improved version of each of the purely human-written essays. The students were provided guidance on how to effectively tailor their prompts to maximize the quality of the model's output. Through this iterative process, they created a fourth version of each essay, combining human insight and AI capabilities to enhance argumentative clarity, language sophistication, and overall coherence.
A second focus group was convened one week later to independently assess a new set of essay samples using the same evaluation rubric and anonymized procedure. This group, composed of prospective teachers who had not participated in previous project phases, was tasked with evaluating three versions of each essay prompt: (1) the original ChatGPT-generated version, (2) the original human-written version, and (3) the enhanced version created by the first focus group through a human-AI collaborative process.
As in the initial evaluation round, all essays were anonymized and randomized to ensure a blind assessment process and minimize bias. The evaluators scored each version based on adherence to the rubric, its coherence, its language use, and the presence of critical thinking, while also providing qualitative observations. The goal of this second round was to test the consistency of evaluations across different rater groups and measure whether the collaboratively improved version (Version 3) showed measurable gains in quality and performance compared to the original outputs. Triangulating these evaluations allowed for a more robust analysis of AI capabilities and the pedagogical potential of guided human-AI revision workflows in Romanian argumentative writing contexts.
In this evaluation round, a consistent pattern emerged. The enhanced versions (Version 3), which were developed through human-AI collaboration by the first focus group, received the highest scores across all prompts. This was compared to purely human-written essays and ChatGPT-generated essays. These results suggest that guided integration of AI-generated suggestions, mediated by human evaluators with pedagogical training, improves argumentative clarity, structural coherence, and linguistic refinement. These results reinforce the potential of AI tools as instruments for targeted, tutor-led enhancement of student writing, rather than as standalone writing agents.

3. Student Evaluation of ChatGPT's Academic Writing Performance

Prior to participating in this study, students had varying degrees of experience with generative AI tools, particularly ChatGPT. According to a preliminary questionnaire, 55.6% of participants reported using ChatGPT to some extent; 33.3% reported minimal prior use; and 11.1% stated that they used it extensively in academic or related contexts.

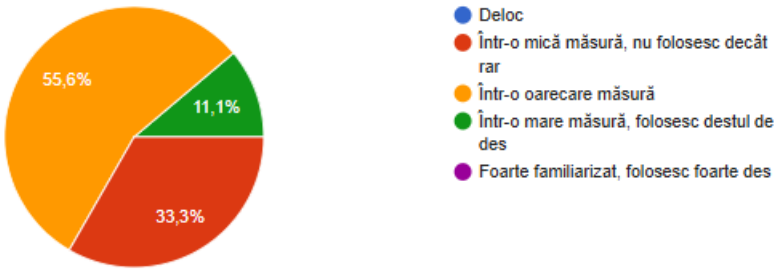

Fig. 1. Students' prior experience with ChatGPT

Reported use cases ranged from basic lexical tasks, such as synonym searches and text reformulation, to grammar checks and obtaining contextual information on literary texts. Some students used ChatGPT to summarize lengthy texts they did not have time to read or to help organize content, finding it useful within limited, well-defined parameters. However, others expressed strong skepticism, citing instances in which the model produced inaccurate corrections, contradictory grammatical explanations, or fabricated bibliographic sources.

The students' prior engagement levels directly influenced their approach to the research tasks in this project. Those with limited experience were more curious, yet more cautious, when evaluating AI-generated content, especially during the blind assessment phase. Conversely, students who regularly used ChatGPT were more confident in crafting prompts and guiding the tool during the enhancement phase. During this phase, they improved human-written essays with AI assistance. This range of prior familiarity underscores the importance of integrating AI literacy into writing pedagogy. Such an integration would enhance students' technical interaction with tools like ChatGPT and foster their critical awareness of the tool's limitations and potential in academic contexts.

At the end of the study, participants evaluated ChatGPT's effectiveness based on a series of criteria relevant to academic writing. Their responses, collected on a 5-point Likert scale, revealed a nuanced perception of the tool's capabilities and limitations.

Table 1. Evaluation - 5-point Likert scale

• ChatGPT responded effectively to the specific requirements of the academic writing tasks.
• ChatGPT helped me save time and effort in the writing process.
• Using ChatGPT contributed to the development of ideas in writing.
• The suggestions received through ChatGPT improved the overall quality of the texts.
• The suggestions received through ChatGPT improved the overall content of the texts.
• The suggestions received through ChatGPT improved the overall coherence of the texts.
• The suggestions received through ChatGPT improved the text structure.
• The suggestions received through ChatGPT improved the clarity of the texts.
• The suggestions received through ChatGPT created a more elaborate expression.
• I noticed an improvement in Romanian expression following the use of ChatGPT.
• Overall, the text "improved" with ChatGPT would receive a higher score in evaluation.
• I noticed a more elevated language style in texts following the use of ChatGPT.
• ChatGPT aligns well with the indicators in the rubric.

The student evaluators focused their analysis on several key dimensions aligned with the national assessment rubric. First, they examined the extent to which each essay met the rubric's specific criteria and whether all required points were adequately addressed. Second, they evaluated the essay's coherence at both the argumentative and discursive levels. They considered the text's structural and formal organization, as well as the depth and clarity of its ideas. Third, they assessed the language used, considering whether the text exhibited clichéd or automatic expressions and predictable, repetitive structures, or more elaborate, academic, and original phrasing.

Additionally, the evaluators assessed whether the author demonstrated critical thinking skills, an essential component of argumentative writing. Finally, they reflected on the rubric itself, questioning its ability to balance content and form and reward all components of good writing, particularly critical thought and argumentative skills.

Students generally found ChatGPT's interface to be intuitive and easy to use, giving it an average score of 4.11. This suggests that user-friendliness is one of the tool's strengths. However, the average rating

was more reserved at 3 out of 5 when asked whether ChatGPT effectively responded to the specific requirements of academic writing tasks, suggesting moderate satisfaction with its relevance to and adaptability to these tasks.
While some students acknowledged the time-saving benefits of ChatGPT (mean score: 3.11), most did not report increased confidence in their academic writing, as reflected by an average score of 2.11. Similarly, students' perceptions of ChatGPT's contributions to idea development, text quality improvement, content enhancement, and coherence were modest (mean scores of 2.66, 2.66, 2.44, and 2.55, respectively). These results suggest that students viewed the tool more as a drafting aid than a transformative writing assistant.
Several concerns also emerged. Students expressed skepticism about ChatGPT's alignment with national assessment rubrics (mean score: 2.77) and noted that its suggestions often failed to meet rubric expectations (mean score: 4.22). Additionally, students felt that ChatGPT might reduce original expression (mean: 4.44), raising concerns about academic integrity and stylistic authenticity. Students rated the tool's capacity to improve Romanian writing low (2.0) and doubted that a ChatGPT-enhanced text could outperform a human-written text in formal evaluations (2.0).
Students reported difficulty distinguishing between accurate and inaccurate suggestions provided by the model (mean: 3.22), underscoring the need for critical digital literacy when using generative AI in writing contexts. Furthermore, students rejected the idea that ChatGPT reduces the need for traditional academic resources, such as courses, books, or scholarly articles. This reinforces the perception that AI should complement, not replace, formal instruction.
Despite these reservations, students largely supported including ethical AI use in educational curricula, giving average ratings of 4.0 and 3.77 for university and high school, respectively. However, only 23.3% of respondents would recommend ChatGPT to improve academic writing skills, and an even smaller percentage believed it could "compete" with human candidates taking the Romanian language exam (17.7%).
These results highlight a central paradox in the pedagogical use of generative AI: while students appreciate tools like ChatGPT for their accessibility and drafting potential, they remain cautious about their educational value, accuracy, and alignment with institutional standards. The findings suggest that future implementations should include explicit instruction on prompt engineering, rubric-based revisions, and ethical use in order to foster informed and critical engagement with AI technologies in the development of academic writing.

3.1 Student Reflections on Effective Prompting Strategies for ChatGPT

When asked to reflect on the most effective prompting strategies in their interactions with ChatGPT, students shared insights from both positive and negative experiences. Several participants found that using a "persona-based" approach – instructing ChatGPT to write from the perspective of an exam evaluator, for example – resulted in more coherent and structured responses. In contrast, those who experimented with evaluator and candidate personas were disappointed by inconsistent or irrelevant outputs, despite providing full prompts and rubrics.
Students recommended formulating clear, specific instructions, especially those emphasizing the use of natural, human-like language. One student pointed out that ChatGPT performs better when asked to maintain a consistent discourse style throughout the response. They also warned against combining too many prompt directions within a single thread. Maintaining prompt continuity across separate chats was considered a beneficial strategy to avoid confusion in task execution.
A user's familiarity with ChatGPT significantly influences how effectively the tool is used and the quality of its results. Students who understand how to craft precise, context-aware prompts tend to receive more relevant, nuanced, and stylistically appropriate outputs. In this sense, AI performance reflects not only its capabilities but also the user's skill in guiding it, demonstrating that stronger students often produce stronger results simply because they know how to ask better questions.
Some students suggested that ChatGPT's strengths lie in providing micro-level assistance, such as generating synonyms, rhymes, or reformulations, rather than producing complete academic essays. However, others noted that the model can produce discipline-specific technical language, which can be useful for achieving a scholarly tone.
Overall, students emphasized the importance of providing detailed instructions for a task, guiding the model through the structure of a response rather than relying on it to generate a solution independently. One participant articulated this distinction, noting that ChatGPT is more effective when asked to suggest ways to solve a task than when asked to provide a final answer. This reflects students' growing

awareness that AI should be used as a process facilitator rather than a product generator, which reinforces the pedagogical shift toward collaborative human-AI writing practices.

3.2 Limitations in ChatGPT's Output and the Need for Prompt Reformulation

When asked to identify types of prompts or aspects of tasks to which ChatGPT responded inadequately or failed to meet expectations, students highlighted several recurring challenges requiring prompt reformulation, clarification, or multiple iterations. One of the most frequently mentioned issues was textual coherence and logical idea sequencing. Students noted that ChatGPT often used bullet points or short, disjointed sentences instead of producing integrated, fluent prose suitable for academic writing. Another commonly reported limitation was the tool's tendency to use formulaic or clichéd expressions, even when instructed not to. Similarly, students had difficulty eliciting grammatically correct or stylistically nuanced revisions, especially in contexts requiring more humanized or context-sensitive language. In some cases, the grammatical corrections were inaccurate and resulted in awkward reformulations requiring close human review.

Tasks requiring detailed reasoning, justification, or evidence-based arguments—such as including citations or quotations—were also flagged as problematic. Students remarked that ChatGPT sometimes produced irrelevant content or fabricated sources, which undermined the credibility of the output.

Some participants noted that the model struggled with complex prompts requiring layered instructions or in-depth elaboration. Furthermore, the model often failed to eliminate redundancies or avoid repeating previously stated ideas, resulting in repetition and circular arguments.

While a few students reported no major difficulties, the majority emphasized the need to verify and revise AI-generated content to achieve more authentic, contextually appropriate, and original expression. As one student remarked, ChatGPT can generate "pearls" of expression that are not always appropriate or logically integrated, which underscores the importance of human oversight in AI-assisted writing.

4. Pedagogical Implications: Integrating AI in Teaching and Academic Writing

The findings of this study suggest a promising pedagogical approach: when used strategically and reflectively, artificial intelligence can support the development of academic writing skills rather than replace or undermine them. The superior performance of the enhanced (human-AI collaborative) essays suggests that, when critically mediated by learners or tutors, AI-generated content can serve as a scaffold for improving argumentative structure, lexical richness, and overall coherence when critically mediated by learners or tutors.

Students' ambivalent responses regarding the use of AI in academic writing reflect the concerns raised in current educational research. Students appreciate AI tools' ability to facilitate idea generation, language reformulation, and structural organization, particularly in the early stages of writing. As several participants in this study noted, AI can serve as a cognitive scaffold that helps students overcome writer's block, organize their thoughts, and identify more academic phrasing. These benefits align with studies recognizing AI's potential to support personalized learning environments and writing feedback systems.

However, these benefits are counterbalanced by critical risks. Students expressed concern that frequent AI use might diminish originality, independent reasoning, and the ability to critically engage with academic sources—an issue also addressed in educational ethics literature.

Participants also expressed concern about overreliance on AI as a shortcut, which could lead to a loss of skills and reduce academic integrity if tools are used to generate student work entirely instead of to support it. Plagiarism by proxy and the undetected incorporation of false or fabricated information further undermine the reliability of AI-generated content. Consistent with this, students in the present study emphasized the importance of critical verification and the necessity of viewing AI as an instrumental aid rather than a writing surrogate. Their comments point to an emerging consensus in research. AI integration in educational contexts should be accompanied by explicit training in prompt design, source evaluation, and ethical usage [10]. At the same time, higher education institutions – including those in Romania – should be encouraged to adopt a multi-level disclaimer policy regarding the use of AI, ensuring clarity about permissible practices, responsibilities, and limitations at both institutional and course levels.

Together, these insights underscore the necessity of reimagining writing pedagogy within an AI-driven academic environment and shifting away from the simplistic utility-versus-threat dichotomy. Instead, what is required is a balanced framework for AI literacy that fosters critical agency and metacognitive awareness in student writers.

Enhancing Student Engagement

Reimagining the Student Experience through Engagement, Rigor and Support

Ana De Jesus[1]

[1]New York City Public Schools, United States
[1]Fordham Universtiy, United States

Abstract

This paper presents a comprehensive, research-aligned model designed to support gifted and high-achieving students through systems that strengthen instruction, expand equitable access, and provide sustained academic and social-emotional supports. The initiatives implemented—including collaborative professional learning, continuous coaching cycles, redesigned Advanced Placement pathways, and enhanced student support structures—demonstrate how coordinated schoolwide efforts elevate instructional quality and foster meaningful inclusion in advanced coursework. Together, these strategies illustrate how rigor, equity, and targeted supports can coexist to promote long-term student success within high-performing academic environments.

Keywords: *support, peer mentoring, access*

Introduction

Supporting students' learning is critical to their overall achievement, especially within gifted and high-achieving populations. Research demonstrates that gifted students require consistent exposure to challenging and complex tasks to avoid disengagement and underachievement [11]. These students benefit from environments that promote cognitive depth, autonomy, and opportunities for advanced problem-solving, while still receiving targeted support that nurtures their social-emotional and academic needs [9]. As a school leader working with this student population, my challenge was to balance rigorous expectations with individualized support systems that enabled all learners to thrive.

To achieve this, I implemented several interlocking initiatives. First, I developed a structured system of professional learning for teachers that included lesson study, mentoring, and individualized coaching. Teacher collaboration is one of the most effective drivers of school improvement, increasing collective efficacy and enhancing instructional quality [6]. Research on lesson study consistently shows that collaborative cycles of planning, observing, and reflecting lead to improved instructional practice and deeper pedagogical knowledge [10]. As a result, teachers in our building engaged in ongoing professional reflection and expanded their instructional strategies through collegial dialogue.

Second, I instituted a cycle of evaluative and non-evaluative observations designed to provide timely, actionable feedback. Instructional coaching research indicates that job-embedded coaching, grounded in structured pre-observation meetings, observation, and post-observation feedback sessions, significantly enhances teaching effectiveness and increases implementation of evidence-based practices [9]. Frequent, specific feedback is a critical factor in teacher growth, and these cycles helped ensure that instructional improvement remained a consistent schoolwide focus.

Third, to promote equity and expand access to rigorous coursework, I redesigned our Advanced Placement (AP) enrollment system by removing recommendation-based gatekeeping and developing AP course pathways beginning in ninth grade. National studies reveal longstanding inequities in AP enrollment for Black, Hispanic, and low-income students, even within schools offering numerous AP options [2]. The College Board has long advocated for open access and expanded pathways as strategies to increase equity and college readiness [3]. By restructuring our approach, we opened doors for students previously excluded from advanced academic opportunities and fostered a mindset that values growth, challenge, and long-term learning over narrow outcome metrics.

To support students' success within these advanced pathways, I estabilised peer-mentoring programs, tutoring structures, and counseling supports. Peer mentoring has been shown to improve academic performance, increase student persistence, and strengthen students' sense of belonging during critical academic transitions [4]. These structures helped ensure that all students—especially those new to AP coursework—received ongoing academic and social-emotional support.

Finally, I revised the schoolwide grading policy by extending marking periods and requiring all teachers to integrate performance-based assessments. Research shows that performance assessment enhances students' higher-order thinking, provides more authentic demonstrations of learning, and aligns with best practices in formative assessment [4]. Longer grading cycles also allow teachers to receive meaningful feedback and give students the time necessary to engage in iterative practice and revision—critical elements of deep learning.This shift aligned assessment with instructional goals and created more equitable and meaningful measures of student mastery.

Enhancing Project Outcomes in First-Year PBL Courses through Increased Teaching Sessions

Marshed Mohamed[1], **Livinus Nweke**[2]

[1]Department of Electronic Systems, Norwegian University of Science and Technology, Norway
[2]Department of Computing, Noroff University College, Norway

Abstract

The quality of student projects in a first-year Computer Architecture course has long been a concern, with many submissions reflecting insufficient mastery of foundational concepts and a lack of confidence to tackle challenging tasks. These issues are compounded by students' limited base knowledge and undeveloped self-learning abilities, which are critical for success in project-based learning (PBL). To address these challenges, the course's teaching sessions were doubled from six to twelve, while assignments were redesigned to integrate knowledge from multiple sessions. This intervention aimed to provide a stronger foundation, foster self-learning, and enhance project outcomes. The results showed significant improvements in student performance and confidence. Project grades increased substantially, with more than 50% of students achieving a grade of B or higher in 2024, compared to only 25% in 2023. Students reported greater confidence in undertaking challenging projects, with over 80% attributing this to the enhanced teaching sessions. Self-learning also improved, as 84% of students independently explored advanced topics like sensor integration and communication protocols to complete more sophisticated projects. Despite the reduction in project implementation time from 15 to 6 weeks, the projects demonstrated higher complexity and quality, underscoring the critical role of foundational instruction. This study highlights the importance of integrating structured teaching sessions with guided assignments to bolster foundational knowledge and promote self-learning. The findings provide actionable insights for improving PBL frameworks, contributing to enhanced educational practices in engineering and related disciplines.

Keywords: *Project-based learning; Foundational instruction; Teaching sessions; Self-directed learning; Engineering education.*

1. Introduction

Project-based learning (PBL) has become an integral part of engineering education as it has been recognized for its effectiveness in enhancing student engagement and bridging the gap between theoretical knowledge and practical application. Recent studies have demonstrated that PBL enables students to cultivate essential technical skills as well as fosters critical thinking, problem-solving abilities, and collaborative learning [1–4]. In the context of engineering education, PBL offers practical means for students to understand abstract concepts by allowing them to apply them in tangible ways [5–7]. This hands-on approach not only enhances understanding but also prepares students for the dynamic challenges of the engineering profession.

Despite the benefits of PBL, first-year students often encounter significant challenges when engaging in project-based assignments within the Computer Architecture course. Their limited foundational knowledge and inexperience can make the transition from structured learning environments to independent project work particularly daunting [8]. Many students exhibit a lack of confidence in selecting appropriately challenging tasks and possess insufficient skills to effectively tackle complex problems [9–12]. This is further exacerbated by the steep learning curve associated with Computer Architecture concepts, which necessitate a solid grasp of both hardware and software principles. Consequently, the quality of submitted projects has been consistently subpar, leading to overall poor performance in project evaluations.

The persistent issue of low-quality project submissions highlights a critical problem in the current educational approach. Specifically, the inadequate number of teaching sessions which was originally limited to six teaching sessions in our case study appears insufficient for first-year students who are still adapting to university-level expectations and learning methodologies. Limited instructional time constraints students' ability to fully comprehend course material, develop essential skills, and build the

confidence required to engage deeply with challenging projects [13]. This gap not only adversely affects their academic outcomes but also impedes their development as self-directed learners, a crucial attribute in the rapidly evolving field of computer engineering.
In response to these challenges, the purpose of this study is to evaluate the impact of increasing the number of teaching sessions from six to twelve in a first-year Computer Architecture course. The rationale behind this intervention is to provide students with additional instructional time to reinforce their understanding of fundamental concepts, thereby enhancing their capacity to apply this knowledge in project settings. By extending the teaching sessions, we aim to offer more opportunities for guided learning, hands-on practice, and personalized feedback which are all essential for developing competence and confidence in novice learners.
The objectives of this study are threefold. First, we aim to enhance students' knowledge base by covering more content in greater depth and providing additional resources for learning. Second, we seek to improve students' self-learning abilities by equipping them with strategies and tools for independent study, critical thinking, and problem-solving. Third, we intend to improve project outcomes by enabling students to undertake more ambitious projects with a higher likelihood of success, thereby fostering a sense of achievement and motivation.
The significance of this study extends beyond the immediate context of the Computer Architecture course. By examining the effects of increased instructional time on student performance and learning experiences, the findings have the potential to inform teaching practices in similar educational settings. Educators and curriculum designers can leverage these insights to optimize course structures, allocate resources more effectively, and implement strategies that support student learning and engagement. Ultimately, this study contributes to the broader discourse on enhancing engineering education by identifying practical solutions to common pedagogical challenges.
The rest of this article is organized as follows. Section 2 presents the methodology that guided this study. Section 3 discusses the results obtained while 4 concludes the paper.

2. Methodology

This section outlines the research design, the course and participants, the course structure, the intervention, and the evaluation methods.

2.1 Research Design

The study employed a mixed-methods comparative research design to evaluate the impact of increasing teaching sessions from six to twelve on student outcomes in a first-year Computer Architecture course. The mixed-methods approach integrates both quantitative and qualitative data to provide a comprehensive understanding of how the intervention affects students' knowledge acquisition, self-learning abilities, and project performance. On the other hand, the comparative aspect of the study involves analyzing and contrasting data collected from two distinct cohorts of students: one that experienced the original six teaching sessions (the control group) and another that participated in the enhanced twelve teaching sessions (the experimental group). By comparing these groups, the study aims to isolate the effects of the increased instructional time on various learning outcomes.

2.2 The Course and Participants

The course used in the study was Computer Architecture, a five-credit points course taken by first-year students in Bachelor of Engineering – Telematics, at the Norwegian Defense University College, Norway. The course aims to provide students with an understanding of the important building blocks of a computer and the connection between these building blocks (hardware) and the software that controls them. The study involved first-year students enrolled in the Computer Architecture course over two consecutive academic years. The control group consists of students from the year before the intervention, while the experimental group includes students from the year when the increased teaching sessions were implemented. Both cohorts consist of approximately the same number of students (e.g., 40 students per cohort) to ensure comparability.

2.3 The Course Structure

Over the years, the fundamental knowledge of the course has been provided through six teaching sessions, each accompanied by an assignment designed to reinforce the concepts covered (one

assignment per teaching session). This structure aimed to equip students with a foundational platform for self-learning and enable them to deliver challenging projects for evaluation. The topics covered in each session, along with their accompanying assignments, are summarized in Table 1.

Table 1. Teaching sessions and their accompanied assignments in 2023

Teaching Session	Topic	Assignment
1	Introduction to Microcontrollers	1
2	Digital Output	2
3	Digital Input	3
4	Interrupts, Timers, and LCD	4
5	Analog-to-Digital Conversion	5
6	Serial I/O	6

While the topics covered are essential, the time allocated to them appears insufficient to address the critical details comprehensively. For instance, teaching session 4 covers interrupts, timers, and LCDs. Each of these topics is extensive and significant enough to warrant its own dedicated session. Similarly, Analog-to-Digital Conversion (ADC), introduced in session 5, could benefit from being expanded into two teaching sessions. ADC is a fundamental concept in which measurable phenomena typically analog in nature are captured through transducers (sensors) and converted into digital signals for processing by digital devices. Expanding this topic would allow students to develop a deeper understanding of this crucial process.

In addition to insufficient time allocation, the current plan omits several important topics. While there is a session on digital output, the equally important concept of analog output is not addressed. For example, Pulse-Width Modulation (PWM) is an essential technique that enables digital devices to produce outputs resembling natural analog signals, which are more intuitive for users. Including this topic would enhance the curriculum by bridging the gap between digital and analog systems.

Another area that could be expanded is communication protocols. While Serial I/O is covered in session 6, introducing an additional protocol such as I2C would provide students with exposure to more sophisticated and widely used communication systems. This addition would deepen their understanding of the diverse communication protocols available in modern systems.

Lastly, the current plan includes only one session on the integration of microcontrollers with external devices, focusing on LCDs. Introducing an additional example involving other common devices, such as Servo Motors, would enhance students' practical understanding of microcontroller applications. Expanding this area would provide students with broader insights into real-world use cases and improve their ability to design versatile and practical solutions.

2.4 The Intervention (Proposed Changes)

The updated content of the teaching sessions and their accompanying assignments (course plan) is summarized in Table 2. This revised course plan was implemented in the spring semester of 2024. While

Table 2. Teaching sessions and their accompanied assignments in 2024

Teaching Session	Topic	Assignment
1	Introduction to Microcontrollers	1
2	Digital Output	
3	Digital Input	2
4	Interrupts	
5	Timers	3
6	Pulse-Width Modulation	
7	Analog-to-Digital Conversion I	4
8	Analog-to-Digital Conversion II	
9	Serial I/O	5
10	I2C	
11	Driving Servo Motors	6
12	LCD	

the number of teaching sessions has doubled compared to the previous plan (Table 1), the number of assignments has remained unchanged. However, the assignments were designed to require knowledge from at least two different teaching sessions. This approach ensures that students not only build their

competencies in specific topics but also develop an understanding of how these topics interconnect. The addition of six more teaching sessions reduced the time allocated for the self-selected individual project from fifteen weeks to six weeks. Despite this reduction, the stronger foundation provided by the additional teaching sessions more than compensated for the shortened project duration. The enhanced preparation allowed students to complete more challenging projects within the six weeks, using appropriate methods and demonstrating higher-quality outcomes than before.
Furthermore, during the six-week project period, students were required to consult with the course instructor at three distinct stages of their project. These consultations ensured that the projects met the required level of challenge and quality. This iterative review process not only provided guidance but also fostered a consistent focus on achieving high standards in project implementation.

2.5 Evaluation Method

The evaluation of the implemented measures was conducted using two primary methods: the analysis of project evaluation results and feedback collected from students. Significant improvement in project outcomes would serve as the strongest indicator that the implemented changes had a positive impact. However, it is important to acknowledge that several other factors could influence the results, such as the quality of the students, their attitude toward the subject, their understanding of prerequisite courses, and even the workload from other courses. These variables could have a considerable impact on the quality of the projects and, consequently, on their evaluation results. To mitigate the influence of these confounding factors, a long-term observation of results before and after the implementation of the proposed measures should be conducted to establish more robust conclusions.
Student feedback was collected through the reference group and normal course evaluation procedures. Two specific survey questions, asked both before and after the changes were implemented, were particularly insightful in this context:

A. Which learning activities used in the course have given you the greatest learning benefit?
B. To what extent did you experience that the general workload in this subject corresponded to the learning outcome descriptions and the number of credits?

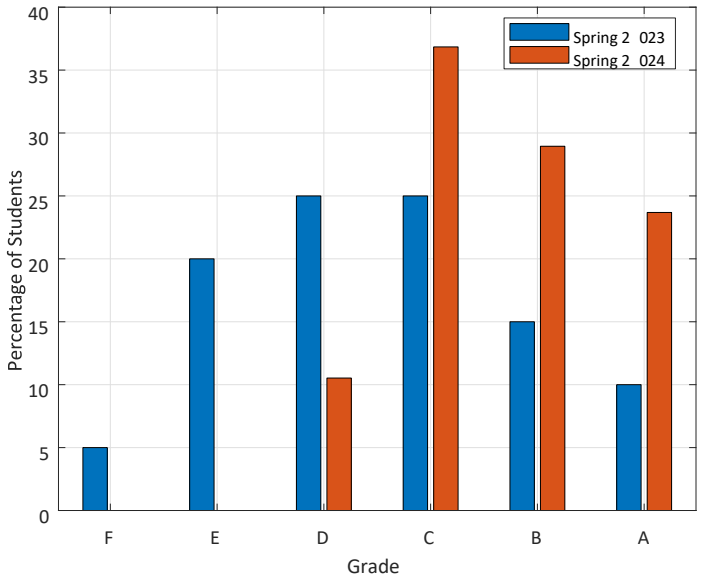

Fig. 1. Comparison of projects' evaluation results between spring 2023 and spring 2024.

The answers to Question A were intended to indicate whether the teaching sessions, along with their accompanying assignments, provided sufficient knowledge to enhance self-learning. Meanwhile, the answers to Question B shed light on how manageable the self-learning process was for students. A negative correlation between these two questions was anticipated; students finding the workload too demanding might report lower benefits from the learning activities.
In addition to the standard questions, the following were added to the survey form used after the implementation of the proposed changes:

C. Did the teaching sessions give you confidence to undertake challenging projects?

D. Did the teaching sessions make it easier to learn on your own?
E. During the implementation phase of your project
   (i). Did you self-learn anything new?
   (ii). What did you teach yourself?

These questions aimed to determine whether the teaching sessions provided a sufficient foundation of knowledge to support students' self-learning. They also sought to explore the influence of the sessions and accompanying assignments on the types of projects students chose to undertake.
Students were asked to respond to Questions A, B, C, and D by indicating the extent to which they agreed with the statements, using a five-point scale: "agree to a very large extent," "a large extent," "a medium extent," "a small extent," and "a very small extent." For Question E(i), students answered "yes" or "no," while those who selected "yes" were invited to elaborate on their response to Question E(ii) in their own words.

3. Results

The results obtained from the discussed evaluation methods are presented in this section. The results are divided into project evaluation, survey questions before and after the implemented measures, and additional survey questions.

3.1 Project Evaluation

Significant improvements were observed in the submitted projects after the implementation of the proposed measures, particularly in terms of the challenges addressed by the projects and the methods students used to overcome these challenges. This improvement is reflected in the grades students received during project evaluation. The evaluation for the semester in question (spring 2024) was conducted by the same two examiners as in the previous year (spring 2023), ensuring consistency in grading standards.
A comparison of the results between the two semesters is presented in Fig. 1. While only a quarter of the students achieved a grade of B or higher in 2023, more than half of the students attained these grades in 2024. The improvement is even more pronounced at the lower end of the grade scale, where only 10% of students received a grade of D in 2024, with no students receiving grades lower than D. This is in stark contrast to the results from 2023, where half of the students were graded at D or lower.

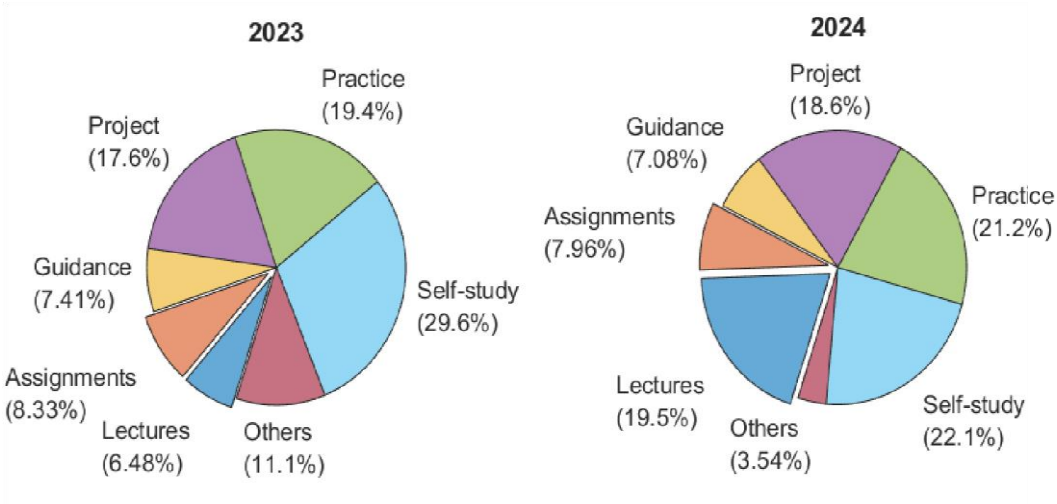

Fig. 2. Summary of the answers to the question "which learning activities used in the course have given you the greatest learning benefit?"

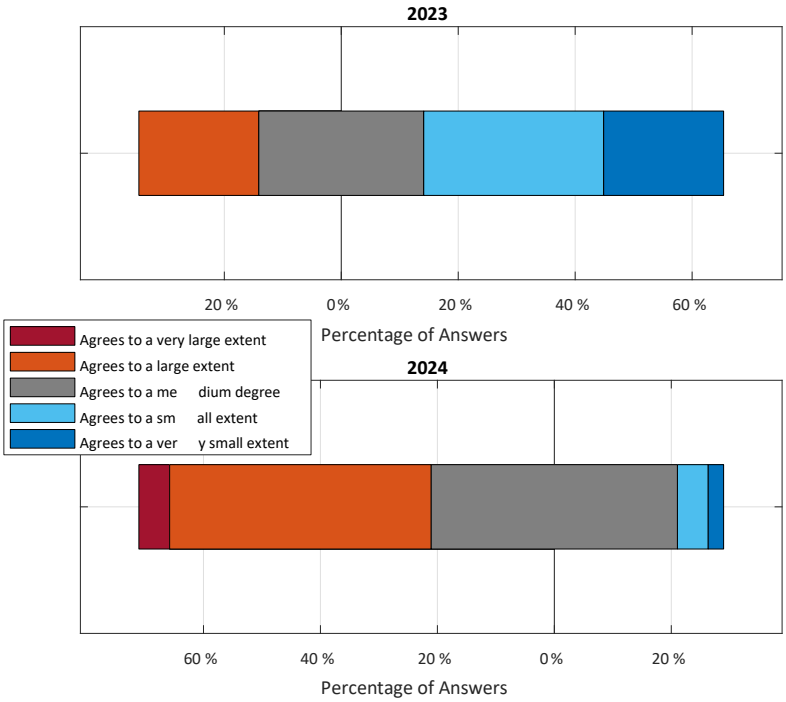

Fig. 3. Summary of the answers to the question "To what extent did you experience that the general workload in this subject has corresponded to the learning outcome descriptions and the number of credits?"

3.2 Comparable Survey Questions

We can further compare the results by analyzing the answers to Questions A, "which learning activities used in the course have given you the greatest learning benefit?" from 2024 and those provided in 2023. As shown in Fig. 2, the percentage of students selecting lectures as the activity that provided them with the greatest learning benefit increased threefold, rising from 6.5% in 2023 to 19.5% in 2024. This significant change suggests that the teaching sessions are now successfully fulfilling their intended purpose of providing fundamental knowledge of the subject.

To evaluate whether the teaching sessions facilitated self-learning and reduced the perceived workload of the course, we compared students' responses to Question B, "To what extent did you experience that the general workload in this subject has corresponded to the learning outcome descriptions and the number of credits?" from 2023 and 2024. As illustrated in Fig. 3, the percentage of students who considered the workload too heavy decreased by more than half, from 65% in 2023 to 30% in 2024. Notably, self-study continued to be identified by many students (Fig. 2) as the activity that provided the greatest learning benefit. These results imply that the reduced perception of workload is not due to a decrease in self-learning but rather because students are now engaging in self-learning more efficiently.

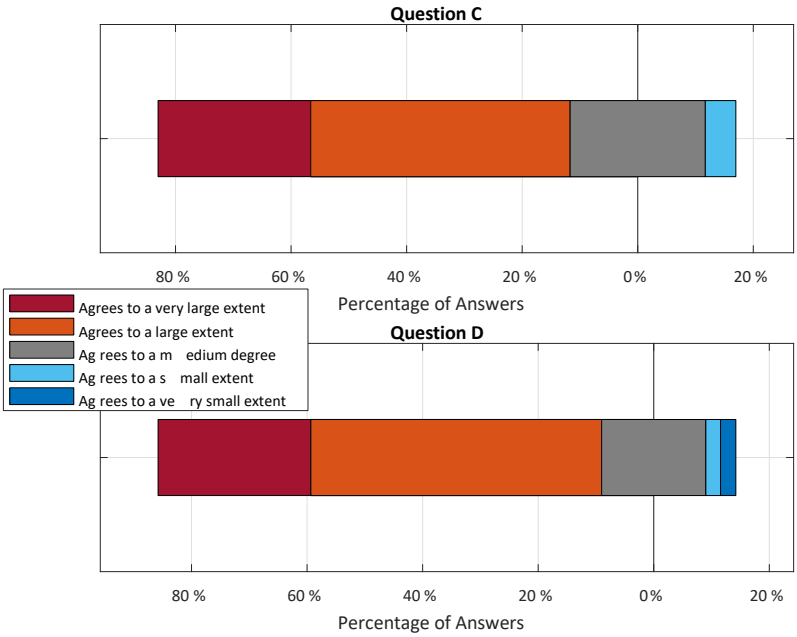

Fig. 4. Summary of the answers to Question C, "Did the teaching sessions give you confidence to undertake challenging projects?", and Question D, "Did the teaching sessions made it easier to learn on your own?".

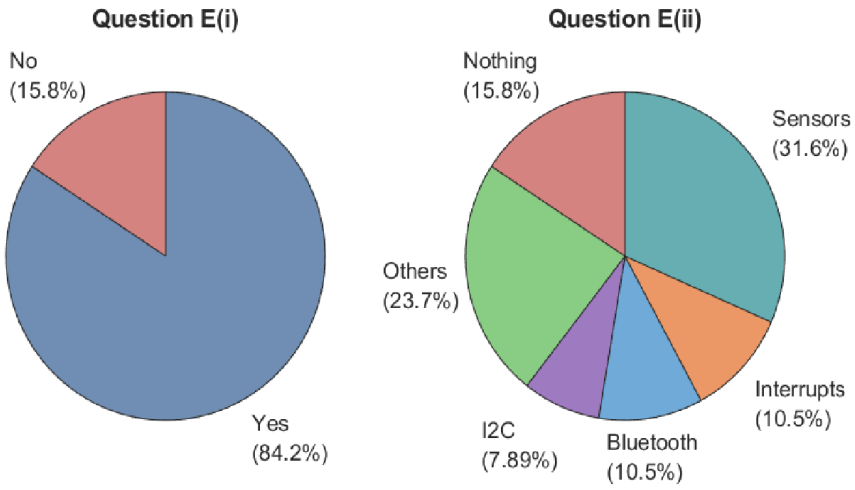

Fig. 5. Summary of the answer to Question E(i) "Did you self-learn anything new during the implementation phase of your project?" and Question E(ii) "What did you teach yourself?".

3.3 Additional Survey Questions

The students' responses to the additional questions (Questions C, D, and E) provide even clearer evidence that the implemented changes achieved their intended outcomes. The responses to Question C, "Did the teaching sessions give you confidence to undertake challenging projects?", and Question D, "Did the teaching sessions made it easier to learn on your own?" are summarized in Fig. 4. The figure shows that over 80% of students believed the teaching sessions significantly contributed to building their confidence to undertake challenging projects, with more than a quarter indicating that the sessions achieved this to a very large extent. Similarly, approximately 85% of students agreed that the teaching sessions provided the fundamental knowledge needed to facilitate self-learning, with more than a quarter stating this was achieved to a very large degree.

Lastly, the responses to Question E(i), "Did you self-learn anything new during the implementation of your project?", and the topics students self-learned during the project phase are summarized in Fig. 5. Approximately 16% of students indicated that the teaching sessions and accompanying assignments

alone were sufficient to complete their projects. However, 84% of students reported learning additional material independently to successfully complete their projects. This latter finding suggests that a significant portion of students had the confidence to undertake more challenging projects that extended beyond the topics covered in the teaching sessions or assignments. Nearly a third of the students (31.6%) learned how to integrate sensors not covered in the teaching sessions with the microcontroller, gaining practical experience in reading and interpreting device datasheets. Communication protocols were another common area of independent learning, with 10.5% of students learning and using the Bluetooth protocol and 7.89% expanding their knowledge of the I2C protocol. Another notable topic was Interrupts, where 10.5% of students deepened their understanding and skills beyond what was taught in the sessions. These findings demonstrate that the teaching sessions, along with their accompanying assignments, effectively covered the fundamental concepts necessary to complete basic projects. Moreover, they provided an excellent foundation for self-learning and built the confidence needed to undertake more complex and challenging projects. This balance between guided instruction and independent exploration underscores the effectiveness of the implemented changes in enhancing both foundational knowledge and students' ability to expand their learning independently.

3.4 Interpretation of the Results

The findings of this study affirm that strengthening fundamental knowledge through increased teaching sessions bolsters student confidence, skill acquisition, and self-directed learning, which are key factors that facilitate better project performance. Recent literature emphasizes that foundational topics must be thoroughly covered in engineering education, especially in project-based courses, due to the hierarchical nature of technical knowledge [14]. Although PBL fosters creativity, collaboration, and real-world problem-solving, it can be undermined if students lack the core concepts necessary to navigate more advanced tasks. In the present study, the extended instructional sessions helped solidify foundational principles, thereby allowing students to approach projects with greater competence and confidence. As [13] suggest, while PBL thrives on hands-on engagement, structured teaching and well-placed assignments provide the essential scaffolding for meaningful application of theory.

Notably, the allocation of project implementation time was reduced from 15 to 6 weeks, yet the quality of student projects improved significantly. This counterintuitive outcome underscores how instructional design outweighs mere project duration [15, 16]. By dedicating additional time to guided instruction, students acquired a deeper conceptual understanding and encountered fewer obstacles during project work. This aligns with [17] view that inductive teaching strategies succeed when learners possess sufficient background knowledge to build upon. The enhanced confidence students reported also ties closely to self-efficacy theory, which posits that mastery experiences and adequate support increase one's belief in their capabilities [11, 12]. Thus, while the total project window was compressed, students' self-assurance and newly honed skills enabled them to work more efficiently, ultimately producing stronger outcomes.

4. Conclusion

This study investigated the impact of increasing teaching sessions from six to twelve in a first-year Computer Architecture course that employs a PBL framework. The results emphasize the importance of integrating fundamental instruction into PBL-oriented courses. The hierarchical nature of engineering knowledge necessitates that students develop a robust understanding of foundational topics before engaging in advanced, application-driven tasks. The intervention demonstrated that well-structured teaching sessions not only enhance technical proficiency but also reduce cognitive load, enabling students to work more efficiently during project implementation. This was particularly evident as project duration was reduced from 15 to 6 weeks without compromising the quality of project outcomes. Moreover, the study highlighted the role of guided tasks and active learning strategies in fostering student engagement and confidence. By moving beyond traditional lecture formats, the additional teaching sessions provided opportunities for hands-on exercises, collaborative problem-solving, and real-time feedback. These elements proved critical in equipping students with the skills and mindset needed for independent exploration and lifelong learning.

While the findings are promising, the study is not without limitations. The small sample size, lack of long-term observation, and potential influence of external factors such as student quality, workload, and prerequisite knowledge warrant caution in generalizing the results. Future research should address these limitations by employing larger sample sizes, longitudinal designs, and more comprehensive control of confounding variables to validate and extend these findings. However, this study contributes

to the growing body of evidence supporting the integration of foundational instruction with project-based methodologies. It provides actionable insights for educators seeking to optimize course structures to enhance learning outcomes, particularly in technical disciplines. Educators can empower students to excel in both their academic and professional pursuits by prioritizing fundamentals, incorporating guided tasks, and creating supportive learning environments. These findings underline the critical role of instructional design in fostering student success, particularly in the early stages of engineering education.

Learning through Lived Roles: Personas as Pedagogical Anchors in Online Higher Education

Betsy Gilbertson[1], Amy Conway[2], Sydney Basset[3], Megan Slatton[4], Amanda Wilcox[5]

[1,2,3,4,5]Auburn University, United States

Abstract

Effective online learning environments situate abstract concepts within authentic, human-centered contexts that promote relevance, application, and deeper learner engagement. Personas support this process by helping learners engage with realistic human situations that make course concepts more concrete and relatable while fostering emotional and cognitive connections to the material. The use of personas in online higher education is informed by established pedagogical theories, including situated learning, cognitive load theory, and social presence frameworks. From a sociocultural perspective, learning is shaped through interaction with meaningful contexts and tools [11], and personas support this process by embedding course content within realistic scenarios. Situated learning further emphasizes that knowledge is inseparable from the social and professional contexts in which it is applied [5]; personas model these environments through representative roles, challenges, and decision-making processes. Personas also align with cognitive load theory by providing narrative coherence that helps learners organize information and reduce extraneous cognitive processing, particularly for novice learners [10]. In online environments, personas can further enhance social presence, a core element of the Community of Inquiry framework associated with learner engagement and perceived relevance [2]. By humanizing instructional content, personas help reduce the psychological distance often inherent in online learning [9].

Across text-, image-, and video-based materials, personas anchor abstract concepts in realistic contexts and make disciplinary thinking visible. Visual and narrative representations can support comprehension, ethical reasoning, and problem solving across disciplines such as business, engineering, public policy, and the social sciences. Video-based personas extend these benefits by modeling professional reasoning through voice, expression, and storytelling. Research on multimedia learning suggests that well-designed combinations of visual and auditory cues enhance comprehension and retention when aligned with evidence-based principles [7]. Interactive AI chatbot interactions further extend persona-based learning by enabling dialogue, practice, and formative feedback at scale [6], [13], [14]. These low-stakes interactions allow learners to explore ideas, rehearse skills, and receive immediate responses while iteratively refining their understanding. AI chatbot personas may also support student-centered learning and accessibility through personalized pacing and just-in-time support [6], [14]. Looking forward, AI avatars may blur the boundaries between instructional content, simulation, and human interaction by enabling learners to engage with intelligent digital characters that model professional reasoning, communication, and decision-making in authentic contexts. However, regardless of the modality through which they are implemented, the strategic use of personas and AI-driven interactions has the potential to humanize online learning, deepen learner engagement, and support authentic knowledge transfer in higher education.

Keywords: *Situated learning, Theory to practice, AI experiential learning, Engagement in Online Learning*

Introduction

Online higher education continues to expand, yet persistent challenges remain regarding student engagement, perceived relevance, and authentic transfer of learning [1]. While technological innovation often dominates discussions of digital pedagogy, engagement in online environments is shaped less by the tools themselves than by how instructional design situates learning in meaningful human contexts, supports cognitive organization, and fosters social presence [2].

Personas—deliberately constructed representations of people in defined professional, social, or disciplinary roles, used to embed course content within an authentic human context—offer a scalable, research-informed strategy for strengthening engagement across modalities. Whether implemented through simple written narratives, recurring case studies, animated video scenarios, AI-driven

conversational agents, or AI avatars, personas function as pedagogical anchors that connect abstract disciplinary concepts to authentic professional and social contexts.
Persona-based learning draws on a well-established set of theoretical foundations—situated learning [5], sociocultural theory [11], cognitive load theory [10], and the Community of Inquiry framework [2]—each of which is examined in greater depth in the next section. Together, these perspectives suggest that engagement depends on situating content in authentic contexts, organizing information for cognitive coherence, and sustaining social presence. Emerging multimedia and AI technologies extend these possibilities [6], [7], [13], but the underlying mechanisms remain consistent across modalities. As a result, personas function as a scalable engagement strategy—effective in low-tech narrative formats and equally powerful when extended through multimedia or AI-driven systems.

Personas as Engagement Framework

In online learning environments, engagement depends less on technological sophistication and more on the extent to which learners experience relevance, social presence, and cognitive coherence across instructional contexts [1], [2]. Engagement emerges from how personas structure meaning-making, reduce abstraction, and model disciplinary thinking — not from the technological complexity of the implementation.
Beyond contextualizing content, personas can be understood as an engagement framework that structures how learners attend to, interpret, and act on disciplinary knowledge. From an instructional design perspective, personas function as representational tools that narrow interpretive possibilities and highlight relevant cues within complex learning tasks. In this sense, they operate as instructional constraint systems that reduce ambiguity and guide decision-making through defined roles, goals, and contextual boundaries. Personas also shape how learners interpret problems, evaluate information, and apply disciplinary ways of thinking within situated scenarios (much like the context faculty provide in person). This emphasis on contextually grounded, role-based activity aligns with research on authentic learning environments, which highlights real-world relevance, complex problem contexts, and sustained engagement with disciplinary practices [3]. This framing supports not only comprehension but also professional judgment, as learners engage in repeated cycles of perspective-taking and problem-solving from a defined role. Importantly, personas provide opportunities for identity rehearsal, allowing learners to practice disciplinary ways of thinking in low-stakes environments that approximate real-world complexity without its associated consequences [12]. In this way, personas extend beyond engagement facilitation to function as scalable pedagogical structures that integrate attention management, meaning-making, and professional reasoning within online learning environments.
At a low-tech level, persona design may take the form of structured narrative briefs with images, reflective case logs, or sequential scenario updates that revisit the same persona across instructional units. At higher levels of technological integration, personas may be extended through video-based simulations, branching multimedia narratives, or interactive AI dialogue systems that allow learners to interrogate, advise, and reason through unfolding professional situations. (See Fig. 1.)

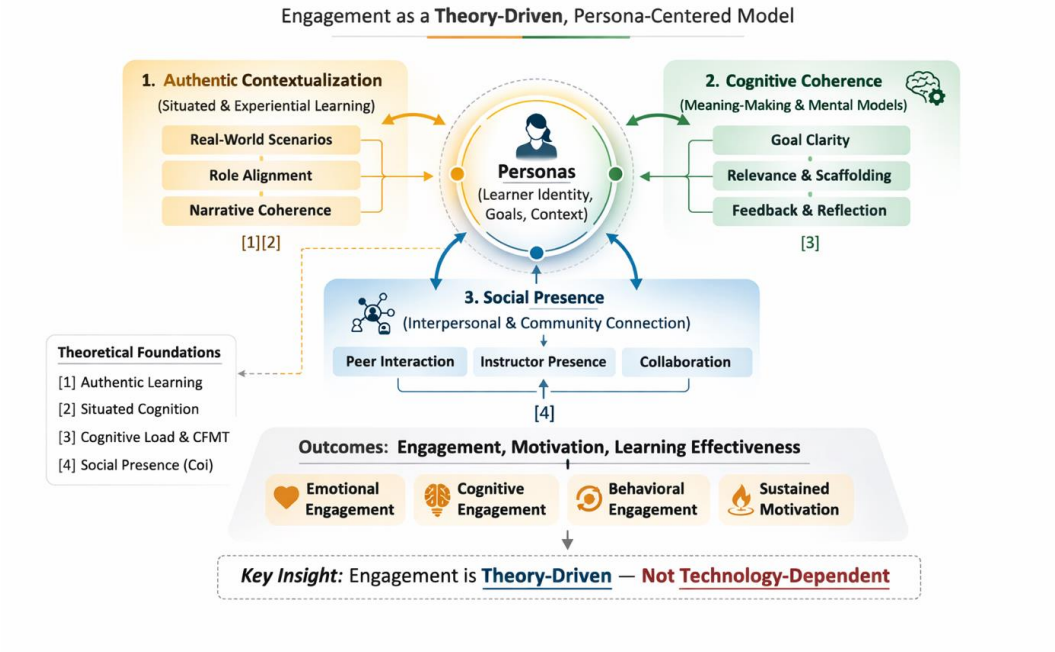

Fig. 1. Persona-Based Engagement Across Theoretical Frameworks
The model highlights how persona design draws on theory to create relevance, coherence, and social presence across modalities.

Personas in Practice

The following examples illustrate how persona-based design operates across a range of disciplines and modalities. Rather than cataloging implementations, the cases are organized around four theoretical lenses — situated learning, cognitive load and narrative coherence, multimedia design, and social and teaching presence — that each surface a different engagement mechanism. Together they show how the same underlying framework adapts to varied disciplinary contexts and levels of technological complexity.

Situated Learning and Disciplinary Role-Taking

Situated learning theory emphasizes that knowledge is inseparable from the contexts in which it is applied [5], while sociocultural perspectives highlight that learning is mediated through social interaction and cultural tools [11]. Within this combined framework, personas function as instructional mediators that translate abstract disciplinary concepts into situated activity systems in which learners take on defined professional roles, navigate contextual constraints, and make decisions under conditions of uncertainty.

In an undergraduate management survey course, for example, seven personas were developed to represent the majors most heavily enrolled in the course, including hospitality management, public relations, health services administration, apparel merchandising, building science, wildlife enterprise management, and aviation management. Because the course serves primarily non-business majors, many students enter without a clear sense of how management theory applies to their intended careers. Each persona occupies a distinct management level and industry context, and course activities use these characters to ground theoretical frameworks such as Value, Rarity, Imitability, Organization (VRIO) analysis and Porter's Five Forces in scenarios students can recognize as relevant to their own professional trajectories. Rather than asking students to bridge the gap between abstract management principles and their own fields, the personas do that translation as a structural feature of the course design.

Cognitive Load and Narrative Coherence

Cognitive load theory emphasizes the importance of reducing extraneous processing to optimize learning [10]. This principle informed the design of an online hospitality professional development course in which students are introduced to the concepts of career planning and preparation in the hospitality

industry. In this course, personas are used to provide context and relevant examples for four specific hospitality fields: Event Management, Culinary Science, Hotel Operations, and Restaurant Management. For each of the four fields, three personas are introduced and referenced throughout the course, representing an early-career position, a mid-career position, and an advanced career position. By providing industry-relevant examples and scenarios that represent potential career paths centered around these personas, the course design makes general professional development instruction specific for students in all four hospitality fields, reducing the extraneous processing required to connect general guidance to field-specific practice.

Personas can also provide narrative coherence by organizing information into structured, recurring contexts that support schema development [10]. An example of personas supporting narrative coherence comes from a graduate Brewing Science and Operations program course designed to bridge online coursework with real-world commercial brewing environments. To support this transition from theory to practice, an animated persona, a beer can character named “AU Brew,” functions as a consistent narrative guide throughout the course. Unlike the role-based personas in other examples, AU Brew does not represent a professional identity; instead, it functions as a narrative anchor for coherence and continuity across modules. This distinction illustrates that persona-based design encompasses both professional role representations and narrative guides, with each activating different aspects of the engagement framework.

AU Brew introduces the practicum by framing the purpose, scope, and expectations of the experience, emphasizing its grounding in cooperative education principles and its integration of academic learning with professional practice [4]. Through narration, AU Brew contextualizes the practicum as an opportunity for students to apply brewing science concepts in authentic settings, collaborate with faculty and industry partners, and engage with professional organizations such as the Brewers Association and commercial breweries. This framing establishes a coherent storyline that connects students’ prior online learning to their experiential work in the field. The persona provides a stable professional perspective that frames learning goals, situates expectations, and supports learners as they integrate classroom concepts into practical environments [4], [5]. This example demonstrates how animated personas can function as cognitive and contextual anchors, supporting coherence and relevance in online-to-experiential learning transitions.

Visual and Auditory Persona Design

Multimedia personas can further enhance germane processing when visual and auditory elements align with evidence-based design principles [7]. This informed the development of a special observation course in an online Speech, Language, and Hearing Sciences program. In this course, a consistent set of animated characters was used across modules to demonstrate course concepts such as target behaviors, goal writing, material selection, and data collection. By keeping the setting and characters consistent, the course design reduces the need for students to reorient to new contexts and supports schema construction by letting them observe how course concepts build on each other within a continuous clinical narrative. As the final course in the program, this narrative continuity also activates prior learning, giving students a framework to integrate and apply knowledge developed across earlier coursework. The animated scenarios further support this by asking students to make clinical decisions within a controlled, zero-stakes environment, allowing them to practice professional judgment without the pressures of a live clinical setting.

Social and Teaching Presence through Personas

Personas can also operationalize teaching presence — the instructor’s role in shaping discourse, guiding inquiry, and offering direct instruction [2]. In a master’s-level social work course, for example, a persona representing the instructor was embedded throughout the course. The course covers extensive historical context related to the evolution of mental health frameworks, and the instructor wanted a clear way to distinguish personal interpretations and contemporary reflections from the historical record itself. Using character animation software, the creative team (under the guidance of an instructional designer) created an animated character based on the instructor’s likeness and paired it with a custom, visually distinct callout box in the online course. This design choice signaled to students that these moments reflected the instructor’s interpretation rather than an objective historical narrative, giving the instructor a recurring, visible channel for interpretive commentary distinct from the historical record. The primary goal was to support critical thinking by helping students differentiate between historical accounts and scholarly interpretation while maintaining clarity and transparency in course content.

In addition to supporting cognition, personas can reduce the psychological distance that often characterizes online environments. Social presence is central to sustained engagement [2], [9], and personas humanize digital instruction by modeling voice, perspective, and lived experience. In a cross-disciplinary entry-level course on mass timber systems, students engage with interconnected industry personas representing key roles across the supply chain, spanning forest management through design and construction. This grant-funded course incorporates a mix of static and animated personas to bring content to life and provide context across the different disciplines to help ensure students have insights into each field of expertise. A forester, construction manager, architect, structural engineer, and landscape designer each approach shared course topics from their distinct disciplinary perspectives, spanning sustainability, construction, design, structural performance, and site integration. Importantly, these personas reappear across multiple learning modules rather than being limited to isolated case examples, allowing students to encounter each issue through different professional lenses over time. As students revisit course topics through these recurring perspectives, they begin to understand how disciplinary roles lead to different interpretations of the same design, construction, or environmental challenge. As a result, learners develop a deeper understanding of mass timber as an interconnected socio-technical process while also strengthening engagement through exposure to authentic, human-centered perspectives embedded throughout the course. This aligns with situated learning theory, which emphasizes that knowledge is developed through participation in socially and contextually grounded practices rather than through decontextualized content alone [5].

Engagement and Technical Complexity

The persona-based engagement framework demonstrates how instructional personas can be implemented across varying levels of technological complexity while maintaining consistent mechanisms. Rather than representing discrete or hierarchical modalities, the model reflects a continuum of design approaches that support learner engagement through structured social, cognitive, and contextual processes in online learning environments. (See Fig. 2.) Prior research in higher education online learning emphasizes that engagement is shaped more by instructional design, social presence, and cognitive presence than by technological sophistication alone [2]. This holds across AI-supported environments as well, where interaction design and narrative structure remain central to sustaining engagement [1].

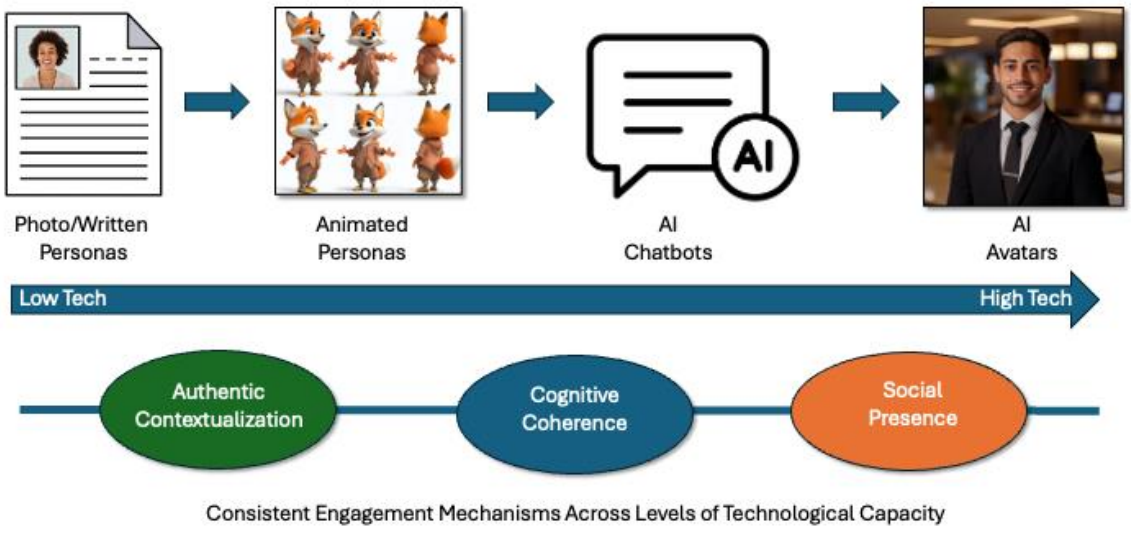

Fig. 2. Continuum from Written Personas to AI Avatars
The scenarios illustrate that personas can be implemented along a continuum of design approaches—from written narratives to AI-enabled avatars—while activating consistent pedagogical mechanisms.

At the lowest level, written narrative personas provide foundational contextualization by situating abstract concepts within relatable human scenarios, consistent with research showing that contextual grounding supports comprehension and meaning-making in online learning environments [3]. As implementation increases in complexity, recurring case-based personas supported by visuals enhance

narrative coherence and support schema development through sustained exposure to consistent characters and contexts [7], [10]. Instructor-recorded video personas extend this approach by modeling disciplinary reasoning and professional identity through voice, presence, and expressive communication, aligning with findings that instructor presence strengthens engagement and reduces psychological distance in online learning [9]. Interactive multimedia scenarios further enable applied decision-making by embedding learners in dynamic, branching environments that simulate authentic professional conditions, reflecting evidence that simulation-based and immersive learning environments enhance cognitive engagement and transfer [8]. At the highest level, AI chatbot personas support iterative dialogue and adaptive feedback, consistent with emerging research demonstrating that AI-mediated systems can enhance personalization, engagement, and formative learning support in higher education contexts [14]. Across all levels, engagement is driven by shared mechanisms of contextualization, cognitive organization, and applied reasoning, demonstrating that pedagogical effectiveness depends on consistent presence-driven instructional design rather than technological complexity alone. (See Table 1.)

Table 1. Scalable Engagement Model for Online Learning: Levels of Implementation

Level of Implementation	Technological Complexity	Engagement Mechanism
Written narrative	Low	Contextualization and relevance
Recurring case study with visuals	Low-Moderate	Narrative coherence and schema support
Instructor-recorded video	Moderate	Modeling reasoning and professional identity
Interactive multimedia scenario	Moderate-High	Applied decision-making
AI chatbot and avatar	High	Iterative dialogue and adaptive feedback

Future Directions

AI chatbots and avatars open new possibilities for course-specific persona implementation, extending social presence through adaptive dialogue and formative feedback [6], [13] and — in immersive learning environments — embodying personas as interactive avatars within extended reality (XR) experiences. For example, in an Occupational, Career, and Placement Services course, students evaluate the accessibility and appropriateness of real-world job sites for individuals with disabilities as part of their professional preparation. The XR experience is modeled after the Auburn University Human Resources (HR) department, allowing students to explore a simulated workplace environment they are likely to encounter in practice. Within this setting, a human-appearing avatar assumes the role of an HR manager, welcoming students to the space and responding to questions about the job position being evaluated. This humanoid avatar functions as an advanced persona within the framework, supporting situated learning through authentic context [5], reinforcing cognitive coherence by embedding evaluation tasks within a realistic narrative [10], and enhancing social presence through voice-based, interactive communication [2]. As illustrated in the framework matrix, this XR implementation demonstrates how advanced and AI-enabled personas can activate the same engagement mechanisms as lower-tech persona approaches while also expanding opportunities for interaction, immersion, and experiential practice [8].

Other implementations apply the same engagement mechanisms through conversational rather than embodied AI personas. For a hospitality management program, course designers are developing a virtual hotel concierge trained on video interviews of multiple hospitality professionals, capable of responding verbally to student questions through either a spoken or typed interface. Key segments of individual interviews will be used within a virtual tour of the Auburn University Hotel and Conference Center. The virtual concierge, however, will draw on the full content of these interviews, enabling it to respond to questions that span multiple departments, require comparison, or extend beyond what the tour clips cover.

Beyond traditional higher education, persona-based approaches are increasingly relevant in professional development contexts, where employees benefit from the same mechanisms of contextualization, cognitive organization, and social presence that support student learning. For example, in a workforce training program, an AI chatbot persona trained on facilitator rubrics and

exemplar submissions engages employees in structured dialogue as they develop professional program assessment plans, offering formative feedback on alignment, clarity, and completeness before formal facilitator review [6], [13]. As AI-generated personas become increasingly lifelike in voice, expression, and responsiveness, the boundary between human and digital interaction will continue to narrow across professional development and traditional learning environments, raising both the potential for deeper engagement and new considerations around transparency, trust, and ethical design.

Conclusion

The effectiveness of personas depends on pedagogical intentionality, not on delivery modality. Across the examples in this paper — from a written persona in an undergraduate management course to an XR avatar in an HR simulation — the same engagement mechanisms recur: authentic contextualization [3], [5], cognitive organization through narrative structure [10], perspective-taking across disciplinary roles [12], and multimodal alignment that reinforces a consistent persona-driven narrative [7]. AI extends what is possible at the high end of the continuum but does not alter the underlying theory [6]; the engagement work is done by the design, not the technology.

As persona-based approaches expand into professional development and workplace learning, these principles hold. What changes is the design challenge: as AI-driven personas become increasingly lifelike, instructional designers will need to address transparency, trust, and ethical intentionality with the same care they bring to pedagogical alignment. The line between human and digital interaction will continue to narrow; the underlying pedagogy does not have to.

Gamifying Feedback for Student Engagement in Research Modules: A Design-Based Research Approach

Joalise Janse van Rensburg

The Independent Institute of Education, Emeris, Faculty of Education, Cape Town, South Africa

Abstract

Designing engaging learning experiences present new challenges especially in contexts where generative AI can be used to complete academic work. This is particularly concerning in research modules where most assessments are text based. Furthermore, providing detailed feedback on informal activities can unintentionally result in students disengaging. They may use the feedback as prescriptive instructions for formal assessments as opposed to actively engaging and interacting with the lecturer and their peers as part of the learning process. This study presents the design and first implementation of a series of activities grounded in experiential learning to gamify feedback in research modules. A Design Based Research approach was adopted to develop and create an artefact by positioning the educator as designer and implementer. Data to refine the artefact was generated by means of expert critique and a structured reflection organizer informed by experiential learning theory and gamification design principles. The findings provide insight into the design process and design choices made to create the artefact aimed at gamifying feedback in research related modules. This study contributes to investigations into practical approaches to possibly improve student engagement and assign value to human interaction and engagement in the learning process.

Keywords: *Gamification, Research Modules, Feedback, Reflective Design*

1. Introduction

A challenge that many Higher Education lecturers face is sustained student engagement [1], [2]. There are two factors that make student engagement especially challenging in research modules where most assessments are text-based and submissions are iterative in nature [3]. The first is Generative Artificial Intelligence (GAI) because students can easily outsource their thinking and work without truly engaging in the learning process [4]. The second is lecturer feedback, not only is it possible that feedback is provided on GAI text with limited to no student engagement, but students may also use the feedback as prescriptive instructions for formal assessments as opposed to actively engaging with the lecturer and their peers during the iterative research process. Gamification of educational content has been found to increase student engagement of which one strategy is using rewards to recognise student effort [1]. This study specifically focussed on designing an artefact to gamify feedback in research modules by rewarding and recognising student engagement. Li et al. [1] explain that developing and implementing gamification could be complicated and suggest that the game mechanics, elements, and structure first be established before including subjective aspects like player experience. Thus, this study was exploratory in nature and focused on developing an artefact to address student engagement in research modules through reflection and expert critique which could be used for formal testing.

2. Design Based Research

Design based research (DBR) is a methodological approach that is systematic and flexible, with the intention to improve current practice by designing interventions to solve real world problems [5], [6]. Characteristics of DBR include grounding in pedagogical theory, considering context, iteratively analysing, designing, implementing, integrating different methods, and practical solutions [5]. During the process the researcher is responsible for systematically designing and implementing interventions to determine how the design could work and why [6]. In DBR the researcher holds multiple identities which ensure an in-depth understanding of the design and process [7]. In this study, the researcher was the lecturer, designer, and implementer. Different authors suggest variations on the phases of DBR, in this study the phases identified by McKenney and Reeves [8] were applied. The three phases include analysis and exploration, design and construction, and evaluation and reflection, which are revisited

regularly throughout the design process [8]. McKenny and Reeves [6] discuss two types of evaluation, formative and summative, as well as three types of testing, alpha, beta, and gamma. For the purposes of this study, only formative evaluation and alpha and beta testing were applied. The reason is that summative evaluation and gamma testing focus on assessing and testing a highly stable version of the artefact [6] whereas this study focused on the initial development and first implementation. Thus, for formative evaluation, one explores how the design could be improved [6]. Alpha testing concerns the logic of the design and its internal structures to determine the artefact's soundness and feasibility [6]. Beta testing considers its use in context without formally testing it [6]. The formative evaluation and alpha testing were done through developer screening, the researcher's reflective notes, and expert appraisal, individual expert critique, and feedback [6]. The reflection was guided by a structured reflective organizer which was informed by Experiential Learning (EL) theory and gamification principles. It also included four perspectives: lecturer, designer, implementer, and researcher. As recommended by McKenney and Reeves [6] the researcher engaged in a social reflective process with the experts but also more importantly solitary reflection regarding the artefact's meaning and application. Figure 1 illustrates a summary of the process followed in this study.

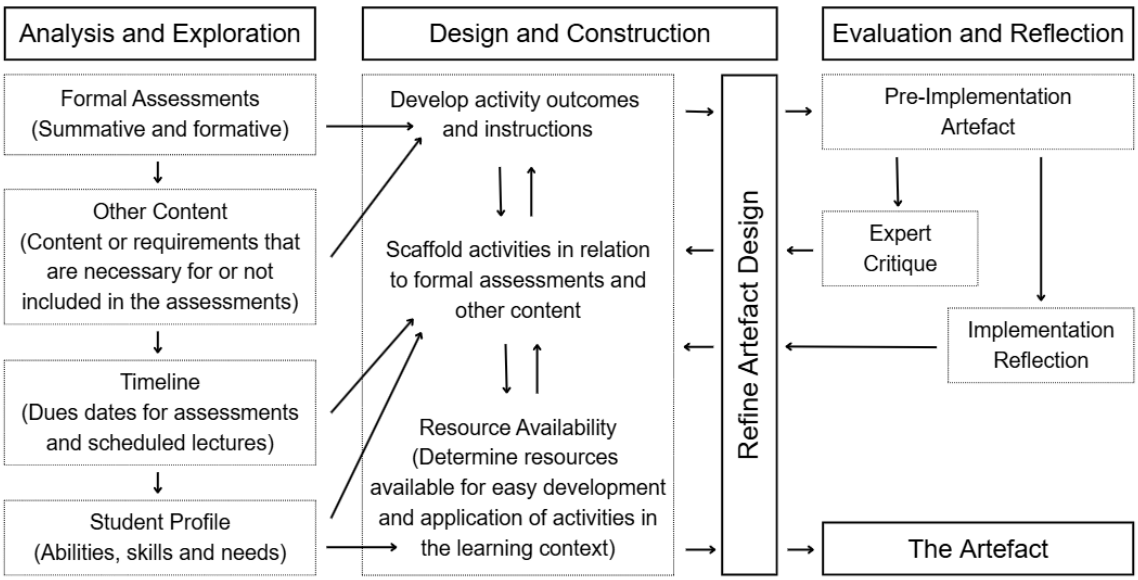

Fig. 1 The Design Process

What is not evident in Figure 1 but necessary to mention is the selection of a pedagogical approach before the research commences [5]. In this study, the pedagogical approach was EL, which was further supported by gamification principles. In the remainder of this article, the theoretical grounding will be discussed as well as each phase illustrated above and finally the artefact that this process yielded.

3. Theoretical Grounding

EL and Gamification formed the theoretical grounding that guided this study in the design process and during reflection. For EL theory the philosophical understanding of John Dewey is discussed as it has a stronger focus on the educator's role in planning and developing educational experiences. Gamification principles are also briefly addressed together with which were applied in the artefact.

3.1 Experiential Learning

John Dewey, the foundational philosopher of EL, argues that true and valuable learning occurs when students are actively engaged and involved in their environment, encounter obstacles, and reflect on outcomes [9]. Knowledge and skills are developed and applied through direct and meaningful experiences where interactions are planned and facilitated by an educator [10]. It is necessary to note that the experience on its own is not enough to guarantee learning, it requires structure and reflection to ensure its educational value [9]. Experiences could also be mis-educative if they do not provide a platform for further growth and learning or do not meet the required learning outcomes [11]. Dewey

suggests two principles for evaluating experiences: continuity and interaction [9]. Continuity relates to the conditions the experience creates to inform and affect the quality of future experiences for further growth and learning [11]. Interaction involves how the students' internal needs, desires, and capacities, and the external environment shape their experiences [9], [11]. Thus, the educator needs to know the context where the learning objective needs to be achieved as well as how it should be scaffolded for continuous learning [9].
In this study EL theory was the pedagogical approach used to develop scaffolded activities. One of the key components of EL is an educator who is knowledgeable in the subject matter as well as the students' readiness [12]. This is to ensure that the experiences are within the students' capabilities but also relevant to the module content [12]. Firstly, the researcher-designer, who is also the lecturer for the research module, considered the students' knowledge at every given point in the scaffolded process based on her previous experiences. In this way, she was able to ensure the continuity of the activities by designing it so that one learning experience informs, builds towards, and affects future experiences. Secondly, the researcher-designer's knowledge of the general student in these modules assisted with designing relevant activities. Understanding where the students should be in the research process and what they would need to continue to the next part, informed how the experiences were designed to ensure optimal progression. EL further informed some of the structured reflective organizer elements, these were learning outcomes, continuity, interaction, lecturer role, learning mechanics, intended experience, and enacted experience. EL also allows room for adapting experiences to ensure that the desired outcomes are reached, any such instances during the design process and reflection were noted by the researcher during the artefact development.

3.2 Gamification Principles

Gamification is the strategic use of game design elements, mechanics, and principles in non-game environments, like classrooms [14], [15]. The intention of gamifying educational content is to motivate students to achieve learning outcomes and increase engagement during their learning journey [15], [16]. The fundamental components that make games fun include game mechanics (non-player characters, points, turns, rewards, avatars, levels, badges, challenges/quests, leaderboards), learning mechanics (task, demonstration, educational tutorial, assessment feedback, reflect/discuss), and game aesthetics (narrative, sensation, audio, fantasy, challenge, fellowship) [14], [15]. Students generally find gamified educational content more engaging, and most studies conclude that it has an overall positive effect on the learning experience [1], [2], [15], [16], [17]. Gamification is more likely to be effective when the experiences are designed to meet students' needs and expectations [17] which relates to EL as a pedagogical approach. With regards to the educator, their willingness and skills, and the resource requirements to use the gamified elements, impact the application and implementation in the classroom [15].
In this study, rewards were used as the main game mechanic, tasks, discussion and reflection the learning mechanics, and challenge the game aesthetic. Students were rewarded with tokens for engaging with the content when posting ideas on a discussion board and then discussing it in class to 'buy' deeper levels of feedback. One could consider openly sharing research ideas with peers as the challenge aspect. Furthermore, games generally have rules and actors who attempt to achieve a goal by obeying the rules [16]. In this study, the 'rules' are the scaffolded instructions and experiences that students, actors, must complete to progress through their learning journey. Triantafyllou et al. [17] state that gamification can encourage both intrinsic and extrinsic motivation. For the most part the artefact in this study relied on extrinsic motivation that was driven by rewards for engagement. This relates most to what Triantafyllou et al. [17] call 'missions' and 'virtual goods' where students have certain goals for which they receive rewards. Since the researcher-designer is also the lecturer, the educator's willingness and ease of use was not a challenge, and resource availability was considered during the design to ensure easy implementation.

4. Analysis and Exploration

There were four distinct aspects analysed and explored to design the artefact: formal assessments, other content, timelines, and student profile. Each element in this phase was considered individually and in order from top to bottom as indicated in Figure 1. First the formal assessments, this included summative and formative assessments which have an impact on a student's final grade, these were considered to establish the milestones and final requirements of the module. In this specific case a Research Proposal was the summative assessment, and a concept document, literature review, and

ethics application the formatives. Thereafter, other content and requirements were considered which students must complete but are not included in the formal assessments. In the research modules where the first implementation took place, this was mostly focused on the memorandum of understanding that a student and supervisor must sign. The next important aspect was the timeline; this was impacted by the due dates for the formal assessments and the frequency and number of lectures scheduled. Lastly, students' abilities, skills, and needs were also considered from the researcher-lecturer's experience. Generally, the students' research abilities and skills are very limited, previous cohorts have differed slightly but usually one would need to start with the basics. Regarding needs, the students usually want the fastest route and only later realize that working consistently throughout the semester is required. The aspects of the research process that students tend to struggle with most include committing to a topic and focus, ensuring the study is feasible and valuing and applying feedback. The analysis and exploration of these aspects during the initial phase of the study informed the choices made during design and construction.

5. Design and Construction

There were three main considerations related to the design and construction: the activity outcomes and instructions, activity scaffolding, and resources availability. These considerations impacted one another during artefact development. Initially the activity outcomes and instructions were considered, and this was based specifically on the formal assessments and other content. While these activities were developed the options for scaffolding were explored and informed by the timeline and student profile. In this specific study the available resources were not considered during the first phase, analysis and exploration, but rather after there was a basic idea of the scaffolded activities and what would be required. This was to decide whether the available learning management system (LMS) could be used or if external tools should be considered. After exploring some external tools, it was decided to develop the artefact in the available LMS to ensure ease of management and support. For the students and lecturer, it meant that all academic work and activities are in one place and for the lecturer if any challenges arose there was support available on campus. For this specific artefact the discussion board tool as well as file submissions were used for the submission of work and the grade book with formula columns were used for managing rewards. Students would receive feedback tokens if they participated and submitted the required work. For some of the token activities it was necessary for students to discuss their thoughts and ideas in class to receive the maximum tokens available. Tokens were awarded by allocating marks for submissions and participation in class discussions and could be exchanged for deeper levels of feedback on formative assessments. The number of tokens received and used were captured in the gradebook where a formula calculated the remaining tokens per student. This yielded the pre-implementation artefact that was discussed with the experts in the evaluation and reflection phase.

6. Evaluation and Reflection

The evaluation and reflection phase included expert critique on the pre-implementation artefact and reflection by the researcher during the entire research process. Ethical clearance was obtained from the researcher and experts' institution before discussions started. The experts were purposefully chosen and recruited to participate in an in-person discussion of the design and included lecturers who taught similar research modules. These discussions were recorded, transcribed, and notes were taken by the researcher. This is considered data collected for artefact refinement. The researcher, who is also the lecturer, designer and implementer, kept reflective notes throughout the entire process. The reflective notes were structured according to a structured reflection organiser that was created using EL and Gamification principles. These reflective notes are also seen as data that was collected to refine the artefact. After receiving the expert feedback and during implementation the artefact was refined by going back to the design and construction phase. Expert critique included suggestions to scaffold some activities differently, incorporate visual and aesthetically pleasing elements and considering alternatives for token calculation. Reflection also yielded additional possibilities regarding the use of badges, levels, quests and leaderboards. The artefact was refined and adapted based on the expert critique and reflection, but major changes did not form part of the first implementation as to not confuse students during the semester. Changes that were made during the first implementation included shifts in due dates and adapting instructions for changes that occurred in the institution and clarity.

7. The Artefact

In this section more detail is provided on the design and logic of the artefact. Firstly, the context specifics will be highlighted, thereafter the scaffolded activities discussed followed by reflective insights gained from the study with a generic structure that could be adapted and applied to other contexts.

7.1 Context Specifics

The module for which the artefact was designed is a research module for post-graduate diploma students in computer science of which the group size is 20-30 students. They generally completed an undergraduate degree the previous year, most of them in computer science but there are usually some students with other undergraduate degrees. All students must have some programming background to study the post-graduate diploma. At the end of the semester students must receive ethical clearance from the institution for their study and submit a research proposal to continue with research and complete a research project in the following semester. These students are generally comfortable with technology, but their research experience is very limited. This means that the module is considered their first introduction to the academic research process. The researcher has taught the module for three years and has experienced a decline in student engagement, in some part due to in-depth feedback provided on submitted documents: the students do not see the value of coming to lectures if they get in-depth guidance on submitted text. The researcher is also comfortable with the institution's LMS which assisted in easy develop the artefact.

7.2 The Scaffolded Activities

In the artefact there are three types of assessments: token activities, formative assessments, and summative assessments. By completing and engaging with token activities students can earn 1 to 2 feedback tokens which can be exchanged for deeper levels of feedback in formative assessments. For 0 tokens a student would receive a basic level of feedback, this includes one-word verbs like "expand" or "clarify". 1 token would buy a student more detailed feedback like "expand on this specific concept, idea, or argument" or "clarify this specific word and what you mean here". Lastly, 2 tokens would buy a student the deepest level of feedback with more detail like "expand on this specific concept by referring to these ideas and arguments" or "clarify this word by explaining how it relates to your study". The token activities and formative assessments are scaffolded in such a way to ensure that a student is prepared for completing and submitting the summative assessment. In the summative assessment feedback tokens cannot be earned or exchanged. Figure 2 illustrates the structure and logic of the designed artefact.

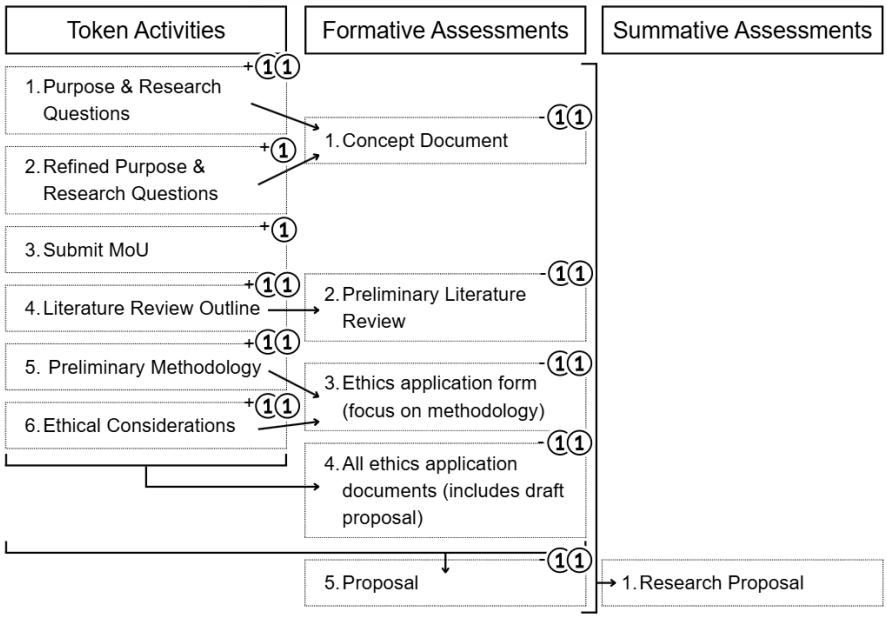

Fig. 2 The Designed Artefact

In Figure 2 the six token activities are listed first, each of these activities required the students to engage with a part of the research process. For activities 1, 4, 5, and 6 the students had to post their ideas on a discussion board and be ready to discuss and explain it in class. A post on the discussion board earned them 1 feedback token and if they also discussed it in class they received another token. Thus, for these activities there were 8 tokens available. It is necessary to note that a student needs to post on the discussion board first before they can view other's posts. For token activity 2 students had to refine their purpose and research questions in token activity 1 to receive 1 feedback token, this was specifically done to allocate supervisors. The first time a student develops a purpose and research questions it generally needs a lot of work, thus by having them post on a discussion board, discuss in class, receive verbal feedback and hear other student's ideas they would be able to better refine their ideas for token activity 2. Token activity 3 was the submission of the signed memorandum of understanding between the student and their supervisor for 1 feedback token. Token activities 1 and 2 were the prior experience to formative assessment 1, the concept document. A student would have been able to earn a total of 3 feedback tokens before submitting formative assessment 1 that would cost them 2 tokens for the deepest level of feedback. Token activity 4 directly related to formative assessment 2, the literature review. For the token activity students had to post their literature review outline on a discussion board for 1 token and then discuss it in class for informal verbal feedback and another token. If students earned and spent the most tokens possible, they would have 4 tokens of which they can exchange 2 for deeper feedback in the preliminary literature review. Token activities 5 and 6 could earn a student 2 tokens each and was the experience that built towards completing the ethical clearance application. For the token activities students had to refine their methodology and ethical considerations. At this point if students completed all activities and spent the most tokens possible, they should have 6 tokens which they can spend on formatives 3, 4, and 5, 2 tokens per assessment for the deepest level of feedback. For feedback assessment 4 students were required to submit all the documents required for ethical clearance which included a draft proposal meaning that all the token activities built towards them being able to complete the required documentation for ethical clearance. Lastly formative assessment 5 is an opportunity for students to buy deeper levels of feedback on their proposal before they submit it for the summative assessment, all the token activities and formative assessments were experiences geared to the students being able to successfully complete their proposal.

7.3 Reflective Insights from the Study

The reflective insights highlighted below can be divided into token management, lecturer perspective, the artefact design, expert insights, and further refinement.

Firstly, token management, initially this was a concern because one does not want to unnecessarily increase admin load. Initially while marking the formative assessments the lecturer had to figure out which tabs and windows were necessary, this was something that one needed to get use to but after a few repetitions she was more comfortable. Remembering to award the tokens was a challenge sometimes but this could easily be circumvented by marking while students discuss in class. Lastly awarding and exchanging tokens within the LMS was beneficial. External systems might add more features but having to work on two systems is not worth it.

Concerning the lecturer perspective there was an assumption that verbal feedback provided during the token activities would mean less feedback in formative assessments, this was not necessarily true. For the students that exchanged the maximum number of tokens providing timeously in-depth feedback was still required but the lecturer gave this gladly as the students were engaging in the classroom. On the other end time was saved during marking for the students who did not exchange tokens for deeper levels of feedback. Furthermore, some students were excited about earning and exchanging tokens which shifted the idea that feedback is something that one will simply receive if work is submitted to feedback requires engagement, is valuable and something one needs to work for.

Regarding general reflective insights of the artefact design, it worked well in the research module where there was one summative assessment at the end of the semester, and all other assessments build towards it. This could mean that it is easily transferable to modules where assessments work in a similar way. Figure 3 illustrates the structure designed and developed in this study.

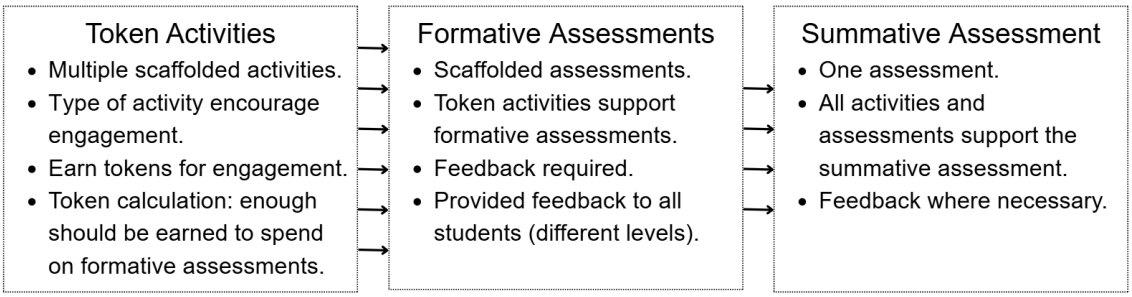

Fig. 3 Structure Gamifying Feedback in Research Modules

Figure 3 illustrates the elements to gamify feedback in research modules which could potentially be adapted to other modules where assessments require iteration and feedback that builds towards a final summative assessment. Important elements to note in Figure 3 is that token activities should be scaffolded, support and build towards the formative assessments, require some form of engagement from the student, and one should calculate the total tokens possible before formative assessments to ensure that students would have enough to exchange it for the deepest level of feedback. For formative assessments the important characteristic is that feedback is required. All students should receive feedback; the depth is dependent on the number of tokens they spend. These assessments should also be scaffolded and build towards the summative assessment. Through this structure a high value is assigned to the human element, lecturer feedback and peer interaction, in the research process. Upon reflection from the implementers perspective this is an interesting idea for further exploration in the age of AI. Many technologies could be used for students to earn tokens and gamify feedback but the idea that they must participate and engage in person to be able to exchange tokens for human, lecturer, time and attention shifts the focus to the importance of the human element. The student must engage to gain access to in-depth feedback from the lecturer.

Furthermore, the experts provided valuable insights of which some were included in the artefact design and others recommended for further development. Their discussions assisted in refining activity expectations and structure as well as motivating a more aesthetically pleasing artefact. Unfortunately, some discussions could only take place during the first implementation which meant that not all expert feedback was implemented as to not confuse students. Suggestions that are recommended for refinement include restructuring feedback types by adding more options and providing students the opportunity to select how they would want to receive the feedback.

Final thought post-implementation reflection to be considered for further refinement. Students started negotiating if they did not have enough tokens for in-depth feedback which leaves room for additional tasks to earn more tokens. Initial ideas regarding this include auto assessed quizzes, peer assessment, and presenting concepts in class. One could also consider the possibility of users gifting rewards to one another, but calculations to ensure viability would be vital before implementing. Students also asked about what happens if they have tokens left at the end of the semester whether they could exchange it for more feedback. This component needs further refinement and could possibly include one-on-one in-person consultation with the lecturer. Which would again assign more value to human interaction.

8. Conclusion

Through the process of DBR and using EL and Gamification principles an artefact to gamify feedback in research modules was developed. This paper described the research process followed and the structural design that was developed. From a practical perspective this study yielded an artefact that is stable and could be used for formal implementation, testing, and measurement. Further research recommendations include exploring lecturer and student perceptions and experiences, and measuring the impact on engagement and academic performance. From a more philosophical perspective this study brought about the idea to find ways to assign value to the human element in the learning process. In this specific study it was rewarding students with tokens for their engagement in a module and then exchanging this reward for access to the lecturer's time, knowledge and expertise. In our current day and age lecturers compete for students' attention and engagement against many forms of media and AI, and this artefact might be a step in the right direction by assigning tangible value to human interaction and engagement.

Designing Project Courses with Purpose: How Benefiting Others Enhances Bachelor Student Motivation

Marijana Teljega[1], Daniel Einarson[2]

[1,2]Dept. of Computer Science, Faculty of Natural Science, Kristianstad University, Sweden

Abstract

Student motivation is a critical factor in computer science education, particularly in project-based courses where collaboration and sustained engagement are essential. Research in software engineering contexts shows that motivation strongly influences productivity and project outcomes, while low motivation is associated with project failure. In educational settings, this raises the question of how to foster not only external motivation, such as grades, but also intrinsic motivation, which is closely linked to deeper learning and long-term competence development.
This paper presents a case study from a Bachelor programme in Software Development, in which project courses across three years have been designed to include a purpose by engaging students in projects that benefit others, such as health-related applications and real-world collaborations. The study is grounded in Illeris' theory of learning, which conceptualizes learning as an interaction between cognitive, emotional, and social dimensions.
Data was collected through course evaluations, student reflections, surveys, and teacher observations. The results indicate that students' experience increased motivation, improved collaboration, and deeper engagement when working on meaningful projects. Furthermore, students demonstrate signs of developing professional identity and reflecting on their roles within teams.
The findings suggest that incorporating purpose-driven project design into computer science education can enhance both learning processes and student motivation, contributing to more effective and meaningful educational experiences.

Keywords: *Computer Science Education, Project-Based Learning, Intrinsic Motivation, Empathy, Service-Oriented Learning*

1. Introduction

Student motivation is a central factor in successful learning, particularly in computer science education, where project-based courses require sustained engagement and collaboration. In software engineering practice, motivation has been shown to significantly influence productivity, team performance, and project outcomes, while low motivation is associated with project failure [1][2].
In educational contexts, this highlights the importance of designing learning environments that support not only external motivation, such as grades and deadlines, but also intrinsic motivation. Intrinsic motivation is closely linked to engagement, persistence, and deeper learning processes, making it particularly relevant in complex and collaborative learning settings.
One approach to fostering intrinsic motivation is to introduce elements of purpose into learning activities. When students perceive their work as meaningful or beneficial to others, their engagement and commitment may increase. In computer science education, this can be achieved by designing project courses where students develop solutions for real-world problems, particularly in domains such as healthcare or social good.
This paper explores how purpose-driven project design, with a focus on benefiting others, influences student motivation and learning processes. The study is grounded in Illeris' theory of learning [3], which conceptualizes learning as an interaction between cognitive, emotional, and social dimensions.
The contribution of this paper is a case study from a bachelor's programme in Software Development, where project courses across three years have been designed to include elements of empathy and real-world impact. The study examines how this design choices affect students' motivation, collaboration, and learning.

2. Theoretical Background

2.1 Illeris' Three Dimensions of Learning

Illeris [3] describes learning as a process involving three interconnected dimensions, as outlined by Figure 1:

- Cognitive dimension, related to knowledge, understanding, and skills
- Emotional, or affective, dimension, including motivation, feelings, and volition
- Social dimension, involving interaction with others and the surrounding environment

Effective learning requires the integration of all three dimensions. The cognitive dimension alone is insufficient without emotional engagement and social interaction. Intrinsic motivation plays a key role in activating the emotional dimension, which in turn supports deeper cognitive processing.

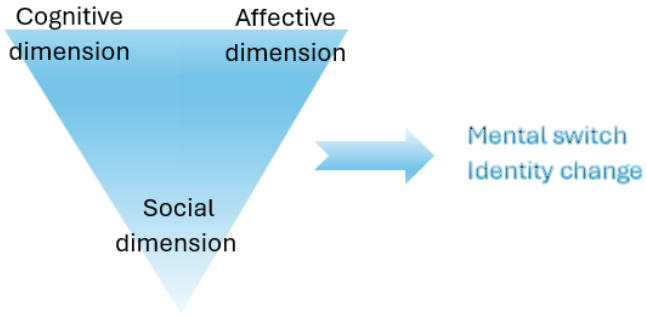

Fig. 2. the three dimensions that contribute to the outcomes that can be understood as a mental switch and identity change in software development students

The three dimensions jointly contribute to outcomes that can be understood as both a *mental switch* and an *identity change*. At the **cognitive dimension**, individuals revise their frames of reference, assumptions, and ways of interpreting situations, resulting in a mental switch toward new patterns of thinking. At the **affective dimension**, shifts in motivation, values, and emotional engagement support a deeper internalization of these new perspectives. Finally, at the **behavioral (or social) dimension**, sustained changes in actions, roles, and participation consolidate these transformations. Together, these dimensions interact to produce not only a temporary cognitive adjustment but a more enduring identity change, in which individuals come to see themselves differently in relation to their practices, roles, and communities.

2.2 Intrinsic Motivation and Empathy

Intrinsic motivation refers to engaging in an activity for its own sake, driven by interest, enjoyment, or perceived meaning. In contrast, extrinsic motivation is driven by external rewards such as grades or recognition.
Empathy and prosocial behavior have been shown to strengthen intrinsic motivation and support collaboration [4]. Activities that involve helping others can create a sense of purpose, which enhances engagement and persistence.
In educational contexts, this suggests that project design can play a crucial role in activating intrinsic motivation by connecting learning activities to meaningful real-world contexts.

2.3 Transformative Learning and Identity Development

Transformative learning involves changes in how individuals understand themselves and their roles, often described as shifts in perspective or identity [5]. Such changes are particularly relevant in professional education, where students gradually develop a sense of professional identity.
Project-based learning environments provide opportunities for such development, since students take on roles, collaborate in teams, and engage with realistic problems. These experiences can lead to increased self-awareness, confidence, and understanding of professional responsibilities.

3. Related Work

Student motivation and engagement have been widely studied in educational research. Fredricks, Blumenfeld, and Paris [6] conceptualize engagement as a multidimensional construct including behavioral, emotional, and cognitive components, highlighting the importance of addressing all three in effective learning environments.
Intrinsic motivation has been further developed within Self-Determination Theory (SDT) by Ryan and Deci [7], which emphasizes the role of autonomy, competence, and relatedness in supporting deep engagement and persistence in learning tasks.
Learning has also been described as a process involving identity transformation. Mezirow [8] argues that meaningful learning experiences can lead to changes in individuals' perspectives and self-understanding, particularly in contexts resembling real-world practice.
Additionally, research on achievement emotions underscores the role of emotions in the learning process. Pekrun [9] demonstrates how emotions, such as enjoyment and anxiety, influence motivation and performance, while Dahlqvist [10] shows how affective experiences shape students' learning in higher education.
Together, these perspectives suggest that learning environments should address not only cognitive aspects but also emotional engagement, intrinsic motivation, and identity development. This study builds on these insights by examining how purpose-driven project courses in computer science can support these dimensions through meaningful and socially relevant tasks.

4. Educational Context

The study is conducted within a three-year Bachelor programme in Software Development at Kristianstad University. The programme combines theoretical courses with project-based courses at the end of each academic year, where innovation is also used to promote engagement and motivation [11]. The project courses are designed to progressively develop students' technical skills, collaboration abilities, and professional identity. During the pandemic, the project courses continued to be delivered despite the challenges [*12*]. In addition, elements of purpose and empathy are introduced by framing projects around real-world problems, often related to healthcare or societal needs.

5. Method

This study employs a qualitative case study approach. Data were collected from:

- Course evaluations
- Student reflections
- Surveys
- Teacher observations

Participation in surveys and reflections was voluntary.
The analysis focuses on how students' experiences relate to the three dimensions of learning proposed by Illeris: cognitive, emotional, and social. Particular attention is given to indicators of motivation, engagement, collaboration, and identity development.

6. Study Cases

Three case studies are presented as outlined in Table 1. The study cases reflect on courses students take during their first, second, and third years, respectively. The programme syllabus is, furthermore, addressed in [13].

Table 1. Study cases

Study cases	Project description	Role-forming identity	Providing support to users
Agile methodology Year 1	4-5 students/group Students are free to decide on projects that focus on mental health	Scrum master Developer Tester Supporter	Supporting individuals with mental health challenges
Android development Year 2	4-5 students/group Students work with companies to develop a prototype	Consultant	Companies, University researchers, Institutions
Software engineering Year 3	13 students/group Designing and developing from scratch Smart home system	Project manager Requirements manager Subgroup-leader Developer Tester	Smart home users, including families as well as institutions such as hospitals

6.1 Agile Methodology (Year 1)

Students work in groups of 4–5 to develop applications related to mental health, more exactly SDG 3.4 Good Health and Well-being, is chosen by the teacher as a base for the project work, with the purpose of reaching the intrinsic motivation. They rotate between roles such as developer, tester, and scrum master.

The project emphasizes:

- Role exploration
- Reflection
- Empathy through application themes

6.2 Android Development (Year 2)

Students collaborate with external partners, such as companies or researchers, to develop mobile applications. They work in a consultant-like role, interacting with stakeholders and managing real-world requirements.

6.3 Software Engineering (Year 3)

Students work in larger teams (approximately 13 students) to design and develop complete systems, such as smart home solutions. The project simulates professional environments with multiple roles and sub-teams.

7. Results and Analysis

Transformative learning (TL) can be understood as a form of confirmation for us as educators that students' learning has taken place. This confirmation is reflected in multiple sources, including students' responses in course evaluations and questionnaires, their project presentations, and the ongoing dialogue between teachers and students throughout the course of the project. Through these interactions, it becomes evident that students develop in terms of their identity. For example, one student may come to realize that they do not enjoy working in a leadership role, while another discovers a strong affinity for leadership and subsequently expresses an interest in further education or courses related to leadership.

The results are first presented in Table 2 and briefly reflected from the perspective of Illeris' dimensions of learning, and followed by a discussion grounded and motivated across levels of course evaluations and observations of students' attitudes.

Table 2. Students' reflections on project work

	Students' reflections	Empathy	Cognitive	Emotional	Social	Identity
Benefits of using a real-case approach in project work	*"Is really great to have group mates working alongside, where we can help each other and ask questions when stuck."*	✓		✓	✓	
	"Everyone works together and must be involved since companies are dependent on us- pressure to do well"	✓	✓	✓	✓	
	"Having to work on a real application that someone would use in future made it even more motivating. Meeting with teacher and company were also an asset to making sure we are on the right track."	✓		✓	✓	
Challenges of working on a real-case project	*"Since it's a limited time it is important that the companies understand it as well."*		✓	✓		
	"Time limitation, due to unknown fields (what companies want) and limited time for improving own abilities."		✓	✓		✓
	"It could be hard for someone who didn't work with clients earlier. As dealing with clients can require certain skills to drive the project further."	✓	✓			
Impact on knowledge, skills, and professional identity	*"This project has affected my skills and knowledge as I was able to work with new tools including real time database e.t.c. it also boosted my confidence as I was able to contribute to an actual company and assist them in solving a need."*	✓	✓	✓		✓
	"I feel more confident in my abilities to solve a lot of tasks and my ability to work with companies and in groups in a good way. So I have a greatly improved image of myself as a future professional."		✓	✓	✓	✓
	"The project has enabled me to understand how it is working for a company and understanding how to operate with deadlines. Regarding future professional I feel that I am more prepared and also that as mentioned before I feel like I got a better understanding of how real work is."		✓	✓		✓

Cognitive Dimension - Students demonstrated increased ability to apply knowledge in complex and realistic contexts. Projects required integration of skills across programming, system design, and collaboration.

Emotional Dimension - Students reported increased motivation, particularly when projects were perceived as meaningful. Students also appreciated having autonomy in project design, which contributed to engagement and ownership.

Social Dimension - Collaboration improved across all project courses. Students developed communication skills and a better understanding of team roles.

Working with external stakeholders further strengthened their ability to interact in professional contexts.

Identity Development - Students showed signs of developing professional identity. Some discovered preferences for specific roles, while others gained confidence in their abilities. These changes indicate elements of transformative learning, where students not only acquire knowledge but also reshape their understanding of themselves.

7.1 Agile Methodology Course

The survey results show that the students felt more motivated to learn when they were given the freedom to decide what kind of app to develop, even though teachers set the theme as mental health. Students felt that changing roles engaged them to seek out more knowledge before they turn over their role work to the next student. Walking in others' shoes gives students insight into their own knowledge and identifies areas where they can improve.
The weekly reflections indicate a progressive development consistent with transformative learning theory. Early reflections show students critically engaging with initial assumptions regarding teamwork, roles, and project planning. As the project advanced, students described changes in perspectives related to collaboration, tool usage, and problem-solving, supported by increased reflection, dialogue, and adaptive action. By the final phase, students demonstrated not only improved technical competence and stable teamwork but also evidence of perspective transformation, expressed through enhanced professional confidence, clearer role awareness, and emerging insights into personal preferences for responsibility and leadership. These findings suggest that learning extended beyond skill acquisition to include shifts in students' frames of reference and professional identity.

> *It was as really beneficial to work in a "work like" environment prior to working in the industry and building up team related skills and trying out different roles. This is especially beneficial as it gave creative freedom to a degree to do what we want to and expand our own skill set based off of that which was a lovely experience.*

Fig. 3. The citation was taken from the course evaluation

Myrmydon [14] is one of the many examples, including applications developed by students with a focus on mental health, striving to help another human.

7.2 Android Development Course

The results from Android development projects on motivation and on working with customers as consultants point out that many students felt it was challenging to work with companies, but they did develop a successful application in the end. Students felt that it was much time-consuming and wished for longer time to develop. Students also reported that they got proper experience and company connections. Students had varying perspectives on their skills and future professional development, with some being less focused on it and others expressing interest in working as consultants in the mobile industry. This way of working was positively received and recommended by students for continued implementation in the programme.

> - *Both hurt my confidence and patched it up and rebuilt it.*
> - *This course has helped me develop my skills a lot and even realise a lot of my strenghts and weaknesses.*

Fig. 4. Reflections about motivation and working with customers shared by two students

One example of an Android app developed in cooperation with a company is an app that prevents littering [15].

7.3 Software Engineering Course

Teachers observed that students felt frustrated at the beginning of the project, when they needed to find their own place in the group. Many students struggled to see how the project would progress, how collaboration would function, and what the completed project would ultimately look like. To address this challenge, teachers recommend the group leaders based on students' grades and communication abilities demonstrated in previous courses. It was beneficial that the projects were designed with the purpose of benefiting their target users. The leaders used the knowledge about the target users to gather the group and provide them with a clear goal, both in the technical area, and to develop a product that

focuses on the needs of product users, families, disabled people, or hospitals. Reaching the end of the project, students realized and felt safe in what their role is and what they shall deliver, how communication flows, and what tools are used. Students felt very proud of their own achievement at the end of the project.

> *It succeeds in forcing students into a real life scenario of being a part of a company. The instructors gave us freedom of choice to some extent to direct the project on own, which leaves room for creativity.*

Fig. 5. Student's reflection on motivation and on the project role

An example of a smart home system involves the use of Brain Computer Interface (BCI) to assist in interacting with the house [16].

8. Discussion

The findings suggest that purpose-driven project design can positively influence all three dimensions of learning.

- The cognitive dimension is strengthened through complex, real-world problem solving
- The emotional dimension is activated through meaningful and empathetic contexts
- The social dimension is enhanced through collaboration and interaction

The use of empathy as a design principle appears to be particularly effective in fostering intrinsic motivation. When students perceive their work as meaningful, they become more engaged and invested in the learning process.
The findings align with prior research on engagement and motivation. In line with Fredricks et al. [6], students show not only behavioral participation but also emotional and cognitive engagement in meaningful project contexts. The course design supports intrinsic motivation as described by Ryan and Deci [7], through autonomy, competence development, and collaboration.
Students' reflections further suggest elements of identity development, consistent with Mezirow [8], while the observed role of emotional involvement aligns with research on achievement emotions by Pekrun [9] and Dahlqvist [10].
However, not all students are equally motivated by empathy-based approaches. Future work should explore how different motivational strategies can be combined to support a broader range of students.

9. Conclusion

This paper demonstrates that integrating purpose and empathy into project-based courses can enhance student motivation, engagement, and learning. By aligning project work with real-world needs, students not only develop technical skills but also gain a deeper understanding of their roles as future professionals. The results suggest that purpose-driven design should be considered an important component in the development of computer science education.

Recalibrating Confidence through Participation: A Design-Based Study of Virtual Student Mobility in a Generative AI–Supported Learning Environment

Sachiyo SEKIGUCHI

Meiji Gakuin University, Japan

Abstract

Many educators intuitively recognise that meaningful international learning does not simply increase students' confidence; rather, it often leads learners to become more aware of the limits of their own abilities and understanding. Despite this shared intuition, how such moments of awareness emerge, and how they appear in empirical data, has remained largely a black box in international and digital learning research. As technology-mediated global learning environments become more prevalent, learning outcomes are often measured by gains in confidence or self-assessed competence. In contexts characterised by complexity, uncertainty, and authentic participation, however, such interpretations may overlook important dimensions of learning. This study adopts a design-based research (DBR) perspective to examine how participation in a semester-long, synchronous Virtual Student Mobility (VSM) course reshaped Japanese university students' self-perceptions of intercultural competence (McKenney & Reeves, 2018). In this course, Japanese students participated remotely and in real time in an undergraduate course offered at a U.S. university, engaging alongside local students in lectures, discussions, and collaborative activities within a technology- and generative AI–supported learning environment designed to scaffold participation and comprehension. A pre-post survey informed by the OECD PISA Global Competence Framework (2018) and an integrated intercultural competence scale developed by Fantini were administered, with 41 students enrolled in the 2025 courses voluntarily completing both surveys. Contrary to expectations, post-course self-assessment scores declined across most survey items. Rather than interpreting this decline as a negative outcome, the study situates the findings within the design of the learning environment itself. Quantitative results are examined alongside qualitative end-of-course reflections, which consistently indicated deeper awareness, heightened recognition of communicative complexity, and increased reflective engagement. This apparent tension highlights a critical but often underexplored phase of learning: the recalibration of learners' self-perceptions following authentic participation in complex learning settings. By foregrounding learning design as the unit of analysis, this study reframes decreased confidence not as failure, but as a meaningful indicator of learning in future-oriented, technology-enhanced environments. The findings suggest a need to rethink assessment practices in global digital learning and offer design implications for supporting learners as they navigate uncertainty and emerging awareness.

Keywords: *Virtual Student Mobility (VSM), Learning Design, Future-Oriented Learning Environments, Student Engagement, Self-Assessment and Recalibration, Design-Based Research (DBR)*

1. Introduction

As technology-mediated international learning environments continue to expand in higher education, Virtual Student Mobility (VSM) has emerged as an increasingly accessible way for students to participate in global learning experiences without physical travel [1]. Alongside this development, generative AI-supported tools such as automatic subtitles, translation systems, and AI-generated summaries are rapidly being integrated into online learning environments to support comprehension and communication across linguistic and cultural differences. Within this context, successful learning outcomes in virtual exchange and COIL environments are often discussed in terms of increased intercultural competence, greater confidence, or improved self-perceived communicative ability [2], [3], [4], [5]. However, authentic participation in complex international learning environments may not always increase learners' confidence. In some cases, direct engagement with unfamiliar academic and intercultural contexts may instead increase awareness of the limits of one's own communicative ability. Although educators often recognise this phenomenon intuitively, it remains underexplored in research relying heavily on self-report measures of confidence and competence. As a result, decreases in self-assessment scores are frequently interpreted negatively. This study argues that such interpretations

may overlook an important dimension of learning in complex, participation-oriented environments. Rather than viewing reduced confidence as a failure, this paper examines the possibility that changing self-perceptions may reflect a meaningful recalibration process emerging through authentic participation. From this perspective, learning involves not only acquiring skills or confidence, but also developing a more realistic and reflective understanding of one's own abilities within socially and culturally situated contexts.

To explore this issue, the present study adopts a DBR perspective [6] to examine a semester-long synchronous VSM programme connecting a Japanese university and a U.S. university. In this learning environment, Japanese students participated remotely and in real time in undergraduate courses alongside local U.S. students. The environment incorporated multiple forms of technological and generative AI support, including live captions, translation support, recorded sessions, and AI-assisted summaries, with the aim of lowering barriers to participation while maintaining authentic interaction and academic complexity. Using pre-post survey data informed by the OECD PISA Global Competence Framework [7] and intercultural competence measures developed by Fantini [8], together with qualitative end-of-course reflections, this study investigates how students' self-perceptions changed through participation in this AI-supported VSM environment. Particular attention is given to the apparent contradiction between declining self-assessment scores and students' qualitative reports of deeper awareness, increased reflection, and heightened recognition of communicative complexity. By foregrounding learning design and participation as the central analytical lens, this paper proposes that decreased confidence may, in some contexts, function as a meaningful indicator of learning rather than its absence.

2. Literature Review

2.1 Virtual Student Mobility and International Online Learning

Virtual Student Mobility (VSM) has emerged as an important approach to expanding access to international learning opportunities in higher education, particularly in contexts where physical mobility is limited by financial, geographical, or institutional constraints. The OECD [1] describes virtual mobility as a form of technology-mediated international learning that enables students to participate in educational experiences across borders without travelling physically. Unlike asynchronous online exchange projects, synchronous VSM environments often require students to participate directly in live classes, discussions, and collaborative activities alongside students from partner institutions, creating opportunities for authentic intercultural interaction in real time.

At the same time, participation in such environments can involve considerable linguistic, cultural, and communicative complexity. Previous research on virtual exchange and online international learning has reported benefits including increased intercultural awareness, communication skills, confidence, and global engagement [3], [9]. However, successful participation in these environments requires more than technological access alone. Learners must also navigate unfamiliar interactional norms, disciplinary expectations, and real-time communication demands within multilingual settings. Recent developments in generative AI and learning technologies have further transformed the conditions of participation in online international learning. Tools such as automatic subtitles, machine translation, and AI-generated summaries may help reduce comprehension barriers and support learners' access to classroom interaction. Nevertheless, technological support does not automatically guarantee meaningful participation. Instead, how such tools are integrated into the learning environment through intentional learning design may play a critical role in shaping students' experiences of participation and engagement.

2.2 Confidence, Self-Assessment, and Intercultural Competence

Intercultural competence has frequently been evaluated through self-report measures examining learners' confidence, attitudes, and perceived communicative ability. Frameworks such as the OECD PISA Global Competence Framework [7] and Fantini's intercultural competence model [8] have contributed significantly to understanding how learners perceive their intercultural development in global learning contexts. In many studies, increases in self-assessed competence are often interpreted as evidence of successful learning outcomes. Recent COIL and virtual exchange studies have similarly reported positive changes in learners' intercultural confidence, effectiveness, and perceived communicative ability following participation in international online learning environments [4]. However, self-assessment in intercultural and multilingual contexts may involve important limitations. Learners entering unfamiliar communicative environments may initially overestimate their abilities due to limited

exposure to authentic intercultural interaction. Through sustained participation, they may become increasingly aware of communicative nuance, cultural complexity, and gaps in their own understanding. As a result, declining self-assessment scores do not necessarily indicate reduced competence, but may instead reflect deeper awareness and more critical self-reflection.
This interpretation aligns with perspectives in educational research that view learning as a process involving uncertainty, reflection, and the restructuring of prior assumptions. In complex learning environments, increased awareness of difficulty may represent an important stage of learner development rather than evidence of failure. Nevertheless, this possibility remains underexplored in research on technology-enhanced international learning environments, particularly in studies relying primarily on quantitative self-report measures.

2.3 Learning Design and Design-Based Research

This study adopts a DBR perspective, which views educational interventions as iterative learning designs situated within authentic learning contexts [6]. Rather than focusing solely on technological tools or learner outcomes in isolation, DBR emphasises the relationship between learning environment design, participation processes, and emerging forms of learning. From this perspective, generative AI tools are understood not as solutions that automatically improve learning, but as mediating resources within broader participation-oriented learning environments. In the present study, the learning environment was intentionally designed to support access to authentic participation while preserving the complexity of real-time intercultural interaction. AI-supported tools functioned as scaffolds to assist comprehension and continuity of participation, rather than as mechanisms for simplifying or replacing interaction itself. Accordingly, this study foregrounds learning design as the primary unit of analysis in examining how students' self-perceptions changed through participation in an AI-supported VSM environment.

3. Context and Learning Environment

The present study was conducted within a semester-long synchronous VSM programme collaboratively implemented between a Japanese university and a U.S. university. In this programme, Japanese undergraduate students participated remotely and in real time in regular undergraduate courses offered at the U.S. institution. Rather than participating in a separate exchange programme designed exclusively for international students, participants joined mainstream classes alongside local U.S. students and engaged in lectures, classroom discussions, and collaborative learning activities conducted fully in English.
The VSM courses were designed to provide students with opportunities for authentic participation in an international academic environment while remaining physically located in Japan. Throughout the semester, students attended weekly live classes via Zoom and interacted with instructors and peers in real time. The courses addressed socially and culturally complex topics related to areas such as ethnicity, society, and culture, requiring students to engage not only linguistically but also intellectually and interculturally within unfamiliar academic contexts. To support participation in this environment, multiple forms of technological and generative AI support were integrated into the learning design. These included live automatic captions, AI-assisted translation support, recorded sessions, and AI-generated summaries that allowed students to revisit classroom interaction after class. In addition, the learning management system (LMS) was used to provide supplementary materials, instructions, and opportunities for reflection throughout the semester.
Importantly, these technological supports were not intended to simplify the learning experience or remove communicative difficulty entirely. Instead, the learning environment was intentionally designed to lower barriers to participation while maintaining the complexity and unpredictability of authentic interaction. Students were still required to interpret meaning in real time, negotiate unfamiliar perspectives, and manage the challenges of participating in a multilingual and intercultural classroom environment. From this perspective, generative AI functioned primarily as a scaffold supporting access to participation rather than as a replacement for communicative effort or intercultural engagement. The design of the VSM environment reflected the assumption that participation itself constitutes an important site of learning. Rather than positioning students as passive recipients of international content, the programme aimed to situate learners within authentic social and academic interaction where awareness, uncertainty, and self-reflection could emerge through direct engagement. This design orientation became particularly important in interpreting changes observed in students' self-assessments over the duration of the course.

4. Methodology

This study employed a pre-post survey design within a DBR framework to examine changes in Japanese university students' self-perceptions following participation in a synchronous VSM course. The study focused not only on learning outcomes, but also on how participation in an AI-supported international learning environment reshaped students' perceptions of intercultural communication and participation. The study was conducted during the Fall 2025 semester in a U.S.-linked undergraduate course involving Japanese students participating remotely and synchronously in regular U.S. university classes. A total of 60 students were enrolled in the programme, and 41 students voluntarily completed both the pre-course and post-course surveys. Only matched responses from these participants were included in the analysis.

The surveys were administered at two time points: at the beginning of the semester and after completion of the course. The questionnaire consisted of self-report items related to intercultural understanding, communication, and participation in international online learning contexts. Drawing on the OECD PISA Global Competence Framework [7] and Fantini's intercultural competence framework [8], survey items were organised into six conceptual categories: (A) attitudes and values, (B) cultural self-awareness, (C) practical communication skills, (D) collaboration and interaction, (E) learner agency, and (F) inclusivity and responsibility. All items were rated using a five-point Likert scale. Mean and median values were calculated for each category, and pre-post differences were examined descriptively. In addition to the quantitative survey, an end-of-course feedback survey was conducted to gather qualitative reflections regarding students' learning experiences. These open-ended responses were used to contextualise and interpret the quantitative findings, particularly regarding students' perceptions of communicative difficulty, participation, and intercultural awareness.

5. Findings

5.1 Quantitative Findings

Analysis of the pre-post survey results revealed that post-course self-assessment scores decreased across nearly all survey categories. While students generally reported high levels of confidence and positive attitudes at the beginning of the semester, their evaluations became lower following participation in the U.S.-linked VSM course. Table 1 presents the mean and median scores for each survey category before and after the course.

Table 1. Pre–Post Survey Comparison of Japanese Students' Self-Assessment Scores (Fall 2025)

Group	Category	Pre Avg.	Post Avg.	Pre Median	Post Median
A	Attitudes & Values	4.87	4.70	5.0	5.0
B	Cultural Self-Awareness	4.70	4.45	5.0	5.0
C	Practical Communication Skills	3.98	3.54	4.0	4.0
D	Collaboration & Interaction	4.40	4.34	5.0	4.0
E	Learner Agency	4.62	4.67	5.0	5.0
F	Inclusivity & Responsibility	4.52	4.41	5.0	4.5

The largest decreases were observed in Group C (Practical Communication Skills) and Group B (Cultural Self-Awareness). In particular, items related to confidence in communicating with speakers from different linguistic backgrounds, explaining ideas clearly in intercultural settings, and managing communication difficulties showed noticeable declines. In contrast, Groups A (Attitudes & Values) and F (Inclusivity & Responsibility) demonstrated relatively smaller changes. Examination of the median values suggests that many attitudinal items had already been rated very highly at the beginning of the semester, indicating a possible ceiling effect in the pre-survey. Overall, the findings indicate a pattern in which students entered the course with highly positive self-perceptions, but evaluated their intercultural communication abilities more cautiously after completing the semester-long VSM experience.

5.2 Qualitative Findings

Qualitative responses collected through the end-of-course feedback survey provided important contextual support for the quantitative findings. Overall, students evaluated the course positively in terms of learning value, instructional quality, and the opportunity to participate in a U.S. university course. Many described the experience as meaningful, stimulating, and valuable for their personal and academic development. At the same time, students frequently referred to the challenges associated with participating in real-time English-medium classes. Common themes included the speed and spontaneity of discussion, difficulty initiating contributions, and uncertainty during intercultural interaction. Several students explicitly reflected on becoming more aware of their own limitations in intercultural communication despite initially believing they could manage such interaction successfully.

These qualitative reflections suggest that the decline observed in post-course self-assessment scores was not associated with dissatisfaction or disengagement. Rather, students' responses indicate that direct participation in authentic intercultural interaction prompted deeper reflection on the complexity of communication in multilingual academic settings. This tendency was particularly visible in areas related to practical communication skills, where students appeared to reassess their abilities based on lived communicative experience rather than abstract assumptions.

6. Discussion

The decline observed in students' post-course self-assessment scores should not be interpreted as evidence of negative learning outcomes or reduced intercultural competence. Instead, the combined quantitative and qualitative findings suggest a process of recalibration in students' self-perceptions following sustained participation in an authentic intercultural learning environment. Prior to the course, many students reported very high levels of confidence and positive attitudes toward intercultural interaction. However, participation in the U.S.-linked course exposed students to the realities of spontaneous English discussion, diverse interactional norms, and the cognitive demands of real-time participation in a multilingual academic environment. Through these experiences, students appeared to develop a more cautious and realistic understanding of their own communicative abilities.

The particularly large decrease observed in Group C (Practical Communication Skills) is significant in this regard. The findings suggest that confidence in intercultural communication may initially reflect idealised or assumed self-perceptions rather than experience-based understanding. Through authentic participation, students moved from a general belief that they "could probably communicate" toward a more situated awareness of the complexity of actual intercultural interaction. As summarised in the course analysis, students appeared to shift from "I think I can do this" to "I realise how complex this actually is." Importantly, the qualitative feedback demonstrates that lower self-assessment did not coexist with negative attitudes toward the course. On the contrary, students simultaneously reported high levels of satisfaction, meaningful learning, and increased awareness of intercultural communication challenges. This tension suggests that productive difficulty and increased reflective awareness may represent important dimensions of learning in international online education. From a learning design perspective, the findings also highlight the role of generative AI-supported learning environments in shaping conditions for participation. Tools such as live captions, translation support, and AI-generated summaries may have lowered barriers to comprehension and enabled sustained participation in the course. However, these tools did not eliminate communicative complexity itself. Rather, they supported students' access to authentic interaction while preserving the uncertainty and challenge inherent in intercultural communication.

7. Conclusion

This study examined how participation in an AI-supported VSM environment influenced Japanese university students' self-perceptions of intercultural communication and participation. While pre–post survey results showed decreases across many self-assessment categories, qualitative reflections suggested that students experienced the course as meaningful, challenging, and intellectually valuable. The findings indicate that authentic participation in complex intercultural learning environments may prompt learners to reassess their communicative abilities more realistically. From this perspective, reduced confidence may reflect an important stage of learning rather than evidence of failure.

The study also highlights the importance of learning design in AI-supported international education. Although generative AI tools may support access to participation, they do not eliminate the complexity

of intercultural communication itself. The findings suggest the importance of more nuanced interpretations of self-report measures and learner development in authentic participation contexts.
For policy-makers and institutional leaders, the findings suggest the importance of supporting learning designs that combine technological scaffolding with authentic interaction and guided reflection, rather than assuming that the introduction of AI tools alone will lead to meaningful participation. Such support is particularly important in virtual international learning environments, where students may need structured opportunities to engage with uncertainty, interactional complexity, and emerging awareness of their own abilities and limitations.

Abstract

Among all the sciences, biology holds a unique place: it is the science of life itself, the key to understanding who we are and the ecosystems we depend on. Yet despite its relevance, biology is often perceived as difficult and abstract, confined to laboratories or textbooks. Making it accessible, engaging, and compelling is therefore one of the most pressing challenges of modern science communication. The ability to communicate science effectively while balancing accuracy and creativity has become increasingly essential. Several educational approaches can be used to spark students' interest in STEM disciplines. In particular, gamification can be a valuable learning tool to support pupils in studying biological sciences while having fun. In this work, we present the educational activity "Dancing with DNA" (original title "La Danza del DNA"), designed for primary and middle school pupils (8-12 years old), to introduce fundamental biological topics such as the cell cycle and DNA replication. The activity was tested in both formal educational settings (primary and middle schools) and informal educational environments (open-access events). This paper reports on the experience conducted during the Genoa Science Festival 2025, Italy's largest science communication event. The workshop consisted of an initial training phase including images, videos, and 2D and 3D models. Pupils were then engaged in a practical and playful activity aimed at illustrating the mechanisms of DNA duplication and cell division. Each participant acted as a nucleotide of the DNA molecule (adenine, thymine, cytosine, or guanine, A-T-G-C) or as one of the proteins involved in the biological process; working together, they simulated DNA replication by applying the rules of complementary base pairing (A::T, C::G). The feedback collected to evaluate scientific engagement, self-perceived learning, and enjoyment suggests that the activity supported perceived learning and was well appreciated by students, regardless of their initial familiarity with DNA. Teachers' evaluations were also highly positive, with the practical component emerging as the main driver of satisfaction. This case study strengthens the potential of a gamification-based approach and supports the integration of gamified learning into science education and communication strategies.

Keywords: *gamification; science communication; biology; DNA*

1. Introduction

Gamification, defined as the integration of game-design elements in non-game contexts [1], is an emerging paradigm attracting significant attention for its innovative potential. In teaching and educational contexts, gamification leverages "game-based mechanisms, aesthetics, and game thinking to engage people, motivate action, promote learning, and solve problems" [2]. At its heart, gamification operates on the principle that the motivational strength of game elements can be effectively transposed into educational settings. This method does more than make learning fun: it creates a safe environment for trial and error, encouraging students to experiment without fear of failure while transforming the learning process into an engaging and rewarding experience [3]. Indeed, gamification aims to boost intrinsic motivators, such as enjoyment and enthusiasm, to promote learning [4]. Therefore, gamification's role is to "affect psychological factors that mediate the learning outcomes" [5]. STEM education is a pivotal component of modern education, as it fosters active and responsible citizenship while highlighting the importance of science for young women and helping to bridge the gender gap. In this context, a primary objective of modern science communication is to ensure that biological knowledge remains accessible, intelligible, and engaging, a goal that increasingly requires balancing scientific accuracy with creative efficacy. The integration of gamification as a learning tool offers a valuable way to support young pupils in studying biological sciences through an enjoyable and interactive approach. By integrating game mechanics into science lessons, gamification can help

overcome traditional educational barriers, boost students' motivation and enjoyment, and enhance cognitive and metacognitive performance [6]. Although biology is the fundamental science of life, it is frequently perceived as complex and challenging; many students find it difficult to visualise and conceptualise core biological mechanisms, such as cell division and DNA replication. To address this challenge and facilitate a deeper understanding of their three-dimensional nature, we developed a kinaesthetic educational activity entitled "Dancing with DNA". The workshop was tested in both formal educational settings (primary and lower secondary schools) and informal educational environments (open-access events). This paper reports on the experience conducted during the Genoa Science Festival 2025, Italy's largest science communication event, which attracted more than 200,000 visitors from October 23rd to November 2nd, 2025. Inspired by "Weaves" (original title in Italian: "Intrecci"), the theme of this Festival edition, we presented our workshop "Dancing with DNA" [7]. Assessments of scientific engagement, self-perceived learning, and overall enjoyment suggest that the activity fostered perceived learning. Furthermore, the experience was met with great enthusiasm by students across both primary and lower secondary school levels. Teachers' evaluations were also highly positive, with the practical component emerging as the main driver of satisfaction. This case study underscores the potential of gamified approaches and contributes to the growing body of evidence supporting active and engaging learning strategies, thereby advocating for the integration of gamified learning into science education and communication strategies.

2. Dancing with DNA: Inside the Mechanics of the Gamified Learning Format

The DNA molecule - the foundation of life as we know it and the blueprint of every living being - engages in a true dance every time it replicates, as two strands intertwine in space to weave a new double helix [8]. "Dancing with DNA" is an active learning exercise that focuses on DNA replication and cell division and is designed especially for primary and middle school pupils (8-12 years old). Our aim was to allow participants themselves to become the DNA molecule, physically moving their bodies through the core stages of cellular life. This kinaesthetic role-playing format can be used to visualise how nucleotides link up, how base pairs form, and how the replication process gives rise to two new DNA molecules belonging to the two daughter cells. The workshop lasts about 45 minutes and can involve up to 60 participants. It was held in a large hall within the School of Robotics building in Genoa, which provided an appropriate setting for the game dynamics. During the Science Festival, two facilitators with university-level training in biology managed all activities for each scheduled session. Before the Festival began, we met with the facilitators to share the key workshop information and suggestions for adapting the playful component to different classroom contexts. The workshop starts with a training session designed to capture the audience's attention and make the scientific content accessible to everyone. Using visual storytelling - including drawings, videos, and real-world examples - participants journey inside the cell to explore how cells divide, why duplication is necessary, and how DNA duplicates itself to produce two identical molecules ready for the newly formed cells. Once the training session is completed, each participant receives a colour-coded tile representing one of the four nucleotides, transforming complex molecules into tangible building blocks and the four chemical bases into a physical game of DNA assembly. Half of the participants are asked to align themselves as a small region of a DNA molecule, simulating its ladder-like shape. They are told to form two parallel lines, using one hand to simulate the bond between the nitrogenous bases (base pairing) and the other to simulate the 3' hydroxyl bond. In this way, each participant places one hand on the shoulder of the child in front of them and joins the other hand to the child next to them in the parallel line (Fig. 1 upper panel). In addition to nucleotides, some volunteers play special roles as part of the molecular machinery (the enzymes) that coordinates the process: helicase ("the unzipper"), which separates the parental double-stranded molecule by breaking the hydrogen bonds between nucleotides; polymerase ("the builder"), which brings free nucleotides to their correct partners to form the complementary DNA strands; and ligase ("the gluer"), which forms the new bonds between nucleotides. The experience then evolves into a living DNA model, with each participant playing the role of a specific nucleotide or protein (Fig. 1 lower panel). By stepping into the role of the molecule itself, pupils can visualise how nucleotides link up and how base pairs form. The crucial task is to keep the base-pairing rules in mind: A always pairs with T, and C always pairs with G. To keep the simulation realistic, participants also have to respect a vital balance between speed and accuracy. Just like the enzymes in our cells, they have to work quickly while maintaining focus, because a single pairing error can lead to a DNA mutation. To set the beat for this hands-on phase, we chose Queen's "We Will Rock You", using its iconic rhythm to turn the simulation of DNA replication into an engaging, choreographed dance. Once the mission is accomplished, participants are

invited to look around: the original DNA molecule has successfully replicated, resulting in two identical DNA helices ready for the next generation of cells.

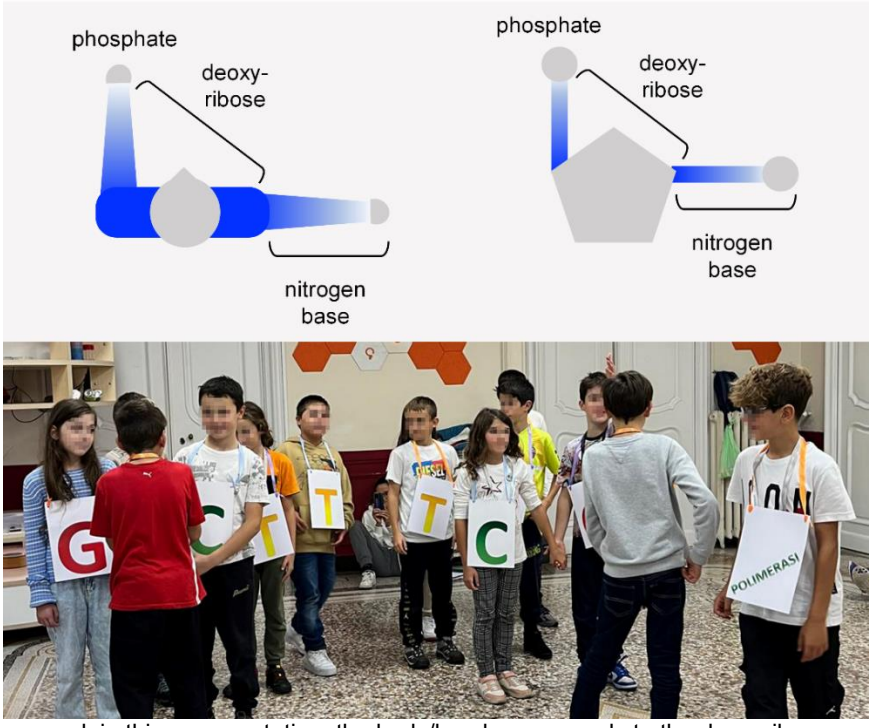

Fig. 1. Upper panel: in this representation, the body/head corresponds to the deoxyribose sugar; the arm extended horizontally to the right (in this case) is the nitrogenous base, which pairs with that of a complementary "nucleotide student" within the complete double helix; the arm extended forwards corresponds to the phosphate backbone. Lower panel: representative image of students participating in the workshop.

3. Assessment of the Impact of the Workshop

Approximately 1,000 individuals attended the workshop during the festival. Due to the large number of participants and the rapid succession of sessions, conducting a robust assessment of impact, objective learning outcomes, and long-term follow-up proved challenging. After each session, both students and teachers were invited to provide feedback on their overall experience with the educational activity through anonymous questionnaires. Students' learning outcomes should be interpreted as indicative and self-reported, due to self-selection bias and the inability to establish participants' baseline knowledge before the workshop. To ensure accessibility and ease of understanding for young primary and middle school pupils, a five-point Likert scale (1 to 5) accompanied by facial-expression icons was used to represent varying degrees of understanding and satisfaction (Fig. 2 left panel). This visual support facilitated engagement and interpretation, ensuring that the questionnaire was age-appropriate and effective for data collection. The questionnaire included three items: Q1, "Before this workshop, how much did you know about DNA?" (prior DNA knowledge); Q2, "How much do you think you learned from this workshop?" (perceived learning from the workshop); and Q3, "How much did you enjoy the workshop?" (workshop enjoyment). These items helped differentiate baseline familiarity from perceived learning gain and emotional involvement. Students were invited to tick the column featuring the emoji that best represented their level of knowledge, learning, and enjoyment; these responses were collected cumulatively across three large-format sheets, each dedicated to one of the three categories. As an interactive and engaging way to gather feedback on the hands-on activity, young participants were also invited to leave a comment or drawing using post-its and coloured pencils, sticking them onto a designated panel (Fig. 2 right panel). In addition, facilitators conducted a qualitative assessment by observing participants' behaviour and noting high levels of engagement throughout the workshops.

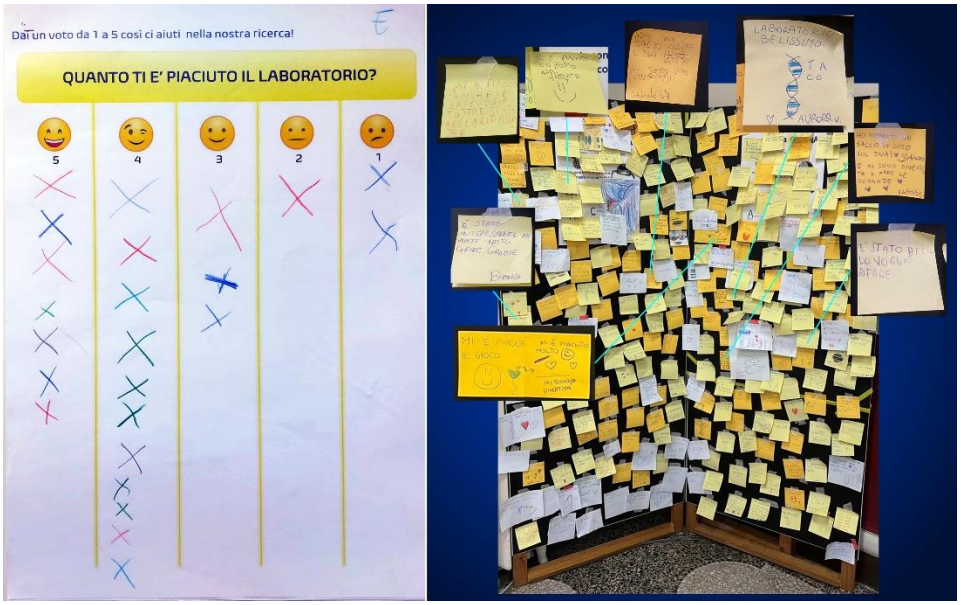

Fig. 2. On the left: example of a children's questionnaire using emojis. On the right: display board showing sticky notes with feedback or drawings created by the children.

In the primary school cohort, Q1 yielded a mean score of 3.23/5 (Table 1 and Fig. 3). High ratings (4-5) accounted for 44.44% of responses, while low ratings (1-2) represented 31.17%. For perceived learning (Q2), the primary school cohort recorded a mean score of 3.89/5. The share of high ratings reached 73.61%, indicating a strong perception of learning after the activity. Workshop appreciation was also high: Q3 yielded a mean score of 3.81/5, with 69.35% of responses in the top two categories. In the middle school cohort (Table 1 and Fig. 3), baseline knowledge (Q1) was lower overall, with a mean score of 2.70/5. Only 30.06% of responses fell in the 4-5 range, while 50.92% were in the 1-2 range. Perceived learning (Q2) nevertheless remained positive: high ratings represented 47.21% of responses, suggesting that the workshop was considered educationally valuable even among older students. Appreciation of the workshop was likewise favourable, as Q3 yielded 52.68% of high ratings.

Table 1. Summary comparison of questionnaire responses between primary and middle school students. N = total number of student respondents. Values in the mean columns are reported as mean +/- SD.

Question	Primary school				Middle school				Mean Difference
	N	Mean +/- SD	4-5%	1-2%	N	Mean +/- SD	4-5%	1-2%	
Q1. Prior topic knowledge	369	3.23 +/- 1.37	44.4	31.2	489	2.70 +/- 1.45	30.1	50.9	0.53
Q2. Perceived learning	288	3.89 +/- 1.27	73.6	14.6	430	3.14 +/- 1.53	47.2	35.6	0.75
Q3. Enjoyment of the workshop	447	3.81 +/- 1.37	69.4	20.1	429	3.35 +/- 1.51	52.7	30.1	0.47

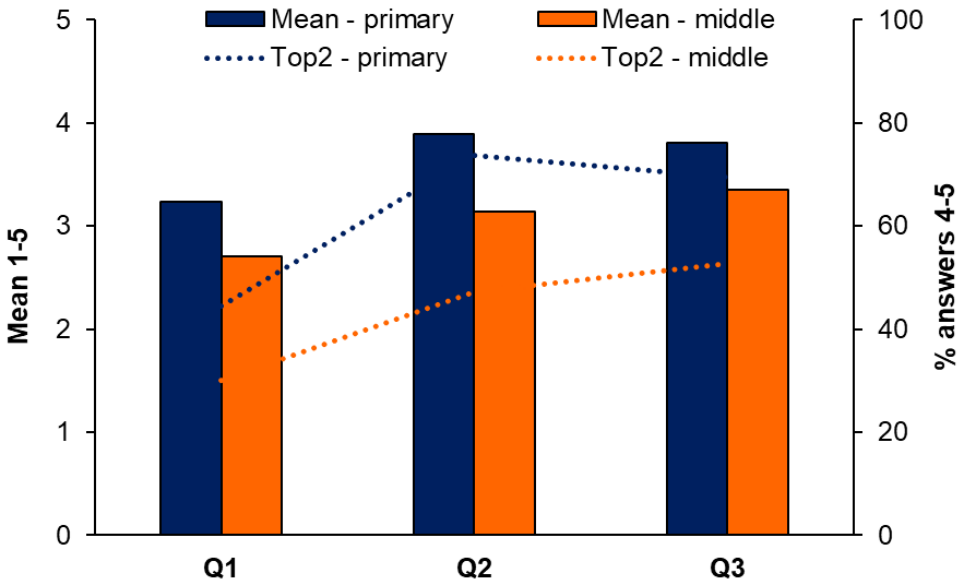

Fig. 3. Comparative overview of primary and middle school responses: mean scores and percentage of high ratings (4-5). Q1 = "Before this workshop, how much did you know about DNA?"; Q2 = "How much do you think you learned from this workshop?"; Q3 = "How much did you enjoy the workshop?".

Primary school pupils' scores were higher than middle school students' scores in all areas (Table 2 and Fig. 4). All differences were statistically significant ($p < 0.001$). The largest gap was observed for perceived learning (Hedges' g = 0.53), followed by initial knowledge and enjoyment. Comparing the mean values of Q1 and Q2 showed an average perceived gain of +0.66 points for primary school pupils and +0.44 points for middle school pupils. Thus, the workshop appeared to encourage perceived learning in both groups; however, it was perceived as more effective among primary school pupils, considering the greater variability observed among older participants.

Table 2. Statistical evidence for the comparison between school levels. Chi-square p and Top-2 p refer to between-group comparisons. Cramer's V quantifies the strength of distributional differences; Hedges' g quantifies the standardized mean difference.

Question	Chi-square p	Cramer's V	Top-2 p	Hedges' g
Q1. Prior topic knowledge	<0.001	0.207	<0.001	0.37
Q2. Perceived learning	<0.001	0.27	<0.001	0.525
Q3. Enjoyment of the workshop	<0.001	0.179	<0.001	0.324

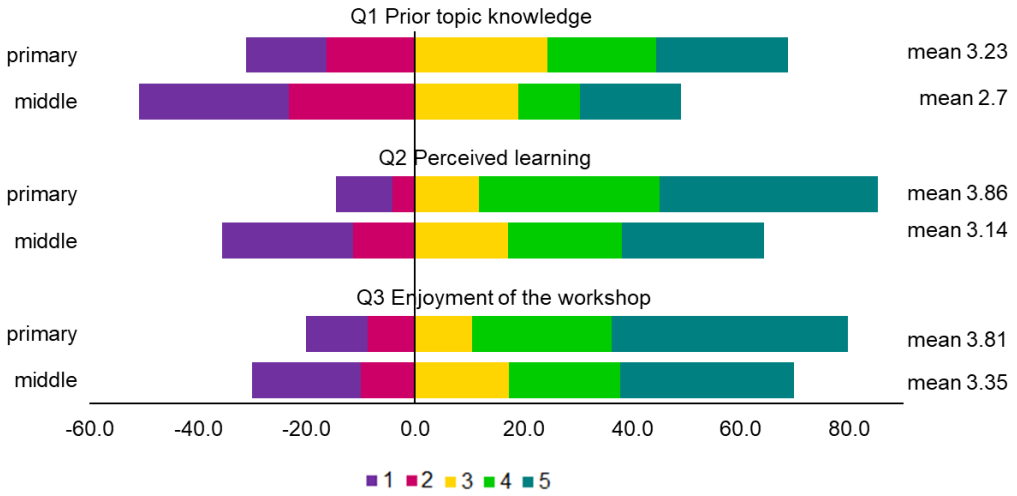

Fig. 4. Diverging stacked bar charts comparing the distribution of questionnaire responses between primary and middle school pupils for the three items: prior topic knowledge (Q1), perceived learning (Q2), and enjoyment of the workshop (Q3). Mean scores are reported for each group.

It is worth noting that participants' baseline knowledge levels differed (Table 1; Q1). Primary school pupils showed greater familiarity with the workshop topic, whereas middle school students generally rated their knowledge as lower. This may indicate a more rigorous self-assessment among older participants. Despite this, in both cohorts Q1 produced lower means than Q2 and Q3, suggesting that the workshop focused on a subject with which many participants were initially less familiar. Nonetheless, they still reported substantial perceived learning and enjoyment after the experience (Fig. 4).

Each teacher filled out an individual questionnaire to assess the game from an instructional standpoint (N = 66 primary school teachers; N = 87 middle school teachers). Feedback was also obtained via a 5-point Likert scale, enabling structured and systematic collection of expert evaluations. The questionnaire included four core questions assessing teachers' evaluation of the workshop in terms of overall satisfaction, contribution to the development of interest in science, and support for understanding the scientific topics proposed to young participants. Teachers were additionally invited to indicate what worked in the workshop in terms of content, methodologies, and communication methods, and to respond to an open-ended question about other relevant aspects from their perspective. This design facilitated the collection of both quantitative and qualitative data, thereby supporting a more comprehensive evaluation of the programme's feasibility and of the influence of the game on the development of essential competencies.

The teachers' questionnaire data (Table 3) indicate an overall positive evaluation of the workshop across both school levels. The most favourable ratings concerned the perceived educational value of the workshop for understanding the DNA replication process, together with the practical component, indicating that the hands-on format was the most appreciated element. Primary school teachers gave a mean score of 4.05 for interest in science, 4.11 for perceived support in understanding DNA, and 4.18 for satisfaction with the practical part. Among middle school teachers, the corresponding means were 3.87 for interest in science, 4.00 for support in understanding DNA, and 3.99 for the practical part. Between-group differences between primary and middle school teachers were assessed using Welch's t-tests, with Hedges' g reported as a measure of standardized mean difference (Table 3). Overall, differences between the two teacher cohorts were small, suggesting that the workshop was perceived positively and broadly consistently across both educational levels.

Table 3. Teachers' evaluation of the workshop by school level. Values are reported as mean +/- SD, percentage of ratings 4-5, percentage of maximum ratings, mean difference, Hedges' g, and Welch's p-value. Welch's p-values refer to between-group comparisons between primary and middle school teachers. n.a. = not available

Indicator	Primary school		Middle school		Mean Difference	Hedges' g	Welch's p
	Mean±SD	% 4–5	Mean±SD	% 4–5			
Interest in science	4.05±0.90	74.2%	3.87±0.71	70.1%	0.17	0.21	0.204
Helpfulness in understanding	4.11±0.83	80.3%	4.00±0.72	74.7%	0.11	0.14	0.406
Satisfaction with theoretical part	3.76±0.86	57.6%	3.72±0.82	60.9%	0.03	0.04	0.808
Satisfaction with practical part	4.18±0.88	75.8%	3.99±0.86	77.0%	0.19	0.22	0.174
What worked: content	3.85±0.81	65.2%	3.82±0.76	70.1%	0.03	0.04	0.801
What worked: methodologies	4.00±0.93	72.7%	3.94±0.87	72.4%	0.06	0.06	n.a.
What worked: communication style	3.97±0.93	68.2%	3.99±0.75	75.9%	-0.02	-0.02	0.893

Within each teacher cohort, ratings for the practical component were significantly higher than ratings for the theoretical component (Wilcoxon signed-rank test: primary schools, $p < 0.001$; middle schools, $p = 0.005$). This supports the interpretation that the workshop was judged most effective when scientific explanation was embedded in an interactive, hands-on activity. The items referring to what worked in the workshop also showed favourable ratings, particularly for methodology and communication style, which were close to 4 in both groups. Qualitative feedback from the open-ended questions highlighted play, hands-on engagement, and physical movement as the most valued elements of the workshop. Teachers emphasised the importance of active involvement and experiential learning, suggesting that these components enhanced both comprehension and retention of the scientific concepts presented.
In conclusion, the positive feedback collected suggests that participants reported high satisfaction with the learning experience. The format appears particularly well calibrated for primary school pupils, who showed higher levels of engagement, appreciation, and perceived learning (Fig. 5). At the same time, teachers' evaluations were highly positive and broadly consistent across primary and middle school levels.

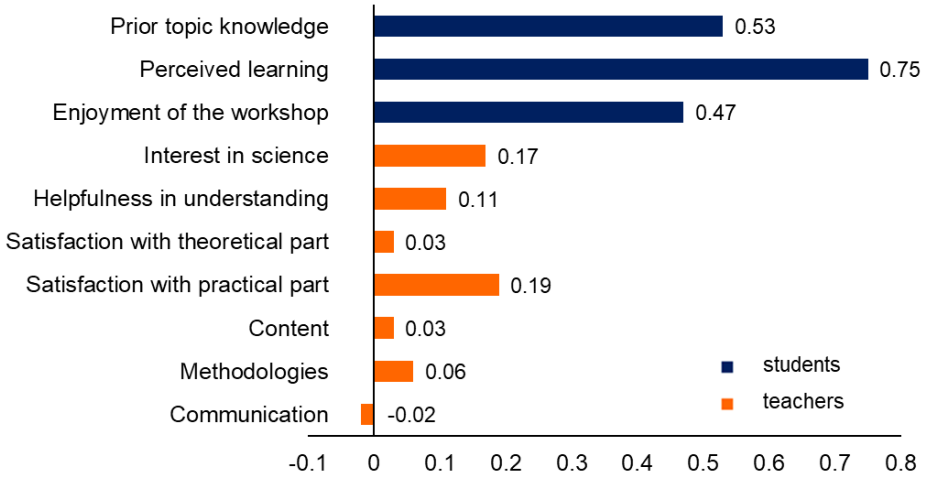

Fig. 5. Differences between primary and middle school ratings across questionnaire domains, expressed as the mean score in primary school minus the mean score in lower secondary school. Blue bars represent pupils' responses and orange bars represent teachers' evaluations.

Conclusions

During the 2025 edition of the Genoa Science Festival, we proposed the "Dancing with DNA" workshop. As the festival attracts a diverse audience with varying socio-economic and cultural backgrounds, the findings offer a degree of generalisability to broader educational contexts. Therefore, a primary strength of this educational case study lies in the breadth and heterogeneity of the sample. The workshop relies on a kinaesthetic learning approach and combines storytelling with visual elements and cooperative gaming. This methodology was designed to spark curiosity and interest in science among young people while simultaneously promoting soft skills through an engaging and enjoyable hands-on experience. This was supported by the facilitators' qualitative observations and by the feedback collected through interactive posters and questionnaires, which highlighted high levels of engagement and interest in the topics covered. The active modelling of DNA replication was successful in introducing DNA-related concepts and the spatial organisation of the cell to learners with heterogeneous prior knowledge, as well as in encouraging active participation and integration into group dynamics. The results suggest that this workshop may be suitable for supporting the development of basic scientific understanding of DNA and cell replication, integrating educational aims with an enjoyable play-based activity. While the findings resonated with both young participants and teachers, the data suggest that the format is currently best calibrated for primary school pupils, who reported higher levels of appreciation and perceived learning. Feedback from middle school students suggests that the format may require further refinement for this age group. This discrepancy likely stems from their more advanced cognitive baseline and different expectations regarding interactive learning.

Overall, this case study suggests that a gamification-based approach is feasible and promising as an educational tool for science communication and school-based science education. Further studies using pre-post designs and objective learning measures would be needed to quantify learning gains more robustly.

The proposed approach uses appropriate yet simple materials, making the educational activity well suited for inclusion within school curricula. We successfully proposed the workshop in standard classroom settings. Indeed, the activity is featured in the "Mappa della Citta Educante" of the Municipality of Rome, a catalogue that offers a variety of free educational activities to schools of all levels across the city.

Early-Warning Prediction of Student Housing Dissatisfaction to Support Targeted University Interventions

Stefania Zourlidou[1], Kavya Hanumanthu[2]

[1,2]Institute for Web Science and Technologies (WeST), University of Koblenz, Germany

Abstract

Student housing dissatisfaction can erode wellbeing and academic engagement, but universities often learn about serious problems only after complaints escalate. We present a leakage-aware early-warning approach that predicts serious housing dissatisfaction from a lightweight student housing survey while excluding items that directly paraphrase the target outcome. Using a University of Koblenz survey (N=158), we define an at-risk case as an overall housing experience score of 3 or lower on a 1–5 scale (51/158, 32.3%). We compare Logistic Regression, Random Forest, histogram-based gradient boosting and a compact MLP under 5-fold stratified cross-validation. Random Forest achieves the strongest discrimination (ROC-AUC = 0.803 ± 0.127), closely followed by Logistic Regression (0.792 ± 0.096). Because student support teams operate with limited outreach capacity, we move beyond headline accuracy and examine threshold policies that translate predicted probabilities into concrete workloads. At the selected operating points, Random Forest and Logistic Regression identify 38 of 51 at-risk students while flagging 64–66 students for follow-up. Permutation importance highlights expectation alignment, affordability pressure, housing instability, privacy and space limitations, and service responsiveness as the most actionable signals. The study contributes a practical blueprint for survey-based triage that links prediction, threshold selection, explainability and ethical safeguards for targeted university support.

Keywords: *early-warning systems, student housing, targeted support, explainable machine learning, threshold policies, learning analytics*

1. Introduction

Housing conditions structure students' everyday capacity to study. A room that is unaffordable, noisy, overcrowded or poorly maintained can reduce sleep quality, limit concentration and make participation in campus life more difficult. These pressures are not always visible to the university, especially when students avoid formal complaints or normalize difficult living conditions until problems become severe. Most universities therefore face a timing problem. Complaints, crisis appointments and end-of-term surveys often arrive too late for preventive support, while student services must still decide which cases deserve attention first. An early-warning signal is useful only when it is operationally realistic: it should rely on information that can be collected early, avoid label leakage from questions that directly encode the outcome, and produce decisions that match available outreach capacity.

This paper develops and evaluates such a workflow on a small institutional housing survey. We benchmark four compact tabular models, report cross-validated predictive performance, and show how decision thresholds transform risk scores into concrete support workloads. We then use model-agnostic explanations to connect risk to intervention levers, so that the output is not a black-box label but a transparent triage aid for student services. The study is guided by three research questions: **RQ1:** *To what extent can non-leaky housing survey features identify students at risk of serious housing dissatisfaction?* **RQ2:** *How do different probability thresholds change the balance between missed at-risk students and feasible outreach workload?* **RQ3:** *Which interpretable risk signals can inform support actions without reducing the model to a black-box decision tool?*

The contribution is deliberately practical and operational. First, the paper defines a leakage-aware prediction task that excludes direct satisfaction summaries from the feature set. Second, it reports not only discrimination metrics but also threshold-dependent workload indicators that a student support unit can understand. Third, it links global explanations to non-punitive support pathways, so that predictions serve as prompts for outreach rather than as labels attached to students.

2. Background and Related Work

Housing has been associated with mental health, stress and academic engagement, especially when students face affordability pressure or unstable arrangements [1,2]. These mechanisms motivate early support: if a university can identify severe dissatisfaction early, it can route students to information about contracts and rights, mediation with providers, emergency options or maintenance escalation before problems compound. Parallel work in learning analytics and early-alert systems shows that predictive models can help target support, but operational details matter as much as discrimination metrics [3-5]. In small-data institutional settings, interpretable models and clear decision policies are often preferable to complex pipelines. We therefore emphasize leakage-aware feature design, transparent thresholding and post-hoc explanations, aligning with applied machine learning guidance on cost-sensitive decision making [5,6].

This article is part of a broader line of analyses using the Koblenz student-housing survey, but it addresses a different operational question. Prior same-dataset work examined affordability and accessibility through geospatial and regression indicators [7], choice scarcity and spatial equity through mixed methods and geographically weighted regression [8], and recurring need profiles through Bernoulli latent class analysis [9]. The present paper does not reuse those analytical framings as its contribution. It instead asks whether early survey signals can be converted into a workload-aware triage policy for targeted support. Accordingly, the outcome, modelling task, validation emphasis and decision logic are distinct from those earlier studies.

Early-warning models also raise two design questions: how to communicate risk scores responsibly and how to convert them into action. In education, this conversion is often hidden behind a default threshold such as 0.5. The best operating point depends on the relative cost of missed severe dissatisfaction, unnecessary outreach, staff availability and the consequences of being flagged [6,10]. We therefore report both discrimination and workload-facing metrics, treating the threshold as a policy parameter rather than a purely technical choice.

3. Data and Problem Formulation

We use a cross-sectional student housing survey conducted at the University of Koblenz (N=158). The instrument includes demographic and study context, housing characteristics, search and moving history, decision factors, service responsiveness, perceived fit and overall housing experience. The survey was designed for institutional insight rather than high-stakes classification, which makes it a realistic test case for low-burden early warning.

The prediction task is binary classification. A respondent is labelled at-risk if the overall housing experience score is 3 or lower on a 1–5 Likert scale (51/158; 32.3%). This threshold captures clearly negative or ambivalent experiences where outreach is plausibly warranted. To avoid label leakage, we remove survey items that directly summarise satisfaction or overall experience. The remaining features describe housing conditions and potential drivers of dissatisfaction, not the target itself.

For interpretation, features are grouped into five domains: affordability and financial strain, expectation and information alignment, service and maintenance experience, physical space and privacy, and stability or search history. This grouping supports communication with non-technical stakeholders and discourages over-interpretation of isolated questionnaire items. Class imbalance is moderate, so we rely on stratified validation and threshold tuning rather than aggressive resampling, which can be unstable in small samples.

4. Methods

Feature representation and preprocessing. Numerical variables such as room size, semester number and number of moves are used as numeric inputs. Ordinal Likert items are encoded with ordered integer scores; categorical variables are one-hot encoded. Missing values are imputed within the modelling pipeline using fold-consistent rules (median for numeric variables and mode for categorical variables) to avoid information leakage across folds.

Models. We benchmark four models that can be deployed without heavy infrastructure: Logistic Regression with L2 regularization, Random Forests [11], histogram-based gradient boosting and a compact multi-layer perceptron. The goal is not to maximise marginal gains, but to identify a model class that balances discrimination, stability and interpretability for institutional use.

Validation, metrics and threshold policies. We use 5-fold stratified cross-validation with shuffling and a fixed random seed (seed = 42). Discrimination is assessed with ROC-AUC, while operational

performance is assessed with precision, recall and F1. Because support services operate under capacity constraints, we tune the decision threshold within the cross-validation procedure and report deployment-style confusion matrices that make workload explicit: how many students are flagged, how many at-risk cases are found and how many are missed. These thresholds should therefore be interpreted as planning-oriented operating points for this survey wave, not as final deployment thresholds. A live system would require prospective validation on a later survey wave before routine use.

Probability calibration. Threshold policies rely on the numerical meaning of predicted probabilities, so discrimination alone is not enough. A model may rank students well while still over- or under-estimating absolute risk. Before deployment, predicted probabilities should therefore be checked with calibration diagnostics such as reliability plots or Brier score, and recalibration methods should be considered if probabilities are poorly calibrated [12]. In this paper, calibration is treated as a deployment requirement and not as evidence already established by the present sample.

Explainability. For the best-performing model, we compute permutation importance using ROC-AUC as the scoring function. This model-agnostic ranking identifies which variables most influence predictive performance and helps map risk signals to actionable responses. Logistic Regression coefficients provide a second, simpler interpretive check; in a future deployment, local explanation methods such as LIME and SHAP could support student-specific review [13,14].

5. Results

5.1 Predictive Performance

Table 1 reports mean performance across the 5-fold stratified validation and should be read in two ways: as a comparison of model discrimination and as evidence that the classification threshold materially changes operational performance. Random Forest provides the strongest discrimination (ROC-AUC = 0.803 ± 0.127) and the best threshold-tuned F1 (0.733). Logistic Regression follows closely (ROC-AUC = 0.792 ± 0.096, tuned F1 = 0.695), which means that the final model choice need not be based on accuracy alone.

Table 1. Model comparison under 5-fold stratified cross-validation. Recall reported here is the mean across folds at per-fold tuned thresholds. Pooled out-of-fold recall at fixed thresholds in Table 2 differs slightly

Model	ROC-AUC (mean ± sd)	F1 @0.5 (mean)	F1 tuned (mean)	Precision tuned (mean)	Recall tuned (mean)	Threshold (mean)
Random Forest	0.803 ± 0.127	0.635	0.733	0.708	0.802	0.40
Logistic Regression	0.792 ± 0.096	0.607	0.695	0.623	0.802	0.27
HistGB	0.767 ± 0.131	0.571	0.652	0.618	0.724	0.28
MLP	0.649 ± 0.116	0.379	0.551	0.435	0.800	0.29

.

The most important pattern in Table 1 is that threshold tuning improves F1 for every model compared with the default 0.5 threshold. This is expected in a support setting where the positive class is smaller than the negative class and where missed at-risk cases are operationally important. The tuned thresholds therefore determine how many students become visible to the support workflow. The table also shows a practical trade-off between marginal predictive gain and institutional transparency. Random Forest is the strongest performer, but Logistic Regression remains close enough to be a credible alternative if a university prioritises a simpler scoring rule for communication and review. By contrast, the MLP has lower ROC-AUC and F1 in this small tabular setting, so the results favour compact, interpretable or ensemble methods over a more complex neural baseline.

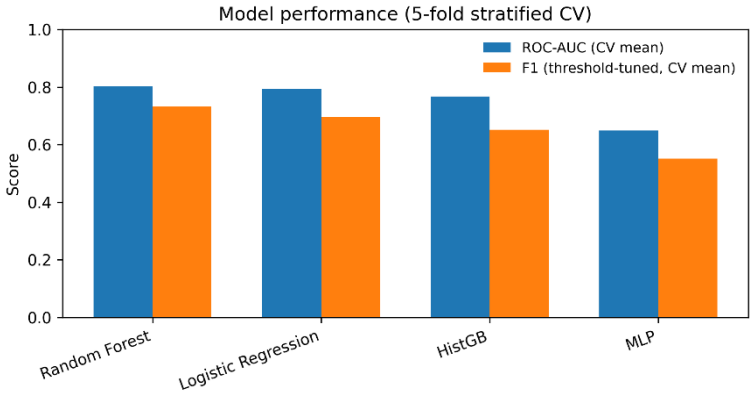

Fig. 1. Cross-validated performance summary. ROC-AUC reports discrimination, and threshold-tuned F1 reflects the per-fold optimal threshold.

5.2 Operational Thresholds and Workload

Accuracy alone does not determine whether an early-warning system is usable. The decision threshold determines how many students are routed to follow-up. Table 2 illustrates deployment-style confusion matrices at the selected thresholds (0.40 for Random Forest, 0.27 for Logistic Regression). At these settings, both models identify 38 of 51 at-risk students while flagging roughly 64–66 students in total. A support unit can move along this precision-recall trade-off by selecting a threshold that matches outreach capacity. Because Table 1 reports fold-level means at per-fold tuned thresholds whereas Table 2 reports pooled counts at fixed thresholds, the recall values differ slightly.

Table 2. Deployment-style confusion matrices and workload metrics at fixed thresholds.

Model (threshold)	TN	FP	FN	TP	Flagged (TP+FP)	Missed (FN)	Precision	Recall
Random Forest (0.40)	81	26	13	38	64	13	0.594	0.745
Logistic Reg. (0.27)	79	28	13	38	66	13	0.576	0.745

5.3 Interpretable Risk Drivers

Permutation importance for the Random Forest indicates that expectation alignment is the dominant signal, followed by affordability pressure, indicators of housing instability, privacy or space limitations and service responsiveness. This pattern points to concrete levers, including clearer listings and realistic photos, contract briefings, affordability guidance, emergency support and faster escalation for recurring maintenance issues.

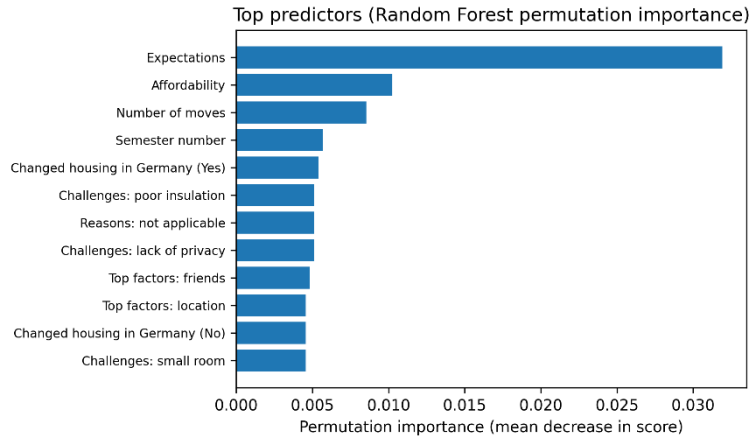

Fig. 2. Top predictors from Random Forest permutation importance (y-axis labels are survey item short names).

As a worked triage example, suppose a support unit can conduct 50 short check-ins in the next two weeks. The threshold can be calibrated to yield approximately 50 flagged students, prioritising the highest predicted risks while keeping workload feasible. Lowering the threshold would increase recall but require more outreach; raising it would reduce staff load but miss more at-risk students. This illustrates why thresholding should be treated as a governance decision rather than a fixed modelling default.

6. From Risk Scores to Responsible Outreach

The intended output of the model is not an automated decision, but a structured prompt for earlier support. Table 3 translates the modelling workflow into an institutional process that can be audited and adjusted. The table is deliberately framed as a support workflow: every step leaves room for human judgement, documentation and revision.

Table 3. Operational workflow for a leakage-aware housing early-warning process.

Step	Input	Decision point	Support-oriented output
1. Early survey	Short housing questionnaire	Exclude outcome-like satisfaction summaries	Leakage-aware feature set
2. Risk scoring	Preprocessed survey features	Apply trained model and record uncertainty	Ranked list of risk scores
3. Threshold choice	Current staff capacity and risk tolerance	Select threshold or top-k workload rule	Feasible flagged group
4. Triage review	Risk score plus global risk-driver information	Match support intensity to likely need	Information, check-in, mediation or escalation
5. Monitoring	Outreach outcomes and error patterns	Audit calibration, subgroup performance and workload	Revised threshold, survey items or workflow

6.1 Thresholds as Capacity Decisions

The same model can support different operating modes depending on the institutional situation. A lower threshold is appropriate when the priority is to miss as few severe cases as possible, while a higher threshold or top-k rule is appropriate when staff time is scarce. Table 4 describes policy choices that can be made without adding new model evidence or changing the underlying survey.

Table 4. Example threshold-policy choices for different support contexts.

Support context	Threshold logic	Priority metric	Reason
Start of semester or known housing pressure	Use a lower threshold	Recall	Avoid missing students whose problems may escalate quickly
Normal week with limited staff	Use a higher threshold or top-k list	Precision and workload	Keep outreach feasible and reviewable
Pilot deployment	Begin conservatively and manually review flagged cases	Trust and auditability	Test workflow before routine use
After additional survey waves	Recalibrate and revisit threshold	Calibration and stability	Check whether probabilities and workload remain reliable

6.2 Appropriate and Inappropriate Uses

The model should be used only to prioritise supportive contact. A flagged case should trigger an invitation to help, not an administrative label. A non-flagged case should not be interpreted as evidence that a student has no housing problem. The system should not be used to allocate scarce housing places, evaluate tenancy behaviour, penalise students or landlords, or replace normal access to support services. These restrictions are important because the target is self-reported dissatisfaction, the sample is small, and prediction errors are unavoidable.

6.3 Governance Checks Before Live Use

Before live deployment, the workflow should pass four checks. First, students should know that survey responses may be used to offer support and should understand what will not happen as a result of being flagged. Second, the model should be prospectively validated on a later survey wave, including calibration checks and subgroup error review. Third, staff should document the selected threshold, the capacity assumption behind it and the date of review. Fourth, outcomes of outreach should be evaluated qualitatively and quantitatively so that the system is judged by whether it improves support, not only by whether it predicts a survey label.

7. Discussion and Implications

The main design lesson is that prediction becomes educationally useful only when it is connected to a concrete service process. In this case, the model is best understood as a triage instrument. It helps identify students who may benefit from earlier contact, and the form of that contact remains a human support decision. The explanation profile matters because it connects risk scores to actions that the institution can take. Expectation alignment suggests the need for clearer pre-arrival information and more realistic accommodation descriptions. Affordability pressure suggests referral to financial counselling or emergency support. Maintenance and service signals suggest response-time standards, clearer reporting channels and escalation rules. In this way, the model output becomes a guide for practical support, not only a statistical result. Threshold selection is the point at which analytics becomes policy. The selected threshold reflects an institutional judgement about missed severe dissatisfaction, unnecessary outreach and available staff time. For that reason, the threshold should not be hidden inside the software pipeline. It should be documented, periodically reviewed and communicated to the team using the system [6,10].

Ethical safeguards are also methodological safeguards. Consent, data minimisation and separation between support and enforcement reduce the risk that students experience the system as surveillance. Error audits are equally important. False positives can create unnecessary concern, and false negatives leave students unsupported. Human review and transparent communication are therefore part of the validity of the intervention, not optional additions.

The study is limited by its small, single-institution and cross-sectional sample, and by a self-reported target label. The reported thresholds and confusion matrices are useful for planning, but they do not replace prospective validation. The present paper also does not estimate causal effects of outreach. It shows how risk can be identified and operationalised, but it does not test whether a specific intervention changes housing outcomes. Future work should validate the workflow across survey waves and universities, assess calibration before deployment, audit subgroup error patterns, and evaluate whether outreach improves housing conditions, wellbeing or engagement.

8. Conclusion

We presented an early-warning system that predicts serious student housing dissatisfaction from a lightweight survey and translates predictions into feasible outreach decisions through threshold policies. In this sample, Random Forest achieved the strongest discrimination. Logistic Regression remained close enough to be a plausible lower-complexity alternative when communicability, auditability and ease of recalibration matter. The broader methodological lesson is that small-data institutional settings require more than headline metrics. Models become more useful when discrimination, threshold-dependent workload and ethical safeguards are reported together. The workflow connects prediction to concrete support levers such as expectation management, affordability guidance and maintenance escalation. In this way, predictive analytics becomes a practical and auditable tool for student wellbeing, not an abstract score.

Abstract

The present study investigated the extent to which the student-student dimension of the Relational Factors for the Risk of School Dropout Scale [1] was able to track students at higher risk of dropping out of school based on their relationships with each other and how class, race, and gender markers [2] were determinant for risk analysis and prevention over the course of a year Synthetic data was generated using the Gaussian Copula technique, which estimates new responses based on the correlation between the observed variables in the real dataset, reproducing its relationships. Due to ethical considerations and compliance with Brazilian data protection legislation (LGPD), this study relies on synthetic, anonymized data, however, a nationwide data collection using real-world data is currently being conducted in Brazil. This approach was considered due to the General Law of Data Protection (LGPD). Results reflect that the use of interventions based on Psychology and Critical Pedagogy have an effect on reducing the risk of school dropout as well as promoting well-being [3] in this environment and quality for the teaching and learning process as showed in the state case [4]. In the end, it is proposed to link the measure to its intersectional analyses, which consider racism, sexism and ableism as important tools in the fight against school dropout when we think of a country of continental proportions and as diverse in numerous factors as is the case of Brazil.

Keywords: *school dropout, large scale analysis, gender, race, school dropout prevention*

1. Introduction

Early school dropout is a multifaceted and persistent challenge, with profound implications not only for individual trajectories, but also for public health, economic development, and social equity [1]. Historically, approaches to mitigate this phenomenon have focused on traditional early warning metrics, such as the ABC typology based on Frequency, Behavior Incidents, and Course Performance [2]. Although useful, these indicators often fail in primary prevention, as they only identify the problem when the student is already in an advanced process of leaving school, ignoring the complex web of structural and contextual factors that motivate school dropout [2].

To overcome these limitations, public policies have been proposed that aim at more systemic perspectives on school dropout. It is in this scenario that the Relational Model (MR) and the Instrument for the Assessment of Risk Factors for School Dropout (IAFREE) stand out, which propose an in-depth analysis of interpersonal dynamics in the school context [1] [2]. IAFREE tracks vulnerabilities through five interrelated dimensions: Student-School, Professional School Students, Family-Student, Student Community, and Student-Student [5]. The model understands that school dropout is not an isolated event or a purely individual failure, but the result of interactional failures and a school environment that often cannot accommodate the diversities and needs of its students [2].

The socioeconomic dimension plays an undeniable role in the failure of students in the educational system, given that the dynamics of contemporary capitalism require more sophisticated analyses. Recent studies have revealed a paradox in Brazilian public schools: from the point of view of "flexible capitalism", the increase in family income may also be associated with a higher risk of dropping out of school [3]. This is because the precarious labor market and the promises of immediate financial gains end up devaluing the school as a significant space for the construction of life projects [3]. In addition, recent educational reforms, such as the New Brazilian Secondary School, are often overtaken by market logics that deepen educational inequality. By focusing on a disjointed and class-based vocational

education, these policies run the risk of acting as tools of a "State Racism", where education functions as an instrument of segregation, condemning young people from the popular classes to underemployment and naturalizing inequalities [4].

1.1 Prejudice in Brasil

It is impossible, therefore, to analyze school dropout in Brazil without an intersectional lens that highlights the markers of race-ethnicity and gender. Racism, as a structural, intrinsic, and multifaceted phenomenon of Brazilian society, directly impacts the subjectivities and trajectories of black students [5]. The school, which should be a welcoming space, often acts as a hostile environment, where discriminatory practices, stigmas and recreational racism (the use of humor to propagate prejudiced violence) are repeated daily [5]. The ideology of whitening and the myth of racial democracy mask this violence, forcing young black people to deal with rejection, invisibility, or stereotyped visibility in teaching materials and social interactions [5].
At the same time, gender inequalities and sexism consolidate significant barriers to school retention and success. Gender relations are socially constructed from belief systems that promote the superiority of normative heterosexuality and hegemonic masculinity [6] [7]. At school, these norms translate into microaggressions, machismo, LGBTQIAPNbphobia and the imposition of restricted social roles, which negatively affect students' mental health and engagement [6] [8]. Exclusionary language and the naturalization of stereotypes (such as the false idea that women do not belong in the field of exact sciences) limit girls' aspirations and reinforce symbolic violence [7] [8].
For the school to act as a protection institution, it is essential to anchor educational practices and research in references that value listening and the dignity of vulnerable populations. Black Feminist Epistemology, by proposing the valorization of lived experience, orality, the ethics of care and personal responsibility, offers a robust methodological path [9]. This framework teaches us that listening to students, validating their experiences intersected by racist and sexist discrimination, is not only an act of research, but a political gesture of emancipation and pain that avoids revictimization and promotes social justice [9].

1.2 The Current Study

In view of this complex web of vulnerabilities, the present study investigates to what extent the Student-Student dimension of the IAFREE scale can track students at higher risk of dropping out based on their interpersonal relationships. More than mapping interactions, the study seeks to examine how race-ethnicity and gender markers are determinants in risk analysis and in the formulation of prevention strategies over the course of an academic year.
To ensure analytical rigor combined with the ethical commitment to privacy protection, in strict compliance with the General Data Protection Law (LGPD) of Brazil, this work adopted an innovative methodology based on the generation of synthetic data using the Gaussian Copulation technique. This method estimates new responses based on the correlations observed in the real data set, allowing for safe and effective simulation of large-scale interventions.
Through this modeling, the research demonstrates that interventions based on Psychology and Critical Pedagogy have a proven effect on reducing the risk of dropout, promoting the well-being and quality of the teaching-learning process. By linking the measurement of dropout risk to intersectional analyses, we argue that the fight against racism and sexism are not marginal agendas, but rather structural tools indispensable for the definitive mitigation of school dropout in a country of continental proportions and deep inequalities such as Brazil.

2. Method

A quantitative, cross-sectional, descriptive-comparative design was adopted, based on synthetic data modeling. We analyzed patterns of vulnerability to school dropout based on the relational dimensions of the Instrument for the Assessment of Risk Factors for School Dropout – Alternative Version (IAFREE-A), with emphasis on social markers of sex and race-ethnicity. The quantitative design with synthetic data allowed us to examine population patterns of school vulnerability, preserving the correlational structure of the original database and, at the same time, ensuring greater protection of student’s privacy.

2.1 Ethics

The generation of synthetic data was adopted as a strategy to mitigate ethical risks, especially in relation to the preservation of privacy, the minimization of the exposure of individual information, and compliance with the General Law for the Protection of Personal Data (LGPD – Law No. 13,709/2018). Thus, no directly identifiable individual data was used in the analyses presented.

2.2 Participants

The database was composed of 10,000 synthetic cases of students, generated to preserve the statistical structure of an original educational base, maintaining patterns of association between variables without exposure of individually identifiable data. For the present analysis, the variables Sex and Race-Ethnicity were considered.
Regarding gender, the total database had 4,898 students classified as male (49.09%), 5,082 as female (50.91%). Considering the inclusion criteria defined for this study, only the cases classified in the binary categories male and female were maintained, resulting in an analytical sample of 9,980 students. The distribution indicates a proportional balance between the two groups, which favors statistical comparisons between males and females, reducing the risk of significant sample asymmetries.
Regarding the Race-Ethnicity variable, the sample presented three categories. The white category gathered 2,079 students (20.83%), the brown category gathered 2,295 students (23.00%) and the black category gathered 5,606 students (56.17%). Therefore, it is observed that category 3 predominates in the racial-ethnic composition of the sample, which already alerts us to the racial profile of public school students in Brazil.

3. Results

The analysis was conducted based on the corrected IAFREE-A scores. According to the calculation manual, all items of the instrument should be inverted, except for items Q5 and Q36, so that higher scores indicate greater vulnerability or greater need for attention to the school trajectory. The results were interpreted based on the five relational dimensions of the instrument, axes of protection and vulnerability related to school permanence, allowing a relational reading of the risk of dropout.

3.1 Gender Analysis

Table 1 shows the mean dimensional scores of the IAFREE-A by gender. In all dimensions, male students had higher averages than female students, indicating greater perceived vulnerability to school dropout.

Table 1. Mean IAFREE-A 46 dimensional scores by sex

Dimension	Male	Male	Female	Female
	M	SD	M	SD
Student – School	2,70	0,35	2,64	0,35
Student – School Professionals	3,02	0,40	2,99	0,40
Student – Family	2,84	0,41	2,79	0,42
Student – Community	2,89	0,34	2,82	0,35
Student – Student	2,85	0,56	2,67	0,57

The differences between the male and female groups were statistically significant in all dimensions. Considering the large sample size, the interpretation prioritized effect sizes. The greatest difference was observed in the Student-Student dimension (d = 0.31), followed by Student-Community (d = 0.19), Student-School (d = 0.16), Student-Family (d = 0.13) and Student-School Professionals (d = 0.07).
This pattern suggests that the difference by sex is more relevant in the dimensions linked to school belonging, peer relationships, educational expectations, and school-community integration. The Student-Student dimension is central to the study, as it allows us to trace how interpersonal relationships in everyday school life can act as protective or vulnerable factors for dropout. Our analysis situates school dropout as a relational phenomenon and not as an individual failure of the student.

Table 2 presents the percentage of students classified as high vulnerability in each dimension, considering the universal normative cut-off points of IAFREE-A.

Table 2. Percentual de vulnerabilidade por sexo

Dimension	Male	Female
Student – School	**96,45%**	**94,59%**
Student – School Professionals	51,16%	44,57%
Student – Family	51,18%	38,57%
Student – Community	42,02%	36,97%
Student – Student	90,10%	88,27%

The Student-Community dimension presented the highest percentages of high vulnerability in both sexes: 96.45% among male students and 94.59% among female students. High scores in this dimension indicate that students capture important weaknesses in the relationship between school and community, including low territorial integration, insecurity, conflicts between school and community values, and difficulties in articulating with external protection networks.

The second most critical dimension was Student-School Professionals, with 90.10% of high vulnerability among male students and 88.27% among female students. This result indicates a largely unfavorable perception of the relationships with teachers, management, coordination and other school professionals. High scores in this dimension express difficulties in dialogue, welcoming, institutional collaboration, teacher expectations and pedagogical quality.

The most substantive difference between the sexes appears in the Student-Student dimension. While 51.18% of male students were classified as highly vulnerable, this percentage was 38.57% among female students. This difference suggests that male students in this database have greater fragility in peer relationships, school belonging, social skills and expectations regarding education. From the psychosocial point of view, this finding can be interpreted in the light of processes of socialization of masculinities, interpersonal conflicts, less adherence to care practices, and greater subjective distance from school.

3.2 Racial Analysis

Table 3. Means of the IAFREE-A dimensional scores by race-ethnicity.

Dimension	White	Brown	Black
Student – School	2,67	2,67	2,67
Student – School Professionals	3,00	2,99	3,01
Student – Family	2,82	2,81	2,81
Student – Community	2,84	2,85	2,86
Student – Student	2,75	2,75	2,77

The averages were quite close between the three race-ethnicity categories. The comparative analyses indicated the absence of statistically relevant differences in the dimensions Student-School, Student-School Professionals, Student-Family and Student-Student. In the Student-Community dimension, there was a statistically significant difference, but with practically zero effect size ($\eta^2 = 0.0007$), indicating low practical relevance.

Table 4. Percentage of vulnerability by race-ethnicity

Dimensão	White	Brown	Black
Student – School	47,62%	47,28%	48,09%
Student – School Professionals	89,37%	88,37%	89,42%
Student – Family	40,12%	39,52%	39,17%
Student – Community	94,61%	95,51%	95,83%
Student – Student	44,73%	43,75%	45,18%

The Student-Community dimension showed high vulnerability above 94% in all race-ethnicity categories, with a higher percentage in the Blacks category (95.83%). Suggesting that the fragility in the articulation between school, community and protection network is a transversal axis of the sample, crossing all racial-ethnic groupings.
The Student-School Professionals dimension also presented extremely high percentages in all categories: 89.37% in the White category, 88.37% in the Brown category and 89.42% in the Black category. Pedagogical and institutional relations constitute a general critical point for school permanence.
The Student-Student dimension presented percentages between 43.75% and 45.18%, with a slight increase in the Blacks category. Although the difference between the categories is small, this dimension remains theoretically important because it is directly connected to school belonging, peer acceptance, subjective recognition, and expectations for the future.

4. Discussion

As seen, vulnerability to school dropout is organized mainly around institutional, community and relational dimensions, and not only around individual characteristics of students. This finding supports the central premise of the IAFREE Relational Model, dropout should be understood as a phenomenon produced in the interaction between everything that makes up the school. We were able to shift the analysis from late indicators, such as attendance and performance, to psychosocial and contextual factors that precede school dismissal.
The Student-Community dimension showed the highest levels of high vulnerability in all groups analyzed by race-ethnicity and sex-gender, suggesting fragility in the articulation between school, territory and protection networks. The school cannot be thought of as an isolated institution, but as part of a broader social ecosystem. When the school does not activate support services, does not establish community partnerships or does not dialogue with the concrete living conditions of students, its protective capacity is reduced. Preventing dropout requires intersectoral actions involving education, social assistance, health, culture, security, family and community.
The Student-School Professionals dimension, with high levels of vulnerability. He pointed to problems perceived in the relationship with teachers, management and other professionals, involving pedagogical quality, institutional communication, teacher expectations and welcoming. Regarding school permanence, the results are relevant because learning does not depend only on formal access to school, but on the quality of pedagogical and institutional interactions that sustain engagement. When students perceive low teacher expectations, unresponsive pedagogical practices or fragile institutional relationships, the school tends to lose its function of recognition and protection.
The sex-gender breakdown showed greater vulnerability among male students in all dimensions, especially in Student-Student, involving interpersonal relationships, social skills, belonging, identification with the school and expectations regarding education. This suggests that students may be more exposed to forms of socialization that hinder the expression of vulnerability, the construction of care bonds and the non-violent mediation of conflicts. Preventive interventions should, therefore, consider masculinities, school life, belonging and life project as central axes, avoiding interpretations that individualize or pathologize boys.
In the cut by race-ethnicity, the dimensional means were close among all regardless of being White, Brown or Black, the high transversal vulnerability should not be interpreted as the absence of racial inequalities. Structural racism, sexism, and other forms of discrimination permeate the Brazilian school experience, affecting recognition, belonging, and permanence. Even when the average differences are small, racialized reading remains necessary, especially in the dimensions related to community, relationships with professionals, and interactions between students.

4.1 Limitations

Although it preserves correlational patterns from the original database and is adequate to protect the privacy of students, the results should not be interpreted as definitive population estimates. The synthetic base allows simulating trends, testing models and guiding interventional hypotheses, but it does not replace analyses with empirical data collected directly in real school contexts.
Another limitation concerns the use of the male-female binary category, which limits the understanding of the experiences of trans, non-binary students and other gender identities. In addition, the race-ethnicity variable was analyzed in three aggregated categories, which may reduce sensitivity to capture specificities among white, brown, black, indigenous, and yellow students. Considering that the

theoretical model of the study itself emphasizes racism, sexism and structural inequalities as fundamental dimensions of school dropout.

4.2 Proposals

It is recommended that schools strengthen intersectoral networks with social assistance, health, guardianship council, community collectives, cultural facilities and territorial organizations, since the community dimension presented high vulnerability in all groups analyzed. It is also proposed to invest in critical, anti-racist and anti-sexist teacher training, qualification of pedagogical practices, improvement of institutional communication and creation of protocols to confront discrimination, bullying, racism, sexism and LGBTQIAPNb+phobia.
The results indicate the need for specific actions aimed at school belonging, peer relationships, masculinities, conflict mediation and the construction of positive educational expectations, especially among male students. It is also recommended that IAFREE-A be incorporated as a preventive and non-punitive screening tool, allowing schools to identify relational dimensions of risk before dropout occurs. Its application should be linked to collective intervention plans, qualified student listening, longitudinal monitoring and continuous evaluation of the effects of the actions implemented, avoiding the use of the instrument to label students and prioritizing its function of protecting school trajectories.

5. Final Considerations

School dropout should be understood as a relational, structural, and intersectional phenomenon, produced by the articulation between social inequalities, institutional weaknesses, precarious community bonds, and school experiences marked by recognition or exclusion. In this sense, confronting dropout requires more than monitoring attendance, behavior, and performance: it requires a school capable of listening, welcoming, and transforming the conditions that make students vulnerable. In dialogue with bell hooks, it is understood that education must be a practice of freedom, sustained by care, listening and ethical commitment to historically marginalized subjects. In the same way, in Paulo Freire, school permanence can only be thought of from a critical, dialogical and emancipatory pedagogy, capable of recognizing students as historical subjects and not as objects of intervention.

Abstract

School dropout has been widely recognized as a complex and multifactorial phenomenon, with significant implications for both individual development and educational systems. In recent years, advances in early warning systems have sought to anticipate this risk by identifying factors associated with school disengagement, particularly those of a relational nature, such as interactions among students, families, and schools [1]. Study aimed to investigate the predictive effect of school dropout risk factors on the performance of Brazilian students, using a synthetic sample of 10,000 cases, derived from a real dataset of 3,678 students from four states of Brazil. Synthetic data was generated using the Gaussian Copula technique, which estimates new responses based on the correlation between the observed variables in the real dataset, reproducing its relationships. Due to ethical considerations and compliance with Brazilian data protection legislation (LGPD), this study relies on synthetic, anonymized data, however, a nationwide data collection using real-world data is currently being conducted in Brazil. This approach was considered due to the General Law of Data Protection (LGPD). Results show that the relationships of students with family, other students, and school professionals' impacts on school performance. Results indicated that the pedagogical quality (p=.004), parenting (p<.001), support structure at home (p<.001), coordination with the family (p=.048), and belonging (p<.001) impact students' performance. These findings reinforce the central role of relational dimensions in shaping students' academic outcomes, highlighting that school performance is not solely determined by individual or structural factors, but emerges from the quality of interactions within the educational ecosystem. Overall, results provide empirical support for the advancement of early warning systems that incorporate relational indicators, contributing to more sensitive, context-aware, and effective strategies to prevent school dropout.

Keywords: *School dropout, Large-scale analysis, Educational psychology*

1. Introduction

School dropout has been widely recognized as a complex and multifactorial phenomenon, with profound implications for both individual development and the structuring of educational systems. The advancement of early warning systems has sought to anticipate this risk by identifying factors associated with school disengagement, overcoming purely individualistic views to focus on relational dimensions [1]. Understanding these interpersonal and institutional dynamics is fundamental for the design of more assertive public policies and for the promotion of a protective educational ecosystem that addresses the root causes of performance inequalities.

In order to capture the complexity of these interactions in different intergroup contexts, the use of robust and ecologically valid psychometric instruments is essential. Assessment models have been developed and improved, structuring risk and protective factors in various dimensions of student life. The refinement of these measures, as observed in the adaptations of the Relational Factors Scale for the Risk of School Dropout in its revised and alternative versions [2],[3] allows for the multivariate mapping of specific vulnerabilities that permeate the student's relationship with school professionals, their family structure, the local community and their peers.

Despite the urgency, contemporary empirical research faces the challenge of balancing investigative rigor with ethical privacy guidelines; therefore, handling educational microdata from vulnerable populations requires innovative approaches. A methodological alternative to the generation of synthetic data has emerged as a promising methodological solution, using techniques such as Gaussian Copula

[4],[5] to reproduce the relationships and distributions of the original data [6], preserving the statistical integrity necessary for inferential analyses without compromising the anonymity of the participants.
Advances in the formulation of early warning systems have challenged strictly individualistic explanatory models, highlighting that the risk of academic disengagement emerges from vulnerabilities intrinsic to the relational networks in which the individual is immersed, particularly in the interactions established with the school ecosystem and the family nucleus. The investigative gap that guides the problematization of this work therefore lies in the need to measure the predictive effect of these psychosocial risk factors on the concrete performance of students.
Given the above, an assessment of the level of international vulnerability was conducted using the Alternative Version of the Scale of Relational Factors for the Risk of School Dropout (IAFREE-A). The analytical approach focused on examining the extent to which these relational dimensions statistically differentiate students with normative trajectories from those who have already experienced grade repetition. Through non-parametric inferences for independent groups, our hypothesis is that the history of academic failure is linked to weaknesses in interactions, constituting an expression of broader socio-educational disinvestment.

2. Method

2.1 Participants

The participants were students enrolled in public schools in four Brazilian states, comprising an original dataset of 3,678 individuals, collected as part of the School Trajectory Protection System (SPTE), a Brazilian initiative aimed at protecting students' educational trajectories. From this original dataset, a synthetic sample of 10,000 cases was generated, in which females predominated (50.82%), students concentrated in the Midwest region (44.35%), and 9,536 (95.4%) were classified as non-repeaters and 458 (4.6%) as repeaters (Table 1).

Table 1.

Sex	n	%	Race/Ethnicity	n	%
Male	4898	48.98	White	2168	21.68
Female	5082	50.82	Black	2062	20.62
I prefer not to declare	20	0.20	Brown	5488	54.88
			Other	282	2.82
Region of Brazil	n	%	Failure history	n	%
Midwest	4435	44.35	Repeaters	458	4.60
Northeast	1368	13.68	Non-repeaters	9536	95.40
North	1625	16.25			
Southeast	2572	25.72			

Characteristics of the participants' sociodemographic background.

2.2 Instruments

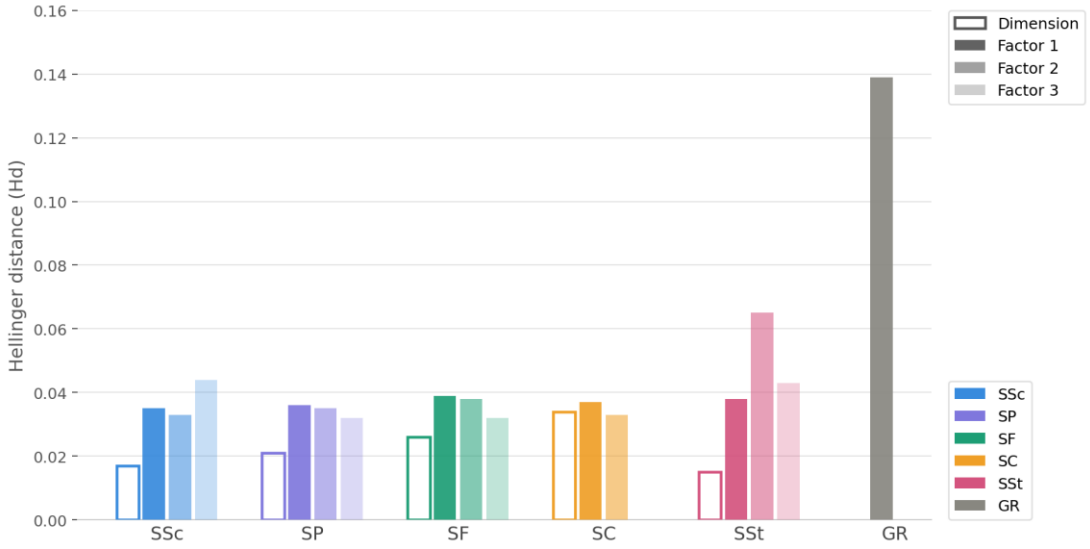
The final version of the Relational Factors for the Risk of School Dropout Scale – Alternative Version (IAFREE-A) [3] is an adaptation of the instrument originally developed by [1] (IAFREE) and revised by [2] (IAFREE-R), structured based on the concept of School Trajectory Protection. The instrument, completed by students, consists of 46 items organized into five protective relational dimensions: Student–School (SSc), Student–School Professionals (SP), Student–Family (SF), Student–Community (SC), and Student–Student (SSt). These dimensions are distributed across 14 factors of attention: Infrastructure (SSc1), School as a Safe Space (SSc2), Discrimination (SSc3), School Management and Organization (SP1), Pedagogical Quality (SP2), Teachers' Expectations (SP3), Parenting (SF1), Family Support Structure (SF2), Family Interaction (SF3), Network Interaction (SC1), Community Relations (SC2), Interpersonal Relations and Social Skills (SSt1), Expectations Regarding Education/Educational Development (SSt2), and Belonging/Identification (SSt3). Responses are recorded on a four-point Likert scale, presented in two formats: frequency ("Never" to "Always") and agreement ("Strongly Disagree" to "Strongly Agree"), both accompanied by pictorial cues. For most items, the scoring is reversed, with the exception of Q5 and Q36, which are phrased negatively. Thus, higher scores indicate a greater need for attention to academic progress, while lower scores indicate a lower degree of vulnerability. To characterize the participants' profiles, a 33-item sociodemographic questionnaire was also administered, covering variables such as gender, race/ethnicity, and history of failing grades, among others.

2.3 Procedures

Data collection was conducted in operational cycles, which provide schools with two options for administering the IAFREE-A: a digital version, accessible via a platform integrated into tablets and computers, and a printed version, intended for institutions with limited or unstable internet connectivity. In this context, students from schools belonging to four state school systems located in the Central-West, Northeast, North, and Southeast regions of Brazil participated in the study. The research was conducted in accordance with ethical guidelines for studies involving human subjects, as per Resolutions No. 466/2012 and No. 510/2016 of the National Health Council, and was approved by the Human Research Ethics Committee (CEP/UFAL), under opinion No. 5.407.594. Furthermore, all procedures related to the collection, storage, and processing of information followed the principles established by the National Council of Ethics in Research (CONEP) and the provisions of the General Data Protection Law (LGPD) [7], ensuring confidentiality, anonymity, and protection of participants throughout the entire research process.

2.4 Data Analysis

The analyses were performed using the R programming language [8], employing the Gaussian copula technique to generate synthetic data. Based on copula theory, this method allows for the modeling of multivariate distributions by separating the marginal distributions from the dependency structure among the variables [4] [9], generating new synthetic observations from integral probability transformations applied to real data [5]. Among its main advantages is the preservation of associations between variables in the database, maintaining the functional equivalence of synthetic data for inferential purposes [10], a relevant aspect in psychometric studies, in which latent factors are derived from correlations between items [11]. Thus, the similarity between the real and synthetic data was assessed using the Hellinger distance, an indicator ranging from 0 to 1, where values close to 0 represent greater similarity between the distributions [6], with values up to 0.20 considered adequate.



Based on this, the aim was to examine whether, and to what extent, the relational factors of the IAFFREE-A differentiate students according to their academic performance trajectory, specifically with grade repetition. Thus, group differences were operationalized by forming two groups defined by academic performance history: students who had never failed a grade (non-repeaters) and students who had repeated at least one school year (repeaters), measured using a single dichotomous self-report item: "Have you ever failed a grade?", to which participants responded with (0) "No, I have never failed" or (1) "Yes, at least once." This binary classification served as the independent variable, while the scores on the dimensions and factors of the IAFREE-A constituted the dependent variables of interest.

The differences were examined using the Mann–Whitney U test (also known as the Wilcoxon rank-sum test; [12] [13], a nonparametric procedure suitable for comparing two independent groups when the distributional assumptions of parametric tests cannot be met. Thus, the magnitude of group differences

was estimated using the rank-based biserial correlation (r) as a measure of effect size for the Mann–Whitney U test [14]. Effect sizes were classified according to [15] as small (|r| ≥ 0.10), medium (|r| ≥ 0.30), and large (|r| ≥ 0.50). All comparative statistical analyses were conducted using JASP [16].

3. Results

The quality of the correspondence between the synthetic data and the original data was assessed using the Hellinger distance (Hd), a measure ranging from 0 to 1, where values closer to zero indicate greater similarity between the distributions analyzed. In this regard, all values obtained remained below the established adequacy criterion (Hd < 0.20), demonstrating high similarity between the distributions of the synthetic and original data.
As shown in Figure 1, the Hd values ranged from 0.015 (SSt) to 0.034 (SC). At the factor level, a slightly more significant range of variation was observed, with values between 0.032 (SP3 and SF3) and 0.065 (SSt2), all remaining within the limits considered satisfactory, which corroborates the quality of the approximation achieved. As for the sociodemographic variable, Grade repetition recorded Hd = 0.139, a value that, although higher than the others, remained below the adopted cutoff point, possibly due to the marked imbalance in the distribution of this variable in the original sample, characterized by a low proportion of students repeating a grade, a condition that tends to increase the complexity of its synthetic reproduction compared to variables with more balanced distributions.

Note. Hd: Hellinger distance. Colors indicate dimension: Darker shade = Factor 1; medium shade = Factor 2; lighter shade = Factor 3; outlined bar = Dimension. GR = Grade Repetition. SSc: Student–School; SP: Student–School Professionals; SF: Student–Family; SC: Student–Community; SSt: Student–Student.

Fig. 1. Hellinger distance by dimension, factor, and grade repetition.

The results of the Mann-Whitney test indicated statistically significant differences between students who had repeated a grade and those who had not across seven variables in the questionnaire (Table 2). Students with a history of grade repetition reported more negative perceptions regarding family support, family involvement, school belonging, and interpersonal relationships compared to those who had never repeated a grade. The most significant differences were concentrated particularly in dimensions related to family dynamics and identification with the school, indicating that grade repetition is not limited solely to low academic performance but is also associated with broader relational vulnerabilities that permeate students' school trajectories.
As for students who had to repeat a grade, the results showed higher means for the factors SF1 (M = 1.983; SD = 0.578), SF2 (M = 1.911; SD = 0.569), SF3 (M = 2.427; SD = 0.694), SSt2 (M = 1.718; SD = 0.492), in the SF dimension (M = 2.114; SD = 0.485), and in the SSt dimension (M = 2.099; SD = 0.525). The concentration of differences in the factors of the SF dimension indicates that the family context is the most sensitive domain to the pattern of academic failure, suggesting that students who repeat a grade perceive less support, less structure, and more distant family interactions regarding school life. The difference in SSt2, in turn, indicates that these students also have lower expectations regarding their own educational development, which may reflect a process of progressive disengagement from their school trajectory and academic performance.

With regard to students who did not repeat a grade, higher means were observed only for factors SP2 (M = 2.307; SD = 0.584) and SF3 (M = 2.491; SD = 0.660). The result for SP2 suggests a more critical assessment of pedagogical quality by these students, given their greater engagement with the learning process; conversely, the difference in SF3 warrants interpretive caution, given the trivial effect size observed.

In this regard, effect sizes ranged from trivial to small, with small effects observed in SF1 (r = .125), SF2 (r = .113), and SSt2 (r = .154), while SP2 (r = −.070), SF3 (r = −.058), SF (r = .071), and SSt (r = .064) showed magnitudes below the cutoff point for a small effect. Among the variables analyzed, SSt2 showed the most significant effect size, although still of small magnitude, suggesting that students' expectations regarding their own educational trajectory constitute the relational factor with the greatest discriminative power between the groups.

Table 2. Mann–Whitney comparison tests: school dropout risk factors and the performance of Brazilian students.

Variables	Groups	Mean	SD	*U*	*p*	Effect Size
SP2 – Pedagogical quality	*1 = "No, I have never repeated"*	2.307	0.584	2.912	.009	−.070
	2 = "Yes, at least once"	2.226	0.556			
SF1 – Parenting	*1 = "No, I have never repeated"*	1.858	0.569	-4.611	<.001	.125
	2 = "Yes, at least once"	1.983	0.578			
SF2 – Home support structure	*1 = "No, I have never repeated"*	1.799	0.575	-4.067	<.001	.113
	2 = "Yes, at least once"	1.911	0.569			
SF3 – Engagement with the family	*1 = "No, I have never repeated"*	2.491	0.660	1.978	.034	−.058
	2 = "Yes, at least once"	2.427	0.694			
SSt2 – Belonging / Identification	*1 = "No, I have never repeated"*	1.589	0.487	-5.511	.001	.154
	2 = "Yes, at least once"	1.718	0.492			
SF - Student-Family	*1 = "No, I have never repeated"*	2.054	0.494	-2.539	.010	.071
	2 = "Yes, at least once"	2.114	0.485			
SSt - Student-Student	*1 = "No, I have never repeated"*	2.033	0.523	-2.637	.021	.064
	2 = "Yes, at least once"	2.099	0.525			

Note. SD = Standard Deviation. *U* = Mann–Whitney U test statistic. Effect Size = rank-biserial correlation. $p < .05$.

4. Discussion

As demonstrated, the family microsystem plays a central role in structuring trajectories of academic vulnerability [1]. The concentration of statistically significant differences in structural support factors at home and in parenting highlighted how grade repetition goes beyond strictly individual cognitive deficits, becoming the outcome of broader relational deprivations for students. The family, therefore, acts as the most sensitive domain in relation to the pattern of school failure. For the formulation of public policies, we indicate that the design of systems to protect school trajectories must transcend intra-classroom barriers, requiring integrated socio-educational strategies that foster the structuring and engagement of the family unit.

Regarding intergroup relations and institutionalization, belonging and identification with the school revealed discriminatory power among student profiles. Students with a history of grade repetition reported significantly lower expectations regarding their own educational development, as well as more negative perceptions about their belonging to the school environment. This pattern illustrates the

crystallization of a progressive disengagement process, in which distancing from normative support networks reinforces the phenomenon of exclusion. The mitigation of exclusionary interpersonal dynamics and the strengthening of intergroup cohesion in the school climate thus emerge as crucial vectors to ensure that academic performance is supported by quality protective interactions.
Counterintuitively, we note that students with academic records free from failing grades reported more critical perceptions regarding the pedagogical quality offered by the institution. This dynamic suggests that greater engagement with the learning process refines the student's evaluative criteria, turning them into a more demanding observer of the infrastructure and teaching practices. Adherence to and success in the educational system presuppose an active demand for excellence and continuous support, challenging educational management to constantly refine its institutional approaches to meet the needs of highly engaged students.

Understanding University–Industry Engagement through Challenge-Based Learning: Evidence from Industry Perspectives

Masoumeh Shahverdi[1], Tatiana Aleksandrovna Iakovleva[2], Baharak Ehtemami[3], Md Navid Hasan[4]

[1,2,3,4]University of Stavanger, Norway

Abstract

Universities are increasingly expected to contribute to innovation, sustainability, and regional development alongside their traditional missions of education and research. Challenge-Based Learning (CBL) has emerged as a pedagogical approach that connects students, higher education institutions, and external stakeholders through student engagement with real-world challenges. While prior research has predominantly examined the effects of CBL on student learning and skill development, limited attention has been given to its outcomes for industry and organizational partners acting as challenge providers. This study addresses this gap by exploring how regional actors perceive their participation in CBL and whether such collaboration supports meaningful university–industry engagement. Using a qualitative exploratory research design, semi-structured in-depth interviews were conducted with six organizations from diverse sectors that collaborated with a university through CBL projects. The interview data were thematically analyzed to identify perceived benefits, outcomes, and challenges associated with CBL collaboration. The findings indicate that CBL provides organizations with access to new perspectives, supports reflection on organizational practices, and contributes to early-stage problem exploration and innovation processes. At the same time, challenges related to time constraints, feasibility of student-generated solutions, flexibility of the collaboration model, and variability in student motivation were reported. Despite these limitations, all participating organizations assessed the overall value of CBL collaboration positively, emphasizing its long-term potential for knowledge exchange, relationship building, and future collaboration. The study contributes to research on university–industry collaboration by providing empirical insights from the perspective of external stakeholders and by positioning CBL as a pedagogical approach that can create mutual value beyond student learning, supporting the broader societal role of higher education institutions.

Keywords: *Challenge-Based Learning, University–Industry Collaboration, Student Engagement, Knowledge Exchange, Higher Education*

1. Introduction

Universities are increasingly expected to contribute not only to education and research but also to broader societal and economic development. In response to technological change, sustainability challenges, and evolving innovation demands, higher education institutions have expanded their role within regional and innovation systems through activities associated with the “third mission,” including knowledge exchange and external collaboration [1]. Within this context, university–industry engagement has gained importance as a mechanism for facilitating collaboration, innovation, and interaction between academic institutions and external organizations. Collaboration between universities and industry enables the exchange of expertise, resources, and practical knowledge that can support both educational and organizational development. Universities contribute research capabilities and access to emerging talent, while industry partners provide practical contexts and real-world challenges that can enrich learning processes and collaborative activities [2], [3].

These interactions have increasingly extended into educational settings through experiential and challenge-oriented learning approaches that connect students with real-world problems and external stakeholders [4]. As a result, universities are increasingly adopting more integrated models that combine education, research, innovation, and societal engagement [5].

One pedagogical approach associated with these developments is Challenge-Based Learning (CBL). CBL involves students in collaborative engagement with real-world challenges through interaction with peers, educators, and external actors, linking academic learning to applied problem solving [6]. Previous studies have primarily examined CBL in relation to student learning and experiential engagement with

real-world challenges. However, comparatively less attention has been given to the perspectives of industry partners and external stakeholders involved in these collaborations [4], [7].
This study addresses this gap by examining how organizations perceive their participation in Challenge-Based Learning and how such collaboration contributes to university–industry engagement. More specifically, the study explores the perceived benefits, outcomes, and challenges experienced by regional actors involved in student-driven CBL projects. Using a qualitative exploratory design based on semi-structured interviews with industry partners, the study provides empirical insight into how CBL may support interaction, collaboration, and knowledge exchange between universities and external stakeholders [2], [8].
The paper contributes to research on higher education and collaborative learning by extending discussion of CBL beyond student-centered outcomes and situating it within broader debates on university–industry collaboration. In doing so, it highlights the potential role of students as participants in collaborative knowledge exchange processes and emphasizes how pedagogical approaches may support the evolving societal role of universities.

2. Literature Review and Theoretical Framework

2.1 University–Industry Collaboration in Higher Education

University–industry collaboration (UIC) describes interactions between higher education institutions and external organizations that facilitate the exchange of knowledge, expertise, and technology [9]. Increasing technological complexity and competitive pressures have contributed to the growing importance of these collaborations, particularly as organizations seek access to external knowledge and innovation networks [10], [11].
Alongside these developments, universities have faced increasing expectations to contribute more directly to economic and societal development. This has strengthened the emphasis on external engagement and positioned universities more prominently within regional innovation systems and knowledge-transfer activities [12], [3].
UIC encompasses a range of collaborative activities, including joint research, knowledge exchange, and educational partnerships. Through these interactions, industry partners gain access to academic expertise and research capabilities, while universities benefit from engagement with practical challenges and applied contexts [13]. Governments have also encouraged university–industry interaction as part of broader innovation and economic development strategies [14].
More recently, collaboration between universities and industry has increasingly extended into educational settings through internships, student projects, and collaborative supervision models [15], [2]. These forms of engagement connect students with external stakeholders and support practice-oriented learning experiences that extend beyond traditional research partnerships [2].

2.2 Experiential Learning and Challenge-Based Learning

The involvement of external stakeholders in educational activities reflects a broader shift toward experiential and practice-oriented learning approaches in higher education. These approaches emphasize active participation, collaborative problem solving, and the application of knowledge within real-world contexts [6], [4]. Through collaboration with external actors, students engage with practical challenges that extend learning beyond traditional classroom settings. Such interactions may also expose organizations to alternative perspectives and forms of collaborative knowledge exchange. In addition, collaborative and practice-oriented activities involving regional actors may strengthen relationships between universities and their surrounding communities [16], [17]. At the same time, engagement with external stakeholders can help connect educational activities more closely with real-world challenges and societal needs [4].
One pedagogical approach associated with these developments is Challenge-Based Learning (CBL). CBL is a collaborative pedagogical approach that connects academic learning with real-world challenges and applied problem-solving activities. Developed through Apple's initiative, the approach emphasizes active participation, interdisciplinary collaboration, and engagement with authentic problems. The CBL framework is commonly structured around three phases—engage, investigate, and act—through which students explore challenges and develop responses to complex issues [6], [8]. CBL has also been associated with the evolving societal role of universities by supporting competencies such as collaboration, critical thinking, and interdisciplinary problem solving [18].

Because CBL frequently involves collaboration with external stakeholders, it can also strengthen connections between universities, industry, and society through engagement with applied and sustainability-related challenges [19]. In addition to supporting student learning, these collaborative activities may also provide organizations with access to new perspectives and collaborative knowledge exchange processes [3], [2].
Prior research on university–industry collaboration and CBL highlights three key dimensions: organizational experience, benefits, and challenges. Benefits include access to knowledge and innovation, while challenges relate to time constraints and feasibility [2], [3], [20]; interaction patterns further shape how organizations experience these collaborations [15].

2.3 Research Gap

Although previous studies have examined CBL primarily as a higher-education learning approach and have emphasized student learning, competencies, and collaboration with industry and community actors, comparatively less attention has been given to the perspectives of external stakeholders themselves [7], [4].
This study addresses this gap by examining how industry partners perceive their participation in CBL and how they evaluate the benefits and challenges associated with such collaboration. By focusing on the experiences of regional actors, the study contributes to understanding CBL not only as a pedagogical strategy but also as a collaborative mechanism within university–industry engagement.

3. Methodology

3.1 Research Design

This study adopts a qualitative exploratory research design to examine how industry partners perceive their participation in Challenge-Based Learning (CBL). A qualitative approach is appropriate for exploring the experiences, perceptions, and reflections of organizations involved in collaborative educational processes and university–industry interaction [21].
The study is guided by the following research question: How do organizations perceive the benefits and challenges associated with participation in Challenge-Based Learning collaborations?

3.2 Data Collection

Data were collected through semi-structured interviews with six organizations that participated as challenge providers in CBL projects. These organizations collaborated with the University of Stavanger and ECIU University initiatives and represented diverse sectors, including innovation, financial services, consulting, and sustainable development (Table 1). Additional respondent and organizational details are not reported at the individual level to preserve anonymity.
A purposive sampling strategy was used to recruit participants with direct experience in university–industry CBL collaboration. Interviews were conducted via Microsoft Teams in May 2023 and lasted between 20 and 35 minutes. All interviews were recorded and transcribed for analysis. Selection criteria included organizations that had participated in CBL collaborations with the University of Stavanger and individuals directly involved as challenge providers.

Table 1. Overview of interview participants and organizations
Source: Adapted from [22]

Code	Field of Activity	Date	Duration	Platform
CO1	Sustainable city development	03.05.2023	20 minutes	Microsoft Teams
CO2	Innovation	12.05.2023	35 minutes	Microsoft Teams
CO3	Financial services	16.05.2023	20 minutes	Microsoft Teams
CO4	Innovation	15.05.2023	24 minutes	Microsoft Teams
CO5	Autonomous solution	08.05.2023	20 minutes	Microsoft Teams
CO6	Business consulting	05.05.2023	20 minutes	Microsoft Teams

3.3 Data Analysis

The data were analyzed using thematic analysis. Interview transcripts were coded iteratively to identify recurring patterns and themes related to organizational experiences, perceived benefits, and challenges associated with CBL collaboration.
Thematic analysis followed an iterative coding process in which transcripts were read repeatedly to support familiarization with the data and identify recurring patterns in participants' descriptions of collaboration experiences. Initial codes were progressively grouped into broader thematic categories through comparison across the six cases, allowing common patterns and variations between organizational perspectives to be identified and refined.
The identified outcomes were grouped into themes such as access to knowledge, efficiency, reciprocity, and organizational reflection. Challenges were categorized into time constraints, feasibility, flexibility, and student motivation.

3.4 Ethical Considerations

Ethical guidelines were followed throughout the study, including informed consent and anonymization of participants. The study was approved by the relevant data protection authority.

4. Results And Discussion

4.1 Benefits and Outcomes of CBL Collaboration

The findings indicate that participation in Challenge-Based Learning (CBL) generate multiple forms of value for industry partners (Table 2). The most frequently reported outcome is access to new knowledge and perspectives, with four out of six organizations emphasizing the benefit of student contributions in approaching challenges from alternative viewpoints. This suggests that CBL can support exploratory thinking and idea generation within organizations, particularly during the early stages of problem identification.
A second key outcome is organizational reflection. Rather than producing immediately implementable solutions in all cases, CBL prompted companies to reassess internal processes, decision-making approaches, and strategic directions. Some participants reported that student contributions encouraged reconsideration of existing practices and assumptions, highlighting the role of CBL in facilitating reflection and dialogue within organizations. This finding aligns with broader perspectives on university–industry collaboration, which emphasize knowledge exchange and collaborative relationships between universities and industry partners [2].
In addition, participants identified benefits related to efficiency and human capital development. Student involvement supported preliminary analysis and idea generation, reducing the need for internal resource allocation. In some cases, participation also created opportunities for continued engagement and future collaboration (e.g., CO6), indicating the potential of CBL to support longer-term university–industry relationships. Similar patterns have been discussed in university–industry collaboration literature emphasizing knowledge exchange and collaborative relationships between universities and external organizations [3].
These findings suggest that the value of CBL lies not only in tangible outputs but also in cognitive and organizational effects, particularly reflection, learning, and collaborative interaction.

Table 2. Outcomes/Benefits of CBL collaboration for industry

Outcomes/Benefits	CO1	CO2	CO3	CO4	CO5	CO6	Cited frequency	Cited frequency (n=6) (%)	Most frequent (>60%)
Strategic institutional policy				X			1	17	
Access to students for internship or hiring					X		1	17	
Shortening product life cycle				X			1	17	
Human capital development	X	X			X		3	50	
Access to new knowledge	X	X	X	X			4	67	X
Solutions to specific problems	X	X	X		X		4	67	X
Access to research networks					X	X	2	33	

Source: Adapted from [22]

4.2 Challenges of CBL Collaboration

Despite these benefits, several challenges were identified (Table 3). The most significant limitation is time constraints, as organizations reported that the duration of a single academic semester is often insufficient for in-depth analysis and implementation. This highlights a structural mismatch between academic timelines and organizational expectations.
A second challenge concerns the feasibility of student-generated solutions. While student contributions were often creative, some organizations found them difficult to implement due to practical or resource-related constraints. This was particularly evident in cases where proposed solutions did not align with operational realities (e.g., CO3), reflecting the tension between exploratory learning processes and organizational implementation requirements.
Participants also noted issues related to flexibility and alignment. For example, some organizations expressed concern that the structured nature of CBL limits adaptability when challenges evolve over time (e.g., CO1). In addition, variability in student motivation and communication was identified as a factor influencing the quality of collaboration, with some participants reporting inconsistent levels of engagement. Similar implementation-related challenges have been discussed in previous CBL research, particularly in multidisciplinary and practice-oriented learning environments [20]. These findings suggest that while CBL facilitates interaction between universities and industry, its effectiveness depends on alignment between project design, organizational expectations, and student engagement.

Table 3. Challenges of CBL collaboration for industry
Source: Adapted from [22]

Challenges	CO1	CO2	CO3	CO4	CO5	CO6	Cited frequency	Cited frequency (n=6) (%)	Most frequent (>60%)
Time constraints	X	X					2	33	
Flexibility	X						1	17	
Feasibility			X				1	17	
Student motivation	X		X				2	33	
Lack of communication				X			1	17	

4.3 Balancing Benefits and Limitations

Across all cases, organizations generally perceived the benefits of CBL as outweighing its limitations, particularly when evaluated from a long-term perspective. Participants recognized that CBL is embedded within an educational context and therefore assessed its value not only in terms of immediate outputs but also in relation to future collaboration, knowledge exchange, and recruitment opportunities. Importantly, the perceived value of CBL was influenced by the scale and nature of the challenge. Smaller, well-defined problems were more likely to produce actionable outcomes, whereas broader challenges tended to generate conceptual insights and reflective value. Some participants emphasized that large or complex challenges resulted in useful perspectives rather than direct solutions, while more focused tasks allowed for more tangible outcomes.
These findings indicate that the effectiveness of CBL depends on careful alignment between challenge scope, stakeholder expectations, and the structure of the learning process. This is consistent with previous CBL research emphasizing the importance of challenge design, collaboration, and structured learning processes within practice-oriented environments [8].

5. Conclusion and Implications

5.1 Conclusion

This study examined the role of Challenge-Based Learning (CBL) in university–industry collaboration by focusing on the perspectives of organizations acting as challenge providers. The findings indicate that participation in CBL may generate value for industry partners primarily through access to new knowledge and perspectives, support for early-stage problem exploration, and opportunities for organizational reflection. While these outcomes do not always lead to directly implementable solutions, they contribute to broader learning and collaborative processes within organizations [2], [3].

At the same time, several challenges were identified, including time constraints, feasibility of student-generated solutions, and variability in student engagement. These challenges reflect structural differences between academic contexts and organizational expectations. Despite these limitations, all participating organizations perceived the overall value of CBL positively, particularly from a long-term perspective related to knowledge exchange and future collaboration.
Overall, the findings highlight the dual role of CBL as both a pedagogical approach and a collaborative mechanism that supports interaction between universities and external stakeholders.

5.2 Theoretical Implications

This study contributes to the literature on university–industry collaboration by extending the understanding of Challenge-Based Learning beyond its traditional focus on student learning outcomes. While previous research has primarily emphasized educational benefits, the present study highlights the role of CBL as a mechanism for collaborative knowledge exchange and interaction between universities and industry partners [4], [7].
By focusing on the perspectives of external stakeholders, the study provides empirical insight into how CBL can facilitate organizational reflection and early-stage innovation processes. The findings also emphasize the role of students as active contributors to knowledge exchange, aligning with broader perspectives on collaborative and practice-oriented learning environments [6], [8].
In this way, the study positions CBL as an integrative approach that connects education, collaboration, and innovation, contributing to the evolving societal role of higher education institutions.

5.3 Practical Implications

The findings offer practical insights for both universities and industry partners involved in CBL initiatives. For universities, the results highlight the importance of designing clearly defined and manageable challenges that align with both educational objectives and organizational needs. Structured coordination, clear communication, and alignment of expectations are essential to enhance collaboration effectiveness.
For industry partners, participation in CBL can provide access to new perspectives, support exploratory thinking, and create opportunities for engagement with future talent. However, organizations should view CBL primarily as a process that supports reflection, learning, and idea development, rather than immediate implementation of solutions.
Furthermore, the findings suggest that the effectiveness of CBL depends on the scope and complexity of the challenge. Smaller and well-defined challenges are more likely to result in actionable outcomes, while broader challenges tend to generate conceptual insights and support strategic reflection [8].

5.4 Limitations and Future Research

This study has several limitations. First, the empirical sample is limited to six organizations, which may affect the transferability of the findings. Second, the study is conducted within a specific collaborative context, which may limit generalizability to other settings. Additionally, the findings rely on self-reported perceptions, which may introduce subjective bias.
Future research could extend this study by including a larger and more diverse sample across different industries and geographical contexts. Further studies could also incorporate perspectives from additional stakeholders, such as students and academic staff, to provide a more comprehensive understanding of CBL as a collaborative approach. In addition, quantitative or mixed-method research designs could be applied to assess the broader impact of CBL on university–industry collaboration outcomes.

APPENDIX A

INTERVIEW GUIDE

1. Warming up/Engagement questions:
    - Introduction of researchers, supervisor, co-supervisor, topic, and main question of the research
    - Asking the interviewees to introduce their organization (challenge provider), professional background, title, and date of CBL program, their role, and tasks in the CBL
    - Terminological clarifications: CBL (challenge-based learning), UIC (university industry collaborations), etc.
    - Explaining different stakeholders/actors of CBL: industry, educational part (academia and students), and society
2. Exploration of present aspects:
    - How did you identify the challenge? Was it a predefined challenge or did CBL learners help you to recognize it? Ask follow-up questions about the limitations/facts while finalizing the challenge.
    - Tell us more about your experience in CBL as a challenge provider. What was the motive behind engaging in a CBL collaboration?
    - Tell us more about the exchange of resources on the company side.
    - What were the benefits/outcomes of CBL for you at an institutional level? Asking follow-up questions to be able to categorize the benefits in one of the main groups
    - What were the benefits/outcomes of CBL for you on an individual level? Asking follow-up questions to be able to categorize the benefits in one of the main groups
    - What were the negatives of CBL for you on an institutional level? Asking follow-up questions to be able to categorize the benefits in one of the main groups
    - What were the negatives of CBL for you on an individual level? Asking follow-up questions to be able to categorize the benefits in one of the main groups
    - What is your thought or plan with the solution you have got from the students?
    - All in all, do you think the benefits outweigh the negatives?
3. Exploration of future aspects and exit questions:
    - What could be done to improve the negatives and increase the positive outcomes
    - Would you or your organization prefer to participate in CBL going forward?
    - Summarization and asking if any other point remains to be mentioned?

Thank you very much for your time indeed

Active Learning in a School-Based Innovation Ecosystem: An Experience Report from Colégio Donaduzzi at Biopark Educação (Brazil)

Carolina Balera Trombini[1], Paulo Roberto Cordeiro Rocha[1]

[1]Associação de Ensino, Pesquisa e Extensão Biopark (Biopark Educação), Brazil

Abstract

Recent evidence from international educational research indicates that active learning methodologies, including cooperative and experiential learning approaches, demonstrate statistically significant correlations with academic achievement, learner motivation, and student engagement across educational levels when compared to traditional teaching methods [1]. Systematic literature reviews further indicate that such approaches lead to improved educational outcomes and are associated with greater knowledge retention and academic performance, particularly when supported by appropriate pedagogical design and effective technological integration [1,2]. This paper reports on the innovative pedagogical practices implemented at Colégio Donaduzzi, an educational institution operating within the Biopark ecosystem in Toledo, Brazil. Situated in a context that integrates formal education, research, and technological innovation, the school adopts active and experiential learning strategies, interdisciplinary project work, and personalized learning pathways as core elements of its educational model. These practices are supported by collaborative learning environments, a bilingual program, formative assessment processes, individualized mentoring, the possibility of customizing learning pathways outside regular class hours to support personalized education, and the use of digital technologies and artificial intelligence to assist learning progression.The institutional model is unique, while inspired by dialogue and knowledge exchange with educational approaches from Finland, the United States, and Portugal, enabling the translation of globally researched practices into the local school context. Preliminary institutional evidence indicates that this approach has translated into measurable outcomes, including strong student participation in scientific projects and consistent performance in national academic competitions, such as sustainability, robotics and language challenges. Drawing on institutional observations and aligned with current international evidence on active methodologies, this experience illustrates how relationally structured and inquiry-driven educational practices can foster deeper engagement, autonomy, and academic resilience.

Keywords: *Personalized learning; Student engagement; Innovation ecosystem; Educational innovation.*

1. Introduction

Active learning has become a central paradigm in contemporary education in response to the demand for learning environments that foster student engagement, autonomy, and meaningful knowledge construction. Methodologies such as project-based learning, collaborative learning, gamification, and inquiry-based approaches have been associated with improvements in academic performance, student motivation, and persistence across educational levels [1]. Empirical and systematic studies indicate that these strategies enhance participation, autonomy, and problem-solving engagement when compared to traditional lecture-based teaching models, contributing to more consistent learning outcomes and sustained student involvement in the learning process [1,2]. Research also shows that student engagement is shaped not only by instructional methods but by institutional environments, collaborative cultures, and classroom dynamics. Learning contexts that integrate participatory pedagogies, interaction, and formative feedback tend to promote stronger and more sustained engagement and learning continuity [2,3]. Although the theoretical and empirical literature on active learning has expanded substantially, its translation into everyday school practices remains uneven, particularly in basic education. Schools frequently face structural, pedagogical, and organizational constraints that limit the systematic adoption of innovative approaches. This scenario reinforces the relevance of studies that document and analyze concrete institutional experiences situated in innovation-oriented educational environments [4].

Innovation ecosystems have been increasingly recognized in educational research as relevant contexts for transformation, particularly when they integrate schools, universities, research initiatives, and technological infrastructures in collaborative arrangements that connect theory and practice and support adaptive learning models and innovation-driven pedagogies [5,6].
Colégio Donaduzzi is a basic education institution that began its operations in January 2025, initially serving students in the final years of elementary education and upper secondary education within the Biopark innovation ecosystem. In 2026, it offered the complete cycles of elementary and upper secondary education. The school is a non-profit educational initiative maintained by Biopark Educação, a civil society organization dedicated to education, research, and innovation. The institution is certified as a charitable educational entity by the Brazilian Ministry of Education and holds public utility recognition at both the state level of Paraná and the municipality of Toledo. This institutional structure supports the integration between schooling, technological development, and interdisciplinary learning environments.
During its first year of operation, the school implemented a pedagogical model grounded in active learning, interdisciplinary projects, individualized mentoring, bilingual exposure, and digitally supported environments, including the use of artificial intelligence to assist learning progression. Within this approach, student protagonism was developed through guided participation and pedagogical mediation. This study examines the implementation of a new pedagogical approach in a basic education school situated within an innovation-oriented environment, analyzing how this model was structured, translated into the local educational context, and remained aligned with international educational trends and research on active learning and student engagement.

2. Methodology

This study adopts an institutional case study design to examine the implementation of an active learning model developed within an innovation ecosystem. This methodological approach is suitable for investigating complex educational processes situated in real institutional contexts, particularly when the objective is to understand pedagogical organization, implementation dynamics, and emerging educational outcomes rather than to test controlled experimental interventions [7,8].
Data were derived from multiple institutional sources, including documentation of interdisciplinary projects, records of student participation in academic and scientific activities, and institutional pedagogical reports. Data triangulation based on documentary sources strengthened methodological rigor and enabled a comprehensive understanding of how active learning and other pedagogical strategies were implemented during the initial phase of the pedagogical model [9,10].
The temporal scope of the study spans from January 2025 to February 2026, covering the first year of operation of Colégio Donaduzzi and the initial implementation phase of its pedagogical model within the Biopark innovation ecosystem in Toledo, Paraná, Brazil.

3. Results and Discussion

The following sections present the results organized into four subtopics: teaching professionals, learning environments and pedagogical practices, integration with the innovation ecosystem, and student and institutional outcomes.

3.1 Teaching Professionals

Colégio Donaduzzi is grounded in the principle that the quality of educational innovation is directly related to the qualification, stability, and continuous development of its teaching professionals. For this reason, the institutional model incorporates structured processes for teacher selection, professional valorization, and pedagogical development as central elements for the implementation of relationally oriented pedagogical practices grounded in teacher–student interaction.
The recruitment process involves a comprehensive evaluation of academic background and professional trajectory, including prior teaching experience and engagement in research activities. Candidates are assessed through a structured selection process conducted by a panel of specialized educators and participate in a simulated classroom teaching session, enabling the evaluation of pedagogical competence, communication skills, and alignment with the institutional educational approach. All teachers are specialists in their respective fields, with 82% holding postgraduate qualifications corresponding to ISCED above 6. According to the International Standard Classification of Education (ISCED), developed by UNESCO, level 6 corresponds to bachelor's or equivalent degrees,

level 7 to master's or equivalent degrees, such as postgraduate programs of strong specialization, and level 8 to doctoral or equivalent research degrees [11].
To contextualize the institutional qualification profile, Tables 1 and 2 compare Colégio Donaduzzi with national and international benchmarks from the Brazilian School Census 2024 and TALIS 2024, covering overall qualification levels and doctoral-level training.

Table 1. Teacher qualification profile (basic education) in national and international comparison according to ISCED classification [11,12,14].

Context	ISCED < 6	ISCED 6	ISCED > 6
Colégio Donaduzzi	0.0%	17.9%	82.0%
School Census 2024 - Brazil	10.3%	42.7%	48.0%
TALIS 2024 - International	3.2%	38.1%	59.7%
TALIS 2024 -Top 1: Slovak Republic	0.6%	0.9%	98.5%
TALIS 2024 -Top 2: Poland	0.3%	2.3%	97.4%
TALIS 2024 -Top 3: Croatia	0.6%	4.5%	94.5%
TALIS 2024 -Top 4: Portugal	0.9%	5.0%	94.1%
TALIS 2024 -Top 5: Finland	3.7%	4.5%	91.8%

Table 2. Proportion of teachers at ISCED level 8 (doctoral level) in national and international comparison [11,13,14].

Context	ISCED 8
Colégio Donaduzzi	12.8%
School Census 2024 - Brazil	1.1%
TALIS 2024 - International	1.7%
TALIS 2024 -Top 1: Italy	5.2%
TALIS 2024 -Top 2: Cyprus	4.9%
TALIS 2024 -Top 3: Spain	4.8%
TALIS 2024 -Top 4: Romania	4.3%
TALIS 2024 -Top 5: Czechia	3.8%

Together, these data indicate that Colégio Donaduzzi presents a higher proportion of teachers with postgraduate and doctoral qualifications than national averages and approaches patterns observed in education systems characterized by strong academic preparation of teaching professionals.
Colégio Donaduzzi adopts employment conditions aimed at attracting and retaining highly qualified professionals. Teaching contracts are structured with full institutional dedication (100%), encompassing the teacher's weekly workload within the school. This model differs from the national Brazilian context, in which a substantial proportion of teachers work under part-time arrangements and approximately 41% need to divide their weekly workload across two or more schools. At the global level, around 20% of teachers work part-time across education systems. Among these, 17% work in only one school, indicating that a substantial proportion of part-time teachers are employed across more than one school, reflecting fragmented professional arrangements and representing a relevant share of teachers working across multiple institutions worldwide [11, 14, 15].
Within the full-time model adopted by Colégio Donaduzzi, half of this workload is allocated to classroom teaching, while the remaining time is dedicated to lesson planning, development of instructional materials, individualized mentoring of students, developing research projects, and continuous professional development, supported by sufficient administrative staff to allow teachers to focus primarily on pedagogical activities. This configuration also differs from the broader Brazilian educational reality, where Federal Law No. 11.738/2008 establishes a maximum distribution of 2/3 of teachers' working time for classroom instruction and 1/3 for extracurricular pedagogical activities, which may include administrative tasks [16]. In practice, however, schools frequently tend to allocate teachers as close as possible to the maximum permitted time in classroom teaching, a condition associated in the literature with reduced well-being and increased work-related stress among teachers, thereby constraining the time, cognitive availability and pedagogical flexibility required to effectively implement active and personalized teaching approaches [17].
At the institutional level, the school also provides dedicated facilities for teachers, including a staff lounge equipped with kitchen facilities, designed to support rest, interaction and well-being during the working day. International evidence indicates that teacher well-being is influenced by multiple factors beyond remuneration, including workload, working conditions, leadership support and opportunities for continuous professional learning; however, salary remains a significant element associated with professional satisfaction and retention in the teaching career [11].
Based on these considerations, teacher valorization is also expressed through remuneration practices above the local average. The entry-level salary is approximately 26% higher than the national salary floor for public basic education teachers in Brazil, while the average remuneration is about 50% higher than the mean salary observed in public basic education teaching positions [18,19], as well as through institutional investment in continuous professional learning pathways. The school provides structured support for the development of individualized professional growth plans and offers continuing education opportunities embedded within the working schedule. As part of these actions, teachers were offered postgraduate specialization programs, each exceeding 360 hours and provided free of charge, including training in learning practices and the development of neurodivergent students, as well as participation in the Star Lessons program, developed through a partnership between Biopark Educação and the

University of Helsinki and recognized as an international professional development initiative originating in Finland. This program was also part of an institutional strategy aimed at strengthening international collaboration. Within this international dimension, knowledge exchange dialogues were established with educational institutions in Finland, the United States, and Portugal. These activities were supported by in loco visits aimed at identifying collaboration opportunities and informing future international engagement of teachers.
Beyond postgraduate training, the institution also promoted professional engagement at the international level, both by hosting and sending educators, including the visit of a renowned educator from Portugal to Brazil to deliver lectures for all teaching professionals, as well as an immersion experience carried out in Finland, in schools internationally recognized for pedagogical excellence, in which 17 teachers from Colégio Donaduzzi participated, enabling them to observe educational practices in context and subsequently adapt these experiences to the Brazilian basic education reality.
Furthermore, other institutional practices contribute to teachers' professional support, including continuous dialogue with institutional leadership, which provides ongoing feedback and feedforward on professional development and offers guidance when challenges are identified.

3.2 Learning Environments and Pedagogical Practices

Learning environments are structured as thematic laboratories rather than conventional fixed classrooms, reflecting an infrastructure intentionally designed to stimulate students' curiosity, creativity, and engagement. Each discipline is associated with its own dedicated environment, for example, a Mathematics laboratory organized with challenges and educational games, and a science laboratory equipped with instruments and reagents to support experimentation aligned with the topics addressed in class. This configuration enables students to move beyond abstract content, engaging directly with concepts through practical experience and experimentation, so that learning is constructed not only through theory but through concrete interaction with the subject matter [20].
The integration of digital tools supports pedagogical organization and formative assessment practices. Each student was provided with an individual portable computer to support digital learning activities and access to intelligent educational platforms that facilitate the monitoring of academic progress and the generation of information to support feedback processes.
Classes are limited to a maximum of 24 students, a size considered pedagogically appropriate to allow closer monitoring of learning processes and effective classroom management by the teacher, also influencing the quality of perceived teacher–student interactions and, consequently, higher levels of student satisfaction [17]. Within each laboratory, learners are typically organized into 4 collaborative learning islands composed of 6 students, fostering teamwork, peer interaction, and collective problem solving. According to the pedagogical objectives of each lesson, the spatial configuration can be reorganized by the teacher, allowing the environment to adapt dynamically to different learning activities.
Each class lasts 50 minutes, followed by a 5 minutes pause for transition between laboratories according to students' schedules. This circulation contributes to maintaining students physically and cognitively active, while each change of environment functions as a new moment of immersion in the subject area.
In this model, space is not simply a physical setting but becomes an active component of the learning process, supporting active and personalized teaching practices [21]. In addition, the school provides dedicated spaces for rest, emotional regulation, and guided study, supporting students' well-being, cognitive recovery, and targeted academic assistance. Differently from the prevailing schedule observed in most Brazilian schools, at Colégio Donaduzzi classes began after 8:00 a.m., a timing consistent with evidence indicating that later school start times are associated with longer sleep duration, improved cognitive functioning, and better academic and mental health outcomes among adolescents [22].
Students participate in a diagnostic assessment when they enter the school, and the results are analyzed by a multidisciplinary pedagogical team. Based on this assessment, working groups are organized to guide classroom activities, aiming to promote complementarity among students and support the progressive development of socioemotional competencies, leadership, collaboration, and other dimensions relevant to learning and personal development.
Each student is also assigned a faculty mentor who provides individual guidance for approximately one hour per week. During the first weeks of the school year, students indicate three preferred teachers to act as mentors, and the school allocates mentorships according to availability to ensure that all students are supported. Mentoring sessions focus on students' academic and personal development and on the continuous refinement of their individualized development plan, referred to as the Life Plan. Whenever necessary, the multidisciplinary pedagogical team supports both students and mentors, contributing to monitoring progress and guiding decision-making throughout each student's developmental trajectory.

When specific learning needs are identified in particular subjects, mentors may recommend the organization of supplementary instructional groups to provide targeted academic support. Students' academic progress, activities, and individualized development plans are systematically recorded in a pedagogical learning log, supporting monitoring, feedback, and communication among teachers, mentors, and the pedagogical team.

Within classroom settings, pedagogical practices were organized around core dimensions aligned with relational pedagogical principles and active learning. Teaching strategies positioned students as active agents in the learning process through project-based activities, problem-oriented tasks, and collaborative knowledge construction. Classroom experiences were designed to support creativity, experimentation, and innovation as components of cognitive engagement. Socioemotional dimensions were also incorporated into the pedagogical organization, with emphasis on structured interactions, active listening, and respectful communication, contributing to students' emotional development and learning engagement. The pedagogical model further emphasized the development of transversal competencies, including communication, problem-solving, interpersonal collaboration, and leadership. These elements were integrated into classroom dynamics to support student participation, motivation, and sense of belonging, understood as relevant factors in the learning process.

Assessment practices were formative and participatory, focusing on performance and learning trajectories. Instruments included learning records, self- and peer assessment, and project-based evaluation, with trimester presentations supporting the monitoring of student development.

Students participated in comprehensive institutional evaluation processes conducted at the end of each trimester, providing structured feedback on learning environments, teaching practices, teacher performance, administrative procedures, transportation logistics, the quality of school meals, and the overall organizational functioning of the school, thereby contributing to a broad and systematic assessment of both pedagogical and operational dimensions of the educational experience.

The school approaches technology as a means to enhance human development and learning processes rather than as an end in itself. Digital resources are integrated transversally into the curriculum to support inquiry, collaboration, knowledge construction, and formative assessment, while maintaining the human dimension as central to educational practice. Within this perspective, technological integration is understood as a pedagogical instrument that supports students' autonomy, critical thinking, and responsible engagement with digital environments.

In alignment with this approach, the institution introduced a dedicated Artificial Intelligence (AI) course for upper secondary students, expanding structured opportunities for digital literacy and computational thinking within basic education. This initiative positions the school among early adopters of curricular AI education in the Brazilian context, reflecting its commitment to aligning educational practices with emerging technological and societal developments.

To begin within the Brazilian regulatory framework for bilingual education, Colégio Donaduzzi chose not to operate initially as a bilingual school. In Brazil, a bilingual school is defined as one that implements a single, integrated curriculum delivered in two languages, with a minimum proportion of instruction conducted in the additional language (30% in elementary education and 20% in upper secondary education) [23,24]. Instead, the institution opted to implement a bilingual program, characterized by extended exposure to the English language within the school schedule. Approximately 20% of instructional time was conducted in English, supported by daily language classes. This decision considered that, in its first year, the school offered classes for the final year of elementary education and all grades of upper secondary education, and that many learners might not yet have sufficient linguistic background to immediately engage in content-based instruction delivered through English, in which curricular subjects are taught in the additional language, potentially affecting their academic development. Research indicates that, particularly among learners with limited prior exposure to the additional language, the integration of disciplinary content and a second language may affect students' comprehension and engagement with subject matter. Evidence from studies on bilingual and content-based language education shows that, in the initial stages of implementation, learning gains are more consistently observed in language development than in disciplinary achievement, and outcomes in content learning tend to vary according to students' linguistic readiness and the conditions of implementation. These findings support recommendations to strengthen explicit language instruction and to adopt gradual or sequential models before expanding subject teaching in English [25,26]. The adopted approach therefore reflects contextual adaptation and alignment with recommendations from the literature on gradual implementation of bilingual education.

As a key component of its institutional strategy to strengthen student protagonism, engagement, and curriculum development, the school organized the daily timetable to ensure alignment with the curricular components required by the Brazilian National Curriculum Guidelines for Basic Education issued by the

Ministry of Education, while also providing opportunities for the personalization of education in the complementary period. Teaching and learning practices were structured according to active and experiential learning strategies, interdisciplinary project work, and personalized learning pathways as central elements of the educational model. The pedagogical organization was articulated through interdisciplinary projects, collaborative learning environments, inquiry-oriented activities, and the integration of digital resources into teaching and learning processes. These strategies were designed to promote student engagement and the articulation between academic knowledge and real-world problem solving. The model was influenced by principles of active learning, including project-based learning and phenomenon-based learning, as well as by the integration of digital technologies and artificial intelligence, while maintaining the human dimension as a central element of educational processes. Personalization of learning was established as a core component of this approach, supported by individualized mentoring and continuous guidance in the definition and development of students' learning pathways according to their interests, needs, and future aspirations.

Finally, as one of the school's main distinguishing features, in the complementary period students were able to fully personalize their developmental trajectories by selecting areas aligned with their individual interests and vocations from approximately 60 possibilities, encompassing science, arts/culture, sports, and technology. This stage of personalized education was implemented within a dedicated structure integrated with Colégio Donaduzzi, located in the Biopark innovation ecosystem and known as Academia Donaduzzi, an institution that is part of Biopark Educação. The Academia Donaduzzi provided additional specialized learning environments, including laboratories for food science, pharmacy, microbiology, arts and culture, and information technology, as well as a makerspace equipped with 3D printers and infrastructure for prototyping and woodworking, in addition to sports facilities and other resources. Within this context, students were able to design and pursue individualized learning pathways aligned with their interests and developmental needs. This approach enabled the exploration and consolidation of competencies connected to personal aspirations, while establishing links between school experiences, higher education trajectories, and potential entry into the labor market.

3.3 Integration with the Innovation Ecosystem Biopark

The integration of Colégio Donaduzzi within the Biopark innovation ecosystem enabled continuous interaction with companies, research initiatives, and educational institutions, providing students with access to infrastructure, technological resources, and innovation-oriented environments. Educational activities were supported by proximity to laboratories, entrepreneurial initiatives, and institutional networks that characterize the ecosystem.

This integration translated into concrete educational opportunities for students. Within this context, students also had access to an entrepreneurial development pathway through a child-focused incubation program linked to the innovation ecosystem. For younger participants, the initiative was adapted into a pre-incubation format appropriate to their age and stage of development. In this program, students were able to develop their own business ideas and projects, developing products or services as well as entrepreneurial proposals, while receiving technical guidance and support from professionals associated with the technology park. At the time of this study, 17 initiatives participated in this program, with approximately 20 additional initiatives projected for 2026.

Scientific initiation activities also formed part of the integration between the school and the innovation ecosystem, involving students in research-oriented projects connected to real-world problems and innovation contexts. The school is currently selecting 30 projects involving up to 50 students, in which each participant will receive a monthly research fellowship of R$ 300 to support their dedication to research activities. These projects are generally developed in dialogue with demands and areas of interest identified within the Biopark ecosystem, strengthening the relationship between school-based research, technological development, and local innovation dynamics.

The relationship between the school and the ecosystem was not unidirectional. The presence of the school also contributed to the dynamics of the ecosystem by expanding the circulation of people and strengthening connections between educational and innovation environments. The student population comes from a regional area that includes 21 municipalities within an approximate radius of up to 290 km, with the host city accounting for about 67% of total enrollment. Families connected to the Biopark ecosystem, including those working in companies and research institutions, became actively involved in school activities. At the same time, the school also attracted new social groups who would not normally access the Biopark environment on a daily basis, representing more than 90% of the student population.

In addition, the school functions as an early educational stage within a broader educational trajectory associated with the innovation ecosystem, which includes higher education institutions located within

the same environment, such as Faculdade Donaduzzi and public universities. In this sense, students represent potential future participants in the innovation ecosystem, contributing to the continuity of educational and professional pathways aligned with research, entrepreneurship, and technological development.

3.4 Student and Institutional Outcomes

Colégio Donaduzzi began its activities with an initial enrollment of 303 students and, within a short period, expanded to 554 students. Participation in personalized learning pathways beyond regular class hours was observed among 422 students, indicating strong engagement with the personalized learning model beyond the compulsory instructional components required by Brazilian basic education regulations. Institutional records also indicate that 160 students have formal diagnoses associated with high abilities. This profile reinforces the relevance of differentiated pedagogical strategies, mentoring, and project-based learning structures and represents a distinctive feature of the school, which is particularly responsive to the needs of high-ability learners.

As a private non-profit educational institution, Colégio Donaduzzi incorporates financial support as an important component of its access model. The majority of students receive some form of scholarship support, determined by family socioeconomic conditions, parents' professional links with the Biopark ecosystem, partnerships with public programs, and internal academic selection processes. Overall, 66% of students receive scholarships, among whom 47% benefit from full scholarships, while an additional 19% receive partial support covering up to half of the tuition fees.

Project-based learning was implemented as a transversal pedagogical axis, with all students participating in interdisciplinary initiatives throughout the academic year. Projects were aligned with real-world challenges and, in many cases, connected to sustainability, technological innovation, and social inclusion. Several initiatives gained visibility in educational and media contexts, including the development of a nutritional supplement for cattle aimed at reducing methane emissions, biodegradable dressings with natural active compounds for acne treatment, and an intelligent wheelchair capable of interpreting facial movements to control mobility [27,28].

Student engagement in scientific fairs and academic competitions resulted in multiple recognitions across areas including sustainability, health, robotics, entrepreneurship, technological development, languages, engineering, and astronomy, totaling 33 medals and 63 honorable mentions in national Olympiads, as well as 12 medals in regional contests. As an illustrative example of performance above the national average, data from the Brazilian Astronomy Olympiad (OBA) indicate that the school achieved an award rate of 8.2%, compared to the national average of 5.6%, representing a performance more than 45% higher than the national benchmark. A similar pattern was observed in the Brazilian Public Schools Mathematics Olympiad (OBMEP), in which approximately 10% of participating students advanced to the second phase, compared to a national average of 5%, corresponding to twice the national rate [29].

Diagnostic evaluations conducted at the time of student entry revealed heterogeneous learning levels across curricular components, guiding the implementation of personalized learning strategies and academic support pathways. Subsequent internal evaluations indicated progressive improvement in average performance across disciplines over the academic terms, increasing from an average of 6.5 to 8.7 (maximum score of 10) in the first trimester of evaluations, suggesting stabilization of learning processes and consolidation of foundational competencies.

Survey data collected from students and families indicated high levels of satisfaction with pedagogical methodologies, learning environments, and institutional organization. Students rated teaching methodology at 8.8 and overall institutional performance at 8.6 (maximum score of 10), while parents or guardians reported ratings of 9.3 for methodology and 9.5 for overall institutional evaluation, reinforcing the perceived relevance of the educational model and its impact on student engagement.

At the ecosystem level, the integration between the school and the Biopark innovation environment produced additional impacts. As described in the previous subtopic, student participation in scientific initiation projects, entrepreneurial pathways, and applied research activities reinforced connections between basic education, technological development, and innovation practices. Furthermore, among students who completed the final year of upper secondary education, 100% were admitted to higher education entrance examinations, and 70% secured admission to higher education institutions within the Biopark ecosystem, enabling continuity of their educational trajectories within the same innovation environment.

4. Conclusion

The implementation of an educational model grounded in active learning, personalization, and integration with an innovation ecosystem was associated with high levels of student engagement, participation in interdisciplinary projects, and recognition in academic and scientific environments during the initial period analyzed.
Aligned with international evidence, the experience suggests that relational and inquiry-driven environments can foster autonomy, engagement, and academic resilience, while strengthening connections between schooling, research, and real-world problem solving.
Within the Brazilian educational context, Colégio Donaduzzi emerges as an institutional model structured to remain connected to global research agendas and educational innovation, translating internationally discussed pedagogical approaches into a locally grounded implementation.

What Would Paulo Freire Think of Generative AI? Critical Pedagogy, Cognitive Offloading, and the Struggle for Humanisation

Joseph Vancell

University of Malta, Malta

Abstract

This paper examines generative artificial intelligence (GenAI) through the lens of Paulo Freire's critical pedagogy, exploring how the Brazilian educator and philosopher might assess contemporary AI technologies in education. Methodologically, it adopts a theoretical-interpretive approach, synthesising recent scholarship (2023–2026) on GenAI in education through a systematic application of Freire's foundational concepts, namely the banking model, problem-posing pedagogy, conscientisation, dialogue, humanisation, and praxis, as an analytical framework rather than reporting original empirical data. Whilst existing scholarship has applied individual Freirean concepts to AI critique, this paper makes a distinct contribution by offering a comprehensive and coherent Freirean reading across all of Freire's core pedagogical principles, and by moving beyond critique to propose a praxis-oriented framework of seven actionable strategies for AI integration. The analysis occupies a deliberate middle ground between techno-optimism and techno-pessimism, arguing that Freire would view generative AI as neither inherently emancipatory nor oppressive, but as a contested terrain requiring deliberate pedagogical choices that centre humanisation, equity, and social justice. The paper identifies persistent risks, including technocratic neutrality, algorithmic bias, and the displacement of authentic dialogue, whilst also recognising AI's emancipatory potential when implemented with critical pedagogical intentionality. Ultimately, it contends that Freire would call for a praxis-oriented approach to AI in education, one that transforms technology from an instrument of domination into a tool for critical consciousness and collective liberation.

Keywords: *Paulo Freire, generative AI, critical pedagogy, conscientisação, banking model, problem-posing education, AI literacy, cognitive offloading, skills atrophy, deskilling*

Introducton

> *I consider the fundamental theme of our epoch to be that of domination—which implies its opposite, the theme of liberation, as the objective to be achieved… In order to achieve humanisation, which presupposes the elimination of dehumanising oppression, it is absolutely necessary to surmount the limit-situations in which people are reduced to things [1].*

The rapid emergence of generative artificial intelligence (henceforth, GenAI), particularly large language models (LLMs) such as ChatGPT, Claude, and Gemini, has profoundly disrupted educational landscapes worldwide [2, 3]. These systems can generate essays, answer complex questions, create lesson plans, and engage in seemingly intelligent dialogue, prompting urgent questions about their role in teaching and learning [4, 5]. A survey of 337 higher education leaders in the USA conducted in late 2024 found that 71% of college students use AI tools for coursework [2]. As educators grapple with whether to embrace, resist, or critically integrate these technologies, Paulo Freire's critical pedagogy offers a powerful analytical framework [6, 7].

Paulo Freire (1921–1997) critiqued the “banking model” of education, in which teachers deposit knowledge into passive student receptacles [6, 8]. He advocated for “problem-posing” education rooted in dialogue, critical reflection, and transformative action, positioning education as inherently political and aimed at humanisation and conscientisation (conscientização): critical awareness of social contradictions and the capacity to act against oppressive elements of reality [9, 10]. Recent scholarship has applied Freirean concepts to GenAI, revealing both emancipatory possibilities and significant risks [11, 12, 13]. This paper synthesises this work and extends it by foregrounding the concern of cognitive offloading and skills atrophy, a risk that AI-enabled externalisation of cognitive tasks may erode the very competences education is designed to cultivate.

This paper adopts a theoretical-interpretive methodology. It does not report original empirical data; instead, it synthesises recent scholarship (2023–2026) on generative AI in education through the analytical lens of Freirean critical pedagogy. Sources were selected purposively to represent the emerging critical literature on GenAI across diverse educational contexts. The aim is conceptual. It attempts to build a Freirean reading of AI's pedagogical implications rather than to produce a systematic review or meta-analysis.

Drawing on Freire's pedagogical theory as an analytical framework, this paper seeks to occupy a middle ground, one that neither uncritically embraces nor wholesale rejects AI's role in educational practice. Whilst existing scholarship has applied individual Freirean concepts, particularly the banking model and conscientisation, to AI critique, this paper makes a distinct contribution by offering a systematic and comprehensive Freirean reading across all of Freire's core pedagogical principles. It further moves beyond critique to propose a coherent, praxis-oriented framework for AI integration, bridging theoretical analysis and practical strategy in ways that prior work has not fully developed. In doing so, it aligns with a growing scholarly effort to engage with AI in education in a measured, and critically informed manner.

The paper is structured as follows. Section 1 outlines the core concepts of Freire's critical pedagogy that are most relevant to the analysis of GenAI. Section 2 examines the risks that GenAI poses when viewed through a Freirean lens, with particular attention to the reproduction of the banking model, the masking of power relations, algorithmic bias, cognitive offloading and skills atrophy, the political dimension of AI-induced deskilling, and the accelerated displacement brought about by the agentic turn in AI development. Section 3 explores the emancipatory possibilities of GenAI when deployed within genuinely critical pedagogical frameworks. Section 4 synthesises these findings into a set of practical commitments for educators seeking to align AI integration with Freirean principles. The conclusion reflects on what Freire's legacy demands of educators in the age of AI.

1. Freire’s Critical Pedagogy: Core Concepts and Principles

1.1 The Banking Model versus Problem-Posing Education

Freire’s critique of the “banking model” of education remains the cornerstone of his pedagogical vision. In this model, education becomes “an act of depositing, in which the students are the depositories and the teacher is the depositor” [1]. Students are treated as empty vessels to be filled with predetermined knowledge, rendering them passive objects rather than active subjects in their own learning. This approach serves the interests of oppression by discouraging critical thinking and maintaining existing power structures. Knowledge, in the banking model, is a finished product to be consumed rather than a living process to be co-created, and the student’s role is one of reception, filing, and storage rather than critical engagement and transformation. The model is not merely an inefficient pedagogy but a political instrument: by training students to receive and accept rather than question and transform, it reproduces the conditions of their own subordination.

In contrast, Freire advocated for “problem-posing” education, which positions teachers and students as co-investigators of reality. This dialogic approach treats knowledge not as a static commodity to be transferred but as something co-created through critical inquiry grounded in learners’ lived experiences. The teacher-student relationship is reconceived as one of mutual learning: teachers learn from students as students learn from teachers, in a horizontal exchange that respects the knowledge all participants bring to the educational encounter. Recent analyses emphasise that Freire’s distinction between these models remains highly relevant to AI integration, as generative systems can easily default to banking-style knowledge delivery if not deliberately designed and framed otherwise [4].

1.2 Conscientisação and Critical Consciousness

Central to Freire’s pedagogy is the concept of conscientisação—the process of developing critical consciousness about social contradictions and the capacity to transform oppressive realities. This process moves beyond mere awareness to encompass “learning to perceive social, political, and economic contradictions, and to take action against the oppressive elements of reality” [1]. Freire understood consciousness-raising not as an individual psychological process but as a collective political one, tied to broader struggles for social justice. Generative AI can either facilitate critical consciousness by revealing algorithmic bias and social structures, or it can naturalise these biases and hinder conscientisação if used uncritically [7]. The question becomes whether AI tools are deployed to encourage questioning and critique or to deliver seemingly authoritative answers that discourage deeper inquiry.

1.3 Dialogue and Humanisation

For Freire, authentic education requires dialogue—a horizontal relationship between teachers and students characterised by mutual respect, trust, and shared inquiry. Dialogue is not mere conversation but a transformative encounter that recognises the full humanity of all participants, standing in stark contrast to the vertical, authoritarian structures of banking education. Humanisation—the process of becoming more fully human—represents the ultimate goal of Freirean pedagogy, orienting educational technology towards equity, dignity, and access rather than mere efficiency or profit [10]. This humanising imperative must function as an ethical constraint on any educational use of AI.

1.4 Praxis: The Unity of Reflection and Action

Freire insisted on the unity of reflection and action, which he termed 'praxis'. Authentic praxis requires both critical reflection on reality and transformative action to change it. Neither reflection without action (verbalism) nor action without reflection (activism) constitutes genuine praxis. This dialectical relationship between thought and action drives both individual conscientisação and collective liberation. Recent scholarship suggests that generative AI can be integrated into cycles of praxis when used to surface problems, support critique, and inform collective action [7]. However, automated systems risk substituting reflection with optimisation metrics unless pedagogically mediated to maintain the reflective dimension essential to genuine praxis [11].

2. Generative AI as Banking Model 2.0: Risks and Reproductions

2.1 The Delivery of Packaged Knowledge

Generative AI systems excel at producing seemingly authoritative, polished responses to student queries, potentially transforming education into an even more efficient banking operation. Rather than teachers depositing knowledge, AI systems deliver instant answers that discourage students from engaging in the messy, uncertain process of inquiry and knowledge construction. Without deliberate pedagogical redesign, AI reinforces teacher-as-depositor roles by providing ready-made answers and narrowing inquiry [4, p.89]. This risk is particularly acute because AI-generated content often appears comprehensive and confident even when inaccurate or incomplete, inviting uncritical consumption rather than critical engagement. The ease of generating essays, summaries, and solutions fosters an instrumental, consumption-style relationship to learning that prioritises efficiency over understanding, credentialisation over conscientisação.

2.2 Technocratic Neutrality and the Masking of Power Relations

Freire emphasised that education is never neutral; it either serves to integrate students into the existing system or enables them to question and transform it. Generative AI is frequently promoted through technocratic framings that present it as a neutral efficiency tool, masking the power relations and ideological commitments embedded in these systems [12]. This apparent neutrality conceals multiple forms of power. AI systems embody the values and biases of their creators and training data, often reflecting dominant cultural perspectives whilst marginalising others. Corporate ownership of major AI platforms concentrates power in the hands of technology companies (primary, American). Therefore, the emphasis on efficiency and scalability serves neoliberal educational reforms that prioritise measurable outcomes over humanisation and critical consciousness. Freire would critique this technocratic framing as a contemporary form of "false generosity". This, for Freire and later critical pedagogists, is a gesture that appears beneficial whilst ultimately maintaining oppressive structures.

2.3 Algorithmic Bias and Automated Inequality

Generative AI systems trained on historical data inevitably reproduce the biases present in that data, including racial, gender, cultural, and linguistic biases. These systems can generate content that perpetuates stereotypes, marginalises non-dominant perspectives, and reinforces existing inequalities [7, p.7]. Beyond content bias, AI creates new structural inequalities: students and schools with greater access to advanced AI tools gain advantages over those without, potentially widening existing educational divides. The digital divide becomes an AI divide, with implications for who can participate fully in an increasingly AI-mediated world. Freire would recognise this as a contemporary manifestation

of oppression: the use of technology to maintain hierarchies and exclude marginalised communities from full participation in knowledge creation and social transformation [9].

2.4 Cognitive Offloading and the Atrophy of Competence

Cognitive offloading, that is,the practice of externalising cognitive tasks to tools and technologies—is not inherently problematic. Writing itself is a form of cognitive offloading; so is the use of calculators, GPS navigation, and reference databases. Clark and Chalmers [16] argue that cognitive processes 'can be partly constituted by, and partly located in, the environment,' and that this extension can enhance rather than diminish human cognitive capacity. Their famous example of Otto's notebook as a genuine component of his memory system illustrates how cognitive extension can be enabling rather than diminishing.

However, the current scale and scope of AI-enabled cognitive offloading raises qualitatively distinct concerns. Sparrow et al. [13] documented what they termed 'the Google effect': the finding that 'when people expect to have future access to information, they have lower rates of recall of the information itself.' Risko and Gilbert [16] have noted that the consequences of cognitive offloading depend critically on 'whether or not the offloaded processing contributes to learning.' More recently, Gerlich [19] has documented correlations between habitual AI tool use and diminished critical thinking capacities, arguing that when AI systems perform the evaluative and generative work that produces competence, repeated use may erode rather than scaffold that competence.

In educational contexts, this concern takes on particular urgency. Students who use LLMs to generate essays are not merely submitting work they did not produce; they are potentially forgoing the cognitive work through which writing competence, argumentation skills, and disciplinary knowledge are developed. The short-term efficiency gain may come at the long-term cost of the very capacities that education is meant to cultivate. From a Freirean perspective, this is especially troubling because the atrophy of critical cognitive competences directly undermines the possibility of conscientisação: one cannot develop critical consciousness whilst outsourcing one's critical thinking to an algorithm.

2.5 Freire and the Political Dimension of Deskilling

What Freire adds to this cognitive analysis is the insistence that deskilling is not merely a technical phenomenon but a political one. For Freire, the dehumanisation of workers, that is, their reduction to passive instruments of a productive process they neither understand nor control, is not an unfortunate side effect of technological change but an expression of the fundamental logic of oppression [1]. AI-induced deskilling, viewed through this lens, is an expression of the power relations governing who controls the means of cognitive production, who benefits from the automation of skilled labour, and who bears the costs.

This political dimension is amplified by the economic logic that drives AI development. As Zuboff [20] argues, surveillance capitalism 'claims human experience as free raw material for translation into behavioural data'—a logic that AI-enabled deskilling intensifies. When legal AI systems automate the analytical work of junior lawyers whilst leaving the profits of law firms intact, when algorithmic management systems reduce skilled workers to responsive appendages of an optimisation engine, these are not neutral technological developments. They are expressions of a logic that extracts value from human cognitive labour whilst systematically undermining the conditions under which that labour can be meaningfully exercised. Freire would insist that educators name this logic rather than accommodate it.

2.6 The Agentic Turn and Accelerated Displacement

The recent development of agentic AI systems—AI capable of planning and executing multi-step tasks autonomously, browsing the web, writing and running code, managing files, and interacting with external services—marks a qualitative escalation in the scope of potential deskilling and displacement. Where earlier AI tools augmented specific tasks within a human-directed workflow, agentic systems begin to approximate the autonomous performance of entire job roles [13].

This development amplifies the Freirean concern in two ways. First, it accelerates the displacement of workers from roles that previously required substantial expertise, concentrating the benefits of this displacement among those who own and control the agentic systems. Second, it deepens the opacity of the productive process: agentic AI produces outputs whose reasoning is often opaque even to the system's creators. This opacity is fundamentally antithetical to the Freirean ideal of praxis. Freire insists

that reflection and action must be consciously integrated—that genuine praxis requires workers who understand what they are doing and why [1]. A labour process mediated by inscrutable algorithms forecloses this understanding by design, producing what might be called 'automated verbalism': outputs without genuine reflection.

2.7 The Displacement of Dialogue and Agency

Perhaps most troubling from a Freirean perspective is the potential for generative AI to displace authentic dialogue—the horizontal, humanising encounter between teachers and students that Freire considered essential to transformative education. As AI systems become more sophisticated in simulating conversation, there is a growing risk that human-AI interaction will substitute for human-human dialogue, fundamentally altering the relational dynamics through which conscientisação develops [17]. When students turn habitually to AI for answers, feedback, and guidance, the locus of educational interaction shifts from the classroom community to individual interactions with algorithmic systems, undermining the collective dimension of Freirean learning.

Moreover, agentic AI systems that can independently perform cognitive tasks risk reconfiguring student agency itself. If AI drafts essays, solves problems, and conducts research on students' behalf, students may be positioned as managers or consumers of AI outputs rather than as active knowledge creators. This reconfiguration contradicts Freire's insistence that students must be subjects, not objects, in their own education. It mirrors precisely the dehumanising dynamic he identified in the banking model.

2.8 Misinformation and the Post-Truth Challenge

GenAI systems remain prone to "hallucinations": the generation of plausible-sounding but factually incorrect information. This tendency contributes to what scholars describe as post-truth problems in knowledge formation, where the distinction between accurate and inaccurate information becomes increasingly difficult to maintain [14]. For Freire, pedagogy depended on the critical reading of reality:

> *"Reading the world always precedes reading the word, and reading the word implies continually reading the world." [15]*

The proliferation of AI-generated misinformation therefore represents a serious obstacle to conscientisação. When students cannot reliably distinguish between accurate and fabricated information, their capacity to develop critical consciousness about actual social conditions is fundamentally compromised. The problem is compounded by AI's authoritative presentation style, which can lend false credibility to incorrect information and discourage the critical scepticism that Freire considered essential to education.

3. Generative AI as Tool for Liberation: Emancipatory Possibilities

Whilst the risks are substantial, a rigorous Freirean analysis must also recognise generative AI's potential to support liberatory education when implemented with critical pedagogical intentionality. Freire was not a technological determinist; he understood that tools could serve either oppression or liberation depending on how they were used and for what purposes. Several emerging approaches demonstrate how AI might be aligned with Freirean principles, particularly when the risks of skills atrophy and deskilling are explicitly addressed.

3.1 Supporting Problem-Posing Inquiry and Critical AI Literacy

Generative AI can facilitate problem-posing education when used as a tool for iterative inquiry rather than as an answer engine. Instead of accepting AI outputs as final knowledge, students can use these systems to generate hypotheses, explore alternative perspectives, and frame problems for further investigation. As Alm and Watanabe demonstrate in language education, AI can co-create localised communicative scenarios that students then critique and refine, positioning learners as active knowledge constructors rather than passive recipients [4]. Recent studies suggest practical strategies: designing assignments that require critique of AI outputs, using AI to scaffold inquiry rather than deliver final answers, and creating tasks where students must verify, contextualise, and improve AI-generated content [4].

In the context of skills atrophy, this approach is particularly significant. By requiring students to interrogate, verify, and improve AI outputs rather than simply accept them, educators can ensure that AI use contributes to rather than displaces the development of competence. The key pedagogical move

is to position AI as a provisional text to be critically read rather than an authoritative source to be consumed—a move that aligns directly with Freire's vision of education as the critical reading of both the word and the world. Critical AI literacy must therefore encompass not only technical understanding and ethical reasoning but also students' metacognitive awareness of when AI use is enhancing versus replacing their own cognitive development.

3.2 Revealing Algorithmic Bias and Fostering Conscientisação

Paradoxically, the very biases embedded in AI systems can become pedagogical resources for developing critical consciousness. When students systematically interrogate AI outputs for bias, stereotypes, and cultural assumptions, they engage in precisely the kind of critical analysis that Freire advocated. As Warr argues, classroom activities that interrogate AI-generated content for bias and social assumptions can build awareness of how power operates through technology and language [7]. This approach treats AI not as a neutral tool but as a text to be critically read because it is a manifestation of social structures and power relations that can be analysed and challenged.

This critical engagement can extend beyond analysis to transformative action. Students might design projects to audit AI systems for disparate impacts and develop collective proposals to mitigate harms, linking critical analysis to social transformation in a genuine cycle of Freirean praxis [7]. Such activities connect the critique of AI to broader struggles for equity and justice, maintaining the political orientation that Freire considered essential to genuine education.

3.3 Extending Dialogue Whilst Centring Human Relationships

Whilst AI cannot replace authentic human dialogue, it may extend dialogic possibilities when carefully integrated. Generative AI can serve as a provisional conversation partner that helps students develop and refine their thinking before engaging in classroom dialogue, functioning as a sparring partner for reflective questioning whilst teacher-facilitated dialogue remains central [4]. This use of AI is analogous to the role of a journal or a drafting process in preparing for genuine dialogue: it supports the individual work of thinking without substituting for the irreducibly social process of meaning-making through encounter with other human beings.

The key distinction is between AI as a tool that supports students' capacity for dialogue and AI as a replacement for dialogic relationships. AI might support dialogue by helping to surface tacit knowledge, generate diverse perspectives for consideration, or provide linguistic scaffolding for students developing academic discourse. In language education, for example, AI can help students practise communicative scenarios and build confidence for human interaction [4]. In this framing, AI functions as a kind of rehearsal space for dialogue rather than a substitute for it. Crucially, the primacy of human relationships in transformative education must remain non-negotiable: Freire's vision of education as humanising encounter cannot be realised through interaction with an algorithm, however sophisticated, because it requires the genuine recognition of another human subject whose freedom and dignity one is called to honour.

3.4 Enabling Praxis Through Iterative Design and Reflection

Generative AI can be integrated into cycles of praxis when used in iterative design processes. Students might use AI to prototype interventions, analyse outcomes, and revise their approaches in ongoing cycles of action and reflection. This application is evident in professional education contexts, where AI-generated case variations support reflective practice and ethical reasoning [21]. For example, students addressing a community problem might use AI to generate potential solutions, critically evaluate these proposals, test implementations, reflect on results, and refine their approach. The AI serves as a tool within a larger praxis cycle rather than as an endpoint of inquiry. Critically, this use of AI for praxis must remain grounded in authentic problems and oriented towards real-world transformation, ensuring that reflection and action address actual conditions and work towards genuine liberation rather than academic simulation.

4. Towards a Freirean Praxis of AI in Education

Based on this analysis, Freire would likely call for a praxis-oriented approach that neither uncritically embraces nor reflexively rejects AI but critically engages these technologies in service of humanisation and liberation [10]. This approach involves several inter-related commitments that together constitute a

Freirean framework for educational AI. Crucially, this framework does not treat AI integration as a technical problem to be solved by better instructional design alone, but as a political problem that requires ongoing critical vigilance about the social relations and power structures that AI technologies embody and reproduce.

Thus, any integration of AI in education must be evaluated against the criterion of humanisation, asking continuously whether AI applications strengthen authentic dialogue, support students as subjects in their own education, and foster critical consciousness rather than passive acceptance [10]. This means prioritising human relationships, learner agency, and social justice over efficiency, standardisation, or profit. Institutional decisions about AI adoption must be governed by this humanising criterion rather than by vendor marketing, administrative convenience, or competitive pressure from peer institutions.

Freire's vision of "reading the word and the world" as critical consciousness demands what scholars call "critical AI literacy": encompassing technical understanding of how AI systems work, critical analysis of bias and accuracy, ethical reasoning about social implications, and agentic engagement with AI outputs [4, 7]. Crucially, given the risks of skills atrophy, this literacy must also include metacognitive awareness of cognitive offloading: students should learn not just how to use AI tools but how to monitor whether that use is building or eroding their own competences. Educators must design learning environments in which AI use is structured to ensure that the offloaded processing contributes to learning, in the terms established by Risko and Gilbert [16], rather than short-circuiting it.

Given AI's potential to displace authentic human dialogue and reconfigure agency in dehumanising directions, Freirean approaches must deliberately protect dialogic relationships. Classroom communities must remain spaces of horizontal, humanising encounter, with teacher-facilitated discussion as the primary site of meaning-making and conscientisação. AI supplements rather than supplants the irreducibly relational character of critical pedagogy.

AI integration should support problem-posing pedagogy rather than defaulting to banking-model knowledge delivery. This requires framing AI as a tool for generating questions and hypotheses rather than providing final answers, and positioning AI outputs as provisional texts to be read critically. Instructional design must ensure that working with AI actively engages rather than bypasses the cognitive processes that develop competence, guarding against the deskilling dynamic that Gerlich [19] and Sparrow et al. [17] have empirically documented.

Moveover, given AI's tendency to reproduce existing biases and inequalities, Freirean approaches must actively identify and counteract these tendencies—auditing AI-generated content for bias, ensuring equitable access, involving diverse communities in implementation decisions, and monitoring AI's differential impacts on marginalised students. The goal is not merely to mitigate harm but to actively advance educational equity, consistent with Freire's commitment to the preferential option for the oppressed.

Finally, Freire's insistence on democratic and participatory education requires transparency about how AI systems work and genuine community participation in decisions about AI adoption and use. This challenges the technocratic model of AI implementation, resisting proprietary black-box systems and corporate dominance and insisting on democratic control of educational AI [2, 8]. The decisions about which AI tools are adopted, how they are used, and whose interests they serve must not be delegated to technology companies but made through processes of democratic deliberation that include educators, students, families, and communities.

Conclusion: AI as Contested Terrain

What would Paulo Freire think of generative AI? This analysis suggests he would view it as contested terrain: a site of struggle where competing visions of education, human development, and social justice collide. The question is not whether to use AI in education, but how, for what purposes, and in whose interests.

Freire would recognise that GenAI can easily reproduce and intensify the banking model of education, delivering packaged knowledge to passive students whilst masking power relations through claims of neutrality and efficiency. He would expose how corporate control, algorithmic bias, and the displacement of dialogue threaten to deepen educational oppression. The risks of cognitive offloading and skills atrophy add a further Freirean dimension that goes beyond earlier analyses: AI-enabled deskilling is not a neutral technical phenomenon but an expression of the power relations governing cognitive production and reproduction. The Google effect, extended mind research, and emerging evidence on AI's impacts on critical thinking together suggest that without deliberate pedagogical counter-measures, widespread AI use in education risks producing what Freire would recognise as a new and particularly insidious form of the banking model—one in which students are not only positioned as passive recipients of deposited

knowledge but are systematically stripped of the cognitive capacities that would enable them to resist that position.
The agentic turn amplifies these risks further, displacing skilled cognitive work whilst foreclosing the reflective understanding essential to praxis. When AI systems execute multi-step reasoning processes autonomously and opaquely, the conditions for genuine conscientisação—the capacity to perceive, reflect upon, and act against oppressive structures—are eroded at their root.
At the same time, Freire's pedagogy was never about rejecting tools but about transforming their use in service of liberation. AI can support problem-posing inquiry, reveal algorithmic bias as a site of conscientisação, extend dialogic possibilities, and enable praxis—provided that its integration is designed to preserve and develop learner agency and competence rather than displace them. The emancipatory possibilities of AI are real, but they require what Freire would call intentional praxis: ongoing critical engagement that refuses to accept technology on its own terms and insists on subjecting it to the criterion of humanisation.
Freire would call for an approach to AI in education that centres humanisation and social justice, develops critical AI literacy inclusive of metacognitive awareness of deskilling risks, preserves authentic dialogic relationships, designs for problem-posing rather than banking-model delivery, actively addresses bias and pursues equity, integrates AI into cycles of genuine reflection and action, and maintains democratic control over technological decision-making. These are not optional refinements to AI integration but its necessary preconditions if that integration is to serve rather than subvert the purposes of genuinely humanising education.
As educators navigate the AI epoch, Freire's pedagogy offers this essential guidance: education is never neutral, technology serves human purposes, liberation requires critical consciousness and collective action, and authentic transformation emerges from dialogue, praxis, and the ongoing struggle for humanisation. In the age of GenAI, these principles remain as urgent and indispensable as ever. The emergence of generative AI presents educators with a choice that Freire would find deeply familiar: will we use this technology to integrate students more efficiently into existing oppressive structures, or will we transform it into a tool for critical consciousness and collective liberation? The answer depends not on the technology itself but on the pedagogical, political, and ethical commitments that guide its implementation. Freire would remind us that this choice is not made once and for all but must be enacted continuously through praxis—the ongoing, vigilant unity of critical reflection and transformative action.

Linking Statistics Education to Professional Practice: An Experiential Learning Approach in Economics and Business Degrees

Claudia Suárez-Arbesú[1], Ana Salomé García Muñiz[2], Ana Suárez Álvarez[3], María R. Vicente[4]

[1]Asturian Society of Economic and Industrial Studies and University of Oviedo, Faculty of Economics and Business, Oviedo, Spain
[2,3,4]University of Oviedo, Faculty of Economics and Business, Oviedo, Spain

Abstract

The teaching of Statistics in Economics and Business degrees still faces the challenge of linking theoretical content with real-world applications, even as data availability and demand for analytical skills grow. Many students perceive Statistics as abstract and disconnected from professional practice, which reduces motivation, understanding, and the ability to apply methods to real problems.
To address this gap, the University of Oviedo implemented an innovative activity within the institutional initiative Professionals in the Classroom. In the course Introduction to Economic Statistics, students attended a session led by a senior statistician from the Asturian Society of Economic and Industrial Studies (SADEI).
The session highlighted the role of official statistics in economic and social analysis and included practical workshops using real data for business and public-sector decision-making. The design follows research on higher education innovation, which stresses active and contextualized learning and shows that real-world contexts improve attitudes toward Statistics.
Previous studies also indicate that collaboration with professionals enhances experiential learning, motivation, and students' perception of the practical usefulness of statistical methods when such activities are aligned with course objectives. A student satisfaction survey reported very positive evaluations and high overall satisfaction, suggesting that professional engagement initiatives effectively strengthen motivation and meaningful learning in Statistics education.

Keywords: *Applied statistics, Higher education innovation, industry-academia collaboration.*

Introduction

Statistics plays a central role in the training of economists and business graduates: it provides the analytical tools to interpret economic reality, make decisions and communicate empirical evidence based on data. However, despite the growing importance of data and the demand for analytical skills in the labour market, the teaching of this subject continues to face the problem that students tend to perceive it as extremely theoretical and abstract knowledge, completely disconnected from professional practice, which negatively affects their motivation, conceptual understanding and, ultimately, their ability to transfer statistical methods to real-life situations (Garfield et al., 2008).
This gap between theory and practice is not, of course, exclusive to statistics—it affects many quantitative subjects in the social sciences—but it is particularly pronounced in this field. The formal nature of its content, the density of the mathematical language used, and the frequent absence of applications to specific economic problems contribute to generating negative attitudes that, far from disappearing with the advancement of studies, tend to become entrenched (Gal and Ginsburg, 1994; Onwuegbuzie and Wilson, 2003).
The literature on innovation in higher education has identified various ways to address this gap. Among them, the experiential learning approach (Kolb, 1984) and the incorporation of external professionals into the classroom have received increasing attention for their ability to promote learning and give practical meaning to curricular content (Coleman, 2013; Ormrod, 2004). Existing evidence suggests that the participation of experts from the world of work not only increases student motivation but also strengthens their perception of the usefulness of what they have learned and facilitates the construction of more lasting and transferable knowledge (Kirby and Turner, 2024).

It is in this context that the experience described and analysed in this paper is framed. For several years, the University of Oviedo has been developing an institutional initiative called Professionals in the Classroom, aimed at integrating the perspective of external experts into the ordinary development of undergraduate degrees. During the 2024-2025 academic year, this initiative took shape in the field of statistics through the collaboration of a professional statistician from the Asturian Society of Economic and Industrial Studies (SADEI) in the subject Introduction to Economic Statistics. The activity combined an introductory lecture on official statistics with two practical workshops on the use of real data in decision-making and was very well received by the students according to the results of the satisfaction survey conducted for this purpose.
This article therefore has two objectives: firstly, to describe in detail the design, implementation process and pedagogical characteristics of the experience; and secondly, to evaluate its impact on student perception and satisfaction based on data from the survey conducted. The paper is structured as follows: section 2 reviews the theoretical background and relevant literature on teaching statistics and experiential learning. Section 3 describes the institutional context and the design of the activity. Section 4 addresses the specific implementation of the experience, and sections 5 and 6 present the results and conclusions of the work, respectively.

Theoretical Framework

Concern about university students' attitudes towards statistics has a long history in the specialist literature. Since the earliest studies, such as those by Roberts and Bilderbeck (1980) and Wise (1985), numerous studies have documented the prevalence of so-called 'statistical anxiety'—understood as the set of feelings of concern, fear and unease that arise when encountering statistical content—and its negative impact on academic performance and willingness to use these tools in subsequent professional practice (Onwuegbuzie and Wilson, 2003; Cruise et al., 1985).
In the specific field of Economics and Business degrees, Garfield et al. (2008) identify the lack of real-world context as one of the most relevant factors explaining these negative attitudes. The authors point out that when students do not perceive the connection between the statistical procedures they learn and the problems they aspire to solve in their future careers, motivation declines sharply and learning tends to be reduced to superficial memorisation of formulas and algorithms—without conceptual understanding or the ability to apply them. This situation is particularly paradoxical when one considers that the demand for analytical skills by organisations has only grown in recent decades, driven by the proliferation and growing importance of data.
Added to this is another factor: statistics, unlike other disciplines, requires students to simultaneously integrate mathematical skills, reasoning ability, and the ability to understand results. This multidimensionality of statistical learning makes conventional teaching strategies insufficient for developing a genuine understanding of the discipline (Biggs et al., 2022).
Considering the theory of experiential learning, Kolb (1984) proposes that learning occurs through a cycle that integrates concrete experience, reflective observation, abstract conceptualisation, and active experimentation. From this perspective, the mere transmission of theoretical content is insufficient: for meaningful learning to occur, students must have the opportunity to experiment, reflect and apply the concepts that give them meaning.
The application of this approach to different degree subjects, including statistics, has given rise to an approach that includes strategies such as the use of projects with real data, the incorporation of case studies, and even the invitation of professionals from outside the classroom (Cobb, 1992; Chance and Rossman, 2006). In all these cases, the common element is the contextualisation of learning in situations that reproduce, faithfully, the real conditions in which students will have to use statistical knowledge once they enter the labour market.
Biggs et al. (2022), in their proposal for constructive alignment, emphasise precisely the importance of designing learning activities that align with expected learning outcomes and assessment methods. In the case of Statistics Applied to Economics and Business, this implies that teaching activities should reproduce, as far as possible, the type of reasoning expected of a professional in the field: knowing how to identify the problem, select the necessary data, apply the appropriate statistical method, and interpret the results in economic or business terms.
The literature on the participation of external experts in university teaching yields consistently positive results, although it also raises some methodological cautions that should be kept in mind. Coleman (2013), in a study focusing specifically on the presence of professional statisticians in higher education classrooms, concludes that this strategy helps to increase student motivation, improve their understanding of the practical relevance of statistical content, and reduce the gap between academic

training and the demands of the labour market. The author stresses, however, that the impact depends largely on the degree of curricular integration of the activity: isolated interventions, without explicit connection to the course content, tend to produce more superficial and shorter-lasting effects.
Similarly, Ormrod (2004) points out that exposing students to professional models activates learning mechanisms that reinforce both motivation and perceived self-efficacy. From the perspective of social cognitive theory (Bandura, 1986), observing a professional who applies statistical tools to solve real economic problems can help students construct a more concrete and manageable representation of statistics, which in turn can have positive effects on their willingness to invest effort in learning.
More recently, Kirby and Turner (2024) analysed the impact of guest speakers—both in-person and virtual—in the context of business degrees, confirming that their well-planned incorporation, aligned with the course objectives, produces significant improvements in students' perception of the usefulness of the content and their own ability to apply it. The authors identify the following factors, among others, as key to success: the suitability of the expert's profile to the disciplinary context of the course, the structuring of the intervention around specific cases or problems, and the possibility for students to interact with the expert through questions or guided exercises.
These findings are consistent with the principles of instructional design based on situated learning theory (Lave and Wenger, 1991), which emphasises the importance of learning through authentic practices or, at least, in environments that realistically reproduce their essential characteristics. The participation of an active professional in the university classroom creates, albeit temporarily, a zone of contact between the academic community and the professional community.

Experience Design

The experience described in this paper was developed within the framework of the ‘Professionals in the Classroom’ initiative, promoted by the University of Oviedo with the aim of enriching the training of university students by incorporating experts from the professional world into the ordinary dynamics of undergraduate courses. This initiative responds to a widely shared concern in the Spanish university system about the need to strengthen links between universities and the labour market, in line with the recommendations and guidelines for competency-based learning.
The programme establishes an organisational framework that facilitates collaboration between university lecturers and external professionals, regulating aspects such as the selection of experts, coordination prior to the activity, the integration of the intervention into the curriculum and the evaluation of results. Participation in the initiative is voluntary for teaching staff, who propose experts based on the most appropriate profile for the content and objectives of their subjects; the institution, for its part, provides the necessary administrative and communication support and manages the formal recognition of the collaboration of external professionals.
The subject on which the experiment was implemented is Introduction to Economic Statistics, a compulsory subject taught in the first years of several undergraduate degrees in Economics and Business at the University of Oviedo. The main objective of the course is to provide students with the fundamentals of statistical reasoning and basic descriptive and inferential methods, with special attention to their application in the analysis of economic and business phenomena. Its placement in the first years of the degree programmes makes it a particularly sensitive subject from the point of view of student attitudes: students often arrive with negative expectations or a limited perception of its relevance to their education and professional future.
The activity took place during the 2024-2025 academic year and was coordinated by the teaching staff responsible for the subject. The selection of SADEI as a collaborating institution was based on criteria of both thematic relevance—SADEI is the statistical body of reference for the Asturian economy and produces and disseminates a wide range of official statistics of direct relevance to regional economic analysis—and institutional and territorial proximity, factors that reinforce the connection between the course content and the economic environment in which students are likely to develop their professional activity.
The design of the experience was geared towards achieving four main objectives, derived both from the analysis of the students' needs and from the principles of experiential learning reviewed in the previous section. Firstly, the aim was to increase students' motivation to learn statistics by showing them in a direct and observable way the relevance of this discipline in the daily professional practice of a professional statistician. Secondly, it sought to illustrate recent developments in the use of data and applied statistical analysis, with reference to official statistics and their role in economic and public policy decision-making. Thirdly, the activity sought to strengthen students' perception of the practical usefulness of the course content, establishing explicit links between the statistical methods explained in

the course and their applications in business and public administration contexts. Finally, the aim was to offer students an initial approach to the type of decisions, dilemmas and reasoning that characterise the work of a statistics professional, thus contributing to the construction of an emerging professional identity.
The activity was organised around three main blocks that combined the transmission of information with the active participation of the students. The first block consisted of an introductory lecture by the guest speaker, focusing on presenting the role of official statistics in the economic information system—with special attention to the statistics produced by SADEI on the Asturian economy—and illustrating through specific examples how statistical indicators are used in business decision-making, territorial planning, and public policy design. The main purpose of this block was to establish the frame of reference and motivate students by directly connecting the statistical concepts of the subject with their real-world applications.
The second and third block took the form of practical workshops. In the second, a business decision-making scenario was presented that required the interpretation of fictitious statistical data, so that students could experience, in a guided manner, the process of statistical analysis applied to a specific management problem. The third block replicated this dynamic in the public sector using real data, employing regional economic development indicators to illustrate the logic of statistical analysis in the context of public policy evaluation.
The activity was specifically designed so that each of its three blocks would be linked to the specific content of the course programme, enabling students to clearly identify the correspondence between what they had learned in the regular classroom and what they observed in the expert's intervention. This curricular alignment, which the literature identifies as one of the determining factors for the success of this type of experience (Coleman, 2013; Kirby and Turner, 2024), was coordinated prior to the activity between the teacher responsible for the subject and the guest professional.

Experience Implementation

Firstly, prior to the session, the teaching staff informed the students about the activity, contextualizing it within the framework of the ‘Professionals in the Classroom’ initiative and establishing an explicit connection with the subject's syllabus. The aim of this preliminary presentation was to prepare the students cognitively and motivationally, activating the prior knowledge necessary to take advantage of the intervention and generating positive expectations about the usefulness of the experience.
The session took place during the regular class time, without the need to modify the weekly course schedule. This integration into the usual classroom dynamics—unlike extraordinary activities that require travel or schedule changes—facilitated student participation. The first block, which was expository in nature, was conducted in a participatory manner that allowed students to ask questions and participate in the debate on the applications of official statistics. The guest speaker presented the SADEI's system for producing and disseminating statistics in an accessible and contextualised manner, illustrating the use of this data in the analysis of the Asturian economy with specific cases and projecting visualisations and statistical tables that the students were able to compare with the types of representations worked on in the regular classes for the subject.
The two practical workshops that made up the second and third blocks were organised around materials prepared specifically for the occasion, based on data provided by SADEI. In the business decision-making workshop, students worked with sectoral indicators and regional economic activity data to inform a series of business management decisions. On the other hand, in the public sector workshop, labour market, demographic and social welfare indicators were used to illustrate the process of evaluating a regional public policy measure. In both cases, the guest professional guided the analysis, pointed out the limitations of the data, and introduced practical considerations—regarding the availability, frequency of updates, and comparability of statistics—that significantly enriched the more formal analysis worked on in the course.
A distinctive feature of the implementation was the care taken in the interaction between the guest professional and the students. Far from adopting a one-way lecture format, the session actively encouraged questions, case discussions, and the exchange of views on the implications of the data presented. This dynamic was consistent with the available evidence on the formats of external expert interventions that have the greatest impact on learning (Kirby and Turner, 2024).
Finally, as an evaluation of the experience, participating students had to respond to a satisfaction survey structured around four main items: overall satisfaction with the Professionals in the Classroom activity, satisfaction and usefulness of the content covered, satisfaction with the external expert's presentation, and assessment of the usefulness of the expert's visit. Each item was rated on a numerical scale from

0 to 10, and there was also the option to add open-ended qualitative comments. The survey was administered through the University of Oviedo's institutional platform, which guaranteed the anonymity of the responses and facilitated data collection and processing

Experience Results

The satisfaction survey was completed by students from various groups on the course 'Introduction to Economic Statistics' across different Economics and Business degree programmes, all of whom took part in the activity described. Although the sample size is small—a factor that limits the generalisability of the results and which will be discussed in greater detail in the section on limitations—the data obtained provide valuable information on the perceptions of the participating students and are consistent with the findings of similar studies in the specialist literature (Coleman, 2013; Kirby and Turner, 2024).
The participants came from different groups within the course, taught by different lecturers, which brings a degree of diversity to the sample and allows for the possibility that the assessments reflect perceptions that are relatively independent of the specific classroom context. The survey was completed on a voluntary and anonymous basis, which minimises social desirability bias.
The results of the satisfaction survey are set out in Table 1, which presents the basic descriptive statistics—minimum value, maximum value and arithmetic mean—for each of the four items assessed.

Table 1. Descriptive statistics from the satisfaction survey (0–10 scale)

Item	Min	Max	Mean
Overall satisfaction with the activity	5	10	8.44
Satisfaction with and usefulness of the content	4	10	8.00
Satisfaction with the expert's presentation	8	10	9.33
Benefits of having an external expert visit	5	10	8.11

Source: own elaboration.

The data reveal that students have rated the experience very positively. Firstly, overall satisfaction with the 'Professionals in the Classroom' initiative averages 8.44 out of 10, with scores ranging from 5 to 10. This average score, which far exceeds the threshold for high satisfaction, is consistent with the results reported in similar studies on initiatives to bring external professionals into the university classroom (Coleman, 2013; Kirby and Turner, 2024) and suggests that the activity was perceived as an experience of significant added value by the majority of participating students.
Secondly, satisfaction with the usefulness and the content covered has an average score of 8.00, with a slightly wider range (4–10) than the other items. This wider range could be interpreted as indicative of greater variability in students' perceptions of the relevance of the content—variability that could be related to differences in prior statistical knowledge, the class group of origin, or individual expectations regarding the activity. However, the resulting average remains high and allows us to conclude that the content was rated positively by the participating students.
The item receiving the highest average score is, significantly, satisfaction with the guest expert's presentation, with an average of 9.33 points and a range of 8 to 10. This result is particularly significant for several reasons. On the one hand, it confirms the importance of the external expert's profile and communication skills as a determining factor in the success of this type of experience, in line with the methodological recommendations in the literature (Coleman, 2013). On the other hand, the high consistency of the ratings—all students awarded a score of 8 or higher—suggests that the quality of the SADEI professional's presentation was consistently perceived positively by the student body, regardless of other contextual variables.
Finally, the usefulness of the external expert's visit received an average score of 8.11 -range (5–10)-. The relative proximity of this item to those concerning overall satisfaction and satisfaction with the content suggests that the assessment of usefulness is consistent with overall satisfaction, with no significant discrepancies observed between the two dimensions. This pattern, moreover, is common in the literature on the evaluation of innovative teaching experiences (Biggs et al., 2022).
A combined analysis of the four items allows us to draw some interesting conclusions regarding the impact of the experience. Firstly, it is noteworthy that the most highly rated aspect—the expert's presentation—is precisely the one that most directly embodies the experiential component of the activity: the opportunity to observe and listen to a practising professional who applies statistics in her day-to-day work. This result supports the hypothesis, well-established in the literature, that exposure to professional role models constitutes a highly effective mechanism for motivation and learning in the context of quantitative disciplines (Ormrod, 2004; Bandura, 1986).

Secondly, the relatively low minimum scores for the items relating to satisfaction with the content and the usefulness of the visit—4 and 5, respectively—suggest that a minority of students did not perceive the activity as particularly useful or relevant. Although the small sample size prevents definitive conclusions from being drawn about the causes of this variability, some plausible hypotheses can be suggested: the possibility that some students attended the session with expectations that were not well aligned with its design, the influence of the group context, or individual differences in interest in applied statistics versus methodological statistics.
Thirdly, the overall consistency of the results with the findings in the specialist literature—and in particular with the work of Coleman (2013) and Kirby and Turner (2024)—lends credence to the interpretation that the positive ratings reflect a genuine impact of the activity on students' motivation and perception of its usefulness, rather than merely a novelty effect or a courtesy response. The robustness of this impact, however, can only be rigorously assessed by tracking the attitudes of participating students over time and comparing them with control groups, which constitutes a particularly interesting avenue for future research.

Conclusions

This paper has described and evaluated an experiential learning initiative within the 'Introduction to Economic Statistics course at the University of Oviedo, centred on the participation of a professional statistician from SADEI as part of the 'Professionals in the Classroom' initiative. The results of the satisfaction survey conducted among the participating students are consistently positive, with averages exceeding 8 out of 10 across all assessed items and a particularly high score for satisfaction with the expert's presentation (M=9.33).
These results suggest, firstly, that bringing external professionals into the university classroom—when done in a planned manner, with appropriate alignment with the curriculum and careful coordination between the lecturer and the guest expert—constitutes an effective strategy for increasing students' motivation to learn statistics and for strengthening their perception of the practical usefulness of the course content. Secondly, the experience illustrates the viability and relevance of the experiential learning approach in Economics and Business degree programs, where the integration of theoretical training and professional practice is a priority pedagogical objective. Thirdly, the University of Oviedo's 'Professionals in the Classroom' initiative proves to be a suitable institutional framework for the development of this type of experience, as it provides the organizational support and formal recognition necessary to ensure that collaboration between university teaching staff and external professionals is sustainable and systematic.
From a curriculum design perspective, it therefore seems advisable that this type of activity should not be viewed as a one-off, exceptional intervention, but rather as a regular component of teaching planning in applied statistics courses—and, more generally, in quantitative subjects that aim to develop analytical skills directly transferable to the labour market. The systematization of the experience, the consolidation of collaborative networks with local institutions and businesses, and the progressive refinement of the pedagogical design constitute, in this regard, the pillars upon which the future development of the initiative should be structured.
The study does, however, have limitations that should be acknowledged: the small sample size limits the generalisability of the results—although their consistency with the literature lends them plausibility—; the absence of a control group prevents the specific effect of the intervention from being isolated from other contextual factors; and the immediate nature of the survey does not allow for an assessment of the long-term impact on learning or the transfer of statistical skills to new contexts.
Finally, it is worth noting that beyond the specific context of Economic Statistics, the experience described in this study offers elements that can be transferred to other quantitative disciplines within social science degree programmes—such as Financial Mathematics, Econometrics or Data Analysis—where the gap between theoretical training and professional practice poses similar pedagogical challenges. The systematisation and dissemination of these experiences, within the framework of institutional initiatives such as the one described, constitute a significant contribution to the advancement of teaching innovation in higher education.

From Abstraction to Story: AI-Generated Comics for Teaching Probability

Ana Suárez-Álvarez[1], María R. Vicente-Cuervo[2], Claudia Suárez-Arbesú[3], Ana Salomé García Muñiz[4]

[1,2,3,4]Department of Applied Economics, University of Oviedo, Spain

Abstract

Teaching probability in Economics and Business degrees is a well-documented challenge. The core difficulty is not so much the technical complexity of the models themselves, but the gap between what students already know from everyday experience and the abstract notation they are suddenly expected to handle.
This project proposes using AI-generated comic panels as a cognitive bridge between familiar situations and formal probabilistic reasoning. Before introducing each probability model, students are shown a brief visual scene which represents a recognisable economic or everyday situation that embodies the model's logic. This is followed by a guided discussion in which they identify the random element, and only then is the formal model introduced. The sequence, repeated at the start of every thematic block throughout the semester, follows a scene → idea → formalisation structure and is applied in several statistics courses at the University of Oviedo and the University of León. The visual materials are produced using generative AI tools, which makes it feasible to customise them to the economic context of each course and to update them without relying on professional illustration. The paper describes the theoretical basis of the approach, the production and implementation methodology, and the evaluation system planned to assess its impact beyond student satisfaction.
The expected outcomes include fewer errors in model identification, greater willingness to engage with mathematical notation, and improved performance in exam questions related to probability distributions. A teaching protocol summarising the design criteria, implementation steps and evidence-based recommendations will be published at the end of the project to allow other instructors to replicate the methodology in their own quantitative courses.

Keywords: *generative AI, educational comics, probability models, teaching innovation, statistics education.*

1. Introduction

The teaching of statistics in Economics and Business degree programmes faces a persistent challenge: its high level of abstraction. This challenge is particularly acute in advanced courses, where students encounter cognitive barriers that lead to stress and disengagement. In quantitative subjects, interest and perceived value decline over the course of the semester, reinforcing the need for methodologies that stimulate motivation from the outset [11]. Added to this is the fact that probabilistic concepts generate a high cognitive load due to their limited intuitive connection with real-life situations [1]. Many errors stem precisely from the lack of an intuitive representation of the random phenomenon, which underlines the importance of supporting understanding before formalisation.
The literature on economics education highlights that the use of cartoons and comics reduces anxiety and encourages more participatory learning [2]. Comics transform complex theories into visual narratives and trigger a mode of reasoning based on spatial metaphors and graphic sequences [5]. Depicting everyday scenes with humour forces students to link the situation to the concept, promoting higher-order reasoning [9]. In probability, this approach helps to develop intuition: visualising, for example, the logic of a uniform distribution allows one to 'see' the behaviour before encountering the formal notation.
This project proposes using generative artificial intelligence (AI) to create cartoons tailored to the economic and probabilistic context without the need for professional illustration.
The paper is structured as follows. Section 2 reviews the relevant literature. Section 3 describes the project design and implementation methodology. Section 4 discusses the evaluation system and expected results. Section 6 concludes.

2. Theoretical Framework

Teaching probability models at university level involves a dual cognitive demand: students must simultaneously build a mental representation of the random phenomenon and map that representation onto a formal language of notation, parameters and conditions of application. When the first step is missing, the second becomes an exercise in rote memorisation rather than genuine comprehension. Research in statistics education consistently shows that the most common errors in probability tasks are not algebraic mistakes but failures of identification: students cannot recognise what type of random structure a given situation embodies and therefore cannot select or apply the appropriate model [1].

This pattern is consistent with the broader cognitive load framework: abstract notation imposes a high extraneous load that competes with the germane processing needed for understanding. The implication for instruction is that reducing the abstraction barrier at the point of first contact with a model, before formalisation begins, is likely to free cognitive resources and improve comprehension. This is precisely the role that visual and narrative resources can play: not as a substitute for formal content, but as preparation for it. Cladera et al. [11] found that student attitudes towards quantitative subjects deteriorate over the course of the semester, which reinforces the importance of engaging students from the very first contact with each new topic.

Comics and cartoons have a reasonably established place in the educational literature, particularly for subjects where abstraction and student anxiety tend to coincide. Van Wyk [2] showed, in an economics education context, that cartoons reduce anxiety and create more participatory classroom dynamics. The argument is not simply motivational: Groensteen [5] points out that the grammar of comics, the sequencing of panels, the interplay of image and text, and the use of spatial metaphors, activates a form of inferential reasoning that mirrors the logic students need in order to understand probabilistic mechanisms. A well-designed scene prompts the reader to ask what is varying, why, and what the likely outcomes are, which are exactly the questions that make probabilistic reasoning work.

Depicting an everyday situation with a degree of humour or exaggeration forces students to link what they see to the underlying concept, which promotes higher-order reasoning and improves retention [9]. In engineering education, Karimi et al. [4] found that comic-based scientific storytelling facilitates the transfer of technical content and increases motivation among university students. Bestil and Punla [3] demonstrated, in a secondary education setting, that digitised comics specifically designed for probability of random variables improved problem-solving performance and significantly reduced mathematics-related anxiety. Works such as The Cartoon Guide to Statistics [6] have long shown that statistical ideas can be communicated visually without sacrificing rigour, and that accessible presentation does not imply a lower ceiling for understanding.

Despite this evidence, the integration of comics into university-level probability instruction has remained scattered. Most documented cases involve isolated resources rather than a systematic use across a complete course, and none has been designed specifically around a structured sequence of probability models. Martin [10] adds a further relevant consideration: the quality of visual learning materials depends heavily on their design, specifically on whether they have an explicit purpose, avoid ambiguity, and focus attention on a single central idea. This suggests that the effectiveness of comic-based resources is not automatic, but contingent on thoughtful instructional design.

The practical barrier to using customised comics in university teaching has historically been the cost and expertise required to produce them. Generative AI tools, such as ChatGPT, Copilot or Gemini, substantially lower this barrier: they can generate images of reasonable quality from textual descriptions in a matter of minutes, without requiring graphic design skills. Kasneci et al. [7] and the UNESCO guidance on AI in education [8] both acknowledge the potential of these tools for producing flexible, low-cost visual materials at scale, while noting that their effective use depends on instructor judgment in the design and selection of outputs.

Eapen et al. [9] describe a concrete workflow for creating AI-generated educational cartoons: the critical step is writing a precise narrative brief before engaging with the tool. This brief must specify the situation to be depicted, identify the random element clearly, and set the intended tone. The AI handles the illustration; the pedagogical content is determined entirely by the instructor. This distinction is important because it means that generative AI does not replace the instructional design process, it accelerates the production step once that process has been completed. The result is a scalable approach to material creation that was not previously available to standard teaching teams operating without dedicated illustration resources.

3. Project Design and Implementation

The project's methodology is based on a structured process that combines the design of visual materials using artificial intelligence, their phased integration into the classroom, and a monitoring system that enables the assessment of their effectiveness and the improvement of the resource for future academic years. The aim is for the illustrations to serve as an intuitive aid that facilitates the understanding of probability models, without replacing the formal content, but rather preparing students for it and making it more accessible.

3.1 Design and Conceptualisation Phase

We begin by identifying the probability models that typically present the greatest difficulty: binomial, geometric, hypergeometric, Poisson, exponential, uniform and normal. For each model, very brief narrative scripts are developed to translate the essence of the probabilistic behaviour into everyday or economic scenarios that are easily recognisable to students. This step is fundamental because it establishes the conceptual 'entry point' that will later allow the visual story to be linked to the mathematical formulation of the model.
In this phase, the quality criteria for the vignettes are also defined: visual clarity, absence of distracting elements, representation of a single central idea, and an accessible tone. These criteria serve as a guide for all subsequent iterations and ensure the aesthetic and pedagogical coherence of the whole.

3.2 Generating Content Using AI Tools

Once the scripts have been finalised, we will proceed to create the panels using various generative AI tools (such as ChatGPT, Copilot or Gemini). We will experiment with several platforms to compare graphic styles, clarity, the expressiveness of the scenes and narrative suitability. This comparison is particularly important in an innovation project, as it allows us to make an informed choice as to which tool produces illustrations that are clearer, more comprehensible and more useful for our objectives.
After generating different versions, the team will select the vignettes that best convey the idea associated with each probabilistic model. Aspects such as the balance between detail and simplicity, the ease with which the random element of the scene can be identified, and the extent to which the situation might be recognised by economics and business students will be reviewed. The final result will be a library of vignettes classified by model, reviewed and prepared for implementation in the classroom [Figures 1 & 2].

Fig. 1. AI-generated comic strip illustrating the Geometric distribution: repeated Bernoulli trials until the first success. Source: own elaboration using generative AI (2026).

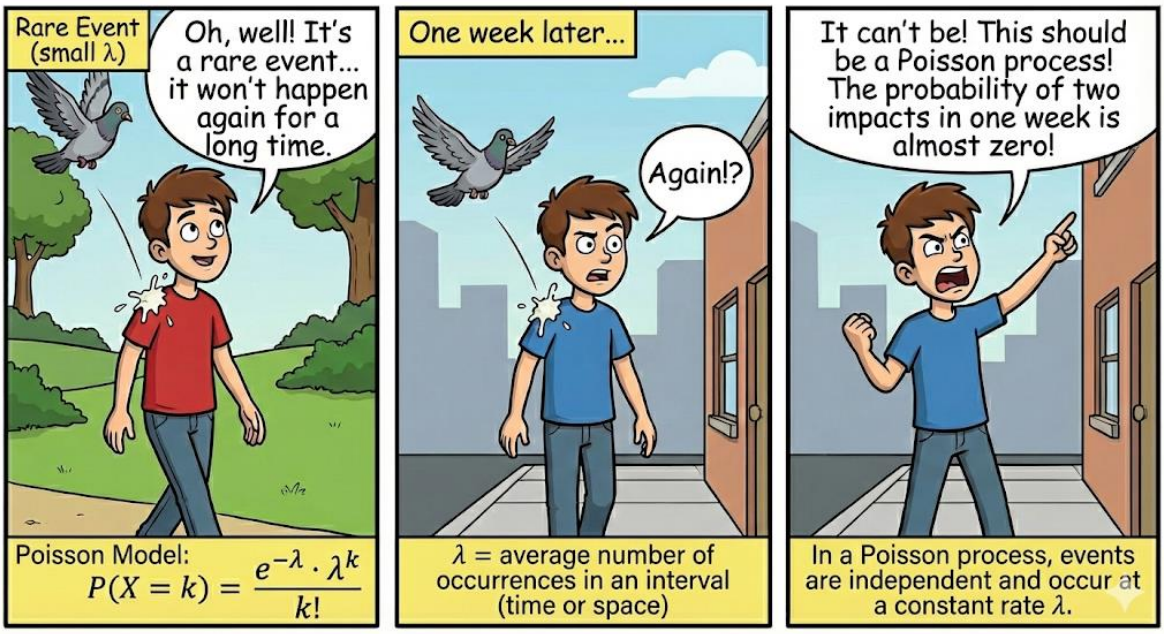

Fig. 2. AI-generated comic strip illustrating the Poisson distribution: counting the number of events occurring in a fixed interval of time. Source: own elaboration using generative AI (2026).

3.3 Integration into Teaching: A Clear Teaching Routine

The use of the vignettes will follow a consistent and recognisable sequence in the classroom. At the start of each section devoted to a probabilistic model, the lesson will begin with the projection of the relevant vignette. This opening serves to activate prior knowledge, spark curiosity and focus attention on a concrete, relatable example.

This will be followed by a brief guided discussion in which pupils will be invited to identify which element of the scene is random and how the phenomenon might be represented. This intuitive identification facilitates the transition to the formal explanation, which is introduced immediately afterwards. The corresponding model, already covered in the syllabus, will then be presented, and its applications will be explored through practical exercises, tables, calculations or interpretations. This integration allows for a direct assessment of the usefulness of the vignettes in the initial identification of probabilistic models and in the transition towards formalisation.

The vignette thus acts as a bridge between the everyday and the abstract. Its aim is not to teach the model in itself, but to create a mental framework that allows the formal explanation to be understood with less cognitive effort and a stronger connection to reality.

3.4 Digital Support and USE on the Virtual Campus

After each session, the comic strips will be published on the Virtual Campus, organised by model. Students will be able to access them to revise the topics, reinforce conceptual associations and recall the logic behind each block. This presence on the Virtual Campus makes the cartoon an accessible and reusable resource throughout the semester, serving as a visual aid for independent study and exam preparation. This digital organisation ensures the sustainability of the resource and facilitates its subsequent adaptation to new subjects.

3.5 Monitoring and Data Collection via a Questionnaire

The monitoring of the project will be based on the students' own feedback. To this end, a questionnaire will be created using Google Forms, published on the Virtual Campus and announced in class. The questionnaire will be brief and anonymous, and will include questions on:

– The perceived usefulness of the diagrams in understanding the model before tackling the formal aspects.

– The clarity of the scenes and whether they have helped students connect better with the examples covered in the exercises.

– Suggestions for improvement for future editions (level of detail, length of captions, context of the stories, etc.).

– Preference regarding the format of the cartoons: whether simpler cartoons without formulas are preferred, or cartoons that already incorporate some mathematical elements.

The data will be analysed to identify patterns, opportunities for improvement and possible adjustments to the design of the scenes or the way they are integrated into the class.

3.6 Analysis of Results

The information gathered will be used to refine the design of the vignettes for the next course. This feedback phase will enable us to identify which models have caused the most confusion, which scenes have worked best, and which visual elements are most or least effective for the students. The methodology thus provides for a cycle of continuous improvement, which is a central feature of the project's innovative nature.

4. Evaluation System

The assessment procedure consists of three stages:

a) During implementation.

Each time a case study is used in the classroom, a practical check will be carried out to ascertain whether students are able to intuitively identify the probabilistic situation depicted and whether the transition to the formal model is made smoothly. This will be assessed through brief, ad hoc checks (short questions, identification of the appropriate model or brief summaries).

b) At the end of the probability module.

Once the probability models for the semester have been covered, a questionnaire will be distributed via Google Forms through the Virtual Campus. This questionnaire will gather information on clarity, usefulness and format preferences, as well as suggestions for improvement.

c) Final course assessment.

At the end of the academic year, a comparative analysis will be carried out of performance on the final exam questions relating to probabilistic models, comparing the results with those obtained in previous years. This analysis will enable us to assess whether the vignettes have had a real and measurable impact on the understanding and application of the models. Data from the student questionnaire will also be incorporated to obtain a complete picture of the resource's effectiveness.

5. Expected Results

The proposed use of AI-generated vignettes is expected to enhance students' engagement with probability models by reducing the initial abstraction barrier that typically hinders understanding. By introducing each model through a familiar and visually grounded situation, the approach aims to activate intuition before formalisation and thus provide a more accessible entry point into the mathematical content.
In terms of learning outcomes, the main expected effect concerns students' ability to correctly identify probabilistic structures. The visual representation of each situation is intended to support recognition of the underlying random mechanism, which should in turn improve the selection and application of the appropriate model in exercises and problem-solving tasks. Consequently, a reduction in frequent errors, such as confusion between distributions or misinterpretation of problem statements, is anticipated.

At the classroom level, the use of vignettes is also expected to foster a more participatory learning environment. The initial interpretation of the scene creates a natural space for discussion, encouraging students to articulate hypotheses and connect the visual narrative with prior knowledge. This interaction is likely to facilitate a smoother transition towards formal explanation and to reinforce collaborative reasoning.
Beyond the classroom, the availability of the vignettes on the Virtual Campus is expected to support independent study. By functioning as visual reference points, the materials may help students recall the logic associated with each model and organise their understanding more effectively over time. In this sense, the vignettes can act as cognitive anchors that strengthen retention in the medium and long term.
A further expected outcome relates to students' confidence when dealing with probabilistic content. Approaching formal notation through an initial intuitive representation may reduce the perceived difficulty of the subject and contribute to greater self-efficacy, as well as to a more positive attitude towards quantitative methods.
Finally, these combined effects are expected to translate into measurable improvements in academic performance, particularly in assessment tasks related to probability distributions. A comparison with results from previous academic years will provide an empirical basis to evaluate whether the integration of vignettes has contributed to a more consistent and accurate application of probabilistic models.

6. Conclusions

This paper presents the design of a teaching innovation project that addresses a well-documented problem in statistics education: the abstraction barrier that prevents many students in Economics and Business degrees from building a solid intuitive understanding of probability models before encountering their formal treatment. The proposed approach combines generative AI to produce customised visual materials with a structured pedagogical sequence, scene → idea → formalisation, that is applied consistently at the start of each thematic block. The result is a replicable teaching routine grounded in the literature on cognitive load, visual reasoning and statistics education.
The evidence reviewed in Section 2 supports the two-core premises of this project: that activating intuition before formalisation reduces cognitive load and improves comprehension [1], and that comics and visual narratives are an effective vehicle for that activation in subjects where abstraction and student anxiety tend to reinforce each other [2] [3] [4]. What generative AI adds to this picture is not a new pedagogical principle, but a practical solution to a production problem that has historically limited the scalability of visual approaches in university teaching.
The expected outcomes described in Section 5, fewer errors in model identification, greater engagement with formal notation, and improved exam performance, will be evaluated through the comparison of results across cohorts and through student feedback collected via questionnaire. Whether or not the data confirm these expectations, they will contribute empirical evidence to a field where systematic studies at university level remain scarce, particularly on the specific challenge of teaching discrete and continuous probability distributions to non-specialist audiences.
Beyond the immediate context, the teaching protocol that will be produced at the end of the project is intended to make the methodology transferable to other quantitative courses and institutions, without requiring prior expertise in AI or graphic design. In this sense, the project's contribution is not only the set of materials generated, but the documented process for producing and using them, which other teaching teams can adapt to their own disciplinary context.

Peer Collaboration and Generative AI Interaction: Assessing Student Agency in Project-Based Programming

Ayfer Alper[1], Gülcan Canbolat[2], Barbara Bruschi[3]

[1,2]Ankara University, Turkey
[3] University of Turin, Italy

Abstract

Generative artificial intelligence (GenAI) and large language models are increasingly integrated into project development processes; however, limited empirical evidence explains how students preserve agency when working concurrently with peers and AI systems. This qualitative study examined how associate degree students positioned GenAI during a project-based programming course and how individual and collective agency emerged in this context. The study group consisted of 42 students enrolled in a Computer Programming Program at a vocational school in Türkiye in 2026. The students developed software projects in 14 collaborative groups over a 14-week Professional Project course. The data were collected through an open-ended questionnaire addressing students' experiences of AI use, decision-making, cognitive support, and collaboration. The data were analyzed through directed content analysis, informed by the concepts of human-AI co-agency, student agency, cognitive scaffolding, and collaborative learning. The findings indicated that students predominantly positioned GenAI as a teammate or mentor rather than as a merely technical tool. They associated AI support mainly with scaffolding, reflective dialogue, and cognitive load reduction. Although AI was used extensively, the students reported that final decisions were generally made through group discussion, critical questioning, verification, and independent judgment. Most participants preferred a hybrid collaboration model that combined AI support with peer interaction. These findings suggest that, when embedded in a pedagogically structured project-based learning environment, GenAI can support problem-solving / project-based programming / project-based learning and collaborative work without necessarily diminishing students' agency. The study offers implications for designing human-centered AI-supported learning environments that maintain learners' responsibility, critical engagement, and collective decision-making.

Keywords: *Generative AI; Project-Based Learning; Student Agency; Collective Agency; Programming Education; Human-AI Co-agency*

1. Introduction

The rapid development of Generative AI (GenAI) and Large Language Models (LLMs) has fundamentally transformed the nature of student-technology interaction in educational settings [1]. These systems are no longer used merely as passive repositories of information; rather, they increasingly function as conversational resources and adaptive control subsystems that actively intervene in the learning process. Shifting from a static tool-user relationship toward a dynamic cognitive partnership [2], [3], AI agents now support complex tasks such as ideation, code testing, debugging, and the refinement of project outputs.

This transformation is particularly relevant for Project-Based Learning (PBL), where students are expected to engage in authentic problems, negotiate ideas with peers, and construct solutions through iterative inquiry and production. When integrated into these environments, AI agents move beyond static utility. They serve as capable peers providing cognitive scaffolding [4], [5], act as teachable models [6], [7], and function as metacognitive regulators that promote socially shared regulation of learning [8], [9]. In AI-supported PBL environments, a central educational issue is not simply whether GenAI can produce technically accurate responses, but whether students remain active agents in the learning process. Student agencies refer to learners' capacity to take initiative, make informed decisions, evaluate information critically, and assume responsibility for learning outcomes. Previous studies suggest that AI can provide cognitive scaffolding, reduce procedural burdens, lower the fear of failure, and promote reflection in collaborative contexts [10], [4], [5]. However, this introduces a significant tension: over-reliance on AI systems may weaken critical engagement, cause "production blocking" through over-mediation, and shift epistemic authority from learners to automated outputs [11], [2], [12]. Thus, the

educational value of GenAI depends substantially on how learners position and regulate it within their learning activities.
This issue becomes more complex in collaborative PBL settings, where agency is distributed across individual learners, peers, tools, and shared routines. Depending on whether students perceive GenAI as a tool, a mentor, or a teammate, their patterns of collaboration, evaluation, and decision-making differ. This aligns with the "cognitive co-agent" model, which emphasizes human-AI co-agency; knowledge construction must emerge through interaction, interpretation, and selective integration rather than through passive acceptance of AI-generated content [13], [14]. Students are required to navigate "epistemic entanglement" [15], treating AI outputs as dialogic material to be interrogated [16]. However, working autonomously with AI risks eroding shared ownership and peer solidarity central to PBL, necessitating that teachers design pedagogical structures where AI enriches rather than replaces peer collaboration [17].
Despite the explanatory power of traditional constructivist frameworks, they struggle to account for systems that actively shape arguments in real time [18]. Furthermore, empirical evidence remains limited regarding how students negotiate this delicate balance of agency and collaboration in programming projects. Accordingly, this study investigated students' experiences of GenAI use in a project-based programming course. Employing a qualitative approach to analyze student interactions and responses, the study addressed three research questions: (a) How do students position GenAI during project development? (b) What forms of cognitive support do students attribute to GenAI? (c) How does student agency manifest during decision-making and collaboration with peers and AI?

2. Method

2.1 Research Design

This study employed qualitative research design. Directed content analysis was used because the analysis was guided by existing theoretical constructs related to human-AI co-agency, student agency, cognitive scaffolding, and collaborative learning [7]. This approach enabled the use of conceptually informed initial codes while allowing additional meanings to emerge from students' written responses.

2.2 Participants and Context

The participants were 42 associate degree students enrolled in the Computer Programming Program at Yüksek İhtisas University Vocational School in Türkiye in 2026. The study was conducted within a 14-week Professional Project course structured according to PBL principles. The students worked in 14 project groups and used GenAI tools during software development. Criterion sampling was used to include students who actively participated in group work, used GenAI during project development, and volunteered to share their reflections.

2.3 Data Collection and Analysis

Data were collected through an open-ended questionnaire developed by the researchers. The first section included demographic items related to gender, programming experience, prior PBL experience, and prior AI-use experience. The second section consisted of seven open-ended questions focusing on students' perceptions of AI, decision-making processes, collaboration experiences, and agency. The responses were transferred to MAXQDA 24 and coded under four thematic areas: role-oriented positioning, functional cognitive support, agency indicators, and collaboration preferences. Code definitions were reviewed collaboratively, disagreements were resolved through discussion, and interpretations were supported by participant statements. Direct participant quotations were included to enhance the reliability of the findings, and the participants were coded as P1, P2, P3... P42.

3. Findings

The findings are presented under five areas: participant characteristics, students' positioning of GenAI, cognitive support attributed to GenAI, agency indicators, and collaboration preferences.

Table 1. Demographic Characteristics of Participants

Variable	n	%
Female	11	26.2
Male	31	73.8
Programming experience: 0-6 months	8	19.0
Programming experience: 6-12 months	3	7.1
Programming experience: 1-2 years	26	61.9
Programming experience: 2 years or more	5	11.9
Previous PBL experience: Yes	17	40.5
Previous PBL experience: No	25	59.5
Previous AI-use experience: Yes	38	90.5
Previous AI-use experience: No	4	9.5

Table 2. Students' Positioning of Generative AI

Code	f
Teammate	24
Mentor	21
Tool	3

As shown in Table 2, students most frequently described artificial intelligence as a teammate (f=24) and a mentor (f=21); very few considered it merely a tool (f=3). This indicates that students view AI not as a passive technology, but as an active participant contributing to the project development process.

Participant statements further support this finding. P15 highlighted AI's contribution to in-group collaboration by stating, "We asked our question and reached a joint decision by exchanging ideas among ourselves." Similarly, P16 noted that AI's suggestions were not accepted outright but were instead evaluated and refined by group members, stating, "We add our own interpretations to the AI's suggestions."

Students also defined AI as a mentor that guides the learning process. P37 stated, "It helped us understand and overcome the obstacles we faced as we advanced our process," while P40 noted, "It guided us, and we reached a solution with my friends."

Overall, the findings demonstrate that students position generative AI not simply as a technical tool that provides information, but as a collaborative learning partner offering guidance throughout the project development process. Student responses indicated that AI-generated suggestions were typically discussed, interpreted, and revised within the group before being incorporated into project decisions.

Table 3. Cognitive Support Attributed to Generative AI

Code	f
Scaffolding	37
Reflective dialogue	20
Cognitive load reduction	15

As indicated in Table 3, the students most frequently associated artificial intelligence with the scaffolding function (f=37). Furthermore, the functions of AI in fostering reflective dialogue (f=20) and reducing cognitive load (f=15) were also frequently emphasized by the students. This indicates that artificial intelligence provides various forms of cognitive support during students' learning and problem-solving processes.

Participant statements reveal that artificial intelligence assumes a guiding role, particularly in problem-solving. P32 highlighted the mentoring function of AI, stating, "It both provided hints and showed the way, and enabled us to notice some of our mistakes." Similarly, P41 noted that AI supported their progress, expressing, "By helping me at points where I got stuck while developing my project on my own, it accelerated my transition to the next stage."

Regarding AI's function of supporting reflective thinking, P41 stated, "By noticing the logic or syntax errors in the code I wrote and alerting me, it took on an interrogative role that enabled me to solve the problems on my own." This view demonstrates that artificial intelligence not only offers solutions but also actively supports students' thinking processes.

The students viewed artificial intelligence not as a source of ready-made information, but as a supportive element that helped them develop their own ideas. P36 summarized this perspective by stating:

"Artificial intelligence is not a source from which I consume ready-made information; rather, I blend the technical infrastructure it provides with my own logic and interpretation to prepare the solution step by step."
Overall, the findings demonstrate that generative artificial intelligence is evaluated by students not merely as an information-providing tool in their learning processes, but as a multidimensional cognitive support element that offers guidance, points out errors, encourages thinking, and facilitates the problem-solving process. Students emphasized that GenAI helped them identify errors, receive hints, and proceed to subsequent stages of design and development. Reflective dialogue was also evident, as the students reported using AI to reconsider their logic, syntax, and solution strategies rather than merely to obtain ready-made code.

Table 4. Student Agency Indicators in AI Interaction

Code	f
Group initiative	30
Group decision-making	29
Independent decision-making	22
Generating own ideas	19
Questioning	18
AI dependence	18
Verification	14
Alternative solution generation	11

As indicated in Table 4, students exhibited behaviors such as taking initiative, decision-making, questioning, verification, and independent thinking in their interactions with artificial intelligence. Group-level decision-making and initiative-taking were particularly prominent, demonstrating that students assumed active roles during the project development process. Additionally, independent decision-making, generating original ideas, and questioning artificial intelligence outputs emerged as notable findings. These results reveal that students did not completely surrender their cognitive responsibility to artificial intelligence.
Participant statements indicate that students utilized artificial intelligence not as a decision-making authority, but as a tool to support their thinking processes. P42 highlighted this approach, stating, "It made us more independent. Instead of taking ideas directly from artificial intelligence, we generated our own ideas and asked the AI for detailed feedback on the nature of our idea and how we could improve it." This perspective demonstrates that students sought to develop their own ideas rather than accepting ready-made solutions.
It was also observed that students critically evaluated the information provided by artificial intelligence. P2 indicated that they cross-referenced AI outputs with different sources, stating, "I did not use the responses directly; I compared them with other artificial intelligence tools to synthesize a single set of data." Similarly, P21 emphasized that the final decisions rested with the students, expressing, "Even though we received help from artificial intelligence, we proceeded according to our own thoughts on certain issues. We questioned the provided answers and selected the most appropriate one."
The findings indicated that agency was most visible through group initiative and group decision-making. The students also reported independent decision-making, idea generation, questioning, verification, and the development of alternative solutions. Although AI dependence appeared in 18 coded instances, it did not dominate the overall pattern. The findings indicate a form of hybrid agency in which AI support was used actively, while final responsibility remained largely with students and groups.

Table 5. Collaboration Preferences

Code	f
AI and group members together	36
Only AI	5
Only group members	2

Table 5 demonstrates that the vast majority of students prefer a collaborative working model that incorporates both artificial intelligence and group members. In contrast, the number of students who prefer to work exclusively with artificial intelligence or solely with group members is lower. This finding demonstrates that students prefer to utilize both the technical support provided by artificial intelligence and group interaction during the project development process.
Participant statements reveal that working alongside both artificial intelligence and group members offers distinct advantages. P14 highlighted the contribution of this joint effort, stating, "Gathering

information to evaluate it with my group mate, and accelerating the process by considering what we can add to that information and how much we can improve it."
Similarly, P26 indicated that artificial intelligence and group members complement each other, expressing, "Artificial intelligence alone is not highly efficient and may not yield the exact results we desire; however, alongside both artificial intelligence and my friends, we reached a more effective outcome." P37 expressed AI's contribution to faster and easier problem resolution, stating, "With the support of artificial intelligence for errors we could not understand, we solved the problem in a much shorter time than usual."
Overall, most students preferred a hybrid collaboration model that included both AI and group members. Students valued AI for rapid technical support and troubleshooting, while peers contributed interpretation, negotiation, contextual judgment, and shared responsibility. Thus, AI did not appear to replace peer interaction; rather, it was generally positioned as a complementary element within group work.

4. Discussion and Conclusion

The findings show that the students in a project-based programming environment tended to position GenAI as a teammate or mentor rather than as an inanimate software tool. This result is consistent with human-AI co-agency perspectives, which conceptualize knowledge construction as an interactive process involving human interpretation, dialogue, and selective integration of AI-generated outputs [13], [14]. In this study, AI suggestions were not simply accepted; they were brought into group discussions and evaluated collectively.
The study also demonstrates the role of GenAI as a cognitive support mechanism. By providing scaffolding and reducing cognitive load, AI enabled the students to address technical difficulties and focus on higher-level problem-solving / problem-based learning processes [10], [4], [5]. This contribution is especially relevant in programming education, where minor syntax or logic errors may interrupt students' progress. However, the findings suggest that AI support functioned primarily as a facilitating mechanism rather than as a substitute for students' own reasoning.
A central contribution of the study is its finding that extensive AI use does not necessarily diminish student agency. The participants reported generating original ideas, questioning AI outputs, verifying information, and retaining control over final decisions [2], [15]. Nevertheless, the occurrence of AI dependence indicates that AI use requires deliberate pedagogical structuring. Learning tasks should require students to justify how they evaluated AI suggestions, why they accepted or rejected them, and how group members contributed to final project decisions.
The findings also address concerns that AI use may isolate learners or weaken peer collaboration. Students' strong preference for a hybrid model suggests that they recognized the distinct contributions of AI and peers. In the observed context, AI supported collective agency by contributing to technical efficiency and reflective problem solving, while peer interaction sustained negotiation, accountability, and shared ownership.
This study is limited to 42 students from a single vocational school and relies on self-reported written reflections. Therefore, the findings should be interpreted as context-specific rather than generalizable to all programming or PBL environments. Future studies should triangulate open-ended responses with AI interaction logs, classroom observations, and project performance indicators. In conclusion, GenAI can support project-based programming education when it is embedded in learning designs that protect students' critical judgment, collaborative responsibility, and agency.

Diagnostic Analysis of Students' Errors in Integral Calculus: Method Selection as a Source of Difficulty in Undergraduate Mathematics

Siditë Duraj[1], Lekë Pepkolaj[2]

[1]University of Shkodra "Luigj Gurakuqi", Albania
[2]University Metropolitan Tirana, Department of Computer Science, Albania

Abstract

Throughout several years of teaching Mathematical Analysis to first-year students in the Bachelor program in Informatics, we have observed that students encounter significant difficulties in selecting an appropriate integration method for a given problem. Our study aims to investigate the major difficulties related both to the selection of integration techniques and to the conceptual understanding of the structure of the integral itself, with the purpose of identifying instructional interventions that may help address these difficulties. These difficulties affect students' ability to apply integration methods correctly. The study was conducted with first-year students at the University of Shkodra "Luigj Gurakuqi" enrolled in the Bachelor program in Informatics, focusing on the transition from procedural methods of integration learned at the pre-university level toward more advanced reasoning grounded in structural understanding. The analysis revealed a tendency among students to apply familiar integration methods without adequately evaluating their suitability for the given problem. The findings indicate that these difficulties are mainly related to misconceptions regarding the structure of integrals and to difficulties in decision-making during the selection of an appropriate method. The study emphasizes the importance of engaging students in the comparison of alternative solution strategies and in the integration of diagnostic tasks in order to systematically address these deficiencies.

Keywords: *Integral calculus; students' errors; method selection; diagnostic assessment; mathematical understanding*

1. Introduction

The transition from secondary to university education represents a major challenge, first in terms of learning approaches and secondly in relation to the academic requirements that demand a higher level of abstraction in scientific subjects. Students often face difficulties adapting to new teaching approaches, the large volume of course material, and the increased emphasis on analytical and independent thinking. Mathematical Analysis constitutes one of the greatest challenges for first-year students enrolled in study programs with a mathematical component. These difficulties are also evident in the understanding and application of integration methods [1], [2].

A fundamental issue that has remained relatively underexplored is that students' difficulties do not lie solely in the technical execution of integration procedures. Many students are able to correctly apply familiar methods when these are presented explicitly, yet they encounter difficulties when they must independently decide which method should be used and why. This moment of decision-making, which precedes every solution process, constitutes the gap that the present study aims to investigate.

First-year students enrolled in the Bachelor program in Informatics study Mathematical Analysis as a compulsory subject. They generally come from a pre-university educational background oriented mainly toward algorithms and familiar exercise types, an approach that tends to favor procedural rather than structural reasoning.

Orton (1983) documented that students tend to treat integration as a sequence of mechanical steps without connecting procedures to conceptual understanding [1]. Mahir (2009) confirmed that procedural performance and conceptual understanding constitute two distinct dimensions [2]. Radatz (1979) showed that mathematical errors are systematic symptoms of the way students construct their understanding [3]. Nursyahidah and Albab (2017) linked difficulties in mastering integration to limitations in critical thinking skills [4].

This study contributes empirical evidence from the Albanian context on error patterns in the choice of integration method. The main theoretical contribution lies in the identification of a recurring pattern, here

termed premature procedural activation: the early triggering of a familiar method without prior analysis of the problem structure, identified as the dominant source of students' errors (defined more fully in Section 5.1). The study is guided by three research questions:
RQ1: How do first-year students identify the structure of the integral when choosing a method?
RQ2: What types of errors characterize method selection and what are their structural and conceptual sources?
RQ3: What metacognitive patterns emerge in students' decision-making during the integration process?

2. Theoretical Framework

2.1 Procedural and Conceptual Understanding

Hiebert and Lefevre (1986) proposed a foundational distinction between procedural understanding the capacity to execute learned algorithmic steps correctly and conceptual understanding, conceived as an interconnected network of ideas that confers meaning upon those steps [5]. In the context of integral calculus, the absence of conceptual grounding produces a characteristic fragility: students perform adequately in familiar problem types, yet encounter difficulties as soon as the structural configuration of the integral changes, even marginally.

2.2 Process-Object Duality

Sfard (1991) advanced the theory of process-object duality, according to which mathematical concepts may be apprehended either as processes or as objects [6]. Structural, object-based understanding is precisely what enables type recognition and, consequently, method selection. According to Tall (1991), many students entering university continue to rely mainly on operational forms of reasoning and experience difficulties in developing a more structural understanding of mathematical concepts [7].

2.3 Classification of Errors

Radatz (1979) classified mathematical errors as systematic symptoms of underlying misconceptions, identifying three principal categories: errors arising from misinterpretation of symbolic notation, errors from the context-independent application of algorithms, and errors attributable to gaps in conceptual knowledge [3]. Orton (1983) further distinguished structural errors rooted in a failure to recognise the integral's underlying form from executive errors, which emerge during the execution of a correctly identified method [1]. Broader frameworks in the literature [9] extend this classification to encompass the distinction between systematic errors, which reflect conceptual deficits, and random errors, produced by carelessness or situational factors. Some of these analyses also draw on cognitive psychology to illuminate the role of mental processes in the emergence and resolution of such difficulties.

2.4 Metacognition and Decision-Making

Schoenfeld (1985) documented that lower-achieving students tend to persist along unproductive solution paths without monitoring their progress, whereas expert problem-solvers flexibly revise their approach in response to emerging evidence [8]. Related research [10] underscores the contribution of formative self-assessment to the development of metacognitive regulation, enabling students to monitor and adjust their mathematical reasoning more effectively. From this perspective, choosing an integration method is not only a technical issue. Students must also evaluate whether the chosen strategy is appropriate and whether it is leading toward a valid solution

3. Methodology

3.1 Research Design

The study adopted a qualitative diagnostic design, oriented towards the analysis of structural reasoning and decision-making patterns. The diagnostic approach enables the exposure of mental processes, not just outcomes, and provides a direct basis for instructional interventions.

3.2 Participants and Context

The study was conducted with $n = 35$ first-year students, enrolled in the Mathematical Analysis course in the Bachelor's program in Informatics of the University of Shkodra "Luigj Gurakuqi" (academic year 2025–2026). Of these, 29 students submitted tests with at least partial answers, while 6 students did not complete any section, classified as level L0 (structural disengagement). The test was administered during class, without time pressure and without impact on students' grades. Participation was voluntary and anonymous.

3.3 Instrument

The diagnostic test "Integration Methods" was developed specifically for this study (100 points, open-ended, eight sections, 22 problems). The five integration methods are clearly labeled: M1 Direct, M2 Substitution, M3 By Parts, M4 Manipulation, M5 Standard. For each exercise, the student is required to: (a) identify the structure of the integral, (b) choose the appropriate method, and (c) justify the choice in a structural manner.

The tasks were developed by the authors on the basis of their teaching experience with this student population and of the error patterns reported in the literature reviewed in Section 2, in particular the procedural-conceptual distinction discussed by Hiebert and Lefevre (1986) [5] and the surface-based problem recognition documented by Mahir (2009) [2]. Several integrals were deliberately paired (e.g., 2a/2b, 4/9, 5/7) so that superficially similar items required, or did not require, the same method, in order to separate structural recognition from procedural execution. The diagnostic purpose attributed to each item, summarized in Table 1, was agreed upon jointly by the two authors prior to data collection. The instrument was not submitted to a separate pilot administration before the study; this is noted as a limitation in Section 7.

Section I (Structural Analysis) contains nine exercises selected to test structural differences, particularly the pairs 2a/2b, 4/9, and 5/7.

Section II (Decision Making) explores the initial method and structural indicators.

Section III (Abstract Structure) tests the transfer of reasoning to the forms $\int \frac{f'(x)}{f(x)} dx$, $\int f(x)\, dx$ and $\int f'(x) e^{f(x)} dx$.

Section IV (Error Analysis) requires critical explanation of the erroneous rule $\int f(x) \cdot g(x) d\, x \neq \int f(x) dx \cdot \int g(x)\, dx$.

Sections V–VIII collect metacognitive data and explore students' heuristics in choosing a method.

Taken together, the eight sections were designed to address four complementary aspects of integration competence. Structural recognition is addressed mainly in Sections I and III, where contrasting and abstract integrand forms require the underlying structure to be identified before any procedure is applied. Method selection is addressed in Section II, where students report and justify their initial choice of method. Procedural execution is addressed through the follow-up items in Sections I, II, and IV, which ask whether the chosen method was carried out successfully and whether it was revised during the solution process. Metacognitive control is addressed in Sections V–VIII, which ask students to reflect on the point at which they reconsidered an unproductive method and on the heuristics guiding their initial decisions.

Table 1. Exercises of Section I Structural Analysis

No.	Integral	Diagnostic Purpose
1	$\int xe^x\, dx$	Intended to assess recognition and application of integration by parts in a product structure involving algebraic and exponential functions (M3).
2a	$\int \frac{2x}{x^2+1}\, dx$	Intended to assess recognition of the logarithmic derivative structure $\frac{f'(x)}{f(x)}$, leading to logarithmic integration (M2).

No.	Integral	Diagnostic Purpose
2b	$\int \frac{x}{x^2+1}\,dx$	Designed to assess students' ability to adapt the logarithmic derivative structure when the exact derivative factor is not explicitly present (M2).
3	$\int \ln x\,dx$	Intended to assess recognition of implicit reformulation as 1·ln x, requiring integration by parts (M3).
4	$\int \frac{x^2}{x^2+1}\,dx$	Requires prior algebraic restructuring before integration can proceed (M4).
5	$\int \frac{x}{x^2-1}\,dx$	Designed to examine premature transfer of the $\frac{f'(x)}{f(x)}$ structure without sufficient structural verification (M2/M4).
6	$\int \frac{\sin x}{1+\cos x}\,dx$	Intended to assess transfer of the logarithmic derivative structure to a trigonometric context (M2).
7	$\int \frac{2x}{x^2-1}\,dx$	Intended to assess recognition of the logarithmic integration structure in a structurally similar but non-identical algebraic context (M2).
8	$\int \frac{1}{\sqrt{1-x^2}}\,dx$	Intended to assess recognition and retrieval of a standard inverse trigonometric integral form (M5).
9	$\int \frac{x^2+1}{x^2-1}\,dx$	Requires algebraic decomposition prior to the application of standard integration techniques (M4 + M5).

3.4 Coding System

Each response was coded according to four dimensions: (S) identified structure; (M) chosen method; (E) type of error: E0 = no error, E1 = weak reasoning, E2 = unclear criterion, E3 = wrong method, E4 = deep conceptual error, E5 = missing; (K) cognitive level (K1–K4). Based on the coding profiles, students were classified into six cognitive levels (L0–L5).
Coding was carried out independently by two coders for every completed item, applying the four-dimension scheme described above to the identified structure (S), the chosen method (M), the error type (E), and the cognitive level (K). The method labels (M1–M5) were given directly by the test format, while the error categories (E0–E5) and the cognitive-level descriptors underlying the L0–L5 classification reported in Table 2 were developed inductively, through an initial joint reading of a subset of responses, and were then applied systematically to the full dataset. After coding independently, the two coders compared their codes item by item and discussed any case of disagreement with reference to the original response and to the working definition of each category, until a shared code was agreed upon. All disagreements were resolved in this way, through discussion and consensus; given the relatively small number of double-coded responses, a quantitative inter-rater agreement coefficient was not calculated for this study.

3.5 Data Analysis

The data were analyzed at three complementary levels: (1) analysis of error frequencies by sections and exercises; (2) categorization of reasoning at three levels: surface, procedural, and structural; (3) analysis of metacognitive models. These three levels of analysis drew on the coding scheme and the coder-validation procedure described in Section 3.4.

4. Results

4.1 Distribution of Students by Cognitive Level

Analysis of the 35 diagnostic tests identified six distinct cognitive profiles (Table 2). The L0 and L3 groups each represented 28.6% of the sample, together comprising 57.2% of the participants. The L4

and L5 levels represented only 14.3%, indicating that full functional competence in the structure–method link was rare. Only one student (2.9%) demonstrated a stable structure–method link (L5).

Table 2. Distribution of students by cognitive level ($n = 35$)

Level	Student Profile	n	%	Dominant Error Pattern
L0	Pre-structural / Non-engagement	10	28.6%	E5 (absence of response)
L1	Formula recall / Low structural activation	5	14.3%	E5 + E3
L2	Surface-level recognition / Decoupled reasoning	5	14.3%	E3 + E1
L3	Overgeneralization / Method fixation	10	28.6%	E3
L4	Partially functional / Structurally conflicted	4	11.4%	E2 + E1
L5	Selectively functional structural reasoning	1	2.9%	E2 (selective)
	Total	**35**	**100%**	

4.2 Structural Errors: Not Knowing the Structure of the Integral

The dominant error category was structural: students activated a method before analyzing the structure of the integral. The contrasting pair 2a/2b, $\int \frac{2x}{x^2+1}\,dx$ and $\int \frac{x}{x^2+1}\,dx$, showed that (19 out of 29) responding students applied the same procedure to both integrals, without identifying that $\int \frac{x}{x^2+1}\,dx$ requires prior adjustment. These results suggest that structure recognition is based on surface features, not deep analysis, in line with Mahir's (2009) characterization [2].

Exercise 4, $\int \frac{x^2}{x^2+1}\,dx$, confirmed this pattern. Most participants attempted the substitution without verifying whether x^2 is a derivative of $x^2 + 1$. Only students at levels L4–L5 performed the preliminary manipulation $\frac{x^2}{x^2+1} = 1 - \frac{1}{x^2+1}$. Section III showed that the transfer to the abstract form $\frac{f'(x)}{f(x)}$ did not occur spontaneously: most students left these exercises unanswered.

4.3 Procedural Errors: Incorrect Implementation after Correct Choice

A second category of errors was identified in students who chose the correct method but made errors during execution. Procedural errors appeared mainly in exercises requiring double application of integration by parts ($\int x^2 e^x\,dx$) and in preliminary algebraic reformulation. According to Radatz (1979), these constitute execution errors, distinct from structural errors [3].

Exercise 17 showed that most students knew that the statement $\int f(x)g(x)\,dx = \int f(x)\,dx \cdot \int g(x)\,dx$ is false, but they failed to justify why, a phenomenon consistent with Hiebert and Lefevre (1986) [5].

4.4 Metacognitive Failures: Failure to Monitor the Process

Most students did not change their method during the process, or only changed it when they were completely stuck. Only a small percentage reported actively monitoring their progress, a finding consistent with Schoenfeld (1985) [8]. From the reflection section, the first step most reported was "try substitution" or "check if it is direct," not "analyze structure." This confirms that students' spontaneous approach is primarily procedural, not structural.

Table 3. Main error patterns by category and theoretical basis

Exercises	Observed Error	Category	Theoretical Basis
2a vs 2b	Identical procedures applied to structurally distinct integrals	Structural	Werner Radatz (1979)
4	Substitution attempted without prior algebraic restructuring	Structural	Anthony Orton (1983)
9	Direct substitution attempted without the required algebraic reformulation	Structural	Anna Sfard (1991)
10–14	No change of method observed during the solution process	Metacognitive	Alan Schoenfeld (1985)
10–14	High confidence reported alongside incorrect solutions	Metacognitive	Nizam Mahir (2009)
17	Inability to justify why $\int f(x)g(x)\,dx \neq \int f(x)\,dx \cdot \int g(x)\,dx$	Procedural	Werner Radatz (1979)
18	Failure to verify structural conditions prior to method selection	Structural	Anthony Orton (1983)

5. Discussion

5.1 Premature Procedural Activation Without Structural Analysis

The central finding of this study, that students activate a method before analyzing the structure of the integral, constitutes the main theoretical contribution. This phenomenon, which we term premature procedural activation, explains most structural errors and can be interpreted through Sfard's (1991) process-object framework: students operate with an operational, not a structural, conception of the integral [6]. The transition that Tall (1991) identifies as essential, from operational to structural thinking, had not yet been realized for most of the sample [7].

We define premature procedural activation as the early triggering of a familiar integration procedure, most often substitution or integration by parts, before the structure of the integrand has been adequately analyzed. The concept is related to, but distinct from, two profiles already identified in Table 2. It differs from surface-level recognition (the L2 profile), in which a method is chosen on the basis of superficial visual cues, such as the presence of a quotient or of the symbol "ln", rather than of a verified structural property. It also differs from method fixation (the L3 profile), which describes the persistence of a method once chosen, even when subsequent steps indicate that it is unproductive. Premature procedural activation can be understood as the initiating mechanism behind both profiles: surface-level recognition concerns what students attend to instead of structure at the moment of selection, while method fixation concerns what happens afterward, once an unverified method has already been activated and is not reconsidered.

The concept should also be distinguished from a general overreliance on procedural knowledge. Most students who showed premature procedural activation were, in principle, able to apply a method correctly once it had been selected, whether the selection itself was correct or not; the errors described in Section 4.3 were procedural rather than structural in nature. In terms of the coding scheme presented in Section 3.4, premature procedural activation is most directly reflected in responses coded E2 (unclear criterion) or E3 (wrong method), where a method (M) could be identified despite an absent, incomplete, or post-hoc structural justification (S); the coding scheme used in this study does not include a separate code dedicated specifically to this phenomenon.

The pedagogical implication is clear: it is not enough to learn the application of a method; it is essential to develop the ability to recognize the structure that requires it. In this sense, the sequencing of teaching must be reoriented, placing structural analysis before procedures.

5.2 Consistency with Existing Literature

The results are in full agreement with Mahir (2009), who documented that students with a dominant procedural understanding identify the type of problem based on its appearance [2]. The pair 2a/2b confirms this mechanism clearly. The metacognitive failure documented by Schoenfeld (1985) is reflected in students' insistence on using unproductive methods [8]. Overall, these findings suggest that the fundamental difficulty in method selection is not technical, but epistemological.

6. Implications for Teaching

The following implications are derived directly from the diagnostic findings reported above. Their pedagogical effectiveness has not been tested empirically within this study; they are proposed here as directions for classroom practice and as hypotheses for future research.
First, the systematic use of contrasting pairs (e.g., 2a/2b), characterized by superficial similarities and structural differences, may support the development of structural recognition, provided that such exposure is deliberate and ongoing rather than occasional.
Second, requiring a written justification as a mandatory step, "Why did you choose this method?", is intended to encourage structural engagement before selection, and could be integrated as a routine component of classroom exercises.
Third, teaching should position structural analysis as an explicit phase of the solution. The question "What do I notice in this integral?" should be the first step, clearly articulated, not assumed.
Fourth, treating typical errors (e.g., $\int f(x)g(x)\,dx \neq \int f(x)\,dx \cdot \int g(x)\,dx$) as case studies may support the transition from memorization to conceptual understanding.

7. Study Limitations

Despite the diagnostic value of the findings, this study should be interpreted within several limitations. First, the research was conducted within a single higher education institution and involved a relatively small number of students who agreed to participate in the study. The study was motivated by recurring difficulties observed among first-year Bachelor students in Informatics when selecting appropriate integration methods. The aim was to focus directly on students' difficulties rather than to follow a traditional, linear approach to teaching.
Moreover, the diagnostic instrument itself was not submitted to a separate pilot administration before the study; its tasks were developed directly from the authors' teaching experience and from the literature reviewed in Section 2, rather than from a preliminary empirical check of item difficulty. This is consistent with the diagnostic, exploratory purpose of the study, but it also means that the psychometric properties of individual items were not established prior to data collection.
In addition, since students were informed that the test would not be graded, not all participants engaged with the same level of seriousness and commitment throughout the diagnostic process. Although several students voluntarily agreed to participate, some of them left sections incomplete or provided only partial responses.
Furthermore, the present study represents primarily a diagnostic investigation of students' difficulties and proposes a framework for pedagogical intervention. However, the effectiveness of these interventions was not empirically tested within the scope of this research and therefore remains open for future studies and broader comparative investigations. Future work might also explore whether targeted structural instruction, even in brief form, leads to measurable shifts in students' method-selection strategies.

8. Conclusions and Recommendations

This study provides empirical evidence that the dominant difficulty faced by first-year students in solving integrals is not related to the technical execution of integration techniques, but rather to the structural analysis of the integral and the decision-making process involved in selecting an appropriate method of solution. The three categories of errors, structural, procedural, and metacognitive, reflect distinct dimensions of the same fundamental gap: the lack of transition from operational to structural understanding.
The diagnostic instrument used in this study provides not only a research tool, but also a pedagogical tool. The study has important limitations, since it was conducted within a single institution and the sample size is also relatively modest.

Future research should test the proposed interventions through comparative designs and expand the sample to other university contexts. A practical starting point would be to require students, as a regular habit, to write one sentence before beginning any solution. This sentence should state what they notice about the structure of the integral and why that observation matters for choosing a method.

Cultivating Empathy through Literature and Creative Writing

Marili Douzina[1], Christos Paraskevas[2]

[1]Arsakeia Schools, Hellenic Open University, Greece
[2]Arsakeia Schools, Greece

Abstract

The aim of this initiative, which has been planned and implemented throughout the 2025-2026 school year in the 2nd grade of a greek private high school in Athens, is to cultivate empathy and understanding of the "Other" through Literature and Creative Writing. More specifically, this is pursued through organized and targeted activities grounded in contemporary theories of empathy in literary studies. According to these theories, empathy is not understood merely as an emotional response of students to literary texts, but also as a complex cognitive-emotional skill that develops through engagement with literary works. Through this process, students gradually become aware that differences among people are shaped by various factors and therefore should be approached with respect and understanding. Contemporary research suggests that while today's youth demonstrate proficient cognitive empathy – the intellectual understanding of others' emotional states– they often encounter difficulties regarding affective empathy, or the capacity to viscerally experience another's emotions. This deficit, partly attributed to digital mediation and its inherent interpersonal distance, hinders effective emotional self-regulation. Consequently, fostering the affective dimension of empathy is of paramount importance. Adolescents require "safe environments" to practice empathic engagement without perceived threats to their own identity. Literature can serve as such a sanctuary, offering a protected space for emotional exploration. Correspondingly, creative writing can function as a secure pedagogical tool, facilitating a deeper understanding of the "Other" while simultaneously promoting self-reflection and self-awareness. Starting from selected modern greek literary texts (prose or poetry), students come into contact with diverse human situations and different types of characters (both deviant and non-deviant, misunderstood and not misunderstood). They approach these heroes and heroines and attempt to interpret their behavior with an attitude of understanding toward human nature, without arrogance or condemnation. They reflect on questions such as: What led the hero or heroine to react in this way? How is this behavior perceived by others who do not know the circumstances? Indicative Creative Writing activities with a psycho-emotional orientation, aiming to strengthen empathy (narrative, poetic, and critical empathy) and sensitivity, include: the Emotion Diary, the "Cardiogram" of the character, the character's internal monologue and others.

Keywords: *Empathy, Creative Writing, Literature*

1. Introduction

The aim of this initiative, designed and implemented throughout the 2025-2026 school year in the second grade of a greek private high school in Athens, is to cultivate empathy and understanding of the "Other" through Literature and Creative Writing. More specifically, this objective is pursued through structured and carefully designed activities informed by contemporary theories of empathy in literary studies. According to these approaches, empathy is understood not simply as students' emotional response to literary texts, but as a complex cognitive and emotional skill that develops through engagement with literature. Through this process, students gradually come to realize that differences among people are shaped by multiple factors and should therefore be approached with respect, sensitivity, and understanding.

Contemporary research indicates that, although today's adolescents often display strong cognitive empathy –that is, the intellectual ability to recognize and understand the emotional states of others– they frequently struggle with affective empathy, namely the ability to emotionally and viscerally experience another person's feelings. This limitation, partly associated with digital mediation and the interpersonal distance it creates, may hinder the development of effective emotional self-regulation. For this reason, strengthening the affective dimension of empathy is considered particularly important. Adolescents need "safe spaces" in which to practice empathic engagement without feeling that their own identity is threatened. Literature can function as such a refuge, offering a protected environment

for emotional exploration and reflection. Likewise, creative writing can serve as a secure pedagogical tool that encourages a deeper understanding of the "Other", while at the same time fostering self-awareness and introspection.
Through selected modern greek literary texts, both prose and poetry, students encounter a wide range of human experiences and diverse character types –including individuals who are marginalized or socially accepted, misunderstood or fully understood.

2. Empathy in Literary Education

The integration of Empathy into literary education is promoted by the emerging field of empathy studies in literature, which emphasizes the close connection between reading and the empathic process. This process does not presuppose the physical presence of another person, as the reader may develop an emotional connection with the "Other" through fictional characters.
This field argues that, at an educational level, empathy can be cultivated through students' active engagement with literature (reading, writing, analysis) by means of a specific methodology focused on "perspective-taking," encouraging students to identify with or approach characters while taking into account their sociocultural background. Creative Writing may play a central role in this approach, as it mobilizes imagination and thought, allowing students to experience the inner world of literary heroes. This experience appears to promote emotional maturity and strengthen respect and tolerance in everyday social life (Hoffman, 2000).

2.1 From Sympathy to Empathy

Historically, the concept of "sympathy" (fellow-feeling) has been fundamental in western thought regarding the experience of the self in relation to the other. Etymologically, it derives from the ancient Greek word "sympatheia" (syn + pathos), meaning participation in another person's suffering (Hammond & Kim, 2014: 2). This form of emotional engagement became inextricably linked with art (Pinotti & Salgaro, 2019: 141). Contemporary approaches define empathy as the innate human ability to participate in, understand, and respond with care to the emotions of fellow human beings (Hammond & Kim, 2014). Despite interdisciplinary divergences, there is broad agreement that empathy possesses both cognitive and emotional dimensions (Decety & Jackson, 2006: 54):
• Cognitive dimension (perspective-taking): The conscious understanding of another person's emotions.
• Emotional dimension: The indirect experience of another person's emotion, which often develops into "empathic concern" (Van der Graaff et al, 2013).

2.2 The Pedagogy of Empathy

Within the Pedagogy of Empathy, empathy is regarded as a pillar of social development and emotional intelligence (Batson, 2009· Mayer & Salovery, 1993). According to Jamieson (2015), empathy lies at the core of quality teaching. Practices such as collaborative learning, role-playing, and engagement with the arts enhance this ability (Feshbach & Feshbach, 2009). During adolescence, neurological development and the shift toward peer relationships make this stage of life ideal for the cultivation of empathy (Hoffman, 2000).
Contemporary studies on empathy, recognizing its conceptual multiplicity, focus on the ways in which the processes of "thinking with" (cognitive) and "feeling with" (emotional) are activated within the literary framework (Hammond & Kim, 2014: 1).
Literary engagement enables a profound connection with the "Other" on both cognitive and emotional levels (perspective-taking) (Leake, 2016; Coles, 1989; Hoffman, 2000; Mar et al., 2006). Systematic writing through shifts in perspective cultivates enduring empathic habits (Leake, 2016).
Through literature, students experiment with unfamiliar cultures and situations within a safe environment, thereby reducing social prejudices (Jamieson, 2015; Shuman, 2006; Mar, Oatley & Peterson, 2009). However, this ability often encounters social prejudices toward different population groups (Cameron et al, 2019; Kiser, 2017).
According to Keen (2013), narrative empathy concerns the sharing of emotions through stories in every form (literature, theatre, cinema). Keen (2006: 214-224) emphasizes that narrative techniques (such as narrator type and focalization) interact with the reader's temperament. She distinguishes empathy into three categories:

1. Bounded empathy: directed toward one's own group.
2. Ambassadorial empathy: directed toward selected groups.

3. Broadcast empathy: characterized by a universal human orientation.

Critical empathy incorporates critical awareness, recognizing that connection with the "Other" is complicated by sociohistorical factors that hinder equality (Leake, 2016). It is based on the assumption that the common human need for self-actualization encounters different cultural and social conditions (Lu, 1999: 173).
The theoretical approach of "feeling into" (Einfühlung) constitutes the cornerstone for understanding poetic experience and reader response to this day. Empathic reading contributes precisely to this process, allowing readers to broaden their horizons and the parameters of their reading act. Lou Agosta refers to the "hermeneutic circle" of the empathic process. This is a process consisting of four phases: a) empathic receptivity of the "open subject" to the various representations of emotional expressions and the lived experience, real or imaginary, of the other; b) empathic understanding; c) empathic interpretation, "as if you were the other, in the other's place"; and d) empathic responsiveness, consisting of exemplary speech acts that ensure optimal communication (Agosta: 1984; 2010: 46).
Within the spectrum of reader-response theories, David Bleich's "subjective criticism" occupies a prominent position, emphasizing the reader's emotional participation (Beach, 1993: 53). In his works *Readings and Feelings* (1975) and *Subjective Criticism* (1978), Bleich proposes the "subjective re-creation" of the text. For Bleich, reading is not contact with a physical object (words on paper), but a perceptual act in which sensory experiences are transformed into consciousness through individual meaning-making processes (Bleich, 1978: 97).

2.3 Criteria for Text Selection

The pedagogy of empathy presupposes the selection of texts that facilitate connection with characters while at the same time maintaining the distinction between self and hero (Coplan, 2004:144). Reading immersion is crucial, as lack of engagement may reduce levels of empathy (Bal & Veltkamp, 2013). Enjoyment, as an intrinsic motivation, is achieved through thematic relevance to adolescent life (Pitcher et al., 2007). Texts addressing moral dilemmas are also recommended (Edgar, 2020: 68-69), so that literature may function as a tool of social criticism. Selection must always be aligned with the cognitive and emotional level of the students (Junker & Jacquemin, 2017; Gallagher, 2009).

2.4 Typologies of the Empathic Reader's Emotions

Through the emotional stimulation of readers, the path toward empathic reading is opened (Keen, 2006). By responding empathically, the reader of a text (prose or poetry) shares the emotions of the characters (Miall & Kuiken, 1995).
The reader's emotional engagement during literary reading differs from real social interactions, as it is primarily based on imagination. It may be distinguished into four fundamental categories (Miall & Kuiken, 2002; Sikora, Kuiken & Miall, 2004):

1. Evaluative feelings: These concern the overall assessment of the text as a whole (e.g., pleasure, satisfaction).
2. Aesthetic feelings: These arise from the formal structure of the work (stylistic devices, metaphors, irony, rhythmic organization) and enhance reading interest through the aesthetic enjoyment of form.
3. Narrative feelings: These focus on specific aspects of fiction, such as empathy toward acting characters.
4. Self-modifying feelings: These reconstruct the reader's self-image, producing symbolic representations capable of transforming personality itself (Miall & Kuiken, 2002; Sikora, Kuiken & Miall, 2004).

2.5 Creative Writing in the Teaching of Empathy

Creative Writing constitutes a quintessentially experiential method for cultivating empathy, since it requires students to adopt the perspective of literary characters (Jamieson, 2015: 230). Through the production of imitative or reflective texts and the subsequent critical discussion, students are gradually led toward the development of critical empathy (Junker & Jacquemin, 2017: 80).

3. Description of the Teaching Proposal

The following teaching proposal was implemented with twenty-seven mixed-ability students in the Modern Greek Literature course of the second grade of a General Upper Secondary School in a private school in Athens. It was designed by two teachers between whom a mentoring relationship exists. The teachers implemented the following proposal in two classes. The first class consisted of 9 girls and 5 boys, while the second consisted of 11 girls and 2 boys.
The intervention, which utilized the activation of empathy during the educational process, lasted throughout the entire 2025-2026 school year. During this period, the teachers identified suitable texts (prose and poetry), selected the most appropriate creative writing exercises, and prepared the students for participation in a related conference held in Athens.
Regarding the selection of texts, it was considered necessary that they should raise concerns and questions through whose exploration students would cultivate their empathic ability. These questions were the following:
• What does the hero/heroine feel?
• Can I put myself in his/her place? Can I empathize with him/her?
• Do I identify with him/her?
• Do I understand him/her?
• What led the hero/heroine to react in this way?
• How is this behavior perceived by others who do not know the background?
• How easy is it for each of us to arrive at hasty and superficial conclusions about another person?
• How easy is it to assign a label or characterization to another person? How important (but also how difficult at times) is it to approach the diversity and uniqueness of human nature with understanding?
Regarding prose, texts were selected from the school textbook *Texts of Modern Greek Literature, Grade B of Lyceum*: “Pararlama” by Demosthenes Voutyras, “The Secret Poppy” by Stratis Myrivilis (excerpt from the novel *Life in the Tomb*), “The Seal’s Lament” by Alexandros Papadiamantis, and “Alexis Zorbas” by Nikos Kazantzakis (excerpt from *The Life and Times of Alexis Zorbas*). As for poetry, the teachers utilized the following works: “[We are something…]” by Kostas Karyotakis, “Marina of the Rocks” and “Maria Nefeli” by Odysseas Elytis, as well as a selection from the *Complete Works* of Kiki Dimoula.
Subsequently, the most suitable creative writing exercises for strengthening empathy and sensitivity were selected. These activities had a psycho-emotional orientation and focused on the creation of original student texts inspired by the texts presented to the students. Indicatively, these included the creation of a personal anthology, theatrical monologue/dialogue writing, dramatization, sketching, diary writing, and original poetic composition. These activities, however, will be presented in greater detail below.
The intervention concluded at the end of the school year with the distribution of a feedback questionnaire.

3.1 Empathic/Empathetic Reading

Starting with prose, in Demosthenes Voutyras’s work “Pararlama”, the students became acquainted with the marginalized and unstable character of the eponymous short story, who longs to become the center of attention by writing the incomprehensible slogan “Pararlama” and taking pleasure in provoking fear and terror. In order to bridge the distance between themselves and the character, the students were asked to answer a series of questions:
• What might drive a person to such behavior?
• How can isolation and exclusion disturb one’s inner balance?
• What kind of treatment might people in a state of weakness deserve?
In approaching the short story, the aim was not to psychoanalyze the character or investigate his pathology, but rather to understand his behavior and human vulnerability.
In the excerpt “The Secret Poppy,” from Stratis Myrivilis’s book *Life in the Tomb*, teachers introduced their class to the following questions:
• How might Sergeant Kostoulas feel?
• What might the war have done to his soul?
• What psychological defenses might he have employed in order to survive in the trench?
• Why does the encounter with the poppy provoke such an emotional overreaction?
• How can a person manage their emotions during a period of intense crisis such as war?
• Does he allow himself room to feel?

• Might he need to “silence” his emotions (fear, guilt, love, hope)?

Furthermore, we followed the journey of old Loukaina in Alexandros Papadiamantis’s short story “The Seal’s Lament”, alongside the tragic course of her little granddaughter, Akrivoula, who, enchanted by the melody of a carefree shepherd, was led to her death. Through discussion among the students, the following questions emerged:
• How might old Loukaina and Akrivoula’s mother have felt?
• What emotions arise in the reader?
• Can we empathize with old Loukaina?
• What would we have felt if we were the shepherd?

Moving on to the excerpt from Nikos Kazantzakis’s novel *The Life and Times of Alexis Zorbas*, an attempt was made to construct a psychological profile of the book’s protagonist. To this end, students focused on the following questions:
• What type of person is Alexis Zorbas?
• How might we interpret his psychology?
• Would you like to meet such a person?
• What might companionship with him offer, and how easy would it be?
• What experiences may have led the character to adopt this attitude toward life and this behavior?

The students’ empathic/empathetic engagement became even more intense through poetry. This empathic/empathetic journey began with Kostas Karyotakis’s poem “[We Are Something…]”, included in the second-grade school textbook. The teachers’ aim was for the recipients of the poem to approach the poetic subject by constructing its psychological profile and answering key questions in order to achieve this goal more effectively. These questions were the following:
• What might the poetic subject be feeling? Disappointment? Dissatisfaction? Resignation? Understanding?
• How does the speaker express these possible emotions? Why might they feel this way? Are these emotions understandable? Might they be excessive?
• Why might the speaker refer to poets and to themselves in this manner?
• Where might the speaker place themselves?

Subsequently, the poetry of Odysseas Elytis was explored, specifically the poem “Marina of the Rocks” and excerpts from the poetic collection “Maria Nefeli”. In the first poem, the emotional background was examined, and an attempt was made to answer the following questions:
• What does the poetic voice feel?
• What are the characteristics of “Marina of the Rocks” that may intensify the poetic voice’s desire to “conquer” her?
• How do we explain the behavior of each figure?
• Which verse attracted our attention? Why might this have happened?

While it became clear that in this poem only the male poetic voice is heard, addressing a rebellious female figure, in “Maria Nefeli” at least two poetic voices are heard: Maria Nefeli, a different kind of girl who struggles to fit into the world, and the “Respondent,” an entity that seems to embody adult thought, convention, limitation, and the “Other”. A voice that stands in opposition to Maria Nefeli. We attempted to define Maria Nefeli’s nature, explain her behavior, and explore any similarities between ourselves and her.
After completing the empathic/empathetic approach to the poems of Odysseas Elytis, and in collaboration with the schools’ drama instructor, an attempt was made to create a theatrical representation of the two poems, through which the students approached the emotions arising from experiential engagement with Elytis poetry. Through this activity, which was based on an original text by the drama instructor, “Marina of the Rocks” was connected with “Maria Nefeli”, constituting a first step toward a more creative perspective through which students could appreciate poetry.
Similar were the empathic/empathetic reading approaches to the poetic texts of K. Dimoula and K. Karyotakis.

3.2 Empathic/Empathetic Creative Writing

The prose and poetic texts already mentioned served as stimuli for the externalization of students' emotions and thoughts regarding elements of the plot and the heroes/heroines that came alive in their minds during empathic/empathetic reading. Among the creative writing activities utilized were the following: an "emotion cardiogram" (an attempt to record the emotions of the hero/heroine), the hero's monologue (a written transformation of "feeling into" through the question "What might the hero/heroine be thinking?"), rewriting the story or part of the story from the student-author's chosen perspective through the question "What would happen if…?" with emphasis on emotion, and the written transformation of "perspective-taking" through the questions "If it were me? How would I feel? What would I do?"

The poem "[We are something…]" by Kostas Karyotakis served as the poetic stimulus for the creation of original written compositions by the students. This activity allowed students to express what they feel as adolescents, pressured and anxious second-grade Lyceum students, or as observers of a world changing rapidly, abruptly, and uncontrollably.

One way of understanding the distinctive surrealist writing of Odysseas Elytis was the assignment of text production through the technique of automatic writing. This is a written production technique in which the filters of logic are bypassed and the speed of thought, the leaps of reasoning, and the faithful succession of emotions are recorded through writing. Although at first glance disconnected from empathy, this activity contributed to liberating students from the constraints of written discourse and the meticulous rules imposed by structured writing within the context of upper secondary education.

The poetry of Kiki Dimoula played a leading role in the empathic activation of students. Initially, students were asked to write a poetic "advertisement" inspired by Dimoula's poem of the same title. Through this activity, they themselves requested something personal they desired and expressed what they could offer in return.

The next creative writing exercise revolved around the poem "The Periphrastic Stone" by the same poet. Students practiced creating a theatrical dialogue or monologue in which they depicted the conversation between the poetic subject and the recipient of the poem, or alternatively the recipient's response to what had been heard through the poem.

In a subsequent teaching session, students came into contact with Kiki Dimoula's poem "Dust" and created their own diaries in which they recorded their impressions from encountering these housewives, so familiar to all of us. Through diary-based creative writing, students practiced perspective-taking, self-empathy, self-understanding, and the expressive representation of a symbolic catharsis.

4. Conclusions – Suggestions

For the evaluation of the intervention, the following tools were utilized:

a. observation of the participating students during the creative exercises assigned each time by the two responsible teachers,

b. the feedback questionnaire, and

c. feedback from students who functioned as a focus group (oral feedback was requested from students of different academic performance levels and varying degrees of classroom participation).

The following findings emerged:

Not all students are familiar with such teaching models. Literature as a subject is often perceived negatively by learners, and there is always the possibility that certain stereotypical attitudes may be reinforced among some students. These attitudes may stem either from the tendency to criticize the portrayal of a character's weaknesses or from the belief that Literature itself constitutes a secondary and less important field of study.

The active involvement of the teacher is essential in order to safeguard students and create a safe environment in which they can express themselves openly and without inhibition. The teacher must remain vigilant in maintaining classroom balance and in eliminating any tendencies toward judgment, belittlement, or arrogance among participants.

The respect that the teacher expects from students must also be demonstrated by the teacher during the presentation of creative assignments to the whole class. The purpose of the intervention is to encourage students' self-expression and cultivate empathy, not to showcase the teachers themselves. Students should neither feel exposed nor pressured into making statements they do not wish to make.

Preparing these workshop-style creative writing lessons requires considerable time on the part of the teacher, both for selecting appropriate texts –texts that raise meaningful questions capable of activating empathy and/or texts preferred by the students themselves, with the ideal approach being a combination

of both. Moreover, the implementation of creative writing activities cannot realistically take place outside the school environment, both for reasons of authenticity and reliability of the students' work and because of the already demanding schedules students face. At the same time, teachers must also ensure that the prescribed curriculum is adequately covered.

Creative writing can bring students closer both to written expression and to the understanding of the "Other". However, for this to happen, educators themselves must also become more familiar with such alternative teaching approaches. A shift in mindset is therefore required among teachers, students, and parents alike if creative writing is to be meaningfully and systematically integrated into educational practice.

Students succeeded in putting themselves in the place of the "Other". They viewed the world from a different perspective and understood emotions they had not previously experienced. They recognized and named emotions: poetic stimuli functioned as opportunities for emotions to emerge, enabling students to recognize and express them in their own way. They practiced listening and acceptance: their emotional understanding was strengthened, while any critical tendencies they may previously have had were weakened. Through the reading of their creative works before the whole class, both the absence of competitiveness and the strengthening of interpersonal relationships became evident. Particularly characteristic was the image of students who felt hesitant while presenting their texts receiving encouragement from their classmates.

Games and Media in Education

Overcoming GBL Teaching Barriers: The Preliminary Stages of a Teacher Action Research

Pier Daniel Cornacchia

University of Milano Bicocca, Italy

Abstract

Game-based learning (GBL) is a motivating and engaging approach to foster students' learning [21]. However, teachers complain that there are many social-organizational barriers to face when integrating games in didactics, which need to be overcome with training [12]. Hence, Ricerca-Formazione (Teacher Action-Research) [4], is chosen as the methodological pathway to foster meaningful research and professional development processes. A community of primary school teachers in the Lecco province in Italy asked to be trained to help them use games in their teaching practice. Throughout 5 Professional development sessions in 2024 and early 2025, teachers practiced instructional design, game analysis, gaming, game modding, and had group discussions for debriefing. Thereby, these teachers defined lack of colleagues' collaboration, due to their traditional teaching style, as the most common and challenging obstacle for game integration in their school contexts. To understand this issue's dynamics, 3 in-training teachers played a theatre game [5], which consisted in the staging of a discussion among colleagues who disagree on game use. The scene was then analysed together with other in-training teachers to look into the portrayed issue, considering different perspectives. Thus, they devised solutions to overcome these challenges and they staged them as well to have a sense of their potential. The second performance was also analysed to get a sense of the actual impact of the designed changes. The overall thematic analysis [9] of the transcribed scripts of the role-plays and of all the focus groups shows that colleagues' resistance toward game classroom use shouldn't be belittled but understood. In fact, teachers with a propensity for traditional didactics are often reluctant to game integration, because of their emotional and pedagogical insecurity. Therefore, teachers who want to promote GBL need to find an accommodating way to convince colleagues of the potential of game use, taking into account the issues all teachers bring forward. In conclusion, game-based teacher training strategies such as role-plays and theatre games allow for a better understanding of teachers' issues and how to address them, as they highlight relational and organizational complexities.

Keywords: *Professional Development, Game-based learning, Teacher Action-research, Theatre games, Analog games*

1. Introduction

Game-Based Learning (GBL) is a pedagogical approach that leverages the affordances of games to facilitate a learning experience which integrates gaming with other specific activities to attain defined learning outcomes [21]. At its core, GBL relies on the active and focused investment of effort in a game environment, encouraging students to learn via experience and direct participation, rather than through traditional methods. From a socio-constructivist perspective, games are viewed as socially situated systems where knowledge is not merely transferred, but is co-constructed through intersubjective and relational processes.

This approach identifies games as meaningful ways to foster learning in their Zone of Proximal Development [30], providing a safe Magic Circle [17], where the rules and structures of the game act as a scaffold for exploring outcomes beyond one's imagined current abilities. According to Boller and Kapp [7] a game is defined as an activity that consists of a goal and of rules that guide how that goal is achieved. Thus, players have to face a challenge which requires interactivity with other players or the game environment. Accordingly with the game mechanisms, the game feeds back information related to the physical state changes of the game. This feedback offers immediate cues regarding the players' performance and, so, it affects them cognitively and emotionally. Hence, games function as a nexus of practice, facilitating situated learning, since skill development is inextricably linked to social interaction and cultural context [23].

Lave and Wenger's theory of Community of Practice is the primary theory used in this study to frame the learning processes [18], as it is centred on situated learning and legitimate peripheral participation.

Thereby, it provides a robust framework for social knowledge acquisition for what concerns student learning and teacher professional development. However, critiques suggest that without specific intervention, this model can mirror what Freire defines "banking education", which prioritizes the community's status quo over individual agency [15][16]. Therefore, to avoid this risk, this study requires the integration of the Community of Practice Theory with some principles of Freire's Liberation Pedagogy. This implies that being in a community is to be seen as something that evolves into a liberatory praxis where learners are active subjects with agency to change the system they are in. This theoretical blending is possible because both frameworks share a common intellectual heritage connected to Marxist analytical perspectives [16], specifically those inherited from the works of Vygotsky [29]. This synthesis facilitates the creation of what can be defined as a Community of Thought [19], which shifts the focus from mere shared tasks to the critical reflection and understanding of intentions, underlying shared practices. This ensures reciprocity and dialogicity, empowering participants to intentionally transform both themselves and their social reality.

Having defined this blended framework, the issue that is hereby investigated is how teachers can integrate games into their didactics. Studies stress that for this to happen teachers need to develop a set of competencies and, especially, attitudes [23]. First and foremost, Game Literacy is required, because teachers need to understand games and need to know many games to choose from [7]. Moreover, teachers need to develop a Lusory Attitude [3][28], which means that they need to be imaginative, flexible, resourceful, resilient and reflective. Moreover, teachers need to develop a set of pedagogical, creative, technical and collaborative competencies [20]. One particularly relevant pedagogical skill, that is often lacking, because it implies a challenging task, is the aligning of game and learning goals [1]. At the same time, teachers need to adopt games as heuristic devices that foster students' co-construction, exploration, expression and sharing [25]. Thus, teachers need to design their instruction so that they get their students to inquire, communicate, co-construct knowledge and try different forms of expression that make sure the game's learning potential is brought out [14].

Mastering all these instructional design practices requires teacher training processes that are recursively situated and that guarantee that what is learnt can be contextualized in the teachers' school contexts [31]. This becomes necessary because teachers who try implementing GBL often face many different types of barriers. Therefore, GBL Professional Development (PD) needs to address these barriers, fostering teachers' understanding of how to overcome them. Moreover, to comprehend the potential practical issues that can be encountered, these PD experiences need to be hands-on and collaborative, by promoting gaming sessions, game analysis and game design alongside peer discussions [10]. Thus, these PD programmes can reinforce the potential value of games for learning, because also teachers learn by playing.

There are many different types of games that are used for GBL, both for student learning and teachers' PD. Digital games have undoubtedly become the most popular in the last 20 and more years [21], but there have been many studies looking into the use of analogue games for learning [1][23]. Among these analogue games, board games are most recurrently adopted, because they are effective for promoting the development of many cognitive, social and emotional skills. However, theatre games and role-playing games are also promoted, because they integrate narrative, collaboration, and character development into a comprehensive educational experience [5][22]. Role-playing games are used, especially for PD, because they help analyse and deal with multiple realistic workplace challenges in a compressed period [21]. More specifically, Boal's theatre games treat theatrical language as the most essential human language, that is meant to be accessible both for professional actors and "non-actors". to foster active problem solving [5]. Indeed, one of these forms of play, defined as Forum Theatre, consists in a theatrical game where a problem is staged in an unsolved form. The members in the audience, acting as "spect-actors", are invited to think of different solutions to suggest them or to stage them personally, together with the other actors, even taking the place of the protagonist, so as to enact the imagined solution. Hence, the stage functions as a rehearsal for real-life action, allowing participants to acquire knowledge and tactics to break cycles of oppression in reality, as it is advocated in Liberation Pedagogy and in the Theatre of the Oppressed [6][15].

However, it is important to remember that the great potential of these games is fostered carrying out in-between formal debriefing stages [13][22], as they allow learners to analyse and reflect on what might be latent in the game experience. Thus, they allow a transfer of skills from the "Magic Circle" of games and play to the real world.

2. Research Questions

- How can teachers involved in Professional Development overcome social and organizational barriers for Game-based Learning adoption?
- How can Theatre games allow teachers to rehearse and validate strategies to manage barriers within their school ecosystem?
- How does participating in a Ricerca-Formazione (Teacher Action Research) affect teachers' professional identity and GBL practices?

3. Methodology

Since this study adopts a Reflexive Thematic Analytical approach [9], it is necessary for myself as a researcher to clarify my background and perspective. I am a 41-year-old PhD student from the University of Milano Bicocca, carrying out research on the Professional Development of teachers who adopt GBL. I have worked for 10 years as a primary school teacher in Italy, specifically in the province of Lecco. I consider this relevant since the teachers belonging to the "Faro Didattico" community, I am doing research with, work in the same province. I also think it's important to state that I have been an active member of this and other teacher communities for the last 4 years, because of the value I give to teacher Professional Development within onsite communities. In addition, I am a man doing research quite exclusively with female teachers and I consider myself a game expert and enthusiast, which is not really typical of Italian teachers [2]. Moreover, I have adopted Game-based Learning in my teaching between 2019 and 2024, and my Master's dissertation in Primary School Education was on Game-based Learning and Game Design for primary school teaching.
This research has been conducted using a qualitative and transformative approach, which follows the Ricerca-Formazione (R-F) methodology [4]. R-F is a specific Italian research approach influenced by the international studies on Teacher Action Research [24]. This methodology posits that:

- teachers should choose to participate and be co-researchers, having well-defined and negotiated roles and goals;
- researchers and teachers should work together as a group according to their negotiated roles;
- the research needs to focus on the specificities of the contexts in which the teachers operate to define barriers and facilitating factors;
- teachers need to have a continuous discussion together with the researcher focused on didactic and school documentation that proves the actual changes happening in the school, in the teaching and in the learning;
- The research needs to have a transformative aim, specifically on how it changes students' learning, teachers' didactics and their school's culture. Thus, these processes need to be monitored ongoingly.

This R-F specifically involved a community of teachers from the Lecco province in Italy between 2024-2025. Within the context of this community, around 80 of these teachers participated in 2 preliminary Professional Development (PD) sessions to familiarize with GBL. Consequently, a restricted group of 8 of them agreed to carry out 3 further monitoring sessions to help them facilitate game integration in their didactics in their school contexts. This whole professional development initiative is then meant to proceed in 2025-26, but this contribution will only look into what happened within this PD teacher community in the first year their teachers trained on GBL.
During these training and monitoring sessions the teachers have played board games, outdoor games, role-playing games and videogames. Moreover, they modified board games [27] to make them align more with their learning goals and to make them more inclusive, according to the Universal Design for Learning principles [11].
In-between the 3 monitoring sessions the teachers were asked to try and adopt GBL in their classes and to document their experience, so as to discuss about it with the other community teachers through some focus groups. This allowed for the integration of co-constructed operative strategies to deal with their educational barriers [8]. Indeed, teachers pointed out some specific barriers and the most recurrent and challenging was the lack of cooperation of class colleagues. Therefore, on the third monitoring session, the researcher asked the teachers to stage a typical situation with class colleagues, which would show how lack of co-worker cooperation made GBL adoption difficult. In this scene one teacher was clearly in favour of GBL, while another one was clearly opposed and dismissive. The third one behaved as a bystander. In this scene the pro-GBL teacher tried to argue that it was important to use games in the classroom and that they were hoping for all the colleagues to cooperate, so that game integration could take place effectively. On the contrary, the oppositional teacher kept dismissing these

requests and the colleagues' arguments. The bystander, instead, didn't really do much, if not ask questions to understand both the other teachers' viewpoints.
Once these three teachers finished staging the scene, they had a debriefing session together with the other in-training teachers to analyse the depicted scene. They confirmed that this performance really portrayed what they live in their school contexts, as the dismissive attitude of colleagues makes it difficult to adopt GBL. Hence, they discussed how to change the script of this scene, so as to make it go in a more favourable direction for the GBL enthusiast. Among the many suggested changes, a core decision was to reframe the role of the teacher who behaves like a bystander, so as to make this role more aligned with that of the pro-GBL teacher. Thus, the 3 teachers re-enacted the scene, according to the established script changes. Although the bystander's support in the scene helped the pro-GBL teacher to make their point, the dismissive teacher only barely gave in to their requests. After this second staging took place, the teachers discussed what happened in this second performance and reflected upon the effectiveness of their script changes. Although they agreed that there was a hint of change in the dismissive teacher's attitude, they acknowledged that this was only a first step towards being fully convincing. Finally, all the 8 teachers discussed about class colleague dynamics and about the potential of using theatre games for PD and for student learning.
All the transcriptions of the focus groups, of the staged scenes and of the debriefings were then analysed using the Reflexive Thematic Analysis approach.
Specifically, this means that, as the reflexive approach suggests [9], I engaged with the data and took note of some initial insights. Then, I systematically coded all the analysed texts to identify insightful features of the data. The choice for the codes was based on the data and how I interpreted their meaning. Consequently, I developed some themes as an outcome of the coding process, ensuring that each theme had a clear central organizing concept that would be distinct from the others. Then, I shared these themes with the teachers involved in the monitoring sessions and with the people responsible for the teacher community. The idea of this involvement was to make sure that these themes made sense to them and, when necessary, I would tweak the wording, so as to make it more appropriately meaningful to them too.

4. Analysis

The analysis of all the transcripts helped define 5 themes that are hereby explained and put in order, according to how the barrier addressing should take place.
1. The GBL Innovator's Self-Work: overcoming Idealism and inexperience.
To implement GBL effectively, the proposing teacher must undergo a process of personal and professional strengthening. This involves overcoming inexperience**,** by moving past the awkwardness of being a novice, and refraining from stubbornly hoping for an ideal school, in favour of a practical and pragmatic approach. Accordingly, teachers need to demonstrate their competence, because, being secure in their GBL mastery, they can argue the pedagogical sense of their choices and counter criticisms towards GBL.
2. Understanding the Conservative Colleague's dismissive behaviour
The teacher dismissing GBL is defined as "conservative", because they are perceived as a strict figure who defends traditional pedagogy as the only "functional and right" method. The conservative approach is characterized by objectivity, obsession for testing, order and predictability and, so, it becomes a refuge of certainty against the perceived "chaos" of play. Thus, their resistance is not merely a lack of interest, but functions as an emotional shield: these teachers fear that moving away from teacher-centric models will lead to a loss of control or an unmanageable workload.
3. The need for Strategic Alliances with Bystander colleagues
Bystander colleagues behave as spectators who remain neutral, but they can actually support the game-based proposal. Thus, the proposing teacher should focus on building an alliance with the bystander, before facing the conservative colleague. When the bystander steps in as a mediator and joins the GBL enthusiast in a "united front," they can persuade together synergistically, making it much harder for the resistant colleague to ignore their point.
4. The failure of Direct Persuasion: opting for an Accommodating approach
Treating the conflict between pro-GBL and pro-traditional didactics as a "battlefield", to be won through assertive persuasion or adulation only, is not really effective, since conservative colleagues are not easily swayed by direct pressure. Instead, a more successful strategy involves "extending a hand", approaching the colleague without belittling their methods. By acknowledging the distance between their positions and avoiding force, an innovator may find a "glimmer of availability" for collaboration, although this requires time and energy on the pro-GBL teachers' behalf.

5. The Principal needs to set up teacher teams according to pedagogical affinity
There is a systemic barrier in how class teacher teams are formed, which is school principals' pairing of incompatible teachers. Those prone to experimentation are not likely to get along with those who are not. Principals don't fully realize the implications of their team-building choices, but they should actually take cultural and pedagogical teacher predisposition into account.
Thus, it is possible to define an overarching theme: *Overcoming Professional resistance requires self-competence, strategic alliances, systemic changes and extending a hand to conservative colleagues.*

5. Conclusions

This study looks into the initial stage of a Teacher Action Research (Ricerca-Formazione or R-F) conducted with a teacher professional community in northern Italy between 2024 and 2025. Specifically, the focus is on 5 sessions of this R-F, during which teachers, belonging to this specific community, participated in Professional Development (PD) to understand how to do Game-based Learning (GBL). Therefore, around 80 teachers were introduced into GBL during the first 2 sessions, while 8 of them went even further by trying teaching with this approach in their classes to then participate in 3 monitoring sessions together with the researcher. Hence, these teachers carried out many practical experiences, such as theatre games, and discussed them collectively. The analysis of the focus groups and of the words used while playing during the theatre games, shows that the effective adoption of GBL is not merely a matter of literacy, but a complex process of relational and systemic transformation within the school environment. This R-F intervention facilitated the reflexivity of teachers, transforming them into co-researchers capable of analysing the specificities and constraints of their unique school environments.
Indeed, a central contribution of this study is that it shows the potential of using one of Boal's theatrical games [5] for training, as it provides a Magic Circle for educators to enact and analyse their professional oppressions as "spect-actors".
Another key contribution is that this PD experience reinforces Yaman's GBL barrier model [31], as all the themes of the analysis fall under GBL attitude, literacy and political barriers. However, this study grounds these categories with empirical examples that are valid for this specific Italian context. In fact, the thematic analysis of all the focus groups and staged interactions clarifies that overcoming co-worker resistance requires self-competence and systemic changes in how teacher teams are built. Moreover, teachers need to build alliances with the colleagues who tend to stand by, creating a synergistic front of persuasion to face the more "conservative" co-workers. Notwithstanding, while dealing with uncollaborative colleagues, teachers should always make sure they are being accommodating rather than confrontational. Overall, through this PD experience teachers got to change from feeling powerless to being aware of the complexities of the school context. Thereby, they are now more empowered, knowing how to deal with the barriers they face.
In conclusion, this study is only an initial step of an R-F, but this methodology, together with the Reflexive Thematic Analytical approach, shows how teachers can evolve their professional identity and competencies. They can indeed become instructional designers that understand the complexity of their school ecosystems and can deal with the social and organizational barriers they face, while they try integrating games in their didactics.

Stamp-Based Gamification for Enhancing Museum Engagement and Informal Learning

Neviana Krasteva[1], Teodor Daskalov[2], Aleksey Potebnya[3]

[1,2,3]Faculty of Economics and Business Administration, Sofia University "St. Kliment Ohridski", Sofia, Bulgaria

Abstract

Museums increasingly compete for visitors' attention while pursuing educational missions that depend on sustained engagement and meaningful interaction. This paper presents a stamp-based gamification model designed to increase museum engagement, support informal learning, and encourage repeat visits. The intervention combines a physical "passport" for collecting stamps with an optional QR-supported layer that enables hybrid participation and flexible visitor routes. The model was developed through course-based projects in marketing and cultural management and informed by established gamification design principles (e.g., clear goals, feedback, autonomy-supporting choices, and meaningful rewards). Each museum implementation integrates a curated route, micro-tasks and inquiry prompts linked to exhibits, and lightweight rewards (stamp collection milestones) to stimulate exploration and reflection. The approach was piloted with small visitor groups across 15 museums in Bulgaria. Feedback was collected through a mixed-method design: (1) on-site observation and immediate debriefing, and (2) structured, on-site interviews supported by a short survey form. "Recall" was operationalized as correct responses to 2-3 post-visit questions delivered via the survey form, targeting core information from the curated route. Across pilot sites, participants reported higher satisfaction and perceived involvement than in typical unguided visits, while observational notes indicated longer dwell time around selected exhibits. Post-visit responses also suggested improved short-term recall of key content addressed by the prompts. The paper concludes with operational guidelines for low-cost deployment (station placement, flow management, staff coordination, and QR integration) and discusses transferability to other cultural institutions seeking scalable, human-centric engagement tools.

Keywords: *gamification, museum education, visitor engagement, informal learning, hybrid physical-digital experience, stamp rally*

1. Introduction

Museums increasingly operate in attention-competitive environments while maintaining educational missions that require sustained visitor engagement. Museum learning research emphasises free-choice, constructivist and contextual learning, in which visitors actively construct meaning through objects, narratives, social interaction and spatial experience [1], [2], [3]. Visitor attention is a key precondition for such learning, because exhibit information must first become detectable, valuable and worth sustained consideration [4].

Despite significant advances in digitalization, many museums continue to seek effective ways to combine physical and online interactions without relying exclusively on resource-intensive immersive technologies such as virtual or augmented reality. Recent research on immersive and hybrid museum experiences suggests that immersion can also be achieved through embodied interaction, spatial exploration and playful engagement rather than technological simulation alone [5].

This paper presents the design and descriptive pilot findings from a student course project that developed a stamp-based gamification system for Bulgarian museums. The project combines traditional tangible interaction with digital extensions, offering both a physical and an online support layer. While the project originates in an educational setting, it is analysed here through a design-based research lens, positioning student work as a testing ground for scalable, low-cost user-experience solutions in cultural institutions.

The Industry 5.0 perspective is used only as a light framing device to emphasise human-centric, non-intrusive and resource-efficient engagement design: an approach aligned with sustainable museum interventions rather than technology-intensive solutions [6], [7]. The paper contributes by proposing a low-cost stamp-based model with optional QR support, reporting a multi-site pilot across diverse Bulgarian museum types, and synthesising a transferability framework for varied institutional contexts.

2. Related Work

2.1 Gamification in Cultural and Museum Contexts

In museum learning research, visitors are not treated as passive recipients of information. They construct meaning through interaction with objects, spatial sequences, prior knowledge, social context and interpretive cues [1], [2], [3]. This supports the use of short, cue-linked prompts that guide attention without imposing a rigid didactic path. The design challenge is to scaffold observation and reflection while preserving the autonomy and open-endedness of the museum visit.
Gamification is commonly defined as the use of game design elements in non-game contexts to enhance motivation and engagement [8]. In museums and cultural heritage settings, prior reviews and design studies suggest that game-based or gamified elements can be associated with improved motivation, perceived learning and visitor engagement, although effects remain context-dependent and design-sensitive [9], [10]. Many implementations rely heavily on digital interfaces, which may introduce accessibility barriers, require maintenance capacity or distract from physical exhibits.

2.2 Stamp Rallies as a Gamification Model

Stamp rallies represent a long-standing form of collectible-based gamification, particularly visible in tourism-oriented cultural routes. Checkpoint-style missions and reward structures can shape visitor behaviour and satisfaction, while also highlighting the need to balance game tasks with the primary experience of sightseeing or cultural engagement [11]. Despite their simplicity, stamp rallies embody core gamification principles such as progression, achievement, feedback and reward [12].
The model presented here deliberately uses lightweight mechanics: a curated route, a passport, visible milestones, short prompts, immediate feedback and optional rewards. These elements are designed to support attention and movement through the museum while keeping the material collection at the centre of the experience.

2.3 Hybrid Immersion and Industry 5.0

Hybrid museum experiences combine physical and digital interaction without treating immersion as dependent on a single technology [5]. A physical passport can provide the core progression mechanism, while QR access can support navigation, additional information or follow-up content. This division keeps the main interaction embodied and object-centred, and uses digital media only where it reduces friction or increases flexibility.
Within Industry 5.0, the focus shifts toward human-centric, sustainable and resilient systems [6], [7]. From this perspective, museum immersion is a socio-technical experience shaped by interaction, context and meaning-making. A low-cost physical-digital model can therefore be more appropriate for many cultural institutions than costly immersive installations.

3. Research Design and Methodology

The study was guided by three research questions: RQ1, what engagement patterns are observed and reported during stamp-based gamified museum visits; RQ2, how the optional QR-supported layer functions within pilot implementations and what forms of friction or support are observed; and RQ3, which implementation factors enable the model to be transferable across different museum types and collection logics.
The study was conducted as a course-based design project and analysed through a design-based research lens. Student teams of four to six members developed and piloted stamp-based routes in collaboration with museum staff. The research design prioritised ecological validity in real museum settings and methodological triangulation through observation, structured on-site interviews and a short survey administered immediately after participation.

3.1 Design Process and Pilot Sites

The design process followed four iterative phases. First, teams conducted context analysis of museum mission, target audiences, exhibition themes, spatial constraints and visitor flow. Second, they selected stamp stations, defined tasks or prompts and aligned these with learning cues. Third, they developed

the physical passport, stamp logic and optional QR-supported layer. Fourth, they conducted on-site testing and rapid refinements based on visitor and staff feedback.
Quality assurance measures included a shared design rubric used across teams, covering clarity, safety, accessibility and museum fit; screening of prompts for factual accuracy by supervising instructors; and a minimum set of comparable post-visit questions used to operationalise engagement and recall across sites.

Table 1. Pilot-site categories and implementation logic.

Institutional group	Sites included	Typical route logic	Evaluation sources
Art and galleries	4 sites: National Gallery Square 500; Sofia City Art Gallery; SAMS; Vaska Emanuilova Gallery	Artwork/detail identification, interpretive prompts and stamp milestones.	Observation, interview, survey and R1 recall.
History and archaeology	4 sites: National Historical Museum; Regional History Museum Sofia; National Military History Museum; Archaeological Park Serdika	Chronological or object-based route with factual micro-quiz and identification tasks.	Observation, interview, survey and R1 recall.
Literature and house museums	2 sites: National Literary Museum; Ivan Vazov House Museum	Room-, author- and object-based narrative prompts supporting reflection and recall.	Observation, interview, survey and R1 recall.
Science and natural history	5 sites: Polytechnic Museum; Museum Earth and Man; Mineralogy Museum; Astronomical Observatory; Natural History Museum	Specimen-, concept- and observation-based tasks with optional QR support.	Observation, interview, survey and R1 recall.

3.2 Data Collection, Measures and Coding

Data collection combined three on-site sources captured immediately after the activity: structured observation of route-following and attention patterns around selected exhibits; short structured interviews; and a brief survey form containing Likert items, one open-ended item and recall questions. Observers recorded whether participants followed the curated route, completed stations and spent visibly extended time at target exhibits. Field notes documented breakdowns such as unclear station placement, crowding and spontaneous visitor comments.
The observation protocol treated dwell time as a contextual indicator rather than as a precise behavioural metric. Observers noted stops, returns, visible comparison between objects and prompts, and bottlenecks at stamp points. These notes were later interpreted only in combination with interview and survey responses, which reduced the risk of overstating observational impressions as outcome measures.
The interview protocol captured perceived engagement, clarity, perceived learning value and concrete improvement suggestions within one to two minutes. It included prompts on the clearest part of the route, places where visitors experienced friction or confusion, whether the stamps changed how they looked at the exhibits, and whether a QR-supported layer would be useful.
Recall was operationalized as correct responses to a small set of route-linked questions. R1 was recognition-based and coded correct or incorrect using a pre-specified answer key per site. R2-R3 were short-answer items coded for semantic alignment with the intended cue in the curated route; borderline cases were discussed between the lead researcher and the relevant student team.
Qualitative data from interviews and open-ended survey responses were analysed through thematic coding. The initial codebook covered engagement drivers, friction points, route clarity, perceived learning and implementation constraints, and was iteratively refined. A subset of responses was double-coded and disagreements were resolved through discussion. Likert-type items were summarised descriptively at site level and across sites, without inferential testing because pilot groups were small, heterogeneous and not randomly assigned.

Table 2. Measures and coding scheme used across pilot sites.

Construct	Instrument / item(s)	Scale / coding	Interpretation
Engagement and involvement	E1-E5 short survey	Likert 1-5	Higher scores indicate stronger self-reported engagement and intention to recommend or revisit.
Route clarity and usability	E2-E3 plus interview prompts	Likert 1-5 plus thematic codes	Used to identify spatial, linguistic and procedural friction.
Recall recognition	R1 post-visit	Correct / incorrect	Immediate recognition of a core cue from the curated route.
Recall open	R2-R3 post-visit	Semantic alignment 0/1 plus notes	Captures salient remembered content and memorable stations.

Construct	Instrument / item(s)	Scale / coding	Interpretation
Dwell-time cues	Observation notes	Contextual indicators	Triangulation only; not treated as stand-alone outcome.

3.3 Field Protocol, Participants and Ethics

To support comparability, teams followed a shared field protocol: provide the passport and a one-minute explanation at entry; allow visitors to complete the route at their own pace with minimal researcher interaction; conduct a short on-site structured interview immediately after the route; administer the short survey on a mobile device; and capture brief observation notes on dwell-time cues and bottlenecks without recording personally identifiable information.
Participants were recruited on-site using convenience sampling and voluntary opt-in. Pilot groups were small and heterogeneous, reflecting real-world museum visitation patterns such as students, families and tourists. The study involved minimal-risk, non-invasive feedback collection in public museum settings. Participants were informed about the purpose of the activity and the voluntary nature of participation, consent was obtained prior to interviews or survey completion, no sensitive personal data were collected, and responses were anonymised for analysis and reporting.

4. Analysis and Results

4.1 Implementation Vignettes

The National Gallery Square 500 case illustrates how stamp stations can be embedded into a large room-based gallery visit. The route balanced autonomy, through multiple possible pathways, with light guidance through a curated sequence of stations. Recognition tasks, short interpretive prompts and stamp milestones provided immediate feedback, while optional QR access offered route information without requiring dedicated hardware.
At the National Historical Museum, stations were aligned with a chronological narrative and key artefacts. Tasks were primarily factual and recognition-based, using micro-quiz prompts linked to exhibit labels. The design emphasised clarity and low cognitive overhead so that diverse visitor groups could follow the route with minimal staff mediation.
The National Museum of Natural History used a question-led scavenger format encouraging visitors to search for answers across halls and display cases. Stations were tied to distinctive specimens and explanatory panels, making the format suitable for families and student groups. Stamps served as progression markers, and the QR layer was reserved for follow-up information and route navigation.
The National Literary Museum case demonstrates transferability to institutions organised as networks of related sites, such as house museums. The literary passport logic supports both single-visit engagement and continuity across multiple locations by framing the experience as an ongoing collection of cultural checkpoints. Narrative prompts connected exhibits to authors, works and biographical episodes.

4.2 Cross-Site Patterns

Across the 15 pilot sites, triangulation of self-reports, interview notes and observational records suggested three recurring non-causal patterns. First, route-following appeared more consistent when stations were spatially legible and tasks were short, requiring one prompt and one action. Second, perceived engagement was higher when stamps acted as immediate feedback and milestones rather than purely decorative collectibles. Third, immediate recognition recall was strongest when prompts pointed to a single salient exhibit detail, such as a date, symbol, material or narrative cue, and the post-visit question mirrored that cue.
The mixed-method design helped distinguish enjoyment of the game mechanics from attention to museum content. Visitors commonly described the activity as guiding and making the visit purposeful, while observers recorded visible stops, returns or longer attention cues around exhibits explicitly referenced by prompts. Where QR support was used, it primarily reduced friction through navigation and optional follow-up information rather than replacing the physical route.

Table 3. Cross-site descriptive results from pilot implementations.

Site	n	Engagement M(SD)	Clarity M(SD)	R1 correct	QR used	Main friction point
National Gallery Square 500	12	4.45(.64)	4.12(.38)	58.3%	16.7%	Staff coordination for stamp availability
Sofia City Art Gallery	10	3.64(.61)	3.47(.66)	80.0%	10.0%	Station discoverability in crowded areas
Sofia Arsenal Museum (SAMS)	9	4.12(.59)	3.41(.31)	66.7%	33.3%	Station discoverability in crowded areas
Vaska Emanuilova Gallery	9	3.87(.53)	4.34(.40)	66.7%	44.4%	Staff coordination for stamp availability
National Historical Museum	8	4.11(.42)	3.48(.77)	75.0%	50.0%	Prompt clarity / language level
Regional History Museum Sofia	6	3.60(.62)	3.93(.36)	66.7%	16.7%	Queue/bottleneck at stamp point
National Military History Museum	11	3.76(.62)	3.77(.56)	72.7%	18.2%	Queue/bottleneck at stamp point
Archaeological Park Serdika	12	4.28(.73)	4.47(.60)	83.3%	16.7%	Queue/bottleneck at stamp point
National Literary Museum	12	3.55(.48)	3.87(.44)	75.0%	25.0%	Staff coordination for stamp availability
Ivan Vazov House Museum	9	4.04(.41)	4.36(.34)	77.8%	44.4%	Station discoverability in crowded areas
Polytechnic Museum (Sofia)	9	3.51(.68)	4.25(.66)	77.8%	11.1%	Staff coordination for stamp availability
Museum Earth and Man	12	3.62(.70)	4.15(.47)	58.3%	25.0%	Staff coordination for stamp availability
Mineralogy Museum	10	4.09(.46)	4.07(.49)	80.0%	50.0%	QR scanning friction: connectivity / device
Astronomical Observatory, Sofia University	10	3.74(.45)	3.45(.66)	60.0%	30.0%	Station discoverability in crowded areas
National Museum of Natural History	8	4.40(.54)	4.08(.65)	62.5%	37.5%	QR scanning friction: connectivity / device
Overall / weighted	147	3.92(.63)	3.96(.61)	70.7%	27.9%	Multiple site-specific constraints

Note. Engagement and clarity were measured on 1-5 Likert-type scales. R1 correct and QR used are reported as percentages of valid responses at each site. The overall row reports weighted descriptive summaries across the 15 pilot sites (N = 147).

4.3 Descriptive Findings and Implementation Constraints

Across the 15 pilot sites, 147 participants completed the post-visit survey. Engagement ratings were generally positive (weighted M = 3.92, SD = 0.63), while route clarity was similarly rated above the midpoint of the scale (weighted M = 3.96, SD = 0.61). Immediate recognition recall was correct in 104 of 147 valid responses (70.7%). QR access was used by 41 of 147 participants (27.9%), suggesting that QR access functioned as a supplementary layer rather than as the main driver of activity.

The most frequent implementation constraints were station placement competing with existing signage or crowding, varying staff availability for brief onboarding and uneven mobile connectivity affecting the optional QR layer. To strengthen validity, the study relied on immediate post-visit measurement, comparable core survey items across sites and triangulation of visitor accounts with observation notes. However, the evidence remains preliminary because the pilots used small groups, prioritised feasibility over experimental control and did not employ a randomised comparison condition.

4.4 Site-Level Interpretation

The art and gallery sites showed that stamp logic can work even in object-rich spaces, but only when stations are visible without competing with existing signage. National Gallery Square 500 had the highest engagement rating in this group, while Sofia City Art Gallery and SAMS revealed the importance of station discoverability in crowded areas. The results suggest that gallery implementations should prioritise visual-detail prompts that are immediately verifiable through looking at the artwork itself.

History and archaeology sites benefited from object-based or chronological route logic. The Archaeological Park Serdika case combined high route clarity with the highest recognition recall value in the pilot, which is consistent with the use of spatial wayfinding and identification tasks. In contrast, the National Historical Museum highlighted the need to calibrate prompt language, especially when factual micro-quiz items must remain accessible to mixed visitor groups.

The two literature and house-museum sites indicate that the model can support narrative routes rather than only factual identification tasks. In these settings, the passport becomes a device for connecting rooms, objects, authors, works and biographical episodes. The main implementation challenge is that narrative prompts must remain brief enough to fit the rhythm of a house-museum visit while still supporting reflection.

Science and natural-history sites showed the strongest need for balancing observation tasks with conceptual explanations. Mineralogy Museum and the National Museum of Natural History displayed relatively high QR use, but also made connectivity and device friction visible. This suggests that the QR layer should remain optional and should duplicate, rather than replace, the minimum information needed to complete the physical route.

Overall, the site-level evidence supports a conservative interpretation: the model appears feasible across different institutional logics, but its success depends less on the stamp mechanism alone and more on the alignment among station placement, prompt design, staff coordination and visitor flow.

5. Discussion

The descriptive findings suggest that stamp-based gamification can function as a low-cost hybrid museum experience in which engagement emerges from embodied interaction, narrative progression and playful discovery rather than from technology-intensive simulation. This interpretation is strongest where stations are spatially legible, prompts are directly tied to observable exhibit cues and stamps provide immediate feedback without distracting from the exhibits.

The evaluation supports design utility and transferability rather than causal inference. Pilot groups were small, self-selected and heterogeneous, and the study did not include random assignment or a controlled comparison condition. Therefore, observed engagement, recall and dwell-time patterns cannot be attributed causally to the intervention. Self-reported engagement may also reflect novelty and social desirability, while dwell-time cues are contextual proxies rather than precise behavioural measures.

Trustworthiness was strengthened through a shared field protocol, pre-specified answer keys for the recognition recall item, an explicit qualitative codebook, double-coding of a subset of responses and triangulation across surveys, structured interviews and observation notes. Student reflections were treated as contextual design evidence rather than primary outcome data, and field interactions were kept minimal to reduce expectancy effects.

Adapting the model to other museums requires sensitivity to local cultural norms, technical infrastructure, educational priorities, visitor density and staff capacity. Negative cases and boundary conditions are important. The model is likely to underperform when visitor flow is already constrained, when routes are too long relative to typical visit duration, when station placement creates queues or when staff capacity is insufficient to maintain stamp stations. For young children, a mediator such as a parent or educator may be needed to prevent the activity from becoming purely completion-oriented.

Table 4. Transferability parameters: stable and adaptable elements.

Stable parameters (should remain consistent)	Adaptable parameters (site-specific tailoring)
Curated route with limited station count; prompts tied to observable exhibit cues; milestone feedback through stamps; short post-visit reflection; non-intrusive facilitation and minimal researcher interaction.	Station count and spacing; reward framing; visual identity of passport; QR depth (none, light or rich); prompt difficulty and language; survey delivery channel; staff involvement intensity.

6. Operational Guidelines and Future Work

The pilot results point to several practical guidelines for low-cost deployment. First, station placement should be decided jointly with museum staff and tested during normal visitor flow, because a theoretically meaningful location may still fail if it is hidden, crowded or too close to existing signage. Second, the number of stations should be limited; a short route with clear prompts is more likely to support attention than a comprehensive route that attempts to cover the entire exhibition.

Third, onboarding should be brief and consistent. A one-minute explanation at entry is sufficient when the passport design makes the task sequence visible. Fourth, stamps should function as feedback and milestones rather than as a separate reward economy. The collectible element is useful when it marks progress, but it may undermine learning if visitors focus only on completion. Fifth, the QR layer should be treated as optional infrastructure. Its strongest role in the pilot was to reduce friction through navigation or follow-up information, not to replace the physical passport.

Future iterations should test streamlined routes and alternative prompt formats in high-density settings. They should also include delayed recall after 24-72 hours, stronger instrumentation of dwell time and QR interactions, and comparison conditions that distinguish the effect of the stamp route from the effects of novelty, instructor presence or museum type.

Table 5. Operational deployment guidelines.

Implementation issue	Guideline	Reason
Station placement	Place stations where they are visible but do not obstruct movement or signage.	Reduces discoverability problems and bottlenecks.
Prompt design	Use one short prompt linked to one observable exhibit cue.	Supports attention and immediate recall without cognitive overload.
Staff coordination	Assign a clear responsibility for stamp availability and visitor onboarding.	Prevents breakdowns in the physical route.
QR integration	Use QR codes for optional navigation, accessibility or follow-up content.	Prevents the digital layer from displacing object-centred engagement.
Evaluation	Collect a brief post-visit reflection and one recognition item.	Keeps assessment feasible while documenting design utility.

7. Conclusion

This study provides preliminary, design-oriented evidence that stamp-based gamification can be used as a pragmatic strategy for structuring attention, route-following and immediate reflection in museum visits. Descriptive findings from 147 post-visit surveys across 15 Bulgarian sites indicate generally positive self-reported engagement and route clarity, but the design does not allow causal inference about learning gains, dwell-time increases or repeat visitation.

The model value lies in its low-cost physical passport, optional QR support and prompts tied to observable exhibit cues. Its transferability is conditional: it is most appropriate when stations can be made spatially legible, routes remain short, staff coordination is feasible and QR use is treated as optional rather than required. Under these conditions, the approach could provide a practical basis for international collaboration and comparative research on tangible, human-centred gamification in informal learning settings.

Playful Learning as a Bridge between Coding and Mathematics in Teacher Education

Federica Pelizzari[1], Sara Bagossi[2]

[1]Università Cattolica del Sacro Cuore, Italy
[2]Free University of Bozen-Bolzano, Italy

Abstract

Recent Italian curricular guidelines emphasize an interdisciplinary approach in STEM education grounded in learning-by-doing and the use of digital and playful resources. Within these guidelines, Informatics is recognized as a conceptual core of Mathematics Education from early schooling, highlighting the need to integrate computational and mathematical thinking from the outset of teacher education. Computational thinking shares key dimensions with mathematical thinking, and Playful Learning can act as a pedagogical bridge between them, supporting disciplinary integration through engaging learning experiences. This qualitative exploratory case study, involving pre-service primary school teachers, examines collaboratively designed digital games on spatial orientation created with the Octostudio app. The instructional design included collaborative prototyping and game design integrating playful dimensions through the Playful Experiences framework. A thematic qualitative analysis of game prototypes and related activities was conducted to identify experiential profiles of designs' playful dimensions and the stimulated cognitive operations through the R-I-Z-A model. Findings suggest that designing playful activities can mediate between content knowledge and promote the development of professional competence.

1. Introduction

Computational thinking (CT) entered educational discourse with Wing's [1] seminal Communications of the ACM article and a subsequent elaboration, Wing [2] defined CT as "the thought processes involved in formulating problems and their solutions so that the solutions are represented in a form that can be effectively carried out by an information-processing agent" (p. 20). With this definition, CT is framed as a thought process, not merely as a set of coding techniques, and, more than that, as a fundamental skill for everyone — alongside reading, writing, and arithmetic — thereby grounding the K-12 educational agenda that would follow.

Subsequent scholarship has sought to operationalise Wing's broad vision through more granular taxonomies. Ng and colleagues [3], working within the Mathematics Education community, converge on a four-component characterisation that is particularly useful for primary-school contexts: problem solving, abstraction, pattern recognition, and algorithmic thinking. Hence, CT is understood as a structured form of reasoning that decomposes complex problems, recognises regularities, formulates step-by-step procedures, and evaluates outcomes systematically.

Within the Italian context, where the present study takes place, CT has entered the official educational agenda through successive policy waves. The National Guidelines for the first cycle of instruction [4] already referred implicitly to algorithmic reasoning within Mathematics. More explicitly, the STEM Guidelines [5] and the draft of the New National Guidelines for the first cycle of instruction [6] identify CT and digital literacy as transversal competences to be cultivated from early schooling, recommending playful and hands-on pedagogies. These policy documents resonate with Trinchero's influential position paper [7], which argues that the pedagogical value of CT in Italian primary education resides not in coding per se, but in the opportunity to make children's reasoning processes visible and discussable through the algorithmic activities.

All these institutional changes have brought to the fore the need to prepare primary school teachers to face the newly arisen challenges. And this preparation should start from their academic journey.

The present study aims not only to address emerging future teachers' needs, but also investigates how playful coding activities could be a suitable conceptual space to integrate Mathematics and computational thinking. Participants in this exploratory case study design digital games for primary

school kids using the Octostudio app. While future teachers engage in such design processes, they strengthen their knowledge of disciplinary aspects and reflect on meaningful ways to integrate play, Mathematics, and Informatics into classroom activities. Given the small number of participants, the short duration of the activity, and the focus on three collaboratively developed prototypes, the study should be understood as an exploratory case study. Its aim is not to generalize outcomes to pre-service teacher education as a whole, but to examine how a specific pedagogical design can make visible possible connections between playful learning, computational thinking, and mathematical reasoning.

2. Theoretical Framework

2.1 Playful Learning as a Pedagogical Framing

Playful Learning, which — building on a long tradition of play scholarship from Piaget [8] and Vygotsky [9] through Sutton-Smith [10] — has received a robust contemporary articulation in the influential theoretical piece by Zosh et al. [11]. Zosh and colleagues propose a conceptualisation of play as a spectrum. Guided play has been proven as a uniquely productive configuration for domains — such as spatial thinking — that require both exploratory freedom and conceptual targeting. The theoretical rationale of guided play rests on the "science of learning" pillars [12]: learning is optimised when experiences are active (minds-on), engaging (without being distracting), meaningful, socially interactive, and iterative. Play, when scaffolded appropriately, is a unique cultural form in which these five conditions co-occur naturally.

Within the broader literature on Playful Learning, a growing body of research focuses specifically on the affordances of play and game-based design for STEM education [13]. The argument is twofold. Empirically, STEM content — particularly spatial and algorithmic reasoning — lends itself naturally to enactive, exploratory learning configurations that playful settings support. Theoretically, play establishes the psychological protective frame [14] that allows learners to engage with cognitive risk — to try a solution, fail, iterate — without the affective cost that such failure carries in conventional assessment-oriented settings. For coding in particular, where debugging - recognizing and fixing errors - is a constitutive practice, the protective frame of play transforms errors from stigmatising events into productive resources [15].

Pelizzari [16] articulates a complementary argument within the Italian educational context: playful learning, videogames, and gamification provide pedagogical configurations in which disciplinary content, active methodologies, and affective engagement mutually reinforce one another. For teacher education specifically, Pelizzari argues, engaging pre-service teachers as designers of playful learning experiences — rather than merely as consumers of them — is a privileged route for the development of the pedagogical reflexivity that distinguishes reflective from technical practitioners.

This design-oriented stance resonates with the constructionist tradition inaugurated by Papert [17] and extended by Kafai and Resnick [18], according to which learners construct knowledge most powerfully when they are concurrently engaged in the construction of external, shareable game prototypes. In such a perspective, the prototype is not an outcome but a medium of thought, and its design-oriented manipulation is constitutive of learning itself. For pre-service teachers, this means that designing a game is a learning process — not merely a rehearsal for future teaching.

2.2 Analytical Frameworks: PLEX AND R-I-Z-A

In this study, we adopt two analytical frameworks through which playful experiences and cognitive operations involved in game prototypes will be systematically described: the Playful Experiences (PLEX) framework and the R-I-Z-A model. The choice of these two frameworks is motivated by three considerations. First, both frameworks are designed to capture observable features of learning activity, making them suitable for the thematic analysis of designed digital games that constitute the methodological core of this study. Second, both are decomposable into fine-grained descriptors, which afford sub-categorical analysis. Third, and most importantly, the two frameworks originate in distinct research traditions (experience design and cognitive pedagogy, respectively) and cover non-redundant dimensions (what is experienced and what is done cognitively).

The PLEX framework was initially developed by Korhonen et al. [19] building on a pre-existing pleasure framework for interactive art. Korhonen and colleagues re-grounded the framework on a wider theoretical base encompassing work on pleasurable experiences, game experiences, emotions, elements of play, and the reasons why people play. The revised framework includes 22 experience

categories — ranging from Captivation, Challenge, and Completion to Fellowship, Sensation, Fantasy, and Subversion — designed to capture the diversity of playful experiences that interactive products can elicit. In a given interaction, multiple PLEX categories can co-activate, and the presence or absence of one category can reinforce or weaken the others. Moreover, PLEX is proposed not as a fixed checklist but as a scaffold for discussion and ideation, a position that justifies the adaptive, domain-sensitive selection of six categories — Sensation, Competition, Discovery, Fellowship, Exploration/Experimentation, Fantasy/Narrative — that we adopt for the analysis of primary-school educational games. Although PLEX was originally developed for user experience evaluation, it has been successfully mobilised in design-oriented activities [20] [21]. In teacher education, this design-oriented use is especially relevant: it provides pre-service teachers with a lexicon for articulating the playful qualities they intend to foreground in their digital games, thereby transforming play from a vague motivational attribute into a multi-dimensional, discussable property of the design.

The R-I-Z-A model, developed by Trinchero [7] [22] within the Italian pedagogical tradition of authentic assessment and competence-based education, offers a taxonomy of cognitive operations observable in school learning activities. The acronym, taken from Italian, refers to four nested families of operations: Risorse (Resources, R), Interpretazione (Interpretation, I), aZione (Action, Z), and Autoregolazione (Self-regulation, A). The Resources family (R) includes basic cognitive operations that allow learners to activate and mobilise prior knowledge and to process perceptual input. These operations concern the identification and organisation of relevant elements in a task. They include processes such as recognising, identifying, locating, and selecting. The Interpretation family (I) includes operations aimed at constructing meaning and understanding relationships between elements. These involve analysing information, comparing elements, inferring implicit meanings, and explaining connections within a given context. The Action family (Z) includes active and productive operations through which learners apply knowledge and strategies to perform a task. These include executing, planning, constructing, describing, and classifying. The Self-regulation family (A) includes metacognitive operations that enable learners to monitor, evaluate, and regulate their own learning processes. These include arguing, justifying, motivating, criticising, and finding errors in one's own work.

Trinchero [22] has explicitly mobilised the R-I-Z-A model in relation to computational thinking, arguing that CT-oriented activities offer privileged occasions for the observation of all four families of cognitive operations, provided that the activities are structured so as to render the children's reasoning processes publicly available for discussion.

3. Method

To fulfill the stated research aim, we conducted an exploratory qualitative case study in a Primary Education course in Italy. Participants were eight students, pre-service primary school teachers, in their third year of study. Participants worked collaboratively, split into three groups (G1, G2, G3). They had former experience with designing digital games, offered within the course itself, but they had no prior experience with computational thinking or Octostudio. Octostudio is a free mobile coding app developed by MIT Media Lab [23]. Available on smartphones and tablets, it allows users to create games or other interactive projects. Users are first invited to select a sprite and a background, then directed to the main app interface. The upper part shows the game's backdrop and the sprites involved, the central part is a clean area for block-based coding, and the lower part contains all available blocks, grouped into seven distinct categories, each distinguishable by color. These categories are: starting blocks, motion, words and sounds, scenes, colors and lights, control, and others. Some of these blocks are particularly suitable for integrating playful dimensions into the games. Moreover, created projects can be easily shared and opened by others in the Octostudio app. All these features led us to identify Octostudio as a suitable app for developing playful digital games, compared to other well-known apps such as Scratch. Blocks use an accessible language and rely on intuitive icons. The block shape allows for an easy identification of main, secondary, and intermediate blocks, which can be combined to create instruction sequences.

Prior to the beginning of the classroom activities, participants were administered a short questionnaire, filled in individually, to collect information on their prior knowledge. From their answers, we know that six of them had heard of computational thinking before the experiment, whilst all of them had already heard of coding. Three of them stated they knew what coding is, even though only one out of the three had already practiced it.

The classroom activity lasted in total 2.5 hours. Students were introduced to computational thinking, the selected dimensions of PLEX, and Octostudio. Then the collaborative design phase took place. Students worked all with the same backdrop, depicting a crossroads with a lake in the bottom left corner. Students were requested not only to design a digital game but also to include it within a short educational activity.

They were supported in this task by a structured template designed by the researchers themselves, which already provided students with learning objectives from National Guidelines for Mathematics [4] and from the draft of the New National Guidelines [6] for Informatics. These objectives can be formulated as summarized in Table 1, where they are already connected to the cognitive operations outlined in the R-I-Z-A framework.

Table 1. Summary of Mathematics and Informatics objectives of the Italian curriculum connected to R-I-Z-A operations

Math objectives	R-I-Z-A operation	Info objectives	R-I-Z-A operation
Communicate objects position in space	Recognizing and arguing	Examine and interpret simple algorithms	Analyzing
Execute a simple path	Executing	Explain an algorithm and its result	Analyzing
Describe a path or give instructions to someone to follow a path	Arguing and planning	Write an algorithm and translate it into code	Planning and constructing

Students were invited to select their objectives among the listed ones. These prescriptive choices were intended to direct students' efforts towards relevant, playful, and educational elements of the activity. The main interface of the three prototypes is shown in Figure 1. The game design phase was followed by peer feedback: students exchanged their prototype with another group, and they were requested to provide feedback on the other group's game again using the structured template. The activity was concluded by a classroom discussion led by the two researchers.

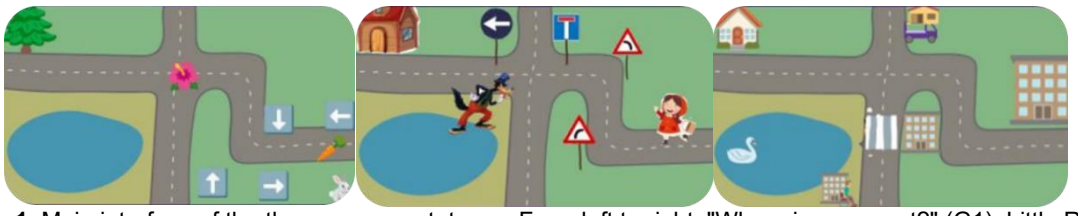

Fig. 1. Main interface of the three game prototypes. From left to right: "Where is my carrot?" (G1), Little Red Riding Hood (G2), and Let's go to school (G3).

Data collected throughout the activity include pre-questionnaire responses, Octostudio game prototypes, and templates for the playful activity (with game design activity and peer feedback). The research questions we aim to answer are:

1. How can playful coding foster both CT and mathematical reasoning?
2. Which PLEX dimensions and R-I-Z-A operations are most evident in student-designed games?

The qualitative analysis of the collected data was conducted following the six-phase procedure of Braun and Clarke [24]. An inductive categorization of the three prototypes and templates led to the identification of the predominant PLEX dimensions and so to the definition of the experiential prototype profiles. A deductive coding of the R-I-Z-A operations was conducted by triangulating data across design templates, prototypes, and peer evaluations. Finally, the emerging PLEX dimensions salient in the prototypes were associated with a set of typically co-activated R-I-Z-A operations in an integrated map. The qualitative analysis was initially conducted by the first author, who coded the prototypes, design templates, and peer feedback by identifying the predominant PLEX dimensions and the corresponding R-I-Z-A operations. The second author then reviewed the coding scheme, the attribution of categories, and the interpretation of the evidence across the three prototypes. Validation was therefore carried out as an iterative peer-debriefing process rather than as an independent statistical reliability procedure. Disagreements mainly concerned the explicit connection between some R-I-Z-A operations and the disciplinary learning objectives, especially when the operation was only implicitly embedded in the prototype. These cases were discussed jointly by the two authors, returning to the original templates and prototypes, until a shared interpretation was reached. When an operation could not be sufficiently supported by the available data, the coding was revised or its intensity level was reduced.

4. Results

The thematic analysis of the collected data produced a double-layered account of pre-service teachers' design activity: (i) the experiential layer of the playful encounters envisaged by the designers, described through the PLEX framework; and (ii) the cognitive layer, classified according to the R-I-Z-A model, which captures the interpretive, action-oriented, and self-regulatory operations that each prototype is designed to make potentially observable during gameplay. Such operations refer to those aspects that children-users might engage with while playing with the prototypes and are explicitly connected to disciplinary aspects.

4.1 Experiential Profiles of the Three Prototypes through PLEX

The three developed game prototypes, all targeted at the learning objectives related to spatial orientation, path description, and execution of simple algorithms. An inductive categorisation — developed through constant comparison across digital prototypes and templates — produced the following PLEX classification, which will serve as the interpretive backbone of the subsequent analysis:

G1 – "Where is my carrot?" is an execution-oriented game. Players guide a rabbit sprite toward a carrot target through directional commands issued under time pressure, with scoring based on execution speed. Mathematics is mobilised in its elementary topological dichotomies (left/right, up/down); computational thinking appears as the execution of short command sequences with immediate feedback (sounds, applause, score increments).

G2 – "Little Red Riding Hood" is a narrative-oriented game. The fairy-tale frame provides a pretext for introducing street signs that function as symbolic constraints on the path: planning the block sequence requires children to interpret conventional signs and translate them into actions executable in Octostudio. Mathematics enters here as symbolically mediated spatial relations, while CT manifests as pre-execution planning and instruction-to-block translation.

G3 – "Let's go to school" is the most explicitly collaboration-oriented prototype. The game simulates the home-to-school bus route and introduces two complementary roles: the navigator, who plans and describes the route verbally, and the driver, who executes the received instructions. This game architecture enforces the decoupling of algorithm design from its execution, rendering the computational process socially distributed and thus observable in its verbalisation.

This inductive categorisation reveals that although the groups started from the same input, the resulting prototypes diverged considerably. Rather than covering all PLEX dimensions, the three groups charted complementary design trajectories, each covering specific PLEX dimensions. This distributional complementarity has pedagogical implications: rather than searching for a single "best" playful design, teacher education may benefit from exposing pre-service teachers to a palette of playful configurations, each carrying a distinct experiential and — as the next section shows — cognitive signature.

4.2 The Activated Cognitive Operations through R-I-Z-A

The R-I-Z-A coding of cognitive operations yielded the synoptic matrix presented in Table 2. Qualitative recurrence is expressed through three intensity levels (✓ present but limited; ✓✓ moderate/recurrent; ✓✓✓ very frequent/central to the game).

Table 2. Summary of R-I-Z-A operations in the three games with associated intensity levels

R-I-Z-A Descriptor	G1 – Carrot	G2 – Little Red Riding Hood	G3 – School
Recognizing (R – Risorse)	✓ arrows as directions	✓ road signs	✓ school as target
Locating (R – Risorse)	✓✓ positions on the grid using arrows (start/goal)	✓ obstacles and path segments along the route	✓✓ positions and paths in realistic routes
Identifying (R – Risorse)	✓ carrot as target	✓✓ signs as constraints	✓ stops along the journey

Analyzing (I – Interpretazione)	✓ post-game discussion	✓✓ detecting errors with signs	✓✓ cooperative debugging
Arguing (I – Interpretazione)	✓ guided reflection	✓ explaining the signs	✓✓✓ verbalizing the route
Justifying (I – Interpretazione)	✓ "why right?"	✓ route-sign coherence	✓✓ discussed corrections
Executing (Z – Azione)	✓✓ use of arrows to define path	✓ blocks as short sequences	✓✓ driving the bus
Planning (Z – Azione)	✓ trial-and-error actions	✓✓ block sequences	✓✓✓ the path to school
Constructing (Z – Azione)	✓ (limited strategies)	✓ creative use of blocks	✓✓ overcoming obstacles
Finding errors (debugging) (A – Autoregolazione)	✓ wrong arrows	✓✓ incorrect use of signs	✓✓ cooperative correction
Motivating (A – Autoregolazione)	barely evident	✓ goals made explicit	✓✓ navigator motivates choices

Table 2 reveals three distinct patterns, each convergent with the corresponding PLEX profile. G1 concentrates strongly on the Locating/Executing axis, i.e. on the procedural-perceptual side of the R-I-Z-A model, with weak activation of self-regulatory structures. G2 redistributes the cognitive centre of gravity onto the Identifying/Planning/Analysing axis: the street signs, as symbolic constraints, require preliminary interpretive work (recognising the symbol as a sign, identifying its rules of use) and sequential planning (ordering the blocks consistently with the constraints). G3 is the only prototype that reaches the ✓✓✓ threshold in two operations (Planning and Arguing), distributed across distinct cognitive structures (Z and A). The navigator role, obliged to verbalise the route in a form that is publicly justifiable to the driver, transforms argumentation from an optional post-hoc activity into a structural device of the gameplay itself.

These patterns empirically substantiate the hypothesis that the ludic architecture of a prototype is not neutral with respect to the repertoire of cognitive operations it makes available — it shapes it in depth [22]. Choosing among an execution-oriented, narrative-oriented, or collaboration-oriented experience determines which R-I-Z-A descriptors find a natural habitat in the game and which remain latent or must be elicited by the teacher's external intervention. This finding has direct consequences for the main claim of the paper: if Playful Learning is to function as a bridge between coding and Mathematics, then the kind of bridge built depends critically on the kind of playful architecture chosen.

4.3 The Integrated PLEX × R-I-Z-A map

The analytical core of this study lies in the systematic mapping of correspondences between experiential dimensions (PLEX) and cognitive operations (R-I-Z-A). Table 3 presents the integrated map, associating each PLEX dimension salient in the prototypes with a set of typically co-activated R-I-Z-A operations, illustrated with concrete examples drawn from the three games.

Table 3. PLEX × R-I-Z-A map

PLEX Dimension	Associated R-I-Z-A Operations	Examples from the Games
Competition	Executing (rapid procedures); Finding errors (quick debug); Calculating (score, moves)	G1: rabbit reaches carrot under time pressure with score; children quickly correct wrong moves.

Sensation	Recognizing (visual/auditory stimuli); Locating (targets in space); Describing (what happened)	G1: applause and the words “right/left” as immediate reinforcement; G3: bus and school graphics to be identified.
Discovery	Identifying (new elements/routes); Hypothesizing (alternative solutions); Constructing (different strategies)	G2: exploration crossroads backdrop and the use of road signs; children try alternative solutions.
Fellowship	Arguing (explaining choices); Justifying (decisions); Organizing (roles and strategies); Planning (sequences together)	G3: the navigator justifies instructions to the pilot; pairs discuss strategies engaging in metacognitive reflection.
Exploration/Experimentation	Analyzing (errors, difficulties); Designing (new procedures); Finding errors (cooperative debugging)	G2: children test sequences of blocks and correct them; G3: if a wrong road is taken, children try another sequence.
Fantasy/Narrative	Describing (stories/routes); Representing graphically (maps); Explaining (causal chains)	G2: children narrate the route; G3: children narrate the journey to school.

The integrated map reveals a non-arbitrary, theoretically motivated correspondence between the two frameworks. PLEX dimensions with a strong competitive/sensory component (Competition, Sensation) tend to co-activate operations from the interpretation (I) and action (Z) structures of R-I-Z-A model, especially in procedural form. Dimensions with a strong social and reflective component (Fellowship, Exploration) predominantly mobilise self-regulation (A) operations — those that require verbalisation, justification, and public defence of one's own choices. Narrative and discovery dimensions (Fantasy/Narrative, Discovery) instead bind to operations of construction and hypothesis-formation, positioning themselves in an intermediate zone where mental representation (describing, hypothesising) precedes and informs action (planning, ideating).
A theoretically central implication follows: designing an educational game in PLEX terms is not an isolated aesthetic or motivational choice, but a curricular decision that predetermines the class of cognitive operations the children will be invited to exercise. Choosing to foreground Fellowship in the design necessarily entails a high probability of activating A operations (arguing, justifying); choosing to foreground Competition entails instead a high probability of activating Z operations in rapid, executive form. The two configurations are not hierarchically ordered but functionally distinct, and they require the teacher-designer to make an informed, intentional choice about the cognitive profile the game is meant to promote. In this sense, the integrated PLEX × R-I-Z-A map operationalises the very "bridge" announced in the paper's title: Playful Learning connects coding and Mathematics not generically, but through specific experiential-cognitive pathways that can be consciously selected and designed.

5. Discussion

The first substantive finding of this study concerns the nature of the relationship between computational and mathematical thinking in the three prototypes. Despite their divergent ludic architectures, the three groups converged on the directions/paths binomial as the conceptual bridge between the two disciplinary domains. This convergence is not accidental: it supports the thesis that computational thinking acts as a boundary object between Mathematics and Informatics [3], with algorithmic thinking functioning as a catalyst for the integration of the two fields. In the created prototypes, the sequential motion of a sprite in space constitutes simultaneously mathematical practice (coordinates, directions) and computational practice (sequence, iteration). The three prototypes differ, however, in the degree of algorithmic explicitness they require of the child. In G1 the algorithm is implicit and instantaneous: children act on the arrows in real time without having to formalise a sequence in advance. In G2 the algorithm becomes semi-explicit: the Octostudio blocks are assembled before execution and can be inspected and modified, but the planning process is individual or tacitly shared within the group. In G3 the algorithm reaches maximum explicitness through the forced verbalisation imposed on the navigator: the sequence must be said aloud, received, understood, and executed by another agent. This gradient demonstrates that the social architecture of the game — rather than the technological features of the platform — determines the level of formalisation and therefore the epistemic quality of the computational thinking activated [11].

The role of Octostudio should therefore be interpreted carefully. Some findings are mainly related to the affordances of the tool: the block-based interface supported the construction of visible instruction sequences; the possibility of combining sprites, backgrounds, sounds, and movement blocks facilitated immediate feedback and sensory engagement; and the mobile format made rapid prototyping accessible within a short classroom activity. However, other findings depend on the pedagogical design of the task. In particular, the collaborative organisation of the groups, the use of a common spatial backdrop, the requirement to connect the game to curriculum objectives, the structured design template, and the peer-feedback phase shaped the experiential and cognitive profile of the prototypes. Thus, Octostudio functioned as an enabling environment for playful coding, but the observed connections between PLEX dimensions and R-I-Z-A operations emerged from the interaction between the tool's affordances and the instructional design.

On the mathematical side, a parallel enrichment is observed: from elementary topology (G1: right/left as binary oppositions) to spatial symbolism (G2: signs as conventional marks that reorganise space) and finally to everyday geography (G3: real paths, relations between familiar places). This spectrum closely mirrors the Italian curricular guidelines in which primary-school mathematics is reframed as a tool for reading everyday experience rather than as an abstract discipline [4] [5] [6]. Playful Learning, when articulated through carefully designed prototypes such as those analysed here, provides a concrete pedagogical mechanism through which this reframing can be operationalised in teacher education [16].

A second theoretically salient finding concerns the trade-off observed between immediate engagement and cooperative depth. G1 maximises sensory-competitive engagement but sacrifices collaboration; G3 maximises cooperation but pays a cost in experiential fluency; G2 sits in an intermediate position, with both dimensions underdeveloped. This triangulation echoes Lazzaro's [25] distinction between hard fun, easy fun and people fun, suggesting that a single game rarely optimises all types of ludic pleasure simultaneously. The trade-off has important didactic implications. If the predominant formative goal is the automation of simple mathematical-spatial procedures (rapid recognition of directions, consolidation of coordinates), an execution-oriented design in the G1 style is not only acceptable but functionally appropriate: competitive reinforcement sustains the repeated practice that automation requires. Conversely, if the goal is the development of metacognitive and argumentative competences, a collaboration-oriented design in the G3 style — even if technically less polished — turns out to be cognitively richer. The design choice is therefore not between a "better" and a "worse" prototype in absolute terms, but between distinct and potentially complementary learning profiles within the broader curricular economy. Notably, the peer evaluation exchanged among groups surfaced this complementarity even in the absence of an explicit theoretical scheme. Peers asked G1 to increase its cooperative component, G2 to strengthen children's agency, and G3 to improve perceptual clarity: each group, in other words, implicitly invited the others to fill their least developed PLEX dimension. This suggests that the PLEX space functions as a shared coordinate system even among designers who have not been formally trained on the framework — an encouraging finding for the pedagogical scalability of the approach in teacher education programmes.

Finally, we acknowledge the exploratory and context-specific nature of our findings. Our research focus is on designing digital games and its potential as learning process. The study does not aim to measure long-term effects on pre-service teachers' professional competence, nor does it test the designed prototypes with primary school children. These limitations of the current study could become valuable future research directions.

5.1 Limitations and Future Research

Several limitations should be acknowledged. First, the study involved a small group of eight pre-service primary school teachers and was conducted within a single teacher education course. The findings are therefore exploratory and context-specific and cannot be interpreted as generalizable evidence of the impact of playful coding activities on teacher education.

Second, the activity lasted 2.5 hours and resulted in three initial game prototypes. Consequently, the study documents an early design experience rather than a complete process of professional competence development. It does not measure long-term changes in pre-service teachers' pedagogical knowledge, mathematical knowledge, computational thinking, or professional identity.

Third, the prototypes were analysed as designed learning artefacts and were not tested with primary school children. For this reason, the R-I-Z-A operations identified in the analysis should be understood as potential or designed-for cognitive operations, rather than as empirically observed learning processes enacted by children during gameplay.

Fourth, the analysis relied on prototypes, design templates, peer feedback, and classroom discussion. Although these data sources allowed triangulation across different traces of the activity, future studies could include video observations, interviews, longitudinal follow-up, and classroom implementation with children in order to examine how the designed experiential-cognitive pathways are actually enacted in educational practice.
Future research should therefore extend the study in two directions: by following pre-service teachers over a longer period to examine whether and how playful coding design contributes to professional competence development, and by testing the prototypes with primary school children to investigate their actual effects on mathematical reasoning, computational thinking, collaboration, and self-regulation.

6. Conclusions

The most original contribution of this study, in our view, lies in the combined use of two frameworks that — although rooted in distinct research traditions (PLEX in user experience research; R-I-Z-A in the Italian pedagogical tradition of authentic assessment) — exhibit significant complementarities. PLEX provides a rich vocabulary to describe what happens at the experiential level during playful interaction; R-I-Z-A provides an equally rich vocabulary for describing which cognitive operations that interaction activates. Their combination affords a two-dimensional analysis that neither framework, taken alone, makes possible. Such combination operates in both directions: as a tool of ex post evaluation (question: "given a game and its experience, which cognitive operations are actually activated?") and as a tool of ex ante design (question: "if we want to activate specific cognitive operations, which experiential configurations should we design?"). In the latter sense, Table 3 can be read as a first nucleus of design patterns in the spirit of Arrasvuori et al. [26]: a grammar of correspondences that helps the designer navigate the decision space more consciously. Even teacher educators might benefit from using the PLEX × R-I-Z-A map when designing or evaluating similar activities in future courses.
More concretely, teacher educators could use the PLEX × R-I-Z-A map in three complementary ways. First, before the design activity, the map can function as a planning tool: educators may ask pre-service teachers to identify which cognitive operations they want children to activate and then select the PLEX dimensions most coherent with those operations. For example, if the goal is to promote argumentation and justification, Fellowship and collaborative game mechanics may be prioritised; if the goal is to consolidate rapid execution of spatial procedures, Competition and Sensation may be more appropriate. Second, during the design activity, the map can support formative feedback by helping pre-service teachers revise their prototypes in relation to the intended experiential and cognitive profile. Third, after the activity, it can be used as a peer-evaluation grid, enabling pre-service teachers to discuss not only whether a game is engaging but also which forms of mathematical and computational reasoning it makes possible.
For initial teacher education, this dual lens offers reflections on what a "cognitively deep game" should be, provides criteria for peer evaluation among pre-service teachers, and enables targeted design iteration: peer feedback can be translated into specific modifications of ludic components. These advantages together support the professional development trajectory foregrounded in the rationale of the study: from Playful Learning as a pedagogical framing, through coding-mathematics integration as a disciplinary bridge, to reflective design practice as a professional competence.

Abstract

Vocational Electronics education increasingly requires pedagogical approaches capable of connecting conceptual understanding, practical reasoning, and learner engagement. However, teaching practices in this field often remain centred on transmissive models that insufficiently reflect students' digital cultures, collaborative ways of learning, and the applied nature of vocational education. This study examines the pedagogical potential of a hybrid Educational Escape Room designed to support the learning of number systems, logic gates, and digital circuits among tenth-grade vocational students. Grounded in game-based and active learning principles, the intervention combined digital tasks, physical clues, collaborative challenges, and a culturally situated narrative inspired by Guimarães Castle and the historical figure of Mumadona Dias. The study adopted a mixed-methods design, integrating quantitative evidence on academic performance and usability with qualitative data on students' perceptions, motivation, collaboration, and learning experience. The design was informed by prior research on educational escape rooms as structured game-based learning environments and by evidence suggesting that escape-room activities can enhance motivation and learning in computing and technical domains. Results indicate gains in academic performance and high perceived usability, alongside strong student reports of engagement, collaborative participation, and consolidation of core concepts in digital electronics. Qualitative findings suggest that the hybrid format, narrative framing, time-bound challenges, and puzzle progression helped students attribute meaning to abstract technical content while developing transversal skills such as communication, teamwork, and problem-solving. The study contributes to current debates on innovation in vocational education by showing how hybrid Educational Escape Rooms can support more active, situated, and collaborative forms of electronics learning when carefully aligned with curricular objectives, usability principles, and opportunities for conceptual consolidation.

Keywords: *Educational Escape Rooms; Hybrid Learning Environments; Gamification; Vocational Electronics Education; Game-Based Learning.*

1. Introduction

Vocational education occupies an increasingly strategic position within contemporary educational systems, particularly in technologically intensive fields such as Electronics. As digital infrastructures, automation systems, and embedded technologies continue to evolve, so too must the pedagogical approaches through which foundational concepts—including number systems, Boolean logic, and digital circuits—are taught. Yet instruction in many vocational classrooms remains predominantly expository, privileging transmission over participation and procedural replication over conceptual understanding.

Within Portuguese vocational education, these challenges are intensified by the distinctive profile of learners, who often respond more productively to practical, contextualised, and action-oriented pedagogies. The resulting tension between traditional pedagogical models and digitally mediated learning cultures calls for structured, theoretically grounded innovation rather than ad hoc technological adoption.

Despite growing interest in Educational Escape Rooms, existing research has predominantly focused on general education contexts, with limited attention to vocational STEM domains. Furthermore, few

studies have systematically examined hybrid configurations combining physical and digital components, particularly in relation to conceptual learning rather than engagement alone.
Educational Escape Rooms (EERs) have emerged as a promising response to this challenge. By integrating game-based learning, collaborative problem-solving, narrative immersion, and technological mediation, EERs have the potential to transform abstract technical content into situated and meaningful learning experiences. A hybrid EER extends this format by combining digital and physical elements within a coherent learning design, such that online interaction, material artefacts, and embodied action work together in support of intended educational outcomes.
This study addresses these gaps through the design, development, implementation, and evaluation of a hybrid EER for tenth-grade students enrolled in vocational Electronics, focused on number systems, logic gates, and digital circuits, and embedded within a historical-cultural narrative inspired by the Castle of Guimarães and the figure of Mumadona Dias. In doing so, it advances both empirical and design-based knowledge on the pedagogical use of hybrid Educational Escape Rooms in vocational STEM education. The study was guided by four research questions: (RQ1) How can core Digital Electronics concepts be epistemically and pedagogically structured within a hybrid EER? (RQ2) What design issues emerge during expert review? (RQ3) To what extent does the resource demonstrate usability and pedagogical viability for classroom integration? (RQ4) How do students experience the hybrid EER in terms of engagement, collaboration, and perceived conceptual understanding?

2. Literature Review

2.1 Vocational Electronics as a Pedagogical Design Challenge

Vocational education is frequently defined by an imperative to connect theoretical knowledge with situated practice, developing both technical and transversal competences for employability [1]. However, classroom practices often remain predominantly transmissive, with limited scope for learner participation and meaning-making [3]. These conditions can be especially detrimental in abstract technical domains such as number systems, Boolean logic, and digital circuits, where conceptual learning requires sustained engagement and iterative reasoning.
The study is informed by three complementary perspectives. First, game-based learning (GBL) provides the basis for examining how challenge, feedback, progression, and narrative can be aligned with curricular goals. Secondly, self-determination theory offers a lens for understanding how the intervention may support autonomy, competence, and relatedness [15]. Thirdly, sociocultural perspectives on learning foreground the collaborative and dialogic character of problem-solving. However, there remains a lack of pedagogical models that effectively translate these theoretical principles into structured learning designs within vocational Electronics.

2.2 Educational Escape Rooms as Hybrid Epistemic Environments

EERs can be interpreted as a designed sequence of interdependent problems requiring learners to mobilise concepts, test hypotheses, and coordinate actions under constraints. In STEM education, EERs are frequently reported to increase involvement and active participation by embedding curricular tasks within time-bound collaborative missions [12]. The conceptual value of EERs depends on whether puzzles are epistemically aligned with disciplinary structures rather than merely entertaining.
Contemporary EERs have evolved from logic-only puzzle rooms to more immersive and technologically mediated experiences, including hybrid and virtual formats. Platforms such as Genially are often highlighted for rapid development of narrative pathways and multimedia interactivity [19], while physical components afford embodied interaction that anchors abstract reasoning in observable phenomena.
Despite these potentialities, EER design involves risks including cognitive overload, time-pressure effects, and inequitable participation [7]. Effective EER design must therefore balance challenge with cognitive accessibility, ensuring that all learners can engage meaningfully and equitably. Nevertheless, much of the literature treats EERs primarily as engagement-enhancing tools, with limited attention to their epistemic design and alignment with disciplinary knowledge structures.
This study addresses these gaps through the design: (i) limited research in vocational STEM contexts; (ii) insufficient focus on hybrid physical-digital escape room designs; and (iii) a lack of empirical evidence linking EERs to conceptual understanding rather than engagement alone. To address these gaps, the present study adopts a design-based and mixed-methods approach

3. Method

3.1 Design and Procedure

This study employed a development-oriented research design [18] to design, refine, and evaluate a hybrid EER for vocational Electronics. The study adopts a design-based research (DBR) orientation, combined with a quasi-experimental comparison to examine both design validity and learning outcomes. The development cycle comprised: (i) prototype conception aligned with curricular outcomes; (ii) expert review and iterative refinement; (iii) usability evaluation; (iv) implementation in an authentic classroom setting; and (v) impact analysis.
The intervention followed a standardised sequence comprising briefing, mission completion, and structured debriefing. Students worked in small teams of three to four for approximately 90 minutes. The teacher assumed the role of facilitator, providing support only when necessary. A mixed-methods case-study approach with a quasi-experimental non-equivalent groups design was adopted, comparing a pilot class exposed to the EER with a control class receiving conventional instruction.

3.2 Participants and Context

The study was conducted at a secondary school within regular vocational education provision. Two 10th-grade vocational classes participated: a pilot group from the Professional Course in Computer Systems Management and Programming Technician (n = 14) and a control group from the Professional Course in Electronics, Automation and Computers Technician (n = 9), yielding a total of N = 23 participants aged 14–17 years. All participants were male, reflecting the demographic composition typical of the participating vocational programmes. The all-male composition of the sample reflects programme demographics and is acknowledged as a limitation regarding generalisability.

3.3 Instruments

Data were collected using a set of complementary instruments. A motivation questionnaire adapted from the Science Motivation Questionnaire II (SMQII) [10] assessed baseline motivational dispositions. Pre-test and post-test knowledge assessments enabled estimation of short-term learning gains. System usability was assessed through the System Usability Scale (SUS) [6]. A structured observation protocol recorded indicators of engagement, collaboration, and problem-solving. A feedback questionnaire and focus-group protocol captured students' perceptions of the experience. All instruments demonstrated acceptable internal consistency.

4. EER Design and Development

4.1 Conception and Narrative

The EER "The Lost Code" was designed as a hybrid pedagogical resource, integrating a digital component developed on the Genially platform and a physical component—a 3D-printed box housing an electronic circuit based on an Arduino Uno board. The design was guided by principles of active learning, gamification, and user-centred design [11].
The framing narrative draws on the historical figure of Mumadona Dias, the countess who founded the Castle of Guimarães in the 10th century. Students are challenged to decipher a secret code hidden within the castle's stones. This historical-cultural dimension provides a contextualised and meaningful framework, linking Digital Electronics content with Portuguese cultural heritage within a STEAM logic.

4.2 Mission Organisation and Game Progression

The EER is organised into five virtual rooms inspired by symbolic spaces associated with the Castle of Guimarães. Progression follows a conditional sequential logic: access to each room depends on the correct resolution of previous challenges, ensuring a gradual increase in difficulty and phased consolidation of knowledge. Table 1 summarises the mission structure, and Fig. 1 illustrates the reading of the letter attributed to Mumadona Dias, which introduces the narrative mission and contextualises students within the historical setting.

Table 1. Mission organisation of the EER "The Lost Code"

Room	Curricular Content	Challenge Type	Outcome
Entry Tower	Number systems: binary, decimal, hexadecimal	Multiple-choice conversion	Fragment 1
Library	Logic gates: truth tables and symbolic representations	Association matching	Fragment 2
Museum	Logic circuits: Boolean expressions and circuit diagrams	Circuit analysis	Fragment 3
Royal Workshop	Physical logic gate identification	Hands-on: switches, LEDs, truth table	Fragment 4
Keep Tower	Integration of all content	Sequential code entry via digital padlock	Mission complete

Fig. 1. Letter introducing the mission of the hybrid EER “The Lost Code”, AI-generated and adapted by the author using ChatGPT.

4.3 Digital and Physical Components

The digital component was developed on the Genially platform, enabling integration of multimedia elements, interactive challenges with conditional progression logic, and a digital padlock system. The visual design evoked the medieval atmosphere of the Castle of Guimarães. Accessibility features included user-controlled audio settings, minimum reading time constraints, multimodal cues combining visual elements and textual information, and consistent layout structures to minimise extraneous cognitive load.

The physical component consists of a 3D-printed box, modelled in Autodesk Fusion 360 and printed with PLA filament. Inside, an Arduino Uno-based circuit includes two input switches and three output LEDs, allowing students to manipulate input states, observe output behaviour, and empirically construct the circuit’s truth table. The “hidden” logic gate can be changed by the teacher through simple code modification, reinforcing resource versatility and reusability. Figure 2 illustrates both the digital interface and the physical component of the hybrid EER.

This component fulfilled a clear epistemic function: enabling students to establish explicit connections between symbolic representations and observable system behaviour, supporting hypothesis testing, inference, and iterative reasoning.

Fig. 2. Hybrid EER "The Lost Code": (left) Library room, AI-generated and adapted by the author using ChatGPT; (right) physical component.

5. Resource Validation

5.1 Expert Review and Iterative Refinement

The expert review process involved four specialists with over 18 years of experience: two from Computing and two from Electrical Engineering. Each specialist independently interacted with the EER following a structured expert walkthrough protocol organised around seven heuristic dimensions adapted from Nielsen [13]. Table 2 summarises the main findings and corresponding redesign decisions.

Table 2. Expert review findings and redesign decisions

Spec.	Finding	Redesign Decision	Severity
S1	No clear indication of mission progress	Added visual progress indicators (padlocks + markers)	Major
S2	Background music could disrupt concentration	Implementation of user audio control	Minor
S3	Entry Tower too demanding as entry point	Adjustment of difficulty level	Major
S4	Museum task was overly complex and risked disengagement before students had processed the instructions	Adjusted difficulty and instruction timing	Major

5.2 Usability Evaluation

Following iterative refinement, the EER's usability was evaluated using the SUS [6], administered to eight students from other year groups. Results revealed a mean SUS score of 86.18 (SD = 3.90), with individual scores ranging from 80.00 to 92.50. This mean score places the system within the Excellent category (Grade A), exceeding both the 80.3-point threshold identified by Bangor et al. [2] and the 68-point benchmark for acceptable usability. Item-level analysis showed particularly positive ratings for ease of use (M = 5.00), user confidence (M = 4.63), and systemic integration (M = 4.63).
As the SUS was administered to students from other year groups, the results provide evidence of perceived usability but should not be interpreted as direct evidence of learning effectiveness among the intervention participants.

6. Results and Discussion

6.1 Learning Outcomes

No statistically significant difference was found between groups in baseline motivation, $t(21) = -0.095$, $p = .925$, confirming initial equivalence. Regarding academic performance, the pilot class improved from a mean of 56.36 (pre-test) to 63.38 (post-test), whereas the control group showed only a modest increase of less than two points. Although between-group differences did not reach statistical significance—attributable to the small sample size—the descriptive gain pattern is consistent with a possible positive contribution of the hybrid EER to short-term learning gains. Although statistical

significance was not achieved, the observed trend suggests a possible practical effect, warranting further investigation with larger samples.

6.2 Motivation, Engagement, And Collaboration

Across data sources, a consistent pattern emerged: students described the activity as more dynamic and involving than conventional instruction, and observation records indicated active participation, sustained attention, and persistence. The escape-room structure required coordinated participation, negotiation of meaning, and shared decision-making, supporting what sociocultural perspectives describe as learning through participation [16]. From the perspective of self-determination theory, the intervention can be interpreted as supporting autonomy (through problem-solving), competence (through progressive challenge and feedback), and relatedness (through collaborative interaction) [15]. These findings align with self-determination theory, suggesting that the design supported intrinsic motivation through structured challenge and social interaction.

6.3 Perceived Contribution of Hybridity and Narrative

One of the most distinctive findings concerns students' perceptions of the hybrid and narrative dimensions. Participants highlighted the value of combining digital progression with physical manipulation, suggesting that the interaction between the Genially-based environment and the electronic box contributed to making abstract Electronics concepts more intelligible and meaningful. Rather than functioning as a superficial motivational layer, the narrative acted as a structuring device that linked tasks, supported progression, and contextualised abstract content, extending existing work on culturally situated storytelling in technical learning contexts [17].
The physical component functioned as an epistemic tool enabling learners to connect symbolic representations with observable system behaviour—supporting hypothesis testing, inference, and iterative reasoning central to conceptual understanding in Electronics [14].
This finding is particularly relevant, as it suggests that hybridity is not merely a technological enhancement but a pedagogically meaningful design feature.

7. Discussion

The findings of this study are interpreted in relation to the four research questions that guided the investigation.
Regarding RQ1, the five-room conditional progression demonstrated that Digital Electronics content can be systematically embedded within a hybrid EER, connecting number systems, truth tables, Boolean expressions, and circuit behaviour within a coherent pedagogical sequence. The alignment between the narrative arc and the curricular scope ensured that each room contributed a conceptual building block, supporting the kind of structured challenge-feedback loop identified as central to effective game-based learning [11, 12].
Regarding RQ2, the expert review process surfaced critical design issues — particularly related to difficulty calibration and progress visibility — that would likely have compromised engagement and learning if left unaddressed. The iterative refinement cycle adopted here reinforces the value of structured expert evaluation as a design validity mechanism prior to classroom implementation [8].
Regarding RQ3, the SUS mean score of 86.18 confirms that the hybrid EER reached a level of usability consistent with excellent classification, supporting its viability for classroom integration [2]. This finding is significant because usability functions as a necessary precondition for meaningful engagement: a resource that students cannot navigate fluently is unlikely to support the epistemic goals it was designed to serve.
Regarding RQ4, student reports of motivation, collaboration, and conceptual consolidation are consistent with evidence from comparable EER interventions in STEM and technical education [4, 14, 16]. The hybrid format appears to have added pedagogical value beyond digital-only designs by grounding abstract symbolic reasoning in observable physical phenomena. From a self-determination theory perspective [15], the intervention supported autonomy through open-ended problem-solving, competence through progressive challenge and immediate feedback, and relatedness through sustained collaborative interaction — conditions associated with intrinsic motivation and deeper engagement.
Taken together, these findings suggest that hybrid Educational Escape Rooms can function as epistemically structured learning environments rather than merely motivational tools, extending the

conclusions of recent systematic reviews [12, 19] to the specific context of vocational Electronics education. These findings should be interpreted in light of several limitations. The small sample size and the non-equivalent groups design limit the statistical power of between-group comparisons and restrict the generalisability of the results. Additionally, the all-male composition of the sample, which reflects the demographic profile of the participating vocational programmes, limits the extent to which findings can be extrapolated to more diverse learner populations.

8. Limitations

This study has several limitations. First, the sample was small, comprising 23 students distributed across two non-equivalent vocational classes. Secondly, all participants were male, reflecting the demographic composition of the programmes but limiting the transferability of the findings to more diverse learner populations. Thirdly, the absence of random assignment prevents causal interpretation of the observed learning gains. Fourthly, the pilot and control groups belonged to different vocational courses, which may have introduced differences in prior knowledge, curriculum exposure, or learner profile. Fifthly, the study examined short-term learning outcomes only; no delayed post-test was administered to assess retention. Finally, although the hybrid design appeared pedagogically promising, further research is needed to examine transfer to unfamiliar digital electronics problems and to evaluate scalability across teachers, schools, and cohorts.

9. Conclusion

This paper described the design, development, validation, and classroom implementation of the hybrid EER “The Lost Code”, conceived as a pedagogical resource for teaching Digital Electronics in vocational education. By combining a structured historical-cultural narrative, interactive digital challenges in Genially, and a physical Arduino-based electronic circuit, the intervention established a hybrid learning environment aligned with principles of active learning and game-based learning.

The validation process confirmed the technical robustness and pedagogical coherence of the resource (SUS mean: 86.18). The classroom implementation provided empirical evidence suggesting improvements in academic performance in the pilot group and, more importantly, qualitative evidence of increased motivation, active engagement, collaborative problem-solving, and meaningful interaction with abstract technical content.

This study advances the field by demonstrating that hybrid Educational Escape Rooms can function not only as engagement-enhancing strategies but as epistemically structured learning environments capable of supporting conceptual understanding in vocational STEM education. By integrating narrative, physical interaction, and digital progression, the proposed design model offers a scalable and pedagogically grounded approach for technology-enhanced learning.

Future research should involve larger and more diverse samples from different vocational education contexts in order to strengthen the generalisability of the findings. Replication studies across different technical disciplines and educational settings would help to further validate the pedagogical potential of hybrid Educational Escape Rooms as meaningful learning environments for vocational STEM education. Furthermore, longitudinal studies are needed to examine the retention and transfer of learning achieved through this approach. More robust comparative research designs could also provide a deeper understanding of the effectiveness of hybrid Educational Escape Rooms in supporting learning outcomes and student engagement in vocational STEM education.

Beyond Accuracy and Speed: A Learning Analytics Approach to Performance Modeling in Digital Phonological Games for Brazilian Children

Tiago José Benedito Eugenio[1], Ana Lucia Hennemann[2], Denise De Micheli[3]

[1,3]Federal University of São Paulo, Brazil
[2]Universidad Internacional Iberoamericana, United States

Abstract

The increasing use of digital technologies in education has expanded the possibilities for assessing cognitive processes related to learning. However, performance in digital tasks is still frequently analyzed using isolated metrics, such as accuracy or response time, which may fail to capture the multidimensional nature of cognitive performance. This study proposes a composite indicator, named the Game Progress Index (GPI), designed to integrate accuracy, speed, and efficiency into a standardized measure applied to digital phonological awareness games. A total of 339 Brazilian children in the early stages of literacy development participated in the study and completed seven digital game-based tasks. Different weighting models were tested, and the model showing the strongest association with performance indicators was selected. A regression-based approach was then employed to estimate expected performance, allowing the calculation of standardized residuals and the identification of discrepancies between observed and predicted outcomes. Results demonstrated a strong association between the GPI and performance rate (r = .90), supporting the coherence and sensitivity of the proposed index. The combined analysis of percentile scores and residuals revealed heterogeneous performance profiles, including children with high overall performance but lower-than-expected outcomes, as well as participants with low overall performance but outcomes above model predictions. Findings suggest that traditional normative metrics alone may be insufficient to capture individual variability in digital learning contexts. The proposed approach offers a more sensitive framework for modeling performance in educational games, with potential implications for educational assessment, learning analytics, and game-based cognitive screening.

1. Introduction

The increasing use of digital technologies has profoundly transformed teaching, learning, and assessment processes. In contrast to traditional paper-and-pencil instruments, digital environments enable the continuous collection of behavioral data generated during user interaction with tasks, including the number of correct responses, response times, interaction patterns, and performance trajectories [1–3]. These records, often referred to as behavioral trace data, expand opportunities to investigate the cognitive processes involved in learning and create new possibilities for the development of more sensitive and informative assessment systems [4–6].

Within this context, Learning Analytics has emerged as an important field of research dedicated to the collection, analysis, and interpretation of educational data to better understand and optimize learning processes [1,7]. Unlike traditional assessment approaches, which focus primarily on final performance outcomes, contemporary Learning Analytics perspectives seek to understand how individuals perform tasks by examining information related to cognitive processing dynamics and learner behavior throughout task execution [2].

Despite these advances, a substantial proportion of digital assessments still rely on isolated indicators to represent participant performance. Measures such as the number of correct responses, percentage of correct answers, or total completion time are frequently analyzed separately, which may limit the understanding of the multidimensional nature of cognitive performance [3]. From a theoretical perspective, performance in cognitive tasks emerges from the interaction of multiple components, including accuracy, processing speed, and problem-solving efficiency [8,9]. Consequently, individuals with similar levels of accuracy may exhibit substantially different cognitive profiles when temporal and process-related aspects are taken into account.

This issue is particularly relevant in the context of literacy acquisition. Among the various predictors of reading development, phonological awareness is widely recognized as one of the most important skills for acquiring an alphabetic writing system and has consistently been associated with reading performance across different languages and educational contexts [10,11]. In recent years, digital tasks designed to assess these skills have been increasingly adopted, facilitating automated data collection and the generation of more precise performance measures [12].

However, the availability of large volumes of data alone does not necessarily lead to advances in understanding learning processes. One of the central challenges lies in developing analytical models capable of integrating multiple dimensions of performance while producing indicators that are meaningful and interpretable for researchers and educators [5,13]. In this regard, composite metrics have been proposed as a promising alternative for representing performance more comprehensively by combining information related to accuracy, speed, and efficiency into a single synthetic indicator [3,14].

At the same time, predictive modeling approaches have gained increasing attention within the field of Learning Analytics because they enable the estimation of expected performance based on behavioral variables collected during task execution [5,15]. Comparing observed and expected performance makes it possible to identify individual discrepancies that may not be captured by traditional normative metrics. Within this framework, residual analysis represents a particularly valuable strategy, as it allows the identification of participants whose performance falls above or below the expectations established by predictive models [16,17].

Against this background, the present study proposes a Learning Analytics–based approach for modeling performance in digital phonological awareness games. To this end, the Game Progress Index (GPI), a composite metric integrating indicators of accuracy, speed, and efficiency derived from participants' interactions with digital tasks, was employed. Subsequently, a quadratic model based on Accuracy per Minute (APM) was used to estimate participants' expected performance, enabling the calculation of standardized residuals and the identification of discrepancies between observed and predicted outcomes [5,15].

Accordingly, the aim of this study was to investigate the relationship between the Game Progress Index (GPI) and Accuracy per Minute (APM), as well as to examine the potential of residual analysis for identifying performance profiles that are not adequately represented by traditional normative indicators. By integrating composite metrics, predictive modeling, and the analysis of individual discrepancies, this study seeks to contribute to the development of more sensitive approaches for game-based cognitive assessment in educational contexts.

2. Method

2.1 Study Design

This was a quantitative, observational, cross-sectional study conducted to investigate performance modeling in Portuguese-language digital phonological awareness games using a Learning Analytics–based approach. Behavioral data collected during participants' interactions with digital tasks were analyzed, including indicators of accuracy, completion time, and efficiency.

2.2 Participants

A total of 369 children in the early stages of literacy development initially participated in the study. Of these, 26 were excluded from the analyses because they presented a diagnosis or indication of neurodevelopmental disorders according to the study eligibility criteria, and 4 did not complete the assessment battery. The final sample therefore consisted of 339 children. Participants included in the analyses had a mean age of 6.45 years (SD = 0.84), ranging from 5.10 to 8.03 years. The sample comprised 170 boys (50.1%) and 169 girls (49.9%). Regarding educational level, 129 participants (38.1%) were enrolled in Early Childhood Education, 121 (35.7%) attended Grade 1, and 89 (26.3%) attended Grade 2. All participants were recruited from a private school located in São Bernardo do Campo, Brazil.

2.3 Instruments

Data were collected using seven digital games designed to assess phonological awareness skills. The games were developed by the authors and implemented within a Brazilian gamified cognitive assessment platform (https://clickneurons.com.br). Tasks were organized in a modular structure, with

each game containing either 10 or 20 items, resulting in a total of 100 items across the assessment battery. This distribution was defined according to the complexity of the skills being assessed, aiming to balance cognitive load across tasks while ensuring adequate representation of different components of phonological processing [10,11]. As shown in Table 1, the games assessed skills such as phoneme–grapheme correspondence, syllable segmentation, identification of initial and final syllables, and rhyme recognition. Tasks were presented through an interactive digital interface, with automated recording of correct responses and response times for each item, enabling the calculation of accuracy, speed, and efficiency indices.

Table 1. Organization of the digital games included in the phonological awareness assessment battery

Game ***Portuguese / English name***	**Primary Skill**	**Task Type**	**No. of Items**
Sopa de Letrinhas ***Letter Soup***	Phoneme–Grapheme Correspondence	Letter selection following an auditory stimulus	10
Toca o Som ***Touch the Sound***	Auditory Discrimination	Selection of the grapheme corresponding to the presented sound	20
Mexe a Boca ***Move Your Mouth***	Syllabic Awareness	Identification of the number of syllables	10
Correio das Sílabas ***Syllable Mail***	Initial Syllables	Matching words sharing the same initial syllable	10
Tesouro das Sílabas ***Syllable Treasure***	Initial Syllables	Matching words sharing the same initial syllable	20
Oficina das Sílabas ***Syllable Garage***	Final Syllables	Identification of the final syllable	20
O Poeta Falou ***The Poet Said***	Rhyme Awareness	Identification of rhyming words	10

During task execution, immediate feedback was provided to participants to maintain engagement and support understanding of task requirements. From a measurement perspective, the digital environment enabled the collection of detailed behavioral data, including: (a) number of correct responses (accuracy); (b) total number of items presented; (c) response time per game; and (d) total task completion time.
To increase the precision of temporal measures, the execution time used in the analyses excluded intervals not directly related to the cognitive processing demands of the task, such as transitions between stimuli, visual and auditory feedback periods, and delays inherent to interface operation. This procedure was intended to ensure that timing measures primarily reflected participants' cognitive processing and response execution, thereby reducing the influence of extraneous factors unrelated to task performance [6,14,17].
The resulting interaction data served as the basis for calculating the GPI, a composite metric developed to integrate indicators of accuracy, speed, and efficiency derived from participants' interactions with the digital games. The index ranges from 0 to 100, with higher scores indicating better performance.

2.4 Data Collection Procedures

Data collection was conducted in a school setting through individual assessment sessions administered by previously trained researchers. All participants completed the tasks using the same device model, an 11th-generation iPad with an 11-inch screen, ensuring standardized presentation of visual stimuli.
Auditory stimuli were delivered through noise-canceling headphones to minimize environmental distractions and ensure uniform testing conditions across participants. During the assessment, children completed a battery of seven digital phonological awareness games designed to evaluate skills associated with early literacy development.
Performance data were automatically recorded by the digital platform, including information related to response accuracy and task completion time. All records were subsequently exported for statistical analysis.
The study was approved by the Research Ethics Committee of the Federal University of São Paulo (Approval No. 8.132.619; CAAE No. 94688725.9.0000.5505) and was conducted in accordance with national ethical guidelines for research involving human participants. Participation was authorized by the children's legal guardians prior to data collection.

3. Results

Table 2 presents the descriptive statistics for the main variables investigated. The GPI showed a mean score of 75.01 (SD = 15.07), whereas APM presented a mean of 7.35 correct responses per minute (SD = 4.12). Performance estimated by the quadratic model showed a mean similar to that observed for the GPI (M = 75.01; SD = 14.45), suggesting good overall correspondence between observed and predicted values.

Table 2. Descriptive statistics of the main study variables (N = 339).

Variable	Mean	SD	Minimum	Maximum
GPI	75.01	15.07	40.02	99.36
APM	7.35	4.12	1.04	19.86
Predicted GPI	75.01	14.45	44.22	96.21
Quadratic Residual	0.00	4.28	-25.14	11.23

Note: GPI = Game Progress Index; APM = Accuracy per Minute; SD = Standard Deviation.

3.1 Association Between Overall Performance and Temporal Efficiency

A strong positive association was observed between the GPI and APM, $r = .913$, $p < .001$. This result indicates that participants with greater temporal efficiency tended to exhibit higher levels of overall performance in the digital tasks. The coefficient of determination ($r^2 = .834$) indicated that approximately 83.4% of the variability observed in GPI was associated with variability in APM.

3.2 Modeling Expected Performance

To estimate participants' expected performance, a second-order polynomial regression model was fitted using APM as the predictor variable. The model demonstrated an excellent fit to the data ($R^2 = .919$; adjusted $R^2 = .919$), explaining approximately 91.9% of the variance observed in the GPI (Table 3). Analysis of variance indicated that the model was statistically significant, $F(2,336) = 1916.95$, $p < .001$. The resulting equation was:

$$GPI = 36.730 + 7.475(APM) - 0.235(APM^2).$$

Table 3. Polynomial Regression Model Predicting GPI from APM

Predictor	B	95% CI	p
Constant	36.730	—	<0.001
APM	7.475	[7.03, 7.92]	<0.001
APM²	-0.235	[-0.259, -0.210]	<0.001

Both the linear APM term ($B = 7.475$, 95% CI [7.03, 7.92], $p < .001$) and the quadratic term ($B = -0.235$, 95% CI [−0.259, −0.210], $p < .001$) contributed significantly to the model. The inclusion of the quadratic term increased the model's explanatory power relative to the simple linear association reported previously, providing evidence of a non-linear relationship between APM and GPI. Figure 1 illustrates the distribution of participants and the fitted quadratic curve.

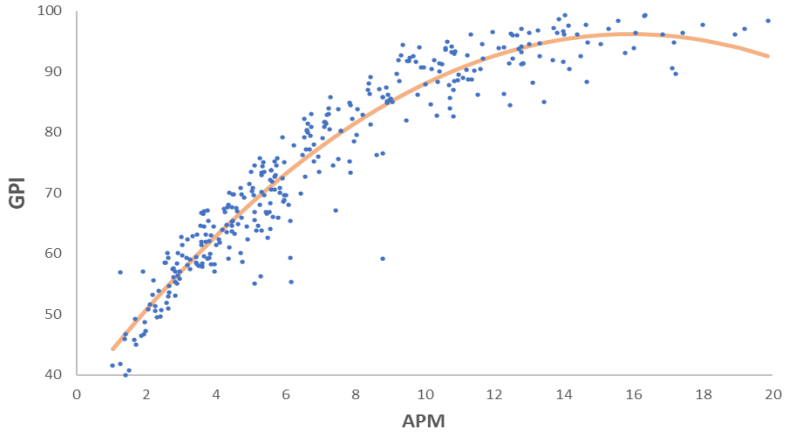

Fig. 1. Relationship between APM and GPI with quadratic model fit ($R^2 = 0.919$).

3.3 Performance Quadrant Analysis

Based on the predictive model, individual residuals were calculated as the difference between observed and expected performance. Residuals were subsequently standardized and analyzed jointly with GPI percentile ranks. Participants were classified using the 50th percentile of the GPI distribution and a standardized residual value of zero as cutoff points. The combination of these criteria allowed each participant to be positioned within a two-dimensional space defined by normative performance and discrepancy from expected performance.
The integration of percentile rank and standardized residual scores enabled the identification of four performance profiles: **Expected High**, **Unexpected High**, **Expected Low**, and **Unexpected Low**. These profiles represent distinct combinations of normative performance level and deviation from model-based expectations (Figure 2).

Table 4. Distribution of Participants Across Analytical Quadrants

Profile	n	%
Expected High	114	33.6
Unexpected High	56	16.5
Unexpected Low	74	21.8
Expected Low	95	28.0
Total	339	100.0

Note: Expected High = participants with GPI percentile rank ≥ 50 and standardized residual ≥ 0; Unexpected High = GPI percentile rank < 50 and standardized residual ≥ 0; Unexpected Low = GPI percentile rank ≥ 50 and standardized residual < 0; Expected Low = GPI percentile rank < 50 and standardized residual < 0.

Participants were distributed across all four quadrants. The discrepant groups (Unexpected High and Unexpected Low) jointly represented 38.3% of the sample, indicating that a substantial proportion of participants exhibited performance patterns that differed from those predicted by the model.

3.4 Association Between Performance Quadrants and School Grade

The distribution of participants across performance quadrants varied significantly as a function of school grade, $\chi^2(6) = 176.89$, $p < .001$. Cramer's V indicated a large association ($V = .511$). As shown in Figure 2, children enrolled in Early Childhood Education were predominantly concentrated on the left side of the analytical space, corresponding to the Expected Low and Unexpected High profiles, whereas students in Grades 1 and 2 were more frequently represented on the right side, corresponding to the Expected High and Unexpected Low profiles.

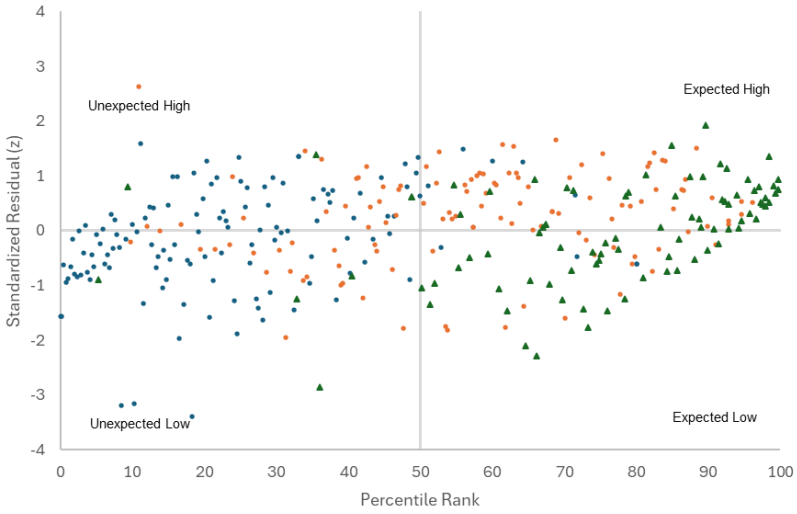

Fig. 2. Distribution of participants according to percentile rank and standardized residual scores. Blue circles = Early Childhood Education; orange circles = Grade 1; green triangles = Grade 2. Reference lines indicate the 50th percentile and z = 0 cutoffs.

4. Discussion

The present study investigated a Learning Analytics–based approach for modeling children's performance in Portuguese-language digital phonological awareness games. Results revealed a strong association between the Game Progress Index (GPI) and Accuracy per Minute (APM), as evidenced by the observed correlation ($r = .913$, $p < .001$) and the high coefficient of determination of the quadratic model ($R^2 = .919$). Taken together, these findings indicate that the integration of accuracy and temporal efficiency provides a robust representation of participants' performance in digital tasks related to early literacy development.

Traditionally, digital educational assessments rely on isolated indicators, such as the number of correct responses or total completion time. Although these measures provide valuable information, they do not always capture the multidimensional nature of cognitive performance. The findings of the present study reinforce the importance of simultaneously considering multiple dimensions of learner behavior, a perspective consistent with contemporary approaches in Learning Analytics and digital assessment [1–3]. In this context, the GPI was designed to integrate accuracy, speed, and efficiency into a single metric, generating a measure that was strongly associated with the behavioral data produced during interaction with the games.

Another important finding was the identification of a non-linear relationship between APM and GPI. The significance of the quadratic term indicates that performance gains associated with increased temporal efficiency do not occur uniformly across the distribution. Performance improved more rapidly at lower levels of APM, followed by a progressive deceleration at higher levels. This pattern is consistent with findings from cognitive performance research, in which additional gains in speed tend to yield progressively smaller improvements in overall performance [8,9].

The most relevant contribution of this study, however, concerns the analysis of discrepancies between observed and expected performance. The integration of percentile ranks and standardized residuals enabled the identification of distinct performance profiles, revealing that a substantial proportion of the sample (38.3%) exhibited patterns that diverged from model-based expectations. This finding suggests that traditional normative indicators may be insufficient to fully characterize individual differences in digital learning environments. Participants occupying similar positions within the normative distribution may nevertheless display markedly different performance profiles when efficiency patterns captured by predictive modeling are taken into account. This interpretation is consistent with recent Learning Analytics research advocating the integration of multiple sources of evidence to better understand individual differences in student performance [5,14,15].

The results also demonstrated a significant association between performance quadrants and school grade. Children enrolled in Early Childhood Education were predominantly concentrated in the lower-performance regions of the analytical space, whereas students in Grades 1 and 2 were more frequently represented in the higher-performance regions. This pattern suggests that the proposed approach is

sensitive to developmental differences expected throughout the literacy acquisition process. At the same time, the presence of participants distributed across different quadrants within the same grade level indicates that the model may also capture individual variability that is not fully explained by schooling alone.

Taken together, the findings suggest that combining composite performance indicators, predictive modeling, and residual analysis can expand the interpretative potential of data generated in digital learning environments, providing information that complements the metrics traditionally used in educational assessment.

Several limitations should be considered when interpreting the results. First, the sample consisted of Brazilian children in the early stages of literacy development, which limits the generalizability of the findings to other age groups and educational contexts. Second, the data were obtained from a specific battery of Portuguese-language digital phonological awareness games, and it cannot be assumed that similar patterns would emerge in other cognitive domains or types of digital tasks. In addition, the cross-sectional design precludes inferences regarding individual changes over time or causal relationships among the variables investigated. Finally, although the model demonstrated substantial explanatory power, further research is needed to evaluate its stability in independent samples and across different educational settings.

5. Conclusion

This study presented a Learning Analytics–based approach for modeling children's performance in Portuguese-language digital phonological awareness games. The results revealed a strong association between the GPI and APM, as well as an excellent fit of a quadratic model capable of explaining approximately 91.9% of the observed variance in performance.

The combined analysis of percentile ranks and standardized residuals enabled the identification of performance profiles that would not be readily detected using conventional normative indicators, highlighting the potential of predictive modeling to complement digital assessment practices. Furthermore, the association observed between performance quadrants and school grade suggests that the proposed approach is sensitive to developmental differences occurring during literacy acquisition.

Overall, the findings indicate that the integration of behavioral metrics, statistical modeling, and Learning Analytics can contribute to the development of more informative digital assessment systems, providing a more nuanced understanding of individual differences in educational contexts. Future studies should examine the applicability of this approach across other cognitive domains, age groups, and educational settings, further expanding the evidence base for its use in assessment and learning monitoring.

Co-designing with Children: Intuitive Insights for Growing Minds

Nimet Hüma Sabırlı[1], Saumya Grover[2]

[1]BESIGN The Sustainable Design School, Turkey
[2]BITS Design School, India

Abstract

This paper examines Growing Minds as a practice-based case study exploring how co-design with children can inform the development of sustainable educational tools and support participatory forms of environmental learning. Positioned at the intersection of design research, primary education, student engagement, and games in education, the project investigates how children's intuitive actions, play behaviours, and collaborative responses can shape both the design process and the learning experience.

The study responds to the limitations of instructional approaches to environmental education, where knowledge is often transmitted as abstract information rather than experienced through participation, exploration, and agency. Drawing on constructivist learning theories, participatory design, and the Reggio Emilia approach, children are framed not only as users but as active contributors whose insights emerge through embodied interaction, experimentation, hesitation, and improvisation.

Methodologically, Growing Minds employed an iterative, play-based co-design process with children aged 5 to 9 through repeated prototyping and playtesting sessions in classroom and garden-based learning environments. Observation, field notes, photographs, and reflective documentation were used to analyse how children interacted with materials, symbols, rules, group settings, and ecological concepts. Each design cycle informed the next, allowing the tool to evolve in response to children's behaviours rather than predetermined assumptions.

Preliminary findings suggest that children's participation improved the clarity, accessibility, and pedagogical relevance of the tool. Symbolic ecological icons supported stronger conceptual connections, while smaller group settings encouraged collaboration, autonomy, and peer learning. Outdoor sessions further strengthened sensory engagement and children's understanding of environmental systems as interconnected relationships rather than isolated facts.

The paper argues that play-based co-design can function both as a design methodology and as a pedagogical framework for transformative environmental education, supporting children's agency, collaboration, and long-term ecological understanding.

Keywords: *co-design; children; play-based learning; environmental education; design thinking; iterative design; primary education*

1. Introduction

This paper examines *Growing Minds* as a practice-based case study exploring how co-designing with children can reveal broader pedagogical issues within environmental education. Although the project resulted in the development of a sustainable educational game, its significance lies not only in the final product but also in the design process itself. Children's intuitive actions, hesitations, play behaviours, and collaborative responses exposed gaps between adult assumptions and children's actual learning needs.

Positioned within the themes of games and media in education, student engagement, and primary and early childhood education, the study responds to the limitations of instructional approaches to environmental learning. Environmental knowledge is often presented as abstract information, while sustainable education requires more participatory, experiential, and action-oriented forms of learning [15], [16]. In this context, *Growing Minds* asks how educational tools can become more meaningful when they are shaped through children's lived experiences and everyday ways of understanding the world.

Drawing on constructivist learning, participatory design, game-based learning, and the Reggio Emilia approach, the paper frames children not only as users of educational materials but as active contributors to educational knowledge [1], [3], [4], [7], [8], [12]. Methodologically, the project employed an iterative,

play-based co-design process with children aged 5 to 9 through prototyping and playtesting sessions in classroom and garden-based learning environments.
The paper argues that play-based co-design can function not only as a design methodology but also as a critical lens for rethinking education. By observing children's intuitive insights, *Growing Minds* demonstrates how educational tools can support more participatory, collaborative, and environmentally meaningful learning experiences.

2. Theoretical Background

This study draws on theories of play, experiential learning, participatory design, and game-based education to position *Growing Minds* as both a design process and a pedagogical case study. Play is understood not as an activity separate from learning, but as a primary way through which children explore ideas, test relationships, and construct meaning through action and interaction [2], [3]. Dewey's theory of experiential learning is also central to this study, as it emphasizes that meaningful education emerges through direct experience, reflection, and connection with real-life situations [1]. In this sense, environmental education becomes more powerful when children do not only receive information about sustainability, but actively experience ecological relationships through materials, movement, collaboration, and problem-solving. Through this approach, *Growing Minds* seeks to help children, as future actors of society, develop environmental awareness, climate consciousness, and a sense of responsibility toward the systems they are part of.
The study is also informed by the Reggio Emilia approach, which frames children as capable, expressive, and active meaning-makers rather than passive recipients of adult knowledge [4]. This perspective supports the methodological decision to treat children's intuitive actions, hesitations, negotiations, and playful responses as valuable research data. Participatory design further strengthens this position by arguing that users and communities should take part in shaping the tools and systems that affect them [7], [8]. In the context of *Growing Minds*, co-designing with children therefore becomes more than a method for improving an educational tool; it becomes a way of revealing the gap between adult assumptions and children's actual learning needs.
Game-based learning provides the final theoretical layer of the study. Educational games can support engagement by combining rules, symbols, goals, feedback, challenge, and social interaction [12], [13]. For environmental education, this is especially relevant because ecological concepts are relational and interconnected. Through game-based experiences, children can practise cooperation, decision-making, systems thinking, and shared responsibility. Building on these perspectives, *Growing Minds* was developed as a play-based educational tool that connects environmental learning with children's everyday experiences, peer interaction, and active participation.

3. Research Aim and Methodology

The aim of this research is to examine how a sustainable educational game can be developed through children's participation and how the co-design process can reveal broader issues within current educational practices. Rather than treating *Growing Minds* only as a final game product, the study approaches it as a practice-based case study in which children's play behaviours, intuitive responses, collaborative actions, and difficulties became central sources of design and pedagogical knowledge. This approach is informed by participatory design, which positions users as contributors to the design of tools and systems that affect them [7], [8], [9].
The methodology combined secondary research, field-based observation, activity design, prototyping, and iterative playtesting. The secondary research focused on play-based learning, participatory design, game-based education, environmental education, and early childhood learning. This stage helped define the main learning goals, themes, and skill areas of the project, including collaboration, ecological awareness, decision-making, systems thinking, communication, responsibility, and the ability to connect environmental concepts with everyday actions [12], [13], [15], [16].
The primary research phase involved working with children in different school and learning environments. The names of the schools are not specified in this paper in order to protect institutional and participant privacy. Instead, the research focuses on the observed interactions and learning situations that emerged during the process. Children participated in designed activities that allowed the researcher to observe how they understood rules, used symbols, collaborated with peers, responded to materials, completed tasks, negotiated decisions, and engaged with environmental themes.
Based on these insights, the first prototype of *Growing Minds* was developed and tested with children. During the playtesting sessions, the focus was not only on whether the game functioned correctly, but

also on how children interacted with it. Their movements, questions, misunderstandings, excitement, peer communication, and problem-solving strategies were carefully observed. This process revealed gaps between adult design assumptions and children's actual learning needs, including the need for stronger visual support, clearer rules, physical action, group participation, and sensory connection with the environment.
After the first prototype test, the design was revised according to these observations. The game mechanics, visual language, ecological icons, rules, and activity structure were adjusted to make the tool clearer, more engaging, and more pedagogically relevant. A second testing cycle then examined whether the revised game could better support the targeted skills and learning goals. In this sense, the methodology was both design-oriented and educational: co-design was used not only to improve the game, but also to understand how children can engage with sustainability through action, play, collaboration, and real-life tasks.

4. Alternative Learning Models and Educational Outcomes

Before entering the field, the development of *Growing Minds* began with a secondary research phase focused on sustainability education, play-based learning, participatory design, and alternative educational approaches. This stage helped define the learning goals and skill areas that would guide the design process. The aim was not only to create a game about sustainability, but to understand how an educational tool could support children's participation, collaboration, ecological awareness, and skill development.
A key starting point was the role of education within sustainable development. UNESCO frames education as both a specific Sustainable Development Goal and a wider driver of social and ecological transformation [15]. This connects directly to SDG 4, which emphasizes inclusive and equitable quality education and lifelong learning opportunities. For *Growing Minds*, this supported the idea that environmental education should not only provide sustainability-related information, but should also help children practise responsibility, cooperation, decision-making, and ecological thinking through meaningful learning experiences.
The review of sustainable education highlighted the need to move beyond purely instructional approaches. Sterling argues that sustainable education requires more participatory, systemic, and transformative forms of learning [16]. This was important for the project because concepts such as ecosystems, interdependence, resources, and collective action can remain abstract when taught only through verbal explanation. Therefore, *Growing Minds* was designed around action-based learning, allowing children to learn through observing, collecting, matching, discussing, deciding, and solving problems together.
The project was also informed by experiential and constructivist learning theories. Dewey emphasizes the importance of experience and reflection in meaningful education [1], while Piaget and Vygotsky show that children actively construct knowledge through interaction with materials, peers, and social environments [2], [3]. This perspective shaped the project's attention to children's movements, choices, hesitations, misunderstandings, and peer interactions as meaningful signs of how learning takes place.
Play-based and game-based learning further shaped the project. Play was approached as a serious educational method through which children explore ideas, test possibilities, negotiate rules, and express understanding through action. Game-based learning literature suggests that games can strengthen motivation and engagement through goals, rules, challenge, feedback, imagination, and social interaction [12], [13]. Recent research also supports the value of well-designed games for children's cognitive, social, and learning outcomes in early childhood education [14].
The Reggio Emilia approach provided another important reference point by framing children as capable and expressive meaning-makers whose understanding can appear through multiple forms of expression [4]. This supported the decision to observe children's learning through drawing, arranging, touching, moving, storytelling, collaboration, and play. Participatory design and co-design literature also informed the methodology, emphasizing that users should help shape the tools and systems that affect them [7], [8], [9]. In *Growing Minds*, this meant positioning children not only as users of the game, but as contributors whose behaviours and responses could guide its development.
From this secondary research, several core learning goals were identified: collaboration, communication, systems thinking, problem-solving, adaptation, responsibility, sensory engagement, and self-driven action. These skills were connected to sustainability learning and to the needs of early childhood education. The secondary research therefore created an initial framework, which was later tested and refined through field observation with children.

5. Field Observations and Identified Skill Gaps

The field phase of *Growing Minds* was conducted to understand how children engage with learning tasks, environmental concepts, classroom routines, peer interaction, and play-based activities in real educational settings. The purpose was not only to test whether the game idea could function, but to observe how children learn, where they hesitate, and which skills require stronger support in early learning environments. Classroom observation, outdoor exploration, nature-based tasks, visual matching, drawing, print-making, and group-based play were used to examine how children responded to different learning situations.

The observations showed that children engaged more actively when learning was connected to movement, sensory experience, visual references, and collaborative tasks. Outdoor activities created visible curiosity and excitement, especially when children explored their surroundings, collected natural materials, and used them in creative activities. These moments suggested that environmental learning becomes more meaningful when children can physically and emotionally connect with the subject. However, the fieldwork also revealed that children often needed support in connecting abstract ideas, understanding ecological relationships, and working collaboratively rather than individually.

In classroom settings, children's learning was strongly shaped by the clarity of the task, the organization of the environment, and the teacher's guidance. Group learning became more visible when shared goals and rules were clear. However, individual work often continued even within group activities, showing that collaboration cannot be assumed simply because children are placed together. It needs to be intentionally designed through turn-taking, shared responsibilities, communication, and collective outcomes.

The first prototype testing also showed that children were able to match images and colours, but needed more support in understanding deeper relationships between categories, ecosystems, and environmental consequences. In the hexagon-based activity, children could recognize visual similarities, yet they did not always explain why certain elements belonged together or how one environmental element might affect another. This became an important design insight: *Growing Minds* needed to move beyond recognition and matching toward relational and systems thinking.

These observations helped identify the main skill gaps that the game needed to address. The skill areas were not chosen only through theory; they emerged from the combination of secondary research and direct field observation. The literature helped define the educational importance of these skills, while the fieldwork showed how they appeared in children's actual behaviours. In this sense, the game was shaped not only by adult assumptions, but by observing what children needed in order to participate more actively, understand more deeply, and connect environmental knowledge with action.

Table 1. Main skill gaps and their translation into *Growing Minds* game actions. It summarizes the five main skill gaps identified during the fieldwork and how they were translated into play-based design response

Identified skill gap	**Field observation**	**Growing Minds design response**
Collaboration and collective consciousness	Children sometimes worked individually even when placed in groups.	Shared missions and group outcomes were added to encourage cooperation and collective responsibility.
Visual connection-making	Children needed visual references to connect stories, categories, and ecological ideas.	Ecological icons, image cards, colour systems, and visual prompts were used to support conceptual links.

Systems thinking	Children could recognize separate images, but struggled to understand deeper ecological relationships.	Hexagon-based connections and environmental themes helped children see relationships between natural elements.
Problem-solving and adaptation	Children engaged more when they could test, repeat, adjust, and physically interact with materials.	Game challenges were designed around trial-and-error, flexible thinking, and active problem-solving.
Self-driven and peer-supported learning	Some children waited for adult direction, but became more active when encouraged to ask and learn from peers.	Structured choices, group tasks, and peer discussion moments encouraged initiative, confidence, and shared learning.

The findings from the fieldwork shaped *Growing Minds* as a game structured around skills, phases, and environmental themes. The main skill areas included collaboration, systems thinking, problem-solving, adaptation, and self-driven learning. The environmental themes included food and agriculture, water, and life on land, allowing children to approach sustainability through familiar and concrete subjects rather than distant or abstract concepts. The game structure therefore moved from local observation to broader ecological understanding and reflection.

The testing process also showed the importance of play-based learning as a research and design method. Play allowed children to engage with complex ideas through action rather than abstract explanation alone. When children moved, collected, matched, painted, discussed, and tested ideas together, learning became visible through behaviour. Their actions showed where the activity supported understanding and where the design needed to change. For example, the need for stronger visual references, clearer connection-making, and more structured collaboration directly informed the revision of the game.

For teachers, *Growing Minds* offers a practical way to introduce sustainability-related skills without relying only on verbal explanation or textbook-based instruction. The game provides visual materials, structured activities, collaborative missions, and adaptable learning themes. In this way, it helps teachers create situations where children can practise environmental thinking through play, action, peer interaction, and shared problem-solving.

6. Growing Minds as a Tool for Children and Teachers

After the secondary research and field observation phases, the next step was to translate the identified learning goals and skill gaps into the structure of *Growing Minds*. The design challenge was to connect sustainability-related curriculum themes with play-based actions that children could understand, practise, and build upon together. In this sense, the game was developed not only as an environmental learning tool, but also as a structured play experience supporting systems thinking, adaptation, problem-solving, collaboration, ecological awareness, and self-driven learning. This approach connects to sustainable education, participatory design, and game-based learning, which emphasize active participation, experiential learning, and social interaction [8], [12], [13], [15], [16].

The game begins with children engaging directly with their surroundings. Rather than starting from abstract information, children observe nature, collect natural elements, and use these findings as the starting point of the activity. This connects learning to place, material experience, and adaptation. From this central point, children gradually create a larger visual and conceptual map. A leaf, fruit, animal, seed, or natural object is therefore not treated as an isolated item, but as part of a wider ecological system. This supports experiential and constructivist learning, where knowledge develops through action, reflection, and interaction with the environment [1], [2], [3].

Collaboration is embedded into the mechanics of the game. Once one child places a piece, the next child needs to respond to what has already been placed by another member of the group. Children

cannot follow only an individual plan; they must observe, adapt, and continue from their peers' decisions. In this way, collaboration becomes a physical and visible action rather than an abstract educational aim. The game also supports adaptation, because children may need to change direction when another player adds a different element to the shared map.

During field activities, the game also encouraged communication and peer learning. When children could not immediately identify a fruit, plant, animal, or natural element, they began asking one another instead of waiting only for the teacher to provide the answer. This showed a shift from teacher-dependent learning toward peer-supported discovery. Through the game, children had a reason to speak, compare, explain, and help each other. This supported confidence as well as collaboration, because knowledge was created through shared exploration.

The curriculum connection is built through environmental themes such as food and agriculture, water, and life on land. These themes are concrete enough for young children to understand through everyday examples, while also introducing wider sustainability questions. Through play, children explore how plants, animals, natural resources, human choices, and environmental conditions are connected. This allows sustainability learning to become active and accessible rather than distant or abstract.

Table 2. Translation of *Growing Minds* game actions into skill development.

Game action	**Skill developed**	**Educational meaning**
Collecting from nature	Adaptation and sensory engagement	Children begin from their real surroundings rather than abstract content.
Creating a shared map	Systems thinking	Children see how natural elements connect within a bigger ecological picture.
Building on another child's move	Collaboration and adaptation	Children respond to peer decisions and continue a shared structure.
Asking peers about unknown items	Communication and confidence	Children learn from each other instead of depending only on the teacher.
Changing direction during play	Flexibility and problem-solving	Children practise adjusting their plan when the game situation changes.

In this sense, *Growing Minds* translates curriculum-based learning goals into play-based actions. Systems thinking becomes mapping and connecting; collaboration becomes building on another child's move; adaptation becomes changing direction according to the shared game situation; and ecological awareness becomes recognizing relationships between natural elements. These skills are not taught separately from the game, but are practised through the act of playing.

The value of *Growing Minds* also lies in how it changes the learning relationship between children, peers, teachers, and the environment. Children are not positioned only as receivers of information; they are learners who become explorers, contributors, and co-builders of the learning process. The teacher's role also shifts from being the only source of knowledge to becoming a guide who supports observation, discussion, group decision-making, and reflection. In this way, *Growing Minds* offers teachers a structured but flexible tool for introducing sustainability-related learning through visual materials, group missions, nature-based tasks, and curriculum-related themes.

7. Conclusion

This paper examined *Growing Minds* as a practice-based case study showing how co-design with children can support the development of sustainable educational tools for early childhood education. The project began with secondary research on sustainable education, play-based learning, participatory design, and game-based learning, which helped define the main learning goals and skill areas of the game. These included collaboration systems thinking, adaptation, problem-solving, ecological awareness, sensory engagement, and self-driven learning [12], [13], [15], [16].

The field observations and prototype testing showed that children engage more meaningfully with environmental concepts when learning is connected to action, movement, visual references, peer interaction, and direct experience with nature. The process also revealed several gaps within conventional educational settings. Children often needed stronger support in connecting abstract concepts, working collaboratively, understanding ecological relationships, and acting with confidence without depending only on teacher confirmation. These findings support the idea that sustainability education should not be limited to transmitting information, but should create situations where children can practise responsibility, cooperation, observation, and decision-making through active learning experiences [1], [3], [15], [16].

Through the development of *Growing Minds*, these educational needs were translated into play-based actions. Collecting natural elements, creating shared maps, building on peers' decisions, asking questions, and adapting to the direction of the game changing constantly allowed children to experience learning as a social and exploratory process. In this way, the game made skills such as collaboration, systems thinking, communication, and problem-solving visible through play. Co-design was therefore not only a method for improving the game, but also a way of understanding how children learn and what educational structures can better support them [7], [8].

The study suggests that play-based educational tools can support both children and teachers. For children, *Growing Minds* offers a way to explore sustainability through curiosity, movement, peer learning, and shared discovery. For teachers, it provides a structured but flexible tool for introducing environmental themes through classroom, garden, or outdoor activities. The teacher does not remain the only source of knowledge; instead, the game creates a learning environment where children can observe, discuss, test, compare, and learn from one another. This reflects the value of social learning, participatory learning, and game-based engagement in early education [3], [12], [13], [14].

Overall, *Growing Minds* demonstrates that sustainable education can become more meaningful when it is designed through children's participation and translated into concrete, collaborative, and playful actions. While this study does not claim to measure long-term behavioural change, it shows how field observation and co-design can reveal important educational needs and transform them into practical learning experiences. Future development of the project could include further testing in different school contexts, closer collaboration with teachers, and longer-term observation of how play-based tools support children's ecological understanding and participation over time.

ICT in Education

Young Learners and AI: Deciding When to Bot

Tatiana Kozlova

Sapienza University of Rome, Italy

Abstract

The AI-powered technologies, and chatbots in particular, are increasingly promoted as solutions to enduring challenges in English language teaching (ELT). While these tools are often praised for their capacity to deliver interactive and personalised learning experiences alongside traditional instruction, their rapid uptake in educational contexts has outpaced critical reflection on pedagogical readiness. The growing imperative to adopt AI raises fundamental questions about whether teachers and learners are sufficiently prepared - linguistically, cognitively, and emotionally - to engage productively with such technologies. Rather than assuming that earlier exposure is inherently beneficial, this study interrogates when *and* how *AI should be introduced to support meaningful language learning. Drawing on an on-site empirical investigation, the study examines the use of AI in English-medium Content and Language Integrated Learning (CLIL) classrooms, focusing on history and art in a bilingual school in Rome, Italy. It analyses interactions between primary (Grade 5) and lower secondary (Grades 6–7) students and AI-based tutoring tools on the SchoolAI platform. Through qualitative analysis of student–chatbot exchanges, the research critically explores how learners negotiate meaning with AI, revealing both the pedagogical affordances and the constraints of AI-mediated interaction in ELT settings. The presentation situates the study within current debates on AI in language education, challenging techno-optimistic narratives by foregrounding classroom realities. It outlines the research methodology and key findings, supported by illustrative excerpts from student-AI interactions, and concludes with a critical reflection on the implications for curriculum design and teacher decision-making*

Keywords: *AI in Education; CLIL; AI-powered tutors; Student-AI interaction; Personalised learning; Educational technology*

1. Introduction

The rapid integration of artificial intelligence into education has generated both enthusiasm and unease. AI-powered tools, especially chatbots, are increasingly framed as solutions to persistent pedagogical challenges, including learner autonomy and motivation, personalised feedback and scalable support [5], [6], [8], [20]. In English Language Teaching (ELT) and Content and Language Integrated Learning (CLIL) contexts, such technologies are often positioned as especially valuable, offering learners additional conversational practice and linguistic scaffolding while engaging with subject-specific content [1], [14].
However, the pace of technological adoption has arguably outstripped critical pedagogical reflection and there remains a lack of empirical research on the use of chatbots in ELT [16]. While AI tools are widely promoted as enhancing learning outcomes, less attention has been paid to the interaction process itself in order to understand whether these tools are genuinely pedagogically appropriate for young learners. Some concerns have already emerged regarding the standardisation of language, over-reliance on technology, data safety, ethics and responsibility [5]. This paper argues that the focus should shift from asking whether AI “works" for learning to investigating for whom, when and under what conditions it might be beneficial.
In Italy, the Guidelines for the Introduction of Artificial Intelligence in Educational Institutions recommend, while deploying AI in the support of students, to "take into account the different levels of development related to age" [15, p. 21]. This raises a central question: when are learners developmentally, linguistically and cognitively ready to benefit from AI-mediated interaction. Is it appropriate to introduce AI in primary school or is it preferable to wait until lower secondary school?
This study addresses this question through an empirical investigation conducted in a bilingual school in Rome, Italy. Focusing on primary (Grade 5) and lower secondary (Grades 6-7) CLIL classrooms, the research examines how learners interact with AI-powered tutors on the SchoolAI platform. Rather than evaluating AI solely in terms of efficiency or accuracy alone, the study adopts Vygotsky’s sociocultural perspective [17], [18] to explore the nature of artificial mediation and how meaning is negotiated in student-AI interaction. By analysing authentic classroom exchanges between learners and AI systems,

this paper seeks to move beyond techno-optimistic narratives and instead foreground the complexities of AI integration in real educational contexts with young learners. It argues that the effectiveness of AI in ELT is not determined solely by technical capability but by learners' developmental readiness and the pedagogical frameworks within which these tools are embedded.

2. Literature Review and Theoretical Framework

2.1 Growth of AI in Contemporary ELT Discourse

Recent large-scale research syntheses [7], [9], [13] confirm both the growth and diversification of AI implementation in second language education. A systematic review of AI-driven chatbots in this field [7] highlights an increase in empirical studies since 2020, reflecting the growing institutional and commercial interest in AI-supported learning environments. These tools are frequently associated with affordances such as increased learner autonomy and motivation, real-time feedback and extended opportunities for practice beyond the classroom [20].
At the same time, meta-analytic evidence [13], [19] provides a more detailed picture of their impact. In a comprehensive meta-analysis of chatbot-assisted language learning, Wang *et al.* [19] report a moderate positive effect on language learning performance (g=0,484), based on 70 effect sizes across 28 studies. However, the analysis also identifies substantial variability across contexts, suggesting that effectiveness is contingent on multiple interacting factors, including learner characteristics and instructional design. Following this line of reasoning Lyu *et al*. [13, p. 834], suggest that "a more refined perspective is needed when discussing the benefits of the use of chatbots in language learning process".

2.2 Evidence of Effectiveness

While a growing body of research report generally positive outcomes associated with chatbot use, these findings must be interpreted with caution. The meta-analysis by Wang *et al.* [19] demonstrates that chatbot-assisted learning can enhance language performance overall; however, the strength of this effect is moderated by several key variables, such as educational level, language level, interface design and interaction capability. This suggests that AI tools do not operate as universally effective pedagogical solutions but rather as context-dependent resources. Similarly, systematic reviews [7], [9], [13] emphasise that improvements are often observed in specific domains, particularly speaking, writing and listening, where opportunities for practice and immediate feedback are crucial. At the same time, these studies note that many empirical investigations are conducted in controlled or experimental settings, which may not fully reflect the complexities of real classroom environments.
A key limitation emerging from this body of research is its predominant focus on measurable outcomes, such as test scores or task completion, rather than on the processes through which learning occurs. In particular, relatively little attention has been paid to how developmental factors shape these interactions. As a result, claims regarding effectiveness often remain insufficiently grounded in an understanding of how learners actually use and interpret AI-generated input.

2.3 Chatbots as Interactional Tools

Within ELT, chatbots are frequently conceptualised as conversational partners capable of simulating authentic interaction. In their study Belda-Medina and Calvo-Ferrer [2] describe chatbots as AI-driven interlocutors that can engage learners in dialogue, thereby creating opportunities for communicative practice that might otherwise be limited in traditional classroom setting. This framing aligns with communicative and interactionist approaches to language learning, which emphasise the importance of meaningful interaction is developing linguistic competence.
However, the notion of chatbots as "partners" requires closer scrutiny. Unlike human interlocutors, AI systems do not possess genuine communicative intent. While they can generate contextually appropriate responses, these are ultimately based on algorithmic patterns rather that a shared understanding. As a result, interaction with chatbots may differ qualitatively from human interaction, particularly in terms of feedback and co-construction of meaning. This distinction becomes especially relevant when considering younger or less proficient learners whose limited metapragmatic and critical awareness may render them especially susceptible to forms of semiotic regulation embedded in AI-mediated discourse.

2.4 The CLIL Context and AI Integration

The application of AI in CLIL contexts remains relatively underexplored, despite its potential relevance. CLIL environments which integrate content and language learning, place additional cognitive and linguistic demands on learners, making them a particularly interesting site for examining the role of AI-mediated support.
Existing studies on AI chatbots in CLIL settings indicate that such tools can support both content comprehension and language development by providing explanations, prompts and feedback tailored to subject-specific tasks [1], [14]. However, these studies tend to focus primarily on the design and affordances of AI systems rather than on the process of their actual use in classroom interaction.The extent to which AI can effectively scaffold this dual demand remains unclear, particularly for young learners whose cognitive and linguistic resources are still developing.

2.5 Critical Gap

Despite the growing body of research on AI in ELT. Several critical gaps remain. First, there is a notable lack of attention to developmental factors. While studies such as Wang et al. [19] identify educational level as a moderating variable, few investigations explicitly examine how learners' cognitive, linguistic and metacognitive readiness shapes their ability to engage productively with AI systems. This is particularly important in research involving young learners. Where developmental differences may significantly influence interactional outcomes.
Second, much of the existing literature is not grounded in sociocultural approaches to learning. Drawing on Lev Vygotsky's work, learning is understood as a mediated process that occurs through interaction with more knowledgeable others within the learner's Zone of Proximal Development. From this perspective, the effectiveness of any instructional tool, including AI, depends on its capacity to provide appropriate scaffolding. However, current research rarely interrogates whether chatbots can genuinely function as mediational agents comparable to human interlocutors. This concern stems from sociocultural approaches to language learning [10], [11] [12], which argue that language development emerges through socially situated interactions rather than through exposure alone, placing a particular emphasis on the quality of interaction
Finally, there is a lack of fine-grained classroom discourse analysis. Much of the literature relies on quantitative measures or self-reported data, offering limited insight into the micro-level dynamics of student AI-interaction. As a result, important questions remain unanswered: How do learners formulate queries to AI? How do they interpret and respond to AI generated feedback? To what extent do these interactions support or hinder the negotiation of meaning?
Addressing these gaps requires a shift in focus from outcomes to processes and from technological affordances to pedagogical realities. The present study responds to this need to examining student-AI interaction in CLIL classrooms through a sociocultural lens, with particular attention to developmental readiness and the conditions under which AI can meaningfully support learning.

3. Methodology

The study adopts a qualitative classroom-based design, which focuses on interactional process. A qualitative approach was selected because the study attempted to understand not simply whether AI "works" but how AI-mediated interaction unfolds in authentic educational setting. The participants interacted with AI-tutors once a week for 30 minutes during four weeks in November, the school year 2025-2026.
Data were analysed using reflexive thematic analysis [3], [4], in which recurring interactional patterns and learner behaviours were identified across the dataset. MAXQDA software was used to facilitate coding and codes were subsequently grouped into broader analytical themes reflecting the affordances and limitations of AI-mediated interaction within CLIL environments.
The analysis was informed by a sociocultural theory [17], [18] and its application in second language development [10], [11] [12], Consequently, coding focused on themes related to mediation, scaffolding, meaning negotiation and interaction within the ZPD.
The analysis proceeded through six recursive phases:

1. Familiarisation with the data;
2. Initial coding of student -AI interactions:
3. Identification of recurring interactional patterns, mediation episodes, misunderstanding, scaffolding, prompt formulation strategies;

4. Development and refinement of themes;
5. Thematic interpretation in relation to sociocultural theory;
6. Final synthesis in relation to sociocultural theory.

Rather than examining interaction solely at the linguistic level, the analysis aimed to understand how learners engaged with AI tutors during CLIL tasks and how developmental readiness influenced the quality of interaction.

3.1 Research Context and Participants

The study was conducted in a bilingual school in Rome where English is used as a medium of instruction for selected CLIL subjects. The participants included 36 students from one primary (Grade 5) and two lower secondary classrooms (Grades 6 and 7), representing learners between 9 and 13 years of age. Their linguistic level was from A1 to B1.

3.2 AI Platform and Learning Tasks

Students interacted with AI history tutor and AI art tutor on School AI platform during classroom activities designed by the teacher. The chatbot platform was used to support content exploration, answer questions, provide explanation and assist learners in completing subject related tasks in English.
Activities included asking chatbot for explanation of historical or artistic concepts, summarising information, generating ideas and clarifying vocabulary. The AI tool functioned as a supplementary instructional resource rather than a replacement for teacher-led interaction.

3.3 Data Collection

Data were collected over four classroom sessions through chat logs, classroom observation notes and focus groups. The primary dataset consisted of chat logs. These transcripts, which documented exchanges between learner and the chatbots, allowed for closer examination of how students formulated prompts, interpreted AI responses and interactional dynamics that emerged from that. Classroom observations were used to contextualise the interactional data by recording learner behavior, moments of confusion, patterns of engagement and teacher intervention during activities. Focus groups were used to clarify the learners' perception of these activities.

4. Findings and Analysis

The analysis of the chat logs reveals a significant mismatch between AI conversational design and young learners' developmental readiness within CLIL environments. Several recurring themes emerged from the data.

4.1 AI Sustains Interaction but Not Necessarily Learning

One of the most prominent findings concerns the chatbot's strong ability to sustain interaction. The AI consistently maintained conversations, redirected students and prolonged engagement; however, these interactions often became disconnected from curricular objectives.
For example:
Student: "do you like pizza"
AI tutor: "How do you think simple pleasures… can be likened to art?"
Student: "do you like spaghetti"

Although the interaction continued linguistically, it drifted pedagogically away from CLIL goals. Conversational continuity was therefore frequently mistaken for meaningful educational engagement.
This illusion of "meaningful dialogue" appeared repeatedly throughout the dataset. The chatbot generated sophisticated, coherent and reflective responses, yet learners often did not engage with the conceptual content, ignored reflective prompts, shifted topics rapidly and produced minimal responses.
For example**:**
Student: "do you like tik tok "
AI tutor: "I appreciate the curiosity and creativity it inspires. How do you think artists can use it to share their creations? "
Student: "tik tok on the clock nanana youuu youuu"

These patterns suggest surface-level interaction rather than negotiated meaning. Interpreted through the lens of Sociocultural Theory, the findings indicate that interaction alone does not necessarily guarantee mediation or learning.

4.2 Developmental Readiness and Prompting Ability

The data also suggest that productive AI interaction depended significantly on learners' metacognitive and communicative maturity. Older or more reflective learners were more likely to sustain topics, elaborate ideas, engage conceptually and connect disciplines. By contrast, younger or less focused learners tended to test boundaries, ask random or highly social questions, produce fragmented prompts or disengage from the educational framing of the activity. These findings indicate that developmental readiness strongly influenced the quality and educational value of AI-mediated interaction.

4.3 Redirection

Another recurring theme concerns the AI's capacity for unlimited patience and continuous redirection. The chatbot never rejected interaction, when deviations from the topic occurred it reframed conversation educationally and persistently redirected students toward reflective discussion.
Examples of inappropriate or off-task behaviour by pupils that required redirection included profanity, nonsense text, trolling behaviour and repetitive off-task questioning. Nevertheless, the AI continually attempted to redirect students toward topics related to art, history, creativity, or reflection. This characteristic created a low-anxiety environment that encouraged participation and emotional safety. However, while this persistence represents an important affordance, the AI was unable to meaningfully distinguish between productive engagement and merely performative participation.

4.4 Teacher Mediation Remains Crucial

The need for teacher mediation emerged consistently across all interactions. The AI could not accurately assess understanding, frequently overestimated engagement, rewarded superficial participation and repeatedly generated generic reflective prompts. Furthermore, the automated summaries generated for teachers often described students as demonstrating "high engagement", "interdisciplinary thinking " or "apprentice artist" qualities, even in cases where students trolled, avoided the task, disengaged, demonstrated misunderstanding. AI-generated evaluations therefore frequently interpreted conversational participation as evidence of conceptual learning. These findings reinforce the continued necessity of teacher interpretation, scaffolding and more fine-grained assessment within AI-supported learning environment.

4.5 Productive Moments of AI-Mediated Learning

Despite these limitations, the data also contained several productive moments of AI-mediated learning. In such cases, the AI successfully sustained exploratory dialogue and encouraged interdisciplinary thinking. However, these successful interactions generally occurred when learners already possessed conversational stamina, reflective capacity and were genuinely interested in the topic.
Another significant affordance concerned multilingual learners. In several interactions, students communicated using imperfect English, occasional code-switching, and simplified grammatical structures, yet they were still able to sustain lengthy intellectual conversations because the AI adapted flexibly and nonjudgmentally without harsh correction.
These findings suggest that conversational AI may reduce anxiety for language learners by providing interaction that is patient, responsive and supportive.
Additionally, students frequently used the AI not only for factual discussion but also for emotional reflection. This tendency became particularly evident in some students, where conversations during art-related discussions evolved into topics such as anger management, emotional expression through painting, colour psychology and self-image.
For example, the student stated:
"I tried to paint to let my anger out and it WORKED!"
This is significant because it demonstrates the AI functioning not merely as an informational tool, but also as an emotional mirror and reflective conversational partner. Such interactions suggest the potential for AI-mediated dialogue to extend beyond factual learning into deeper forms of personal reflection and self-expression.

Discussion

From a socio-cultural perspective, the findings suggest that the AI frequently failed to operate effectively within learners' Zone of Proximal Development (ZPD), generating lengthy philosophical inquires that did not resonate with young learners. Although the chatbot maintained continuous interaction and generated sophisticated reflective prompts, these prompts often exceeded learners' developmental readiness and communicative capacity. As a result, students frequently ignored questions, shifted topics abruptly or disengaged from conceptual exploration.
Unlike human teachers, the AI was unable to dynamically recognise misunderstanding, confusion, or cognitive overload in ways that could meaningfully adjust the interactional trajectory. Instead, conversational persistence frequently replaced genuine scaffolding. The chatbot continued producing elaborated reflective responses regardless of whether learners demonstrated comprehension, conceptual engagement or readiness to sustain the discussion. This finding is significant because socio-cultural theory emphasises that learning occurs not through interaction alone, but through appropriately mediated interaction within the learner's developmental capacity. In many cases within the dataset, the AI maintained linguistic participation without successfully supporting conceptual progression. Consequently, the interaction often simulated educational dialogue without fully achieving scaffolded learning.

Conclusion

The findings therefore suggest that conversational AI currently lacks the adaptive pedagogical sensitivity required to consistently function as an effective scaffold within learners' Zone of Proximal Development, particularly for younger learners or students with limited metacognitive and communicative maturity. The older the learners are the more likely they are to benefit from the interaction with AI. While AI may support low-anxiety interaction, exploratory dialogue and sustained conversational participation, human teacher mediation remains essential for recognising learner readiness and transforming interaction into meaningful educational development.

From Automation to Augmentation: Teaching AI Literacy in Media and Design Education

Peggy Bloomer

Central Connecticut State University, United States

Abstract

The rapid evolution of generative artificial intelligence since 2023 has fundamentally altered creative practice, educational expectations, and professional standards in Media and Design fields. AI tools have moved beyond experimental novelty to become embedded within everyday creative workflows, reshaping how designers ideate, prototype, iterate, and evaluate visual work. This paper argues that Media and Design education must respond by teaching AI literacy as a studio-based, ethical, and skill-driven practice—shifting emphasis from automation toward augmentation rather than replacement.
Grounded in studio pedagogy and Scholarship of Teaching and Learning (SoTL) frameworks, the paper examines how AI can be integrated into hands-on assignments, iterative design sprints, and critique-based learning. In this model, students engage AI systems as collaborative tools for exploration and variation while retaining human authorship, conceptual control, and critical judgment. Key competencies include prompt design, evaluative and strategic decision-making, ethical reasoning around bias and authorship, and fluency with industry-standard AI-enabled software. These skills are increasingly essential for career advancement, as the creative job market favors designers who can combine human creativity with intelligent systems rather than compete against them.
The paper also addresses persistent pedagogical and institutional challenges, including uneven access to technology, gaps in AI literacy among students and faculty, technical limitations of current tools, and the lack of clear ethical and academic guidelines. By embedding experimentation, reflection, critique, and ethical inquiry into studio workflows, Media and Design programs can transform AI from a disruptive force into an inclusive and professionally relevant learning resource. Teaching AI as an augmentative creative partner prepares students to adapt to rapidly changing industry conditions while sustaining reflective, ethical, and human-centered design practice.

Keywords: *AI literacy, studio pedagogy, generative artificial intelligence, design education, human–AI collaboration, ethical design practice.*

1. Introduction

The rapid emergence of generative artificial intelligence since 2023 has intensified ongoing transformations within Media and Design education, reshaping creative workflows, professional expectations, and classroom practices. While digital tools have long influenced design production, recent AI systems differ in both scale and integration. Image generators, large language models, and AI-assisted creative software are now embedded directly within ideation, prototyping, editing, and production environments, altering how students and professionals approach visual communication and creative labor. At the same time, these developments have emerged alongside broader institutional shifts shaped by the lingering effects of pandemic-era remote learning, growing attention to equity and decolonization within curricula, and increasing pressure for career-oriented technological adaptation within higher education.
These converging conditions have produced a significant pedagogical tension within Media and Design programs. On one hand, institutions and industries increasingly emphasize acceleration, efficiency, automation, and rapid technological adoption. On the other hand, studio-based design education has historically depended upon slower forms of reflective practice grounded in critique, iteration, experimentation, and material inquiry [13]; [6]. As generative AI tools become normalized within creative industries, educators face the challenge of integrating emerging technologies without reducing design education to software training or automated production.
This paper argues that the design studio can function as a system boundary that mediates between accelerating technological infrastructures and enduring disciplinary practices. Rather than treating AI as either a threat to creativity or a neutral productivity tool, the paper positions studio pedagogy as a critical environment for teaching students how to engage AI systems reflectively, ethically, and strategically. In

this model, generative AI operates not as a replacement for creative labor, but as an augmentative tool within iterative and critique-based learning processes.
Grounded in studio pedagogy and Scholarship of Teaching and Learning (SoTL) frameworks, the paper examines how AI literacy can be integrated into hands-on design assignments, collaborative critique, and process-oriented workflows [13]; [6]. Drawing from classroom-based approaches in Media and Design education, the discussion focuses on how students use AI systems for ideation, variation, and experimentation while maintaining human authorship, evaluative judgment, and conceptual control. By framing AI literacy as a reflective and ethical studio practice rather than solely a technical competency, the paper proposes a transferable pedagogical model for integrating generative AI into creative disciplines while sustaining human-centered approaches to design education [14].

2. Educational Transformation Across Time

Studio-based learning has long occupied a central role in Media and Design education, emphasizing iterative making, critique, experimentation, and reflection as core components of creative practice. Rather than treating knowledge as something transmitted primarily through lecture or standardized instruction, studio pedagogy positions learning as an active and situated process shaped through dialogue, revision, and material engagement. Schön's concept of the "reflective practitioner" describes design education as a process of reflection-in-action, in which students develop understanding through cycles of making, testing, and revising within complex problem spaces [13]. Similarly, Cross argues that design disciplines cultivate distinct "designerly ways of knowing" grounded in synthesis, visualization, and iterative inquiry rather than linear problem-solving alone [6].

2.1 The Critique as a Reflection Point

At the center of studio pedagogy is critique culture, which functions as both a teaching method and a social structure within design education. Critique encourages students to articulate decisions, evaluate alternatives, and situate their work within broader cultural and communicative contexts. At the same time, contemporary scholarship has increasingly examined the limitations and inequities embedded within traditional critique models, particularly around authority, hierarchy, accessibility, and student vulnerability. Recent approaches to design education have therefore sought to reframe critique as a more collaborative, reflective, and inclusive process rather than a purely evaluative performance.
These conversations intensified during and after the COVID-19 pandemic, which forced rapid shifts toward remote and hybrid learning environments across creative disciplines. The pandemic disrupted assumptions about the physical studio as the singular site of design education and prompted broader reconsiderations of pedagogical space, participation, and technological mediation. Digital collaboration tools, asynchronous workflows, and online critique environments became normalized within many programs, expanding how studio interaction could occur while also revealing inequalities in access to technology, workspace, and institutional support. As a result, post-pandemic design education increasingly operates within hybrid conditions where physical and digital practices continuously intersect.

2.2 Generative AI Prompts as Inquiry

The rapid emergence of generative AI has introduced another layer of transformation within higher education discourse. Much of the initial response to tools such as ChatGPT and AI image generators focused on concerns surrounding plagiarism, academic integrity, automation, and assessment. However, more recent scholarship has shifted toward questions of integration, literacy, and critical use [11]; [10]. Rather than viewing AI solely as a threat to educational practice, scholars increasingly argue that students must develop the ability to critically interpret, evaluate, and direct AI systems within professional and creative contexts.
These discussions also connect to longer traditions of reflective and critical pedagogy. Dewey framed education as an experiential process grounded in inquiry, reflection, and active engagement with social conditions rather than passive information transfer [7]. Freire similarly emphasized education as a dialogic process in which learners critically examine systems of power and develop agency through participation and reflection [8]. Together, these frameworks reinforce the importance of pedagogical models that encourage critical engagement with technology rather than passive technological adoption. Current AI discourse often frames integration as adoption or resistance; this binary obscures how pedagogical space itself can function as mediation.

3. Conceptual Framework: The Studio as System Boundary

As generative AI becomes increasingly integrated into creative industries, Media and Design education faces pressure to adapt quickly to changing technological conditions. However, rapid adoption alone does not necessarily produce meaningful learning or critical engagement. Within this context, the design studio can be understood as a system boundary: a pedagogical space that mediates between accelerating technological infrastructures and the slower reflective processes associated with disciplinary learning, critique, and creative inquiry.

In accessible terms, a system boundary is not simply a barrier or point of separation. Instead, it is a space of negotiation and exchange where different forms of knowledge, practice, and decision-making interact. In the context of design education, the studio operates as a boundary between technological systems and human interpretation. Students encounter AI-generated outputs, algorithmic suggestions, and automated workflows, but these systems are filtered through critique, reflection, revision, and discussion. Rather than accepting technological outputs as neutral or authoritative, the studio creates opportunities to pause, evaluate, and contextualize them within broader creative, ethical, and communicative frameworks [13].

This pedagogical approach requires interruption as a deliberate educational stance. Contemporary AI systems often prioritize speed, optimization, and efficiency, encouraging users to move rapidly from prompt to output with minimal reflection. Design education, however, has historically emphasized slower forms of inquiry grounded in process, experimentation, and iteration. Within the studio, interruption functions not as resistance to technology itself, but as a method for creating reflective distance from automated systems. Critique sessions, process documentation, revision cycles, and collaborative discussion all interrupt the immediacy of AI production by requiring students to explain choices, assess outcomes, and reconsider assumptions [7]; [8].

3.1 Generative AI Automation versus Augmentation

This distinction is particularly important in conversations surrounding automation and augmentation. Automation often frames AI as a mechanism for replacing or streamlining human labor, reducing creative practice to efficiency and output. Augmentation, by contrast, positions AI as a tool that expands exploratory capacity while maintaining human judgment, authorship, and responsibility. In this model, AI does not eliminate the need for disciplinary expertise; instead, it increases the importance of interpretation, evaluation, and intentionality within creative workflows [14]; [12].

3.2 Encouraging Technological Fluency

Three pedagogical shifts help support this framework within Media and Design education. The first is the development of slow technological fluency. Students must learn not only how to operate AI tools, but also how to critically engage them. This means moving beyond rapid prompt generation toward reflective experimentation, iterative refinement, and consideration of how systems shape outcomes. Slowing the interaction process encourages students to recognize patterns, limitations, biases, and inconsistencies that may otherwise remain invisible within highly automated workflows [11].

3.3 Using Disciplinary Knowledge to Support AI Practice

The second shift involves reinserting disciplinary knowledge into AI-supported practice. Generative systems can quickly produce visual variation, but they do not replace foundational knowledge of typography, composition, hierarchy, accessibility, rhetoric, or audience. Without disciplinary grounding, students risk treating AI outputs as finished solutions rather than starting points for critical development. Studio pedagogy therefore remains essential because it situates technological experimentation within broader histories, methods, and principles of design practice [6].

3.4 Making Process Visible

The third shift focuses on making processes visible. Traditional studio education often emphasizes sketches, drafts, critique notes, and iterative development as evidence of learning. AI-supported workflows require similar forms of transparency. Process documentation, reflective writing, prompt iteration records, and collaborative critique help students articulate how decisions were made and how

technological systems influenced outcomes. Making process visible reinforces accountability, strengthens critical reflection, and shifts evaluation away from polished outputs alone [9].
Viewed through this framework, the studio does not function as a site of technological resistance or passive adoption. Instead, it becomes a mediating space where students learn to critically navigate AI systems while sustaining reflective, ethical, and human-centered approaches to creative practice.

4. Case Study: Writing in the Discipline Studio Implementation

The conceptual framework outlined above was implemented within an undergraduate Writing in the Disciplines (WID) course in Graphic/Information Design focused on research, visual communication, and process-oriented studio practice [3]. The course was developed as part of a broader curricular effort to strengthen discipline-specific writing, multimodal communication, and research literacy within design education. Structured around the production of a 2,500–3,000-word research monograph paired with a professionally designed printed and digital publication, the course positioned writing, research, and visual communication as interconnected rather than separate practices [3]. Rather than functioning as a technical AI training environment, the course operated as a studio-based learning space in which students critically examined how generative AI systems influence design research, ideation, writing, and visual development. This approach aligns with scholarship emphasizing reflective and experiential learning within design education [13]; [6].
The course structure emphasized iterative development through proposal writing, annotated bibliographies, peer review workshops, visual integration exercises, and staged draft revisions distributed across a sixteen-week sequence [3]. Students progressed from topic development and literature review into qualitative research methods, visual analysis, drafting, revision, and final monograph production using Adobe InDesign. The curriculum intentionally framed design students as reflective practitioners capable of producing original disciplinary scholarship rather than simply visual artifacts.
A central component of the course involved collaboration with university librarians and research support staff, an approach also connected to a curriculum development initiative focused on sustainable research access and library-integrated design pedagogy. Within the course, librarian collaboration emphasized information literacy, source evaluation, citation practices, and ethical research methods alongside AI-supported creative production. Students were introduced to generative AI systems within the broader context of research methodologies rather than as isolated productivity tools. Librarian-led instruction focused on distinguishing scholarly research from unverifiable AI-generated summaries, identifying bias within generated outputs, and evaluating the credibility of visual and textual information sources. This reinforced the idea that AI literacy requires contextual interpretation and critical inquiry rather than simple technical proficiency [11]; [10].

4.1 The AI Engagement Protocol

To support reflective engagement, the course adopted an AI engagement protocol that structured how students incorporated generative systems into assignments. Students documented when and how AI tools were used throughout their process, including prompt construction, generated outputs, revisions, and evaluative decisions. Rather than prohibiting AI use or permitting unrestricted automation, the protocol positioned AI systems as collaborative tools subject to critique and revision. This approach shifted emphasis away from whether AI was used toward how students interpreted, refined, and contextualized generated material within disciplinary frameworks.
Prompt documentation became a particularly important pedagogical practice. Students maintained process logs containing prompts, screenshots, revision notes, and short reflections explaining why certain outputs were selected, revised, or rejected. These process records functioned similarly to sketchbooks or design journals traditionally used within studio education. By making AI interaction visible, students were encouraged to recognize how prompt specificity, typographic direction, audience framing, and iterative refinement shaped generated results. Documentation also exposed recurring limitations within generative systems, including repetitive visual conventions, inaccuracies, and formulaic stylistic tendencies. This emphasis on process transparency reflects broader calls for human-centered AI engagement and accountability within creative workflows (Shneiderman; [9].
Critique sessions were also restructured to accommodate AI-supported workflows. Traditional studio critiques often prioritize final visual outcomes; however, projects involving generative systems required greater attention to process transparency and evaluative reasoning. During critiques, students presented not only finished work but also process documentation, prompt iterations, failed outputs, and

revision strategies. Peer discussion focused on how AI-generated material was interpreted, modified, and integrated into broader design objectives rather than simply evaluating technical polish. In this sense, critique functioned as a form of reflective inquiry consistent with Dewey's experiential learning framework and Freire's dialogic model of education [7]; [8].

4.2 Evaluating AI in Assessment Rubrics

Assessment criteria similarly prioritized transparency, revision, and critical reflection alongside final project quality. Course rubrics evaluated research focus, argument development, revision practices, citation ethics, peer critique participation, and visual integration rather than polished production alone [4]. Students were assessed on their ability to identify limitations within generated outputs, revise material through disciplinary principles, and articulate the reasoning behind design decisions. This process-oriented structure responded directly to broader concerns surrounding automation and the changing role of creative labor within AI-supported industries [1].

One assignment required students to develop a design research proposal connected to a final monograph project [3]. A student initially used a broad AI prompt requesting "a modern sustainability poster for college students," which produced visually polished but generic imagery reliant upon predictable environmental symbolism. Through critique, research integration, and revision, the student refined the prompt to specify audience, rhetorical goals, typographic hierarchy, and accessibility considerations while incorporating scholarly sources on sustainable communication design. In a reflective process statement, the student observed that the revision process revealed how strongly generative systems defaulted toward familiar visual clichés unless directed through more intentional design reasoning. The assignment therefore shifted attention away from rapid image production toward evaluative and conceptual development rather than technical novelty alone [12].

Viewed collectively, these pedagogical strategies positioned AI literacy as a reflective studio practice rather than a purely technical competency. The course framework did not treat AI as either a replacement for design education or a tool to be excluded from the classroom. Instead, the studio functioned as a mediating environment where students learned to critically navigate AI-supported creative systems through documentation, critique, revision, and disciplinary inquiry.

5. Discussion: Conserving What Works

The rapid integration of generative AI into higher education has often been framed through narratives of disruption, acceleration, and institutional transformation. Within these discussions, design education is frequently positioned as either resistant to technological change or obligated to rapidly adapt to emerging industry standards. However, the case study presented here suggests that meaningful innovation does not require abandoning longstanding pedagogical structures within studio education. Instead, many of the practices historically associated with studio learning—including critique, iterative development, reflection, research documentation, and collaborative inquiry—remain essential for navigating AI-supported creative environments.

5.1 AI Integration into Studio Pedagogy

Studio pedagogy has historically emphasized dialogue, process, and evaluative judgment rather than purely technical production [13]; [6]. These characteristics become increasingly important within AI-supported workflows where systems can rapidly generate polished visual outputs, written summaries, and compositional variations with minimal effort. Without reflective structures, students may begin to equate speed with quality or automation with expertise. The Writing in the Disciplines course discussed in this paper intentionally resisted this tendency by embedding AI interaction within slower cycles of drafting, peer critique, process documentation, revision, and research-supported argumentation [3]. Students were required not simply to generate outputs, but to explain how and why particular decisions were made, what revisions occurred, and how disciplinary principles informed the final work.

Within this framework, critique culture functioned as a stabilizing pedagogical force rather than an outdated educational tradition. In the AI-supported studio, critique became a mechanism for slowing technological acceleration long enough for reflection and interpretation to occur. Peer review sessions, prompt analysis, process journals, and revision workshops interrupted the immediacy often encouraged by generative systems. Rather than treating AI outputs as inherently innovative or inherently invalid, students examined how generated material related to audience, accessibility, rhetorical intent, visual hierarchy, and ethical communication practices. This reflects Dewey's understanding of education as

reflective inquiry grounded in experience and Freire's emphasis on dialogue as a critical educational process [7]; [8].
The case study also demonstrates that the spatial and social dynamics of studio education remain highly significant within AI-era learning environments. While post-pandemic educational discourse often emphasizes flexibility, remote access, and digital integration, the collaborative structure of the studio continues to shape how students learn from one another through observation, discussion, and shared experimentation. The WID course integrated librarian collaboration, peer workshops, and collective critique sessions not simply as supplementary activities, but as central components of the pedagogical model [3]. Students learned to negotiate AI-supported creative processes collectively, comparing outputs, discussing failures, and evaluating how technological systems shaped research and design decisions.
This emphasis on mediation also reframes boundary-setting as a form of institutional and pedagogical design. AI integration within higher education is frequently discussed in terms of permissibility or prohibition; however, the course model presented here suggests that the more productive question concerns how institutions structure technological engagement. Documentation requirements, transparency protocols, rubric-based assessment criteria, and process-oriented evaluation frameworks created conditions in which experimentation remained accountable to disciplinary learning outcomes [4]. These boundaries did not restrict creativity. Instead, they preserved spaces for reflection, revision, and critical inquiry within increasingly automated workflows.

5.2 The Importance of Technology, Space, and Social Interaction

Viewed more broadly, the studio operates not only as a pedagogical model but also as an architectural and institutional form that organizes relationships between technology, space, and social interaction. The design studio structures attention, collaboration, critique, and iterative development through both physical and institutional arrangements. In the context of generative AI, these structures become increasingly valuable because they maintain conditions in which human judgment remains central to creative practice. Conserving critique, reflective inquiry, and collaborative learning is therefore not a rejection of technological innovation, but a necessary strategy for ensuring that AI integration remains aligned with ethical, human-centered, and disciplinary forms of education [14]; [12].

6. Transferability Across Disciplines

Although this paper focuses on Media and Design education, the proposed framework is adaptable across a range of disciplines currently negotiating the rapid integration of generative AI into teaching and professional practice. The concept of the studio or classroom as a mediating system boundary is particularly relevant in fields where technological acceleration intersects with reflective, collaborative, and disciplinary forms of learning. Across these contexts, the framework emphasizes that AI literacy should not be reduced to technical proficiency alone, but integrated into pedagogical structures that support critique, interpretation, revision, and ethical inquiry [14]; [12].
In architecture education, studio culture has long emphasized critique, iterative development, and collaborative problem-solving. As AI-assisted visualization, modeling, and drafting tools become increasingly common, architectural studios face challenges similar to those emerging within design education. Maintaining critique-based inquiry and process transparency can help ensure that technological efficiency does not replace contextual reasoning, spatial analysis, or ethical decision-making. Architectural education has historically relied upon studio environments that combine technical experimentation with reflective discussion, making the field especially well positioned to adapt AI within existing pedagogical traditions rather than through purely technological acceleration.
Engineering education similarly benefits from approaches that balance technical fluency with reflective practice. While AI systems may support simulation, coding, optimization, and data analysis, engineering pedagogy continues to require forms of collaborative evaluation and human oversight that cannot be fully automated. Structured reflection and process documentation help students critically assess both the capabilities and limitations of AI-supported systems. In these contexts, reflective inquiry reinforces professional responsibility by encouraging students to consider not only whether systems function efficiently, but also how automated systems shape decision-making, public safety, and institutional accountability.

6.1 Including AI Workflows and Transparency into Documentation, Revisions, and Critiques

The framework also has implications for humanities education, particularly within seminar-based courses increasingly affected by large language models and AI writing tools. Rather than centering instruction solely around detection or prohibition, humanities classrooms can incorporate reflective documentation, revision analysis, and dialogic critique to help students examine authorship, interpretation, and the social implications of automated language production [7]; [8]. AI-supported writing environments raise important questions concerning originality, voice, and interpretation that align closely with longstanding humanities traditions centered on critical reading and reflective analysis.

6.2 Recognizing Ethical and Social Consequences of AI

In health, communication, and data-centered disciplines, AI literacy likewise requires more than technical competency alone. Students must learn to evaluate bias, interpret outputs critically, and understand how algorithmic systems shape professional decision-making and public outcomes [5]; [2]. This is particularly significant in fields where AI increasingly influences diagnosis, communication systems, predictive analytics, and institutional decision-making. Educational models that emphasize transparency, documentation, and collaborative evaluation can help students recognize the ethical and social implications embedded within technological systems rather than treating AI outputs as neutral forms of authority.

Across these disciplines, the proposed framework offers a transferable pedagogical model that positions reflective inquiry, transparency, collaborative critique, and process-oriented learning as essential components of ethical AI integration. Rather than advocating a universal technical solution, the framework encourages institutions to adapt existing disciplinary practices in ways that preserve human judgment, contextual interpretation, and collaborative learning within increasingly automated educational environments.

7. Conclusion: Ethical Augmentation as Educational Design

The rapid emergence of generative AI has intensified ongoing questions surrounding technology, labor, creativity, and educational practice across higher education. Within Media and Design disciplines, these transformations are particularly visible because AI systems now operate directly within the processes of ideation, visual production, communication, and critique. Yet the challenge facing educators is not simply whether AI should be adopted or resisted. Rather, the larger question concerns how educational structures can shape meaningful relationships between technological systems and human learning.

7.1 The Studio as a Technological Mediator

This paper has argued that studio pedagogy offers an important framework for addressing this challenge because it already contains practices capable of mediating technological acceleration through reflection, critique, and iterative inquiry. The studio functions not as a nostalgic holdover from pre-digital creative culture, but as an adaptive pedagogical environment in which emerging technologies can be critically integrated without abandoning disciplinary knowledge or human-centered approaches to learning. Longstanding studio practices—including process documentation, collaborative critique, revision cycles, and reflective discussion—remain essential precisely because generative AI systems increasingly privilege speed, automation, and frictionless production.

The proposed framework also suggests that teaching, theory, and technology evolve together rather than separately. AI literacy cannot be reduced to software proficiency alone because technological systems inevitably reshape how students understand authorship, expertise, labor, and creative judgment. As scholars of reflective and critical pedagogy have long argued, education is not simply the transfer of technical information but the cultivation of inquiry, interpretation, and ethical agency [7]; [8]. Within AI-supported creative environments, these capacities become even more important. Students must learn not only how to generate outputs, but how to question systems, evaluate assumptions, identify biases, and situate technological production within broader social and disciplinary contexts.

Within this framework, interruption emerges as a future-facing educational practice rather than an obstacle to innovation. Slowing workflows through critique, documentation, revision, and discussion creates opportunities for reflective engagement that highly automated systems often discourage. Interruption allows students to examine how AI systems structure decisions, reproduce conventions,

and shape creative possibilities. In this sense, reflective pause becomes a necessary condition for ethical technological engagement rather than a rejection of technological progress itself.

7.2 The Role of Educators and AI Practice

This perspective also reframes the role of educators within AI-era institutions. Educators increasingly function as boundary designers responsible for shaping the conditions under which technological systems enter learning environments. Decisions surrounding transparency, critique structures, documentation requirements, collaboration, and assessment are not secondary administrative concerns; they are forms of institutional and pedagogical design that determine how students engage emerging technologies. Establishing boundaries does not restrict innovation. Instead, boundaries create the reflective conditions necessary for experimentation, accountability, and meaningful disciplinary learning.

As generative AI continues to transform creative and educational environments, Media and Design programs are uniquely positioned to model forms of ethical augmentation that preserve human judgment while engaging technological change critically and constructively. The future of AI in education will not be determined solely by the capabilities of intelligent systems, but by the pedagogical structures through which those systems are interpreted, challenged, and made accountable within shared learning environments [14]; [12].

Acknowledgments

The development of the Writing in the Discipline course discussed in this paper was supported in part by a curriculum development grant from Central Connecticut State University.

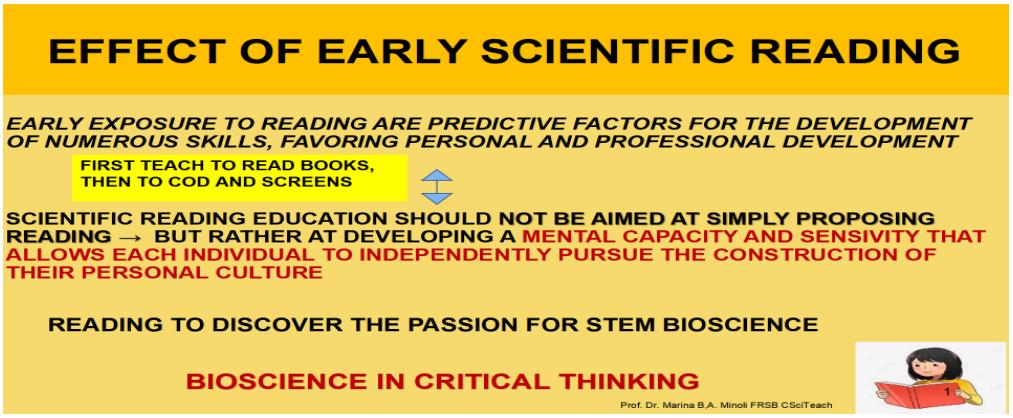
STEM Educational and Didactic Reading Paths with Reasoned AI Integration

Marina B.A. Minoli

Royal Society of Biology, United Kingdom
Biologists Order Federation - STEM DidaInnovaBioLab, EU



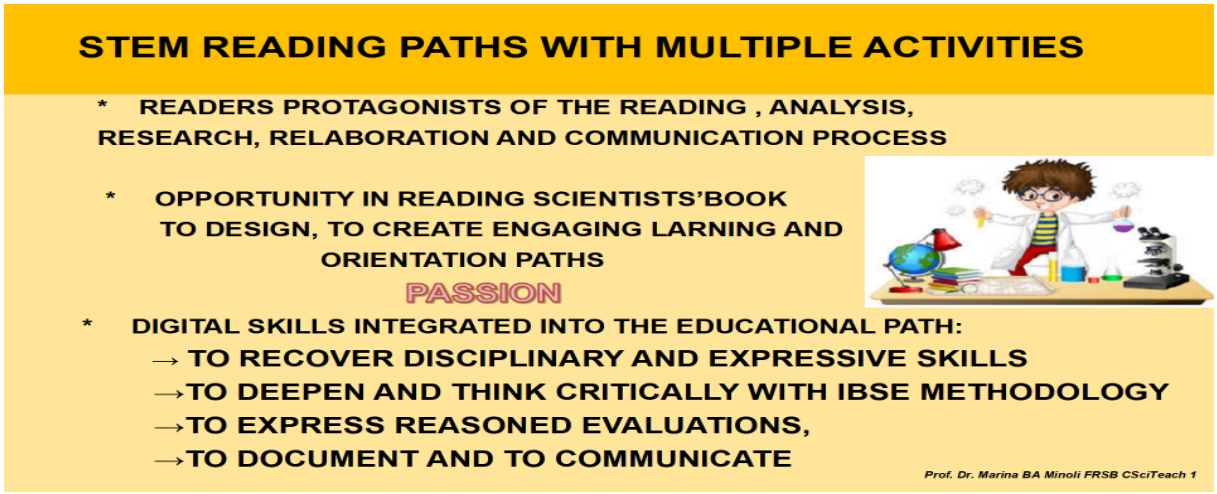
Abstract

The integration of artificial intelligence into STEM reading pathways represents a profound shift in how learners engage with scientific knowledge. Rather than replacing traditional reading practices, AI has the potential to expand and enrich them, transforming the act of reading into a more interactive, adaptive, and conceptually connected experience. Different STEM reading activities were realized at different education levels with the main objective to propose the passion of reading in critical thinking about some scientific discoveries. During the training sessions, detailed answers were provided to these questions: why to realize interdisciplinary book paths in the AI age, how to realize innovative STEM reading education at different levels; which interdisciplinary STEM reading activities with the protagonist reader at the center of the reading process. Some activities realized with the double role of "teacher-educator learning designer" and of "reader-learning designer" were presented during the 2025 virtual SEB Outreach Event. It was useful for the integration of AI as a cognitive mediator, offering contextual explanations, generating analogies and visualizing complex ideas. AI systems have contributed tailor reading pathways also to individual learners by adjusting complexity, suggesting supplementary materials, and identifying misconceptions. Reading thus becomes a dynamic process that evolves with the learner's needs and pace. At the same time, it is useful to strengthen interdisciplinary thinking, a core dimension of the STEM education. Reading paths with elements of AI, in our context of research and teaching, will be realized to promote future activities not just as technological aid, but as a catalyst for deeper engagement, intellectual autonomy, and innovative learning practices.

Keywords: *STEM Education; Teacher-learning designer; Student-Learning designer; STEM Books reading paths; AI in Critical thinking*

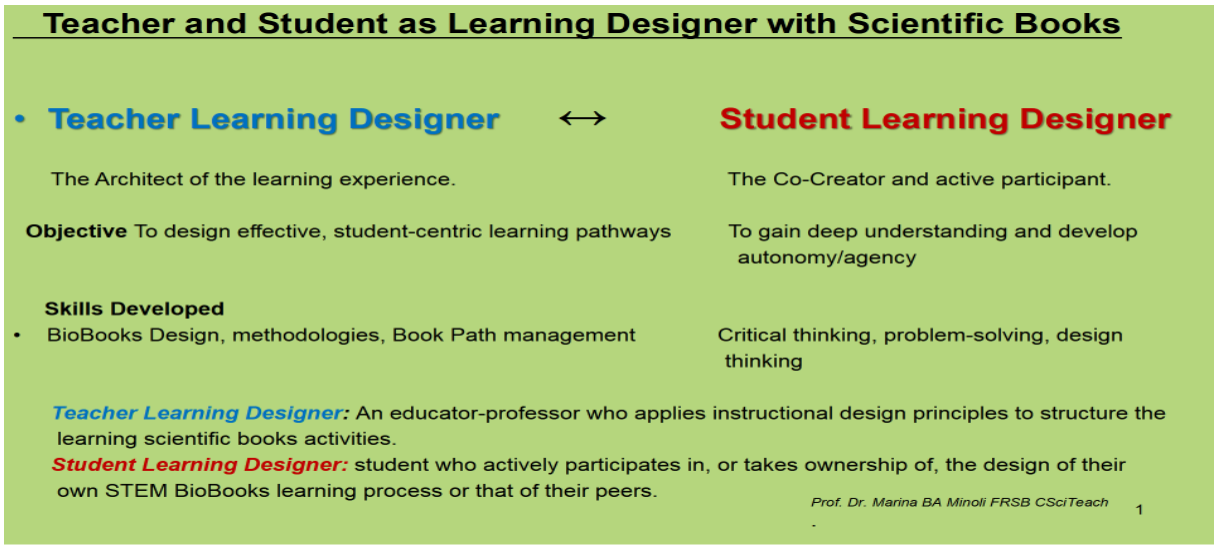
1. Introduction

The objective of all realized reading activities was to promote interest and passion for the STEM books and critical thinking skills, analyzing in particular the formative effects of an early habit of scientific reading as predictive factors of the development of numerous skills, favoring personal and professional development.
All didactic itineraries organized with high school's teachers and students were presented in two engaging virtual webinars, event disclosed on STEM Learning Centre, YORK; Royal Society of Biology, London; attracting a lot of interest with participants of different countries in the world. Event approved by Royal Society of Biology for 9 CPD points for continuing professional development.
The reading activities implemented across different contexts aimed to foster interest in STEM books and to develop critical thinking skills. Particular attention was given to the formative effects of early scientific reading as a predictor of multiple competencies relevant to personal and professional development.



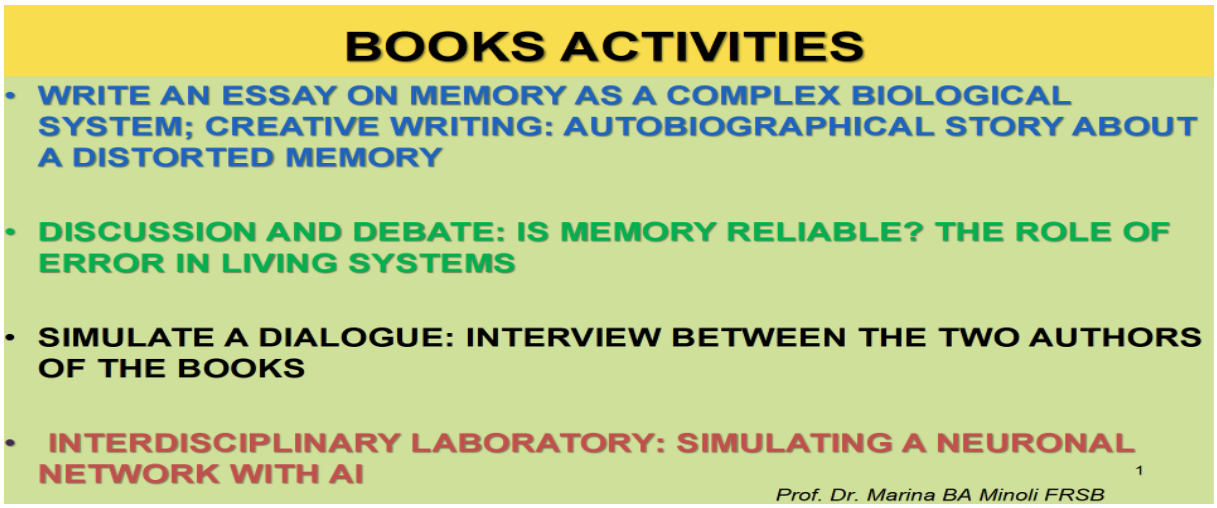
Beginning with an analysis of global reading trends—which reveal significant disparities in the percentage of active readers—the first BioTalk presented the results of activities conducted with high school students motivated to read science books in the era of artificial intelligence. The central question guiding the discussion was: *"What if AI reads and interprets bioscience texts for us?".* The BioTalk introduced the dual role of teachers and students as *learning designers*, presenting reading pathways based on bioscience books such as *The Double Helix* and *The Secret of Life* by James Watson, *King Solomon's Ring* by Konrad Lorenz, *An Immense World* by Ed Yong, and other texts used in different reading projects. A comparative analysis was then proposed to examine reading pathways designed before and after the emergence of generative AI, focusing on methodological and organizational differences in activities involving students, teachers and citizens interested in science. The discussion emphasized that scientific reading should not be offered to young people as a simple, isolated activity. Instead, it should be embedded within structured educational pathways that develop mental capacities, cultural sensitivity and the "narrative intelligence" needed to build personal scientific culture and cultivate a passion for STEM integrated with critical thinking.

2. Methods



The second BioTalk presented a set of reading activities designed to make students *protagonist readers*, improving text comprehension, knowledge retention and operational reasoning skills. Teachers and students explored two key questions through educational pathways based on books written by scientists in biology and STEM fields, including comparative readings in Systems Biology.

The guiding questions were:

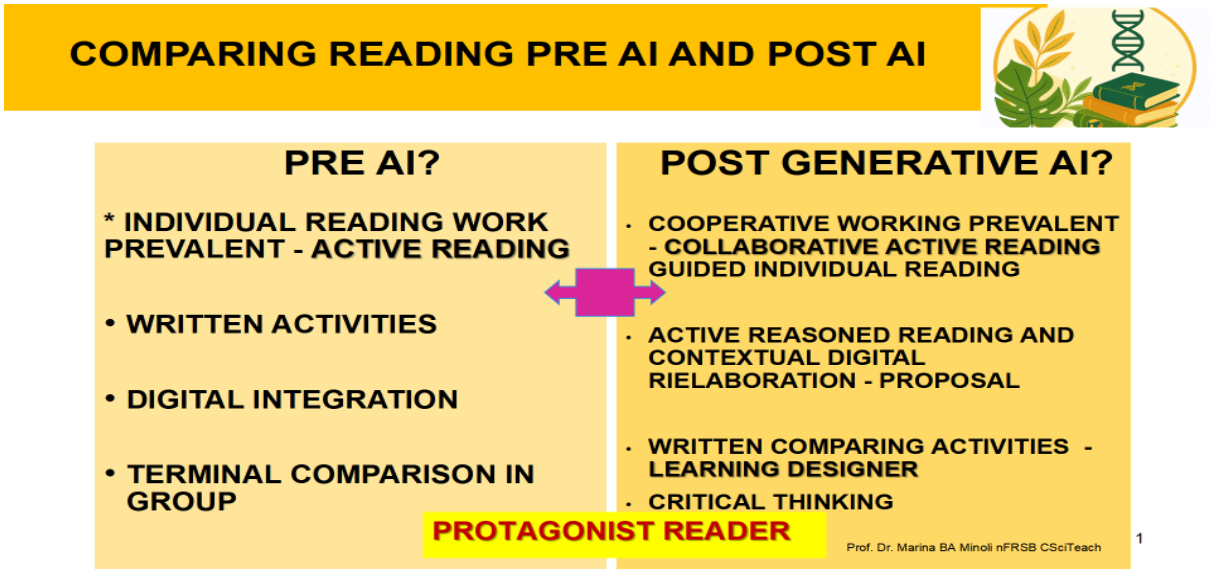


- How to learn science through STEM books
- Why a systemic culture of reading is essential
- Which Systems Biology perspectives support open science
- When to promote curiosity and passion for STEM reading
- Which books foster interdisciplinary STEM contaminations

In all activities, participants assumed the roles of student-designers and teacher-designers. Analysis, comparison, re-elaboration and communication were carried out in an integrated manner with generative AI, while maintaining human guidance at all levels. STEM books were used for individual and group work within a reasoned and interdisciplinary approach, identifying AI as an enhancer—never a substitute—for the work carried out. The selected books addressed themes such as biological memory, information technology, the discovery of DNA, the evolution of molecular biology, botany and astrobiology. For each text, a structured pathway was designed using diverse teaching strategies, including digitalization of final outputs and AI-supported comparison and enhancement. Teachers summarized the educational value of these reading activities for their students.

In reading pathways dedicated to DNA, molecular biology, botany and neuroscience—with particular attention to memory processes—the introduction of generative AI has transformed teaching design into a cooperative, active and critical learning experience that moves beyond traditional disciplinary boundaries. At the level of cooperative working, the reading of scientific popularization texts is supported by digital tools that generate preliminary concept maps on topics such as DNA replication, plant

communication or synaptic plasticity. Students compare these maps with their own and collaboratively build a shared representation that integrates scientific knowledge with language, metaphors and cultural references, naturally opening connections with philosophy, the history of ideas and scientific literature. Active and reasoned reading is enriched through contextual digital reformulation offered by AI: complex concepts—such as Epigenetics, long-term memory or adaptive strategies in plants—are rewritten in different registers and linked to real-world issues or humanistic narratives. Molecular biology intersects with ethics (genetic editing), botany with aesthetics (the perception of landscape), and neuroscience with philosophy of mind (identity, memory, consciousness). Students produce critical notes that relate the scientific text to broader cultural perspectives.
Finally, AI becomes a laboratory for argumentative writing and critical thinking, where students design prompts that require the system to take a position on questions that cross science and the humanities: the relationship between nature and culture in memory, the narrative dimension of DNA as an "archive", plant intelligence as a challenge to anthropocentric models, or the ethical implications of biotechnologies.



The responses are evaluated according to criteria of scientific accuracy, logical coherence and awareness of cultural bias. In this way, generative AI not only amplifies the understanding of scientific content but also fosters authentic interdisciplinary learning, where biology, botany and neuroscience interact with philosophy, literature, the history of science and ethics, transforming reading into a complex, cooperative and deeply cultural cognitive experience.

3. Results

Teachers were asked to identify differences in their work before and after the integration of generative AI, starting from the difficulties that often discourage young readers from engaging with STEM texts.
Three main differences emerged:

1. Cooperative working – collaborative and guided reading, with increased student participation.
2. Active, reasoned reading – contextual digital reformulations that support comprehension and comparison.
3. Written activities for critical thinking – production of reflective and argumentative texts as learning designers.

Across all classes, teachers observed strong student engagement: independent reading, group work, analysis, evaluation, comparison and communication of results. Students appreciated the integration of AI as a tool for comparing ideas, strengthening intuitions and expanding evaluative thinking beyond superficial approaches.
Notably, students who were initially less interested in reading STEM texts became highly engaged in cooperative reading and AI-supported comparative work. In the final survey, 80% of students expressed very positive opinions, stating that they had the opportunity to read "in a different way," as active protagonists, encouraged to propose ideas and compare them without fear of evaluation.

4. Discussion

The integration of generative AI into reading pathways dedicated to DNA, molecular biology, botany and the neuroscience of memory has shown—as verified in several reading experiences and classroom implementations—that technology can expand didactic possibilities without ever replacing what remains the true core of the educational process: the teacher's mind, vision and professional judgment. Across multiple reading pathways, it became clear that AI can generate maps, summaries, reformulations and interdisciplinary connections, but it is always the teacher who decides how, when and why these materials become meaningful learning tools. Final evaluations confirmed that students achieve deep understanding only when the teacher guides the process, selects stimuli, frames questions and constructs the interpretive context. AI provides possibilities, but the teacher provides direction, coherence and meaning. Similarly, the cooperative dimension observed in several classes does not arise spontaneously from AI use. It emerges because the teacher intentionally designs situations in which technology becomes a point of comparison, not a source of ready-made answers. Concept maps generated by AI, for example, proved useful only when teachers asked students to correct, discuss and integrate them, transforming them into opportunities for negotiating meaning. Evaluations also showed that active and reasoned reading strengthens when the teacher guides students in critically assessing AI reformulations: distinguishing between accurate explanation and oversimplification, recognizing bias, identifying omissions. AI can propose variants, but only the teacher can help students understand why one version is more rigorous, more coherent or more faithful to the scientific text. Finally, the emergence of authentic interdisciplinary learning, observed in several reading pathways, does not stem automatically from AI. It depends on the teacher's cultural vision, which connects biology to ethics, botany to aesthetics, neuroscience to philosophy of mind and to the literature of memory. AI may suggest connections, but it is the teacher who makes them relevant, profound and educational. The evidence gathered across these reading pathways confirms a crucial point: generative AI can be a powerful amplifier, but never a substitute. The priority remains unchanged: the teacher's ideas, intellectual freedom, critical capacity and creative leadership. Technology can accelerate processes, offer alternatives and generate materials, but it cannot determine what is pedagogically relevant, culturally meaningful or ethically responsible. These decisions belong to the teacher.
Ultimately, generative AI does not diminish the teacher's role; it makes it even more central. In an environment saturated with information, what matters is not producing more content, but shaping thought. And this remains, now more than ever, a human, professional and intellectual act that no technology can replace.

5. Conclusion

The experiences carried out in reading pathways dedicated to DNA, molecular biology, botany and the neuroscience of memory clearly show that generative AI represents a major opportunity to rekindle students' passion for formative reading. AI can open spaces of curiosity, make complex concepts more accessible, and create interdisciplinary connections that speak to different cognitive styles. Yet this

opportunity becomes real only when AI is embedded within a solid pedagogical framework, guided by what remains the true engine of learning: the teacher's mind, vision and professional judgment. The teacher is the architect of the pathway, the learning designer who intentionally shapes the learning environment and who—precisely through the conscious use of AI—can transform students into designers of their own thinking, capable of questioning texts, generating ideas, and evaluating responses critically. AI does not replace reading; it revitalizes it. It does not replace the teacher; it amplifies the teacher's impact. It does not replace thinking; it stimulates it, provoking reflection and intellectual movement. The future of education points in this direction: a school where students and teachers remain thinking minds, able to use AI as a tool for exploration, comparison and re-elaboration, without ever delegating to technology the responsibility for judgment, interpretation or deep understanding. Generative AI can become a valuable ally for building richer, more inclusive and more motivating reading pathways. But the heart of the educational process remains human: the teacher's guidance, relational presence and cultural vision. It is this intellectual leadership that allows AI to be what it should be: a didactic and formative support, never a substitute, serving a school that continues to form individuals capable of thinking, interpreting and imagining the world.

Comparison of Pose Estimation Models toward Nonverbal Feedback for Pre-service Teachers

Shota Shirasaka[1], Takahisa Imagawa[2], Shuichi Enokida[2]

[1]Fukuoka Institute of Technology, Japan
[2]Kyushu Institute of Technology, Japan

Abstract

Teachers' nonverbal behavior is a strong predictor of instructional effectiveness, yet manual observation is difficult to scale. Deep learning-based pose estimation offers automated extraction of body posture from classroom videos, but existing studies adopt single models without comparative evaluation. This exploratory, single-cohort study compared four pose estimation models—RTMPose-m (CNN/SimCC), ViTPose-b (Vision Transformer/heatmap), YOLOv8m-pose (CNN single-stage), and MediaPipe Pose (BlazePose, CPU)—applied to 27 micro-teaching videos (~294,000 frames) under two human detector conditions (RTMDet-tiny, YOLOv8n). Friedman tests revealed significant differences on all stability metrics (all $p < .001$). RTMPose-m achieved the highest detection rate ($M = .857$), while ViTPose-b showed the lowest normalized jitter and was the only model whose detection rate did not significantly decline during back-facing/board-writing intervals. The choice of human detector showed minimal differences in confidence-based output stability, with significant effects limited to temporal jitter for two models. These findings inform the design of automated nonverbal feedback systems in teacher education, where model choice may bear substantially on the reliability of downstream behavioral analysis.

Keywords: *pose estimation; teacher education; nonverbal feedback; classroom video analysis; micro-teaching*

1. Introduction

Teachers' nonverbal behavior—gestures, posture, movement, and body orientation—contributes substantially to instructional effectiveness. [1] showed that observers can predict teaching evaluations from 30-second silent video clips ($r = .76$), with accuracy remaining significant even for two-second clips ($r = .71$). Nonverbal immediacy is associated with student motivation [2], and nonverbal communication correlates strongly with achievement [3]. Systematic analysis of teachers' physical behavior could thus provide actionable feedback for professional development, particularly in micro-teaching exercises within teacher education programs.

However, manual observation is labor-intensive and difficult to scale. Deep learning-based pose estimation offers automated posture extraction from classroom video recordings. A systematic review identified 80 studies applying computer vision to classroom behavior recognition [4], and several studies have applied skeleton-based approaches to teacher behavior detection [5], [6], [7]. These studies typically adopt a single pose estimation model suited to their specific objective. Given that pose estimation models differ substantially in architecture and output characteristics [8], [9], a comparative evaluation under classroom-specific conditions—persistent occlusion, back-facing postures, and fixed-camera setups—could provide useful guidance for application-oriented researchers.

Automated analysis is also employed as a component of multi-source feedback designs intended to support reflection in micro-teaching. Three-point comparison feedback [10], which presents automated, peer, and self-evaluations side by side, frames discrepancies among sources as material for reflection, while noting that the educational value of such discrepancies may depend on whether they arise from differences in perspective or from measurement instability. Characterizing which body parts each model can stably measure under classroom conditions is therefore important for designing a reliable automated-feedback component in multi-source feedback. In teacher education, this technical reliability matters because unstable pose outputs can lead to misleading feedback about posture, gesture, or orientation, even when the downstream pedagogical interpretation is carefully designed.

This study compares four architecturally distinct pose estimation models applied to 27 micro-teaching videos under two detector conditions. We address:

- RQ1: How do models differ in detection stability?
- RQ2: How does performance change between front-facing and back-facing postures?

- RQ3: What are the practical trade-offs in processing speed?
- RQ4: To what extent does detector choice influence confidence-based output stability?

2. Related Work

Computer vision for classroom behavior analysis has expanded rapidly, with YOLO-based methods dominating and physical action recognition as the most common task [4]. Several studies have applied pose estimation to teacher behavior: [5] used OpenPose with graph convolutional networks for classifying five nonverbal behavior categories (81.6% accuracy); [6] used HRNet with rule-based indicators for six behavior types; [7] combined AlphaPose with Faster R-CNN for behavior monitoring. These studies advance specific aspects of classroom analysis using a pose estimation model chosen for the task at hand. Complementary work has examined adjacent components: [11] compared detection architectures for classroom interactions, and [12] evaluated an integrated body-language assessment system.

Pose estimation has advanced through multiple paradigms [8], [9]: top-down two-stage methods including heatmap-based ViTPose [13] and coordinate-classification RTMPose [14], single-stage YOLOv8-pose [15], and lightweight MediaPipe Pose [16]. These are typically evaluated on benchmarks such as MS COCO [17], but benchmark performance does not necessarily translate to applied settings [18], and temporal instability (jitter) remains a recognized challenge that per-frame metrics cannot capture [19].

A systematic comparison of multiple pose estimation models under classroom-specific conditions would complement these efforts by clarifying model selection trade-offs, characterizing behavior under domain-specific occlusion patterns, and informing downstream system design. This study examines four architecturally distinct models across 27 videos (~294,000 frames), evaluating detection stability, orientation robustness, speed, and detector dependency.

3. Methodology

3.1 Participants and Data

Twenty-seven third-year undergraduate students enrolled in a teacher education program participated in the study. As part of a course on Tokubetsu Katsudo (Special Activities in the Japanese curriculum), each student prepared a lesson plan and delivered a three-minute micro-teaching session on a topic of their choice. Sessions were video-recorded in December 2025 in a single classroom at 59.94 fps (1920 × 1080), with a whiteboard behind the speaker and a lectern partially occluding the lower body. This setup introduces domain-specific challenges for pose estimation, including persistent lower-body occlusion and frequent transitions between front-facing instruction and back-facing board-writing. The total dataset comprises 294,300 frames. Ethical approval was obtained from the institutional review board, and all participants provided informed consent. The same cohort and recordings have also been analyzed in Shirasaka et al. [10] under a different research question (an exploratory investigation of reflection on multi-source feedback). The present study focuses on the technical comparison of pose estimation models and does not analyze the participants' reflection narratives or cross-source evaluation comparisons reported in that paper.

3.2 Pipeline and Models

We adopted a top-down pipeline: human detection with single-object tracking, followed by per-frame pose estimation within the detected bounding box (Fig. 1). The tracker selects the person closest to a manually identified reference at video start, ensuring consistent identity across frames. This step was important because the classroom scene contains stable background objects and occasional non-target body parts, whereas the analysis requires a single continuous teacher trajectory rather than frame-wise independent detections. Two detectors were employed (RQ4): RTMDet-tiny [20] (45.6 ms/frame) and YOLOv8n [15] (21.5 ms/frame). Frames with zero detection confidence were not passed to pose estimators and were retained as zero-keypoint rows (< 0.1% for both detectors). Using a detector-first design also separated two questions: whether the pose estimator remained stable once a person region was supplied, and whether detector choice changed downstream stability. For the top-down models, the detected box was cropped and passed to the pose estimator; YOLOv8m-pose was run in bounding-box input mode to keep person regions comparable across models. Because these arrays were saved

before analysis, all four stability metrics were computed from the same post-inference data structure rather than from framework-specific visualizations or logs.

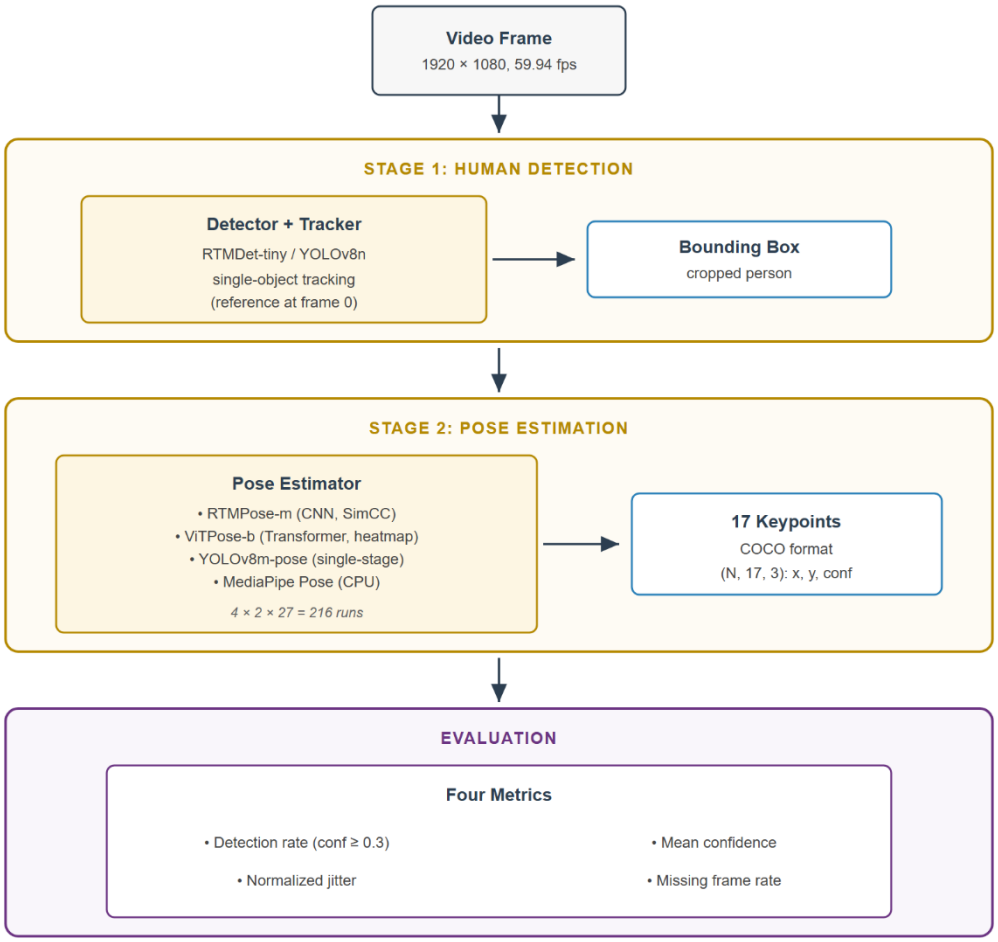

Fig. 1. Overall analysis pipeline from video frames to human detection, pose estimation, and the four stability metrics.

Four pose estimation models represented distinct paradigms (Table 1): RTMPose-m (CNN/SimCC), ViTPose-b (Vision Transformer/heatmap), YOLOv8m-pose (single-stage CNN, used in bounding-box input mode), and MediaPipe Pose (BlazePose heavy, CPU). Outputs were stored as 17-keypoint COCO-format arrays (N, 17, 3); MediaPipe's 33 landmarks were mapped to COCO by anatomical correspondence. The third channel was treated as a model-provided confidence-like score, with architecture-specific meanings (heatmap peak, SimCC softmax, YOLO keypoint confidence, and MediaPipe visibility) discussed in Section 5. Each model was applied under both detector conditions: 4 × 2 × 27 = 216 inference runs.

Table 1. Pose estimation models and pipeline performance.

Model	Type	Params	Pose (ms)	FPS w/ RTMDet	FPS w/ YOLOv8n
RTMPose-m	CNN (SimCC), 2-stage	13.6M	16.1	16.2	26.3
ViTPose-b	Transformer (Heatmap), 2-stage	~86M	16.3	16.2	26.1
YOLOv8m-pose	CNN single-stage	~26M	11.9	17.4	29.5
MediaPipe	CNN (BlazePose, heavy), CPU	N/A	60.9	9.4	12.8

Code for the analysis pipeline was developed with assistance from Claude (Anthropic); the first author reviewed and tested all code and takes responsibility for the content.

3.3 Evaluation Metrics

The goal is to assess model suitability for classroom behavior analysis as a component of nonverbal feedback systems, where macro-level posture information matters more than millimeter-precise joint locations. This annotation-free deployment screening evaluates confidence-based proxies for output availability and temporal stability rather than pixel-level accuracy (PCK, AP), which would require ground-truth annotations across approximately five million keypoint instances.
Four metrics were computed per video × model × detector condition:

- Detection Rate: proportion of keypoints with confidence ?? 0.3. Sensitivity analysis at thresholds 0.1–0.5 indicated stable model rankings for 0.1–0.4.
- Mean Confidence: average confidence across all keypoints and frames.
- Normalized Jitter: median frame-to-frame Euclidean displacement of each keypoint, divided by torso length (mean of left and right shoulder-to-hip distances when both sides are valid, otherwise the available side) for scale normalization. Only consecutive frame pairs where both keypoints exceeded the threshold were included.
- Missing Frame Rate: proportion of frames with no keypoint reaching the threshold.

All four metrics are computed from the full saved keypoint arrays. Frames where the human detector returned zero confidence (< 0.1% of frames) are stored with zero keypoint output and therefore contribute to detection rate, mean confidence, and missing frame rate as undetected/missing; normalized jitter additionally requires both frames of a consecutive pair to satisfy the confidence and torso-length criteria, which naturally excludes these zero-filled frames.
These metrics map onto feedback needs: face-keypoint availability for orientation, wrist/elbow stability for gestures, missing frames for movement summaries, and latency for offline processing.

3.4 Front/Back Classification

To compare performance across orientations (RQ2), we first attempted automatic classification by four-model consensus on face keypoints (nose and eyes): frames were labeled “front” when all four models detected all three points with confidence ?? 0.3, and “back” when three or more models reported all three below 0.3. This labeled 80.9% as front but only 0.1% as back (F1 = .028), with 19.0% ambiguous. Because 73.3% of ambiguous frames fell within manually annotated board-writing intervals, we adopted a hybrid scheme. The first author annotated 35 board-writing intervals across 25 of 27 videos; within each interval, frames where all four models detected face keypoints were excluded as clearly front-facing (4.6%), and the remaining interval frames were labeled back-facing (41,048 frames, 13.9%). All other frames were labeled front-facing. Labels differed by only 25 frames (0.06%) between detector conditions.

3.5 Statistical Analysis

All analyses used the RTMDet condition unless noted. RQ1: Friedman test (N = 27, k = 4) with Kendall’s W; Nemenyi post-hoc. RQ2: Friedman on degradation rates (N = 25, excluding two videos without back-facing frames); per-model Wilcoxon with rank biserial. RQ3: Descriptive statistics. RQ4: Wilcoxon (N = 27) for 16 comparisons (4 models × 4 metrics); Holm correction.

4. Results

4.1 Overall Model Comparison (RQ1)

Friedman tests revealed significant differences on all metrics (Table 2). Detection rate showed the strongest effect (W = .971): RTMPose-m ranked highest (M = .857), followed by ViTPose-b (.808), YOLOv8m-pose (.768), and MediaPipe (.710). All six Nemenyi pairwise comparisons were significant (all $p < .05$).

Table 2. Descriptive statistics and Friedman test results for the four stability metrics (N = 27, k = 4). Values are Mean (SD).

Metric	RTMPose-m	ViTPose-b	YOLOv8m-pose	MediaPipe	Chi2	W
Detection Rate	.857 (.029)	.808 (.038)	.768 (.042)	.710 (.034)	78.64	.971
Mean Confidence	.636 (.027)	.686 (.029)	.703 (.035)	.685 (.035)	56.29	.695
Norm. Jitter	.0055 (.0010)	.0050 (.0013)	.0081 (.0017)	.0067 (.0012)	75.58	.933
Missing Rate	.00053 (.00131)	.00038 (.00111)	.00191 (.00229)	.00165 (.00240)	38.50	.475

All Friedman tests: df = 3, p < .001.
Mean confidence showed a reversed top ranking: YOLOv8m-pose was highest (.703) and RTMPose-m lowest (.636), consistent with architecture-specific confidence distributions. Sensitivity analysis showed stable detection-rate rankings across thresholds 0.1–0.4 (all W > .90), with RTMPose-m and ViTPose-b reversing only at 0.5. Temporal stability formed two groups: two-stage models (ViTPose-b, RTMPose-m; jitter ~.005) were more stable than MediaPipe (~.007) and YOLOv8m-pose (~.008), with significant between-group but not within-group differences; missing frame rate followed the same pattern.
Per-keypoint analysis (Fig. 2) showed that ankles were detected in at most 5% of frames across models, consistent with lower-body occlusion by the lectern. Knees varied substantially under the same condition (RTMPose-m: 81%; MediaPipe: <10%), and MediaPipe also showed lower elbow and wrist detection rates (70–81%) than the other models (95%+).

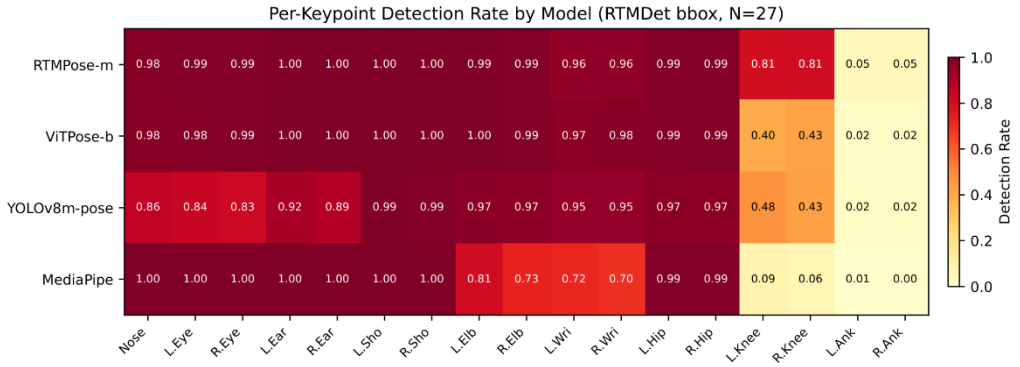

Fig. 2. Per-keypoint detection rate by model (mean across 27 videos, RTMDet condition). Ankles were near zero across models because the lectern physically occluded the lower body; model differences were largest for knees and wrists.

4.2 Front-Facing vs. Back-Facing Performance (RQ2)

Degradation rates differed significantly across models for all three metrics (Friedman, all p < .001; Table 3). Two-stage models showed minimal detection rate degradation (RTMPose-m: 2.2%, ViTPose-b: 1.8%), while YOLOv8m-pose dropped 17.0% and MediaPipe 13.7%. Per-model Wilcoxon tests indicated significant front-to-back differences for all models except ViTPose-b (p = .127, rb = .35)—the only model whose detection rate did not significantly decline during back-facing/board-writing intervals. Mean confidence declined significantly for all models (all p < .001), with YOLOv8m-pose showing the largest drop (24.8%). Jitter worsened for all models, most severely for YOLOv8m-pose (66.5%, SD = 61.6%).

Table 3. Detection rate, confidence, and normalized jitter for front-facing and back-facing frames, with degradation rates (N = 25). Values are Mean (SD).

Metric	Model	Front	Back	Degradation (%)
Detection Rate	RTMPose-m	.860 (.030)	.840 (.041)	+2.2 (4.9)
	ViTPose-b	.810 (.041)	.796 (.045)	+1.8 (6.0)
	YOLOv8m-pose	.788 (.044)	.654 (.051)	+17.0 (7.3)
	MediaPipe	.725 (.039)	.623 (.037)	+13.7 (7.8)
Mean Confidence	RTMPose-m	.649 (.025)	.555 (.039)	+14.6 (5.4)
	ViTPose-b	.698 (.029)	.616 (.041)	+11.6 (6.0)
	YOLOv8m-pose	.729 (.032)	.549 (.043)	+24.8 (6.0)
	MediaPipe	.701 (.039)	.590 (.028)	+15.5 (7.0)
Norm. Jitter	RTMPose-m	.0053 (.0011)	.0069 (.0015)	+35.9 (50.5)
	ViTPose-b	.0049 (.0014)	.0065 (.0016)	+48.8 (74.2)
	YOLOv8m-pose	.0077 (.0017)	.0122 (.0030)	+66.5 (61.6)
	MediaPipe	.0065 (.0011)	.0099 (.0052)	+52.8 (84.9)

4.3 Practical Feasibility (RQ3)

Replacing RTMDet-tiny with YOLOv8n reduced pipeline latency by 26–41% (Table 1). The fastest combination was YOLOv8n + YOLOv8m-pose (33.9 ms, 29.5 FPS); YOLOv8n + RTMPose-m (38.0 ms, 26.3 FPS) balanced speed and output availability. MediaPipe, though slowest (78–107 ms total), is the only pose stage that runs on CPU. All combinations are feasible for offline analysis of three-minute videos.

4.4 Detector Dependency (RQ4)

Of 16 Wilcoxon tests, only two reached significance after Holm correction: jitter for YOLOv8m-pose (RTMDet: .00806; YOLOv8n: .00813; $p = .006$, $rb = -.74$) and MediaPipe (RTMDet: .00674; YOLOv8n: .00703; $p < .001$, $rb = -.95$). Detection rate and confidence showed no significant differences (all $p_{holm} > .19$, mean differences < .003). The statistically significant jitter differences were small in absolute terms (≤ .0003), suggesting that bounding-box fluctuations can propagate to temporal stability without materially changing per-frame proxy metrics.

5. Discussion

The results point to a task-dependent model-selection strategy rather than a single best model. RTMPose-m maximized output availability; ViTPose-b minimized jitter and showed the smallest, non-significant detection-rate decline; YOLOv8m-pose prioritized speed; and MediaPipe provided a CPU-based option. For offline micro-teaching analysis, model choice can be guided by the behavioral features of interest rather than benchmark performance alone.

Two broader points follow. First, confidence distributions differ systematically between SimCC and heatmap architectures, so confidence-based metrics are not directly comparable across architectures. Researchers reporting confidence values benefit from specifying the architectural class to support cross-study interpretation. Second, the selective detector effect on jitter, despite minimal effects on per-frame metrics, shows that bounding-box fluctuations can propagate to temporal stability. Evaluations targeting downstream temporal analyses may benefit from including jitter-aware metrics rather than relying solely on per-frame accuracy [19].

The failure of automatic front/back classification ($F1 = .028$) highlights that current models cannot reliably distinguish orientation from detection failure in classroom settings, motivating domain-specific model development.

The per-keypoint heatmap (Fig. 2) further shows that models differ markedly in which body parts they detect reliably. Near-zero ankle detection reflects the filming configuration rather than model capability; analyses requiring lower-body information would require repositioning the camera or lectern. Within the

visible body, model differences for knees (.09–.81) and wrists (.70–.97) indicate that model selection may benefit from considering the body parts relevant to the intended analysis.
Persistent lower-body occlusion also complicates confidence interpretation. In the present data, this pattern is consistent with the possibility that heatmap peaks decrease more sharply under weak local visual evidence, whereas SimCC softmax scores over discretized coordinate distributions may retain moderate values even when the predicted location is partly inferred from pose context. This is not evidence of a general SimCC advantage for occluded regions: a supplementary inspection of face-keypoint outputs showed higher ViTPose-b confidence in both front-facing and back-facing intervals. The RTMPose-m advantage for lower-body keypoints therefore likely reflects confidence normalization under weak evidence, and the structural plausibility of such predictions requires ground-truth validation.

6. Limitations and Future Work

6.1 Limitations

This evaluation relies on confidence-based metrics rather than ground-truth annotations. Because these scores have architecture-specific meanings, detection rate and mean confidence should be interpreted as output-availability proxies rather than calibrated accuracy measures. While sensitivity analysis indicated stable rankings across thresholds, the absence of pixel-level accuracy measures means we cannot rule out the possibility that maintained confidence under occlusion corresponds to structurally implausible joint positions. All recordings used a single camera in a single classroom in a Japanese teacher education program. Generalizability to other educational contexts—different cultural settings, classroom configurations, age groups, or instructional formats—requires verification. The front/back classification depended on manual annotation of board-writing intervals with model-output filtering and is better regarded as an interval-level approximation than as frame-level orientation ground truth; fully automatic orientation detection remains an open problem. The micro-teaching format also differs from authentic classroom instruction, and behavioral patterns observed here may not fully transfer to in-service teaching. Scale normalization of jitter relies on torso length computed from shoulder and hip keypoints; under persistent lower-body occlusion, uncertainty in hip-keypoint estimates may introduce minor noise into the normalization, though absolute jitter rankings remained consistent across models. Given the descriptive, single-cohort design, the findings should be interpreted as context-bound exploratory evidence for model selection rather than as definitive performance claims.

6.2 Future Work

Three directions follow from these findings. First, partial ground-truth annotation on a representative subset of frames could validate confidence values under persistent occlusion, particularly for SimCC-based lower-body outputs. Second, architecture-aware confidence interpretation—distinguishing outputs grounded in visual evidence from those reconstructed from pose context—could improve the reliability of downstream behavioral analysis. Third, evaluations across multiple classroom configurations and instructional formats would help characterize the boundary conditions of the present findings.

7. Conclusion

This exploratory, single-cohort study compared four architecturally distinct pose estimation models across 27 classroom videos under two detector conditions. All confidence-based stability metrics showed significant model differences, with detection rate ranking nearly perfectly consistent ($W = .971$). Two-stage models ranked higher on output availability and temporal consistency; detector choice had minimal association with the selected proxy metrics except for jitter.
These findings should therefore be read as an evaluation of the technical layer that supports automated feedback, not as an automated assessment of teaching quality itself. For automated nonverbal feedback in teacher education, ViTPose-b is a cautious choice when board-writing or orientation analysis is involved because its detection-rate decline was small and not significant. MediaPipe remains viable when GPU acceleration is unavailable, and RTMPose-m with YOLOv8n offers the highest detection rate at practical speed for balanced offline use. These findings can inform the automated-feedback component of multi-source feedback designs [10] and support selecting classroom pose-estimation pipelines by the body parts and behavioral features needed for feedback, not by benchmark performance alone.

Beyond model selection, two methodological considerations may apply across studies. First, confidence values are not directly comparable across architectural classes; the same numerical value can reflect different generation processes (heatmap peak vs. SimCC softmax vs. visibility score), so cross-study comparisons benefit from architectural disclosure. Second, detector and pose-estimator behavior can decouple on temporal-stability metrics even when per-frame metrics agree, so evaluations supporting downstream behavioral analysis benefit from including jitter-aware indicators alongside per-frame accuracy.

Finding a Balance between Generative AI and AI-based Tools and Critical Thinking in Legal Education

Michael Laubscher

North-West University, South Africa

Abstract

The use of generative AI and AI-based tools in legal education and legal practice is escalating. A growing number of law firms indicate that they use AI in practice, and learning institutions also report an increased use of generative AI and AI-based tools, by both students and academics. The question is not if generative AI and AI-based tools should be used in teaching and learning, and in legal practice, but rather how it should be done effectively and responsibly while enhancing critical thinking. The use of generative AI and AI-based tools can foster a deeper understanding of law and can help to breach the gap between theory and practice in legal education. It can aid in the formation of individual learning styles and it can offer a more hands-on experience of simulated environments. However, an over-reliance on AI and a loss of human interaction and intervention will skew this process and produce unwanted results and consequences. A balanced and meaningful approach to the use of generative AI and AI-based tools in legal education is needed, where the fostering of critical thinking is combined with the innovation and impact of AI to create an optimal situation for the use of generative AI and AI-based tools in legal education.

Keywords: *Generative AI and AI-based tools, legal education, critical thinking, balance*

1. Introduction

The use and integration of AI into the legal profession and legal education, has influenced and reformed the legal profession as well as the teaching of law [1]. Generative artificial intelligence [GenAI] systems such as ChatGPT, brought a revolution in the manner in which tasks are performed but has also led to greater efficiency together with a multitude of opportunities for innovation [2,3]. GenAI and AI-based tools are positioned to transform legal education and the legal profession in the near future [4]. GenAI systems feature prominently in this specific context since these systems allow for the generation of text since it has been trained to process large amounts of data which are contained in Large Language Models (LLMs). LLMs are also capable of automating the translation of documents, for both research and communication purposes [4].

At higher education institutions the emergence of GenAI offers possibilities as well as significant challenges. GenAI and AI-based tools promote and enhance teaching and learning, as well as research, but its use also highlights the concerns regarding ethical considerations, academic integrity, the protection of data and safeguarding data privacy as well as intellectual property rights (IPR) while considering the ongoing debate centred on the responsible use of GenAI tools [5, 6, 7, 8]. Additionally, and very importantly, GenAI and AI-based tools also engage with the question of critical thinking in legal education, which raises the concern that the use of GenAI will negatively impact critical thinking in legal education.

In legal practice the impact of GenAI is also substantial. The exact reach and nature of this transformation create extensive uncertainty. At the one end of the spectrum certain experts, mainly technologists, predict a fundamental restructuring of the industry, which will lead to AI performing a multitude of legal tasks and might even cause the replacement of certain types of lawyers entirely [9,10]. Others argue that AI is useful to streamline certain aspects, but it will not alter the fundamental nature of lawyering [11].

The use of GenAI in both legal education and legal practice, cannot be denied. In 2025 a survey done amongst 172 UK legal professionals 47 % of them indicated that they are using AI-powered tools to initiate or edit their work, while 87 % of these UK professionals believe that AI will have a significant transformational impact on the legal profession within the next five years [12]. Generative AI and Ai-based tools are also transforming the student experience in tertiary education, having a direct influence on how students learn, communicate and work [13]. AI-related content needs to form part of legal education curricula, and, even more importantly, by empowering students to understand and

acknowledge the capabilities and limitations of AI tools, they will be further equipped to utilise these technologies responsibly to enhance legal practice [14].

2. Generative AI in Legal Education

AI offers the opportunity to personalise learning experiences which cater specifically for individual needs of different students, which in turn improves enhancement and also boosts learning outcomes [15, 16]. GenAI technologies are utilised to develop interactive learning materials, create engaging educational resources, and construct design immersive learning experiences, as well as improving the quality and relevance of educational materials [17]. Another huge advantage of GenAI and AI-based tools is the promotion of inclusivity and accessibility through the selection and application of adaptive learning solutions for students which display diverse learning needs [4]. AI applications are effectively used to enhance learning and teaching activities and assist with academic performance [18, 19, 20, 21].
GenAI, such as Chat GPT assist lawyers in task such as drafting generic, non-legal documents mainly, but not always limited to these documents [4]. Lawyers also use GenAI for more effective case management and it is also used for legal research [4].
This leads to the question: to which extent does AI and, specifically GenAI, threaten to replace essential legal skills? [22] This is a crucial question for both legal education and legal practice. The most sensible way to approach such a question would be to acknowledge the possibilities and potential of AI, as well as to recognise the dangers, challenges and limitations of the use of GenAI and AI-based tools [23].
This paper will specifically discuss the use of GenAI and AI-based tools with regard to the fostering of critical thinking skills in legal education. Critical thinking is an essential skill in legal education as well as legal practice [24] and the use of GenAI and AI-based tools in fostering critical thinking calls for proper discussion and application of these same critical thinking skills.

3. Critical Thinking in Legal Education

Critical thinking is regarded as the “purposeful, self-regulatory judgment which results in interpretation, analysis, evaluation, and inference, as well as explanation of the evidential, conceptual, methodological, criteriological, or contextual considerations upon which that judgment is based.” [25, p 3] Ideally a critical thinker is “ habitually inquisitive, well-informed, trustful of reason, open-minded, flexible, fair-minded in evaluation, honest in facing personal biases, prudent in making judgments, willing to reconsider, clear about issues, orderly in complex matters, diligent in seeking relevant information, reasonable in the selection of criteria, focused in inquiry, and persistent in seeking results which are as precise as the subject and the circumstances of inquiry permit.” [25, p 3]
One of the models used in legal education is the vocational model which places emphasis on practical skills, while the liberal arts model, emphasises critical thinking [24]. A comprehensive educational approach would incorporate both models in order to create a healthy balance between practical skills and a more nuanced approach to societal issues [24, 26].
Additionally, in the context of legal education skills, such as those proposed above which form part of critical thinking skills, would be extremely beneficial. An Indonesian study focusing on criminal justice education stated that critical thinking skills will assist students to, for instance: “critically assess evidence, question assumptions, and navigate the ethical and systemic complexities of the field.” [246, p 546]. The Indonesian study reflected that critical thinking is a core component of criminal justice education, these skills enable students to assess evidence critically, question
assumptions, and navigate the ethical and systemic complexities of the field. Critical thinking is a fundamental component of criminal justice education, and it equips students with skills to: “analyze complex social issues, question assumptions, and make informed decisions. Incorporating critical thinking into criminal justice programs is crucial for developing a deeper understanding of the field and preparing students to address the multifaceted challenges within the criminal justice system.” [24, p 546]
This can be extended to other branches of legal education and it is clear that the fostering of critical thinking skills better equips law students to fully engage with their legal studies as well as aiding them in expanding and refining their practical skills relating to the study and practice of law.

4. How has AI Assisted in Developing Critical Thinking?

A recent study from a university in Indonesia highlighted the value of AI and AI-based tools in fostering critical thinking. The study involved 100 students who were registered for a criminal justice programme

at the university. Two groups were formed – an experimental group (which followed an "AI-based pragmatic application to analyse authentic Indonesian texts and videos") and a control group which followed traditional learning methods without AI integration." [24, p 550] The experimental group specifically used an AI-powered tool which had been designed to improve critical thinking skills "by analyzing authentic Indonesian texts and videos related to criminal cases." [24, p 550] The tool offers immediate, real-time feedback on the dynamics of communication, e,g. speech acts and non-verbal gestures and cues, which in turn assisted the students to enhance their analytical skills in the solving of criminal matters. The tool uses advanced AI technologies, generative AI and natural language processing (NLP) as well as machine learning (ML) to supply detailed insights into "the structure and meaning of speech acts and conversational strategies within various texts and multimedia content." [24. p 552-553]. The students in the experimental group used the AI tool to do an analysis of case materials such as transcribed witness testimonies and interrogations which have been conducted and recorded [24].

The AI tool utilises multimodal analysis which proved to very beneficial since it led to a greater understanding of verbal and non-verbal clues which is essential when interpreting witness testimonies and interrogations. Video analysis and audiovisual content were provided for a more holistic view. [24]. The experimental group used the AI tool during the course of the whole semester when completing assignments and case studies. The tasks they were given were all simulations of real-world criminal investigations and called for the application of critical thinking skills as well as analytical skills to gain greater understanding of complex issues and to solve these issues [24].

The control group, on the other hand, followed traditional learning methods used for the analysis of criminal cases, such as lectures, readings and discussions. Emphasis was placed on "in-depth case studies on criminal investigations, emphasizing techniques like assessing witness statement credibility, analysing physical evidence, and interpreting non-verbal cues such as body language in interrogations, which equipped students with essential analytical frameworks." [24, p 558]. Students manually, without the assistance of an AI-based tool, analysed testimonies and evidence, while debating issues such as reliability, assumptions, and engaged in a lot of reasoning by means of peer collaboration. They also analysed videos recordings of interrogations and manually reviewed transcribed witness statements and highlighted inconsistencies while analysing key evidence [24]. So, there was a clear difference in the two approaches- one used AI-based tools extensively, and the other one relied on traditional teaching methods. At the conclusion of the intervention both groups took the same standardised critical thinking test [24].

Various instruments were used to assess and measure the critical thinking skills of both groups. This included pre- and post-critical thinking tests, task-based assessments utilising AI applications, student surveys, and semi-structured interviews. The idea was to provide a holistic view of the experiences and performances of the participants, and the study's findings reflected that students who participated listed various advantages of the AI tool that was used. These included: "heightened confidence and improved problem-solving capabilities when tackling complex criminal cases." [24, p 566]. During interviews participants also indicated concrete examples of these benefits as illustrated by the participants. The authors stated that there was "compelling evidence of the transformative potential of AI-enhanced applications," [24, p 567] such as the AI tool that they used during their project. Substantial improvement was noted in argument analysis and evidence evaluation with the participants praising the AI tool's intuitive interface and integration into coursework [24]. On the other hand, the traditional methods that the control group had used, resulted in less significant gains. This, again, highlighted the value that AI can add in deepening cognitive engagement. The authors suggested that AI-based tools and GenAI can be incorporated gradually into traditional lectures while scaffolding AI-related activities and introducing concrete strategies to achieve this. [24].

5. Challenges in the Use of GenAI and AI-based Tools in Fostering Critical Thinking Skills

There is little doubt that GENAI and AI-based tools can add immense values to the development of critical thinking skills in legal education, as the study above suggests. However, there are also concerns that the increased use if AI can impact students' critical thinking skills and ethical reasoning [22]. There is a fear that AI technologies do not cultivate independent legal reasoning or assist students to manage the intricacies and pitfalls of ethical dilemmas [22]. The question arises - can students become overly reliant on AI-based tools and GenAI and in the process dull the development of their critical thinking skills? Might students not become complacent if AI becomes their default position when it comes to critical thinking skills? Farber states that an "overreliance on AI may lead students to accept surface-level outputs without sufficient scrutiny." [22, p 175]. Extending this further to legal practice – what if a

lawyer must address court on a matter and counterarguments and inquiries pop up during trial and there is no opportunity to reach for AI to bail them out? Additionally, especially in the practice of law, various nuances and context-specific aspects find its way into arguments and counterarguments, and AI tools are not structured or fashioned to deal with these nuances. This is where applied critical thinking skills are essential, and although AI can potentially prompt these skills, as displayed in the Indonesian study, it falls short when it comes to the full realisation of such critical thinking skills in legal education and legal practice. Farber refers to the "nuanced judgment essential to criminal practice" [22, p 166] that AI lacks, and it "cannot replicate the complex dynamics of legal argumentation, in-class demonstrations or the nuanced interactions between judges, prosecutors and defence attorneys in a courtroom setting " [22, p 170]

He suggests that experiential learning bridges the gap between theory and practice and will assist the use of AI-based tools and GenAI in offering a more holistic learning experience for students [22]. Such an approach requires the integration of knowledge, skills and aptitude [22]. He seems to prefer the use of AI tools as mere preparatory tools while emphasising that the "live performance reflects the student's autonomous ability to synthesise decide and advocate without technological assistance." [22, p 168]. This experiential learning approach was utilised over three years, from 2022 to 2024, in a criminal law module for students, and Farber reported that it caused an upward trend in student performance across three major written assignments that students had to complete [22]. The use of mock trials, an example Farber cited, clearly reflected the pedagogical value of more traditional methods of teaching and learning. These mock trials require students to engage deeply with core criminal law topics and are dynamic in nature [22]. The students assume different roles e.g. prosecutors, defence attorneys, judges and witnesses, and mock trials call for "unpredictable scenarios and demanded real-time adaptation" [22, p 170] which are aspects that AI-based tools cannot assist students with adequately. Additionally, the mock trials also lead to an overall improvement in student performance and engagement [22].

The use of AI and AI-based tools in legal education needs further exploration and as lecturer in legal education the findings presented in this article, certainly made me reflect on my own teaching and learning. The development and application of such AI-tools need to be considered carefully, since as the Indonesian study clearly showed, a focused and specific approach is more effective than a mere generic approach. This would include substantial research in developing an AI-tool that is specifically geared towards the unique teaching and learning context which each teaching opportunity presents. Collaboration with AI-specialists would also be beneficial in order to forge a strong link between content and establishing a practical, user-friendly AI-tool that focuses on the specific module in which it would be used. Our students have not worked with an AI-tool that has been specifically developed for them, so it would also be important to gain some insight regarding their thoughts on such a tool. At this stage, a pilot project might be the most prudent way forward, where the AI-tool can initially be used for one or two study units within the module to expose students to the AI-tool in a limited manner. Feedback should then be gained and this feedback used to refine the tool. Additionally, the pedagogical approach during this process should also be considered, since the teaching and learning approach is just as important, if not more important, than the use of the AI-tool. Research has also shown that certain, so-called "traditional aspects" of teaching and learning cannot be discarded - a balance between the use of Gen Ai and AI-based tools and a sound pedagogical approach is essential.

6. Conclusion

The relationship between generative AI and AI-based tools and the development of critical thinking regarding legal education, is a complex relationship [22]. AI has potential to assist in transforming student learning and specifically assist in the development of critical thinking. It can assist with argument analysis and evidence evaluation and highlight counterarguments or possibly reveal gaps in reasoning [Farber,2025]. However, experiential learning methods- e.g. mock trials, remain critical in shaping critical thinking and ethical judgment, which algorithms cannot emulate [22]. AI must, however, not be neglected and there is no doubt that it has an important role to play in legal education and legal practice. It must be integrated thoughtfully and serve to amplify skills and competencies students and legal professionals need, rather than replace them [22]. This calls for a balancing act, where there is not an overemphasis of either one of the aspects. The most effective way in which to combine AI tools with more traditional learning methods, such as experiential learning, must be sought. This will lead to students being able to apply law with insight and nuance [22]. There is no doubt that AI-based tools and Generative AI offer a wider scope of legal knowledge and can assist students in a variety of ways, however, AI cannot replace the value of human judgment. [22]. The key is not choosing one or the other but creating a harmony between tradition and technology [22].

From Signals to Support: A Classroom-Scale Biometric–Facial Research Platform for Inclusive Education

Mykhailo Kotyk[1], Olena Budnyk[2], Kateryna Fomin[3]

Abstract

War-affected children in Ukrainian inclusive schools often mask emotional distress, and teachers have no reliable way to detect it [1, 2, 3]. Our previous work introduced BioMirror, an iOS platform that combines ARKit facial tracking with Apple Watch physiology to compute an emotional–physiological coherence score every 5 seconds; adult validation yielded 87.3% emotion-recognition accuracy, sub-50 ms cross-device synchronisation, and 94% biometric signal quality [4]. This paper presents BioMirror Researcher, a macOS companion that uses Bonjour/mDNS and persistent WebSockets to monitor up to 30 iPhones simultaneously. The dashboard provides a device grid, an alert feed, and remote session control, turning a single-participant prototype into a classroom-scale research instrument. We describe the adaptations a school deployment would still need (teacher-facing indicators, an on-device privacy mode, and guided regulation micro-sessions) and propose a mixed-methods pilot for students aged 8–14 in Ukrainian inclusive schools [5, 6, 10].

Keywords: *biometric-facial emotion recognition, inclusive education, war-affected children, emotional regulation, educational technology, research dashboard*

1. Introduction

The full-scale russian invasion of Ukraine has produced one of the largest child displacement crises in recent European history. Millions of children have experienced conflict, forced relocation, and the loss of familiar social structures, all established risk factors for PTSD, anxiety, and disrupted emotional regulation [1]. Ukrainian schools, both inside the country and abroad, now provide inclusive, trauma-informed education to a population whose distress is often invisible [2, 3]. Teachers report that war-affected children often suppress emotional expression and present as calm or disengaged while in fact experiencing significant autonomic arousal [3], which makes it hard to identify students who need support.

Affective computing systems that combine facial analysis with physiological sensing can detect what behaviour alone might hide [7], but most are designed for one-on-one clinical use and do not scale to classroom settings [8]. Doing the same thing in a school is not just an engineering problem. Privacy, teacher workload, and the ethics of collecting biometric data from minors in a conflict zone all bear on the design [9]. Our previous work introduced BioMirror, an iOS implementation of biometric facial emotion analysis for trauma recovery [4]. This paper reports an architectural extension (BioMirror Researcher, a macOS companion that turns the single-device prototype into a multi-device research instrument) and outlines a deployment strategy that integrates BioMirror with art therapy and play-based learning [10] in Ukrainian inclusive schools.

2. Related Work

2.1 Wartime Education and Trauma-informed Pedagogy

Elevated rates of PTSD, anxiety, and depression have been documented in Ukrainian student and teacher populations since 2022 [1]. Refugee studies report the same pattern in classroom behavior (hypervigilance, numbing, withdrawal), often misread as disengagement rather than recognized as

trauma [3, 11]. Inclusive education frameworks call for adapting the environment [12], but the practical tools available to teachers are limited: observations are subjective, standardised assessments are periodic, and specialist referrals are slow in conflict-affected settings [13]. Budnyk et al. [10] looked at this directly. They ran three focus groups in Ukrainian preschool and primary schools (twelve parents of children aged 5–9, five teachers, and four art therapists, psychologists, and rehabilitation specialists), with rural communities affected by the war as the central case. Combining art therapy with play-based learning supported emotional recovery, motor and cognitive rehabilitation, and social reintegration; natural materials (clay, sand, leaves, straw) and folk traditions worked well where formal art-therapy resources were scarce. Two practical problems came up repeatedly. Teachers had no reliable way to tell, during a session, whether a method was actually helping a particular child. And primary school teachers reported that having one teacher for 30 pupils, with no assistant, made it hard to fit the methods into the daily curriculum at all [10]. Related FOE work in VR empathy training [14] and spatial analysis for health education [15] shows an appetite for technology-enhanced socio-emotional learning, but neither addresses continuous monitoring in a trauma-sensitive classroom.

2.2 Biometric Sensing and Ethics

Facial emotion recognition has been used to study engagement [8], but most systems rely on RGB cameras and posed-expression datasets, which limit accuracy on the spontaneous, low-intensity expressions characteristic of trauma masking [11]. HRV and accelerometry provide information about autonomic arousal [16], and multimodal systems outperform unimodal ones [17], but classroom deployment has been hindered by hardware costs and intrusiveness. Two pieces of consumer hardware now make a school-friendly setup feasible. The iPhone's TrueDepth camera exposes 52 ARKit blend-shape coefficients that map to FACS Action Units [18], and the Apple Watch has been validated as a research-grade HRV instrument [19]. Privacy and ethics still constrain any school deployment. Biometric data from minors is sensitive personal data under GDPR, so parental consent and child assent are required [9]. Re-identification risk persists even after anonymisation [20]; in conflict-affected settings, the consequences of misuse are greater [21]; and the digital divide is structural [22]. We address each of these directly in §4 and §6.

3. The BioMirror Platform

3.1 Overview

BioMirror was introduced in [4] as an iOS implementation for biometric facial emotion analysis. The premise is simple: a child's face and their autonomic state, taken together, say more than either does alone. A neutral face with elevated HR and suppressed HRV is a likely sign of masking; a face that moves with the physiology points to real engagement, or real distress. The emotional–physiological coherence score is the central output.

3.2 Facial and Physiological Sensing

The facial component runs on an iPhone using ARKit, which extracts 52 blend-shape coefficients at up to 60 fps; these map closely to FACS Action Units [18]. BioMirror smooths the vector with a two-frame moving average and passes it to a rule-based classifier that maps activations to seven basic emotions at a 0.15 confidence threshold. A 500 ms micro-expression detector flags brief deviations from the neutral baseline that may indicate suppression. Physiology comes from a paired Apple Watch via HealthKit and WatchConnectivity (HR, HRV/SDNN, wrist temperature, respiratory rate, motion); CoreMotion on the iPhone adds acceleration, rotation, a tremor index, and gait metrics. All values are validated against physiological plausibility ranges, and the system derives a stress score (SDNN/RMSSD/LF-HF), a fever-risk indicator, and a breathing classification.

3.3 Coherence Computation

The DataIntegrationService computes the coherence score every five seconds over a 30-second sliding window (Fig. 1). Three weighted components combine: emotional stability (0.3) from emotion-classification variance, physiological state (0.4) from HR/HRV/tremor/temperature, and cross-modal alignment (0.3) from the Pearson correlation between smoothed emotion intensity and the autonomic arousal index. The score ranges from 0 to 1, and higher values mean tighter alignment. A discordance

detector flags two patterns at a 0.4 threshold: a suppressed face with elevated arousal (potential masking), and simultaneous suppression of face and HRV (potential dissociation). Session data persists in Core Data, and the device generates an end-of-session report.

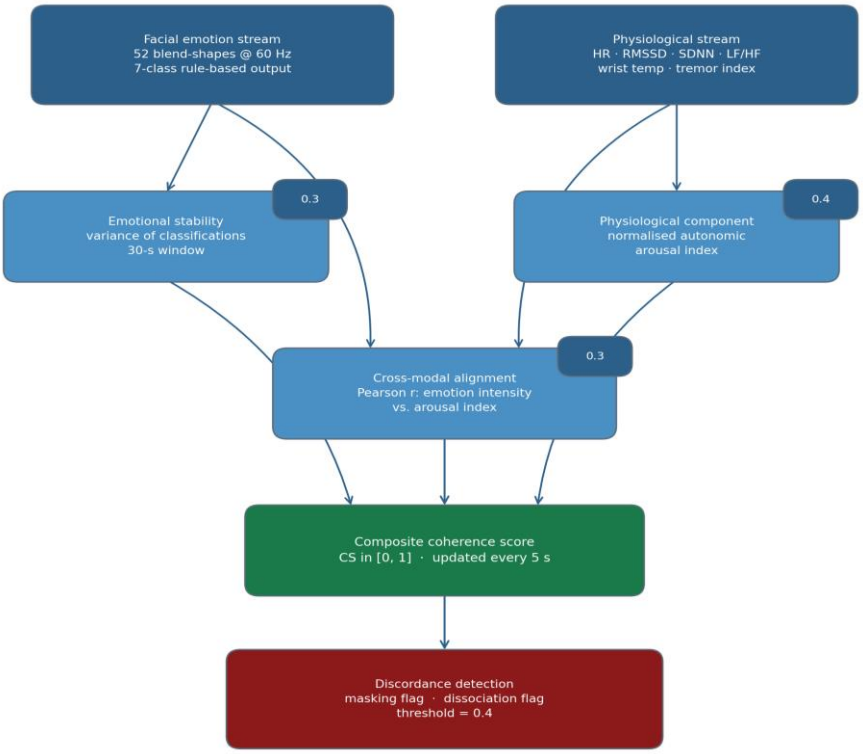

Fig. 1. Coherence computation pipeline

4. BioMirror Researcher: macOS Multi-Device Dashboard

4.1 Architecture

Scaling BioMirror to a classroom means aggregating real-time streams from many iPhones at the same time. We use a hybrid design (Fig. 2). All sensing and coherence computation run on the iOS device. The macOS application is a supervisor: it receives pre-processed summaries, never raw sensor streams. No raw blend-shape vectors and no facial images cross the wire during a session.

The Mac advertises itself with Bonjour over `_biomirror._tcp` and runs an `NWListener` WebSocket server. Each iPhone uses an `NWBrowser` to discover it and opens a persistent connection that retries with a five-second backoff. The link is TLS, and the server's identity is held in the Secure Enclave so the private key cannot be exported. iPhones present a short-lived pairing token on first connect; a researcher generates the token in the Mac dashboard and reads it as a QR code on the phone. Zero-config discovery matters in schools where IT support is thin.

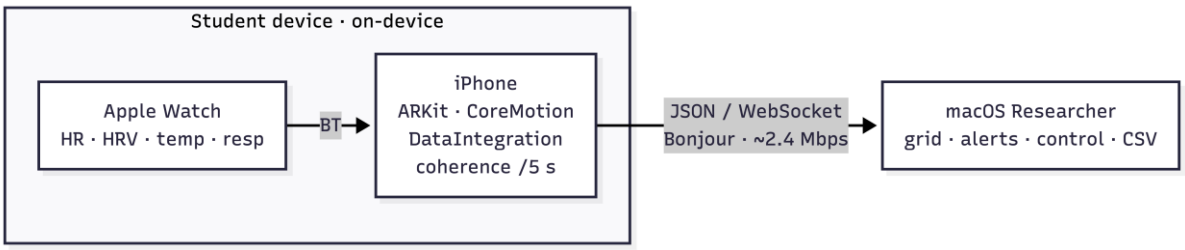

Fig. 2. BioMirror system architecture

4.2 Protocol and Dashboard

Client and server speak a single JSON envelope (`WSMessage`) over the WebSocket. The envelope carries a typed message: `register` and `heartbeat` keep the device list current, `sessionUpdate` streams live metrics every 2 s, `alert` flags discordance events, `command` lets the Mac broadcast start/stop/pause/resume across the cohort, and a chunked `sessionExport*` channel ships gzip-compressed full-session data back to the Mac at the end of a session for offline analysis. Each device sends a heartbeat every 10 s and a metrics update every 2 s with emotion, HR, HRV, coherence, and Watch connectivity, so 30 devices produce well under 3 Mbps on standard school Wi-Fi.
The dashboard has three areas. A device grid shows one card per iPhone with current emotion and confidence, a live HR chart, a coherence sparkline, battery, and Watch link status; cards turn amber or red on low battery, dropped face tracking, or missed heartbeats (>25 s). An alert feed lists discordance events with per-event or bulk acknowledgement. An experiment control panel assigns pseudonymous participant IDs, sends targeted or broadcast commands, and exports the timeline as CSV. The same panel lists the available iOS protocols, marks the ones still in development as "Coming soon", and refuses to start them — the iOS side enforces the same gate, so a teacher cannot accidentally launch an unfinished protocol on a class.

5. From Prototype to Classroom-Scale Research Instrument

5.1 Technical Capabilities

Together, the iOS sensing stack and the macOS dashboard do something the single-device prototype cannot: collect a coherent record across a whole class. Table 1 lists the main performance metrics from adult validation [4] and multi-device system testing.

Table 1. Technical performance metrics of the BioMirror platform.

Metric	Value	Condition
Emotion recognition accuracy	87.3%	Controlled lighting, front-facing, 20 adults
Cross-device synchronization latency	< 50 ms	Local network, 10 connected devices
Biometric signal validity	94%	Normal activity, Apple Watch Series 6+
WebSocket connection stability	98.2% uptime	4-hour continuous session
Battery drain (iPhone 13, screen on)	12%/hour	Active face tracking and streaming
Maximum concurrent devices	30	Standard school Wi-Fi, 2.4/5 GHz
Dashboard update rate	2 s per device	JSON-over-WebSocket
Network bandwidth (30 devices)	< 3 Mbps	Compressed JSON stream
Coherence score update interval	5 s	30-second sliding window
Alert detection latency	< 5 s	Rule-based, evaluated per heartbeat

Thirty devices, sub-50 ms synchronization, and under 3 Mbps of bandwidth all sit comfortably within standard school Wi-Fi. 98.2% WebSocket uptime covers a school morning without reconnection, and at a 12%/hour drain, an iPhone 13 lasts roughly 8 hours. The recognition and biometric numbers are from adult validation under controlled conditions [4]; classifier behavior with children in classrooms is unknown, and is a primary focus of the pilot.
Table 2 compares BioMirror with two alternatives: manual observational coding and single-modality wearables.

Table 2. Comparison with alternative classroom emotional monitoring approaches.

Dimension	BioMirror	Manual coding	Wearable-only
Temporal resolution	5 Hz (emotion), 1 Hz (physiology)	~0.1 Hz	1 Hz
Physiological correlation	Yes (facial + autonomic)	No	Yes (autonomic only)
Classroom scalability	30+ participants	5–8 (observer limit)	15–20
Trauma sensitivity	High (masking + dissociation detection)	Variable	Medium
Implementation complexity	Medium	High	Low
Participant burden	Low (consumer devices)	High	Medium
Privacy risk	Medium (facial data on-device)	Low	Low

5.2 Coherence as a Research Variable

For war-affected children, coherence has two readings. High coherence means the visible emotional state matches autonomic arousal, signalling either engagement or distress. Low coherence means face and body are telling different stories: the child is masking. From a trauma-informed perspective, low coherence is the more clinically significant signal, and exactly the pattern that teachers currently have no reliable way to detect. The multi-device architecture also enables a second-order variable: group coherence synchrony. If several students show correlated drops in coherence after a loud noise or a distressing topic, that may signal a shared trauma response, and the pairwise coherence matrix could inform grouping and the timing of regulatory interventions.

5.3 Adaptations for School Practice

The current dashboard is a research tool, not a classroom one. Three additions are on the design board; none have been implemented yet. The first is a teacher-facing indicator layer that translates raw coherence into colour-coded signals without exposing the biometric data. The second is a hardened minimal-data privacy mode that strips even the identifiers of derived scores from the macOS log. The third is a guided micro-session module that lets the teacher start a regulation activity (a breathing exercise or a short art prompt) and observe the group's coherence response in real time. Fig. 3 shows the layout for a 30-student classroom.

Fig. 3. Proposed classroom deployment

6. Proposed Deployment in Ukrainian Inclusive Schools

6.1. Rationale

The deployment combines two strands established earlier: the mental health crisis among Ukrainian students [1, 2] and the evidence that art therapy and play-based learning support psycho-emotional rehabilitation in war-affected children [10]. Budnyk et al. propose a four-stage pedagogical model — diagnostic, selection, application, evaluation — for folding these methods into the daily classroom.

BioMirror does not yet implement that cycle as a first-class object. What it does do is provide an instrument for the stages that depend on objective signal:

- Diagnostic. The baseline phase of every protocol records HR, HRV, and emotional baseline for two to five minutes. That gives the teacher (or, in phase one, the researcher) a per-child reference for the rest of the session.
- Application. The pilot protocols listed in §6.2 each carry an ordered phase script and always finish with a Regulation phase, so the system de-escalates automatically rather than ending on a creative-task arousal peak.
- Evaluation. Per-session coherence distributions, RR- interval shift vs baseline, discordance counts, and (for the group protocols) a cross-device synchrony view feed back into the teacher journal and post-session interviews.

The selection stage stays with the teacher and the school psychologist; BioMirror does not currently recommend which activity to run next. Building that out — driven by per-child coherence history — is in the §8 future-work list.

6.2. Mixed-methods Pilot Design

The pilot runs in three phases in two to three Ukrainian inclusive primary schools serving students aged 8–14, including both resident and internally displaced children, with at least one rural school to mirror the setting described by Budnyk et al. [10]. The preparatory phase (four weeks) covers ethics approval, parental consent, child assent, Wi-Fi configuration, and teacher training on the dashboard and coherence interpretation, following the guidelines for responsible AI use in academic institutions in [23]. The data collection phase (eight weeks) runs two to three sessions per week, 30–45 minutes each. Of the activities Budnyk et al. document in [10], one is fully runnable in the current build: a guided breathing protocol. The iOS app drives a five-step phase script — Baseline, Paced Inhale at 4 counts, Paced Exhale at 6 counts, a 5-minute Regulation phase, and Recovery — using a SwiftUI breathing circle as a visual pacer. At the end of each session the system reports the mean RR-interval shift between the Regulation phase and the baseline, which is the primary success metric for this activity.

During a session the iPhone runs the breathing script and the on-device facial analysis. The paired Apple Watch streams HR and HRV to the iPhone over HealthKit and WatchConnectivity. The macOS Researcher app aggregates the resulting per-device LiveMetrics from up to 30 iPhones over a Bonjour-advertised WebSocket (_biomirror.tcp) on the school LAN. The dashboard shows one card per child with the dominant emotion, live HR, a coherence sparkline, battery, and Watch connectivity, and a separate alert feed for discordance events. Raw images and blend-shape vectors never leave the iPhone. The connection is TLS. The server's private key is held in the Secure Enclave on the Mac, and each iPhone presents a short-lived pairing token on first connect.

The other four activities documented in [10] are part of the pilot plan but are not yet enabled in the current build: drawing and modelling with natural materials, a collaborative class mosaic or "friendship tree", folk-song-based group play, and story-drawing followed by short theatrical performances. They are scaffolded in the iOS app with the same four-step phase structure (Baseline, main task, Regulation, Debrief), and they appear in the macOS dashboard with a "Coming soon" badge. Both apps refuse to start them via the same planning gate used to block stress-induction protocols for minors. The work remaining before they can run in a school is the per-activity UI for the main task (a drawing canvas for the natural-materials and story-drawing protocols, an audio-cue player for the folk-song protocol, and a shared-canvas component for the class mosaic). The two group activities (mosaic and folk song) already attach a groupSessionID to their iOS payload; the cross-device synchrony computation on the Mac is the next piece of work, and the first round of the pilot will report per-child coherence only.

The researcher monitors the dashboard and logs alerts. Teachers run sessions as normal without access to real-time data and record observations in structured reflection journals. The analysis phase, an indicative four weeks, combines quantitative data (coherence distributions, alerts, and group synchrony once available) with qualitative data: teacher journals, post-session interviews, and student focus groups modelled on [10].

Fig. 4. Proposed three-phase pilot study design.

6.3 Teacher Role and Safeguards

Restricting teacher access to real-time data in phase one avoids confounding the research and lets us evaluate the platform's outputs independently. In a later phase, teachers would get the simplified indicator view (§5.3) with interpretation training; the indicators are one input among many, not a definitive assessment. Several safeguards apply. All facial processing stays on-device, with no images or raw blend-shape vectors transmitted or stored on the macOS server. Coherence scores and emotion classifications are stored under pseudonymous IDs, and the ID-to-identity mapping is held separately by the school administrator. Data are retained for the study duration and deleted afterwards. Participation is voluntary, and withdrawal does not affect a student's standing. The protocol will be reviewed by the ethics committee of Vasyl Stefanyk Carpathian National University before data collection begins.

7. Discussion

7.1 Ethics, Hardware, and the Digital Divide

Facial emotion recognition can encode demographic biases, be repurposed for surveillance, and create power asymmetries between institutions and the people they monitor [9]. The stakes are higher for war-affected children, who are already vulnerable [21]. The architectural choices in §4 and §6 (on-device processing, transmission of derived scores only, pseudonymization, and time-limited retention) reduce these risks but do not eliminate them. The hardware requirement is a separate constraint. BioMirror needs an iPhone and an Apple Watch per student, a significant investment that most Ukrainian schools, especially rural or conflict-affected ones, cannot meet [22]. A deployment available only to well-resourced schools would deepen existing inequalities. The most direct fix is a version that drops the Watch and uses the iPhone's front camera alone; lending and device-sharing models are a shorter-term option [22].

7.2 Teacher Workload and Technical Limitations

Teachers in Ukrainian schools already operate under exceptional pressure [1]. BioMirror is designed to reduce, rather than add, workload by automating distress-signal detection that currently relies on effortful observation, but using it effectively takes some learning. Teachers have to read coherence, interpret the alert feed, and decide how to fold those outputs into what they were already going to do in the lesson. The pilot's training component is therefore central [23]. Over-reliance on algorithmic outputs is a known concern in AI-in-education [24], and phase one mitigates it by restricting teacher access to real-time data.

The platform also has technical limits. ARKit requires the student to face the iPhone at a distance of 30–80 cm, so head turns or peer interactions create data gaps. The rule-based classifier may not capture the full complexity of expression in children with trauma histories [11]. And we have not yet validated the coherence score against established measures of emotional regulation or trauma symptomatology; that requires running standardised psychological assessments alongside BioMirror in a later phase.

8. Conclusion and Future Work

BioMirror Researcher takes BioMirror, originally a single-participant iOS tool, and lets it supervise up to 30 participants at once over Bonjour/mDNS and persistent WebSockets. The iOS sensing stack achieved 87.3% emotion-recognition accuracy, sub-50 ms synchronization, and 94% biometric signal validity in adult validation [4], and the multi-device architecture holds those numbers across 30 concurrent connections on standard school Wi-Fi. The coherence score picks up the masking and

dissociative patterns typical of war-related trauma, which periodic assessments, observational coding, and single-participant systems all largely miss.

Three lines of future work follow. First, run the pilot in two to three Ukrainian inclusive primary schools, integrating BioMirror with art therapy and play-based learning [10] and validating the coherence score against established measures of emotional regulation and trauma symptomatology. Second, build and evaluate the teacher-facing adaptations from §5.3. Third, develop a Watch-free configuration for schools that cannot provide wearables for every student.

Between Hope, Probability, and Practice: Teachers' Visions of AI-Supported Inclusive Education

Lina Gaižiūnienė[1], Laura Daniusevičiūtė-Brazaitė[2], Raminta Pučėtaitė[3]

[1,2,3]Kaunas University of Technology, Lithuania

Abstract

This study explores teachers' visions of AI-supported inclusive education through a futures literacy perspective, focusing on how educators distinguish between desirable, probable, and plausible educational futures. Using a scenario-based qualitative design, data were collected from 50 teachers who described future learning environments shaped by artificial intelligence. The findings indicate that teachers primarily view AI as a pedagogical support tool enabling personalised learning, adaptive feedback, immersive environments, and increased accessibility. Inclusive education is mainly conceptualised through learner agency, universal design, and equitable participation rather than deficit-oriented approaches. The analysis identified four configurations of AI-supported inclusive education. The most desirable scenario presents AI as an enabler of learner-centered and inclusive education that strengthens teacher agency and supports diverse learners. However, efficiency-driven systems focused on monitoring, automation, and performance optimisation are perceived as the most probable trajectory. A third scenario highlights ethical concerns, including surveillance, algorithmic bias, and the erosion of human relationships, thereby defining the boundaries of undesirable futures. Finally, a hybrid and negotiated scenario emerges as the most plausible pathway, characterised by context-sensitive AI integration guided by teachers' professional judgement. The findings reveal normative, probabilistic, and pragmatic tensions shaping teachers' anticipatory thinking and demonstrate that inclusive AI futures depend not only on technological advancement but also on ethical governance, institutional conditions, and professional agency. The study contributes to futures-oriented educational research and highlights the importance of futures literacy in supporting inclusive, ethical, and human-centered educational transformation.

Keywords: *futures literacy; artificial intelligence in education; inclusive education; teacher agency; educational futures*

1. Introduction

Artificial intelligence (AI) is increasingly presented as a transformative force capable of personalising learning, improving efficiency, and supporting learner diversity [7]. At the same time, critical scholarship emphasises that educational technologies are not neutral and that their adoption is shaped by social, political, and institutional contexts [10]. These tensions are especially visible in discussions of inclusive education, where questions of participation, equity, and accessibility are central. Most existing research on AI in education focuses on technological capabilities, implementation challenges, or data-driven governance. Such approaches often frame technological change as inevitable while underestimating the ethical and pedagogical implications of AI integration [9]. From a futures literacy perspective, however, the future is not treated as predictable but as a space of multiple possibilities shaped by values, assumptions, and anticipatory thinking [6]. Futures literacy emphasises the capacity to distinguish between desirable, probable, and plausible futures and to reflect critically on the assumptions and values that underpin anticipatory thinking [4]. In educational research, this perspective shifts attention away from forecasting technological outcomes towards examining how different actors use the future as a resource for sense-making and decision-making in the present. Teachers play a central role in shaping how AI is interpreted and enacted in educational practice. As professionals situated at the intersection of policy, technology, and everyday pedagogy, teachers' perspectives provide insight into how future educational change is imagined, contested, and negotiated. Research on teacher agency highlights that educators are not merely implementers of externally defined innovations but active agents whose professional judgement is crucial for ethically and pedagogically meaningful practice [2]. Understanding teachers' future imaginaries therefore offers a window into broader questions about the purposes of education, professional responsibility, and the conditions under which inclusion is pursued or constrained.

2. Methodology

This study adopts a qualitative scenario-based research design grounded in futures literacy. Rather than predicting future developments, the study explores how teachers imagine and evaluate possible futures of AI-supported inclusive education. Scenario-based analysis was selected because it enables the systematic exploration of desirable, probable, plausible, and risk-oriented futures. The research integrates narrative inquiry with futures-oriented analysis. Narrative inquiry supports the exploration of how participants construct meaning through imagined future scenarios [3]. The study additionally draws on the future-scaffolding skills framework [4], which enables the identification of tensions, uncertainties, and anticipatory thinking patterns within participants' narratives [1]. Grounded Theory principles guided the inductive coding process [5].

2.2 Participants and Data Collection

The study involved 50 teachers working in formal education settings in Lithuania. Participants represented different subject areas, teaching experiences, and institutional contexts. Teachers were invited to imagine educational environments in the year 2050 where AI technologies play a significant role in teaching and learning. Data were collected using an open-ended scenario-oriented questionnaire. Participants described future educational environments, reflected on differences between current and future practices, and evaluated the desirability and likelihood of their envisioned futures.

2.3 Data Analysis

The analysis combined thematic coding with scenario-based synthesis. Responses were segmented into meaning-bearing fragments and coded across several analytical dimensions: AI functionality, pedagogical processes, inclusion, ethical concerns, and emotional orientation. The second stage of analysis focused on positioning responses within a futures cone framework distinguishing desirable, probable, plausible, and possible futures.

3. Results

AI is predominantly imagined as a personalising, adaptive, and supportive pedagogical agent, closely aligned with learner-centred and relational educational values. Inclusion is framed less as targeted remediation and more as a matter of agency, accessibility, and participation, indicating a shift away from deficit-based discourses. At the scenario level, teachers' visions are strongly oriented toward desirable futures in which AI enhances inclusive education, while simultaneously acknowledging plausible hybrid arrangements shaped by ethical concerns, infrastructural limits, and professional judgement. These patterns underscore the coexistence of aspiration and caution in teachers' futures literacy, setting the stage for the subsequent discussion of normative–probabilistic–pragmatic tensions in AI-supported inclusive education.

Scenario 1: AI as an Enabler of Inclusive Education

This scenario represents a normative vision of a future in which artificial intelligence (AI) functions as a key enabler of inclusive education, supporting diverse learners through flexible, learner-centred, and equitable educational practices. Participants describe AI not merely as a technological innovation or a tool for efficiency, but as a pedagogical mediator that enables personalised learning pathways, reduces learning barriers, and strengthens social inclusion (INC1, INC2, INC4, INC5; AI-F1). Learning in this envisioned future is grounded in principles of universal design, whereby content, assessment, and learning pace are adapted to individual learners rather than requiring learners to conform to standardised expectations (INC1, CMP4). AI-supported tools provide multiple modes of content representation and continuous formative feedback perceived as supportive rather than controlling (AI-F3, CMP3), as reflected in participants' accounts, for example: "I would like technologies to adapt to each learner, instead of learners having to adapt to the system" (R14). Inclusion is conceptualised through the lens of equity rather than equality, with respondents emphasising AI's potential to support students with special educational needs, language

difficulties, or those at risk of marginalisation by adjusting learning pace, task complexity, and modes of explanation (INC2, AI-F7), as one participant noted: “AI could support students who are currently left behind by adjusting the pace, tasks, and even the way explanations are provided” (R31). Within this scenario, AI is predominantly portrayed as a learning assistant that complements rather than replaces teachers, automating technical and repetitive tasks while leaving pedagogical decision-making and relational work firmly within the teacher’s domain (AI-F2, AI-F4, GOV2), thereby strengthening rather than diminishing teacher agency (PED5, CMP3). This future is also strongly associated with emotional and social well-being, with participants expressing feelings of hope and reduced stress and describing learning environments in which mistakes are framed as an integral part of learning rather than failure (EMO1, PED5), for instance: “This kind of future feels calmer—for both students and teachers” (R22). When positioned within the futures cone framework, this scenario is clearly identified as desirable (CONE-DES) but less frequently perceived as probable, as respondents highlight the need for systemic conditions such as teacher training, ethical and legal regulation, adequate infrastructure, and policy support (CONE-PLAUS; CHG2; GOV1–GOV3), noting that “the system is not yet ready for it” (R9). This reveals a pronounced normative–probabilistic gap (GAP1), further reinforced by respondents’ limited sense of influence over system-level change (GAP5; CHG3), as expressed by one participant: “I can change my own teaching practices, but not the entire system” (R18). Ethical concerns related to data privacy and algorithmic bias are also identified as potential constraints (ETH1, ETH2; GAP3), underscoring the complexity of translating this value-driven vision of AI-supported inclusive education into practice.

Table 1. Scenario 1: AI as an Enabler of Inclusive Education – Core Configuration

Element	Description
In the centre	Learner (diverse needs)
Teacher	Professional judgement grounded in care and relational pedagogy
AI tools	Supportive role enabling personalisation and accessibility
Learning environment	Universal design and flexible learning pathways
Value base	Inclusion as equity, learner well-being, and learner agency

Table 1 summarises Scenario 1, which represents a learner-centred and care-oriented configuration of AI-supported inclusive education. In this scenario, AI functions as an enabling tool rather than a governing force, supporting personalised learning and accessibility alongside teacher professional judgement. Inclusion is understood as equity and meaningful participation, grounded in a learning environment designed according to universal design principles and flexible pathways.

Scenario 2: AI as an Instrument of Efficiency and Control

This scenario represents a future of AI-supported education that is predominantly shaped by efficiency, standardisation, and data-driven governance, and is therefore most frequently positioned as probable within the futures cone framework. In participants’ accounts, AI is primarily associated with automating assessment, monitoring learner progress, and optimising instructional processes at scale (AI-F3, AI-F4, CMP1). Learning analytics, predictive systems, and automated feedback mechanisms are described as central features of everyday educational practice, enabling institutions to track performance, identify risks, and allocate resources more efficiently (GOV1, GOV3). While such uses of AI are often perceived as realistic extensions of current trends (CONE-PROB), respondents express ambivalent emotional responses, oscillating between cautious optimism and concern (EMO3). Inclusion in this scenario is framed more narrowly and instrumentally, focusing on identifying “at-risk” students through data rather than fundamentally redesigning learning environments to accommodate diversity (INC4, CMP5). As one participant noted, “AI would probably help schools see who is struggling faster, but I am not sure it would really change how learning works” (R26). Teachers in this scenario are positioned as implementers of AI-generated recommendations rather than autonomous pedagogical decision-makers, with AI systems increasingly shaping instructional choices, assessment criteria, and pacing (GOV2, CHG4a). Although this redistribution of responsibility is sometimes viewed as reducing workload, it also raises concerns about the erosion of professional agency and pedagogical judgement (CMP3, ETH3), reflected in comments such as “There is a risk that teachers will have to follow what the system suggests, even if it does not fully fit their students” (R11). Emotional and relational dimensions of education receive comparatively less attention in this scenario, and learning is often described in terms of performance indicators, benchmarks, and compliance rather than well-being or belonging (PED5, CMP2). Ethical issues, particularly related to data privacy, surveillance, and algorithmic bias, are recurrently mentioned

as latent risks rather than central design considerations (ETH1, ETH2), suggesting that ethical reflection may lag behind technological implementation. When contrasted with the first scenario, this future is perceived as more likely to materialise but less desirable, revealing a clear tension between what participants expect will happen and what they believe should happen in AI-supported inclusive education. This scenario thus illustrates a probable trajectory of AI integration that prioritises systemic efficiency over transformative inclusion, highlighting the risk that AI adoption may reinforce existing educational structures rather than challenge them.

Table 2. Scenario 2: AI as an Instrument of Efficiency and Control – Core Configuration

Element	Description
In the centre	AI-driven system (data analytics and automation)
Teacher	Implementation of AI-generated recommendations; constrained professional agency
Learners	Monitored through performance data; categorised into risk profiles
Governance context	Accountability frameworks, standards, indicators, and KPIs
Value base	Efficiency, standardisation, and control

Table 2 summarises Scenario 2, which represents a system-centred and efficiency-oriented configuration of AI-supported education. In this scenario, AI-driven analytics and automation structure teaching and learning processes, positioning teachers primarily as implementers rather than autonomous decision-makers. Learners are framed through data-based monitoring and risk categorisation, and inclusion is addressed instrumentally within governance and accountability frameworks rather than through pedagogical redesign.

Scenario 3: AI as a Source of Risk, Inequality, and Educational Regression

This scenario captures a future-oriented perspective in which the integration of artificial intelligence (AI) into education is primarily associated with risk, uncertainty, and potential regression rather than improvement. Participants describing this scenario express strong concerns regarding the ethical, social, and pedagogical implications of AI use, positioning these risks as outweighing its potential benefits (ETH1, ETH2, ETH3). AI is frequently perceived as a technology that may intensify surveillance, reduce human interaction, and exacerbate existing inequalities, particularly for students from disadvantaged backgrounds or those with specific learning needs (INC4, CMP5). Rather than fostering inclusion, AI in this scenario is seen as reinforcing deficit-based approaches to learning, where students are categorised, monitored, and labelled based on algorithmic predictions (AI-F4, CMP3). As one participant articulated, “I am afraid that technology will decide who is capable and who is not, and that this will only increase exclusion” (R33). Teachers’ professional roles in this scenario are characterised by a loss of agency and increased dependency on externally imposed technological systems and policy mandates (GOV1, GOV2; CHG4a), leading to feelings of powerlessness and resistance (CHG3, EMO2). Respondents describe a future in which pedagogical judgement is subordinated to algorithmic logic, raising fears of dehumanisation and the erosion of meaningful teacher–student relationships (ETH3, CMP3), as reflected in statements such as “Education risks becoming a process managed by systems rather than people” (R19). Emotional responses associated with this scenario are predominantly negative, including anxiety, frustration, and concern for the future of education (EMO2), and are often linked to a broader distrust in institutional capacity to regulate AI responsibly. Within the futures cone framework, this scenario is most often positioned as possible but not desirable (CONE-POSS), and in some cases as a plausible outcome should ethical, regulatory, and pedagogical safeguards fail to materialise (CONE-PLAUS; GAP3, GAP4). In contrast to the first two scenarios, this future is characterised less by a debate over implementation strategies and more by fundamental doubts about whether AI should play a significant role in inclusive education at all. As such, the scenario highlights the importance of ethical governance, professional agency, and value-driven decision-making in shaping AI trajectories in education, while illustrating the perceived risks of uncritical or poorly regulated technological adoption.

Table 3. Scenario 3: AI as a Source of Risk and Educational Regression – Core Configuration

Element	Description
In the centre	Perceived risks and uncertainties related to AI use
Teacher	Loss of professional agencies; resistance and ethical concern
Learners	Risk of exclusion, labelling, and marginalisation
AI systems	Opaque algorithms; surveillance and bias
Value base	Ethical caution, protection of human relationships, avoidance of harm

Table 3 presents Scenario 3, which frames AI-supported education primarily through risks, ethical concerns, and the potential for educational regression. In this scenario, AI is associated with surveillance, algorithmic bias, and the erosion of human-centred pedagogical relationships. Teachers express diminished professional agency and principled resistance to AI adoption, while learners are viewed as vulnerable to categorisation, exclusion, and dehumanisation. Rather than enabling inclusion, AI is perceived as a threat to equity and educational integrity, positioning this scenario as possible but normatively undesirable.

Scenario 4: AI as a Catalyst for Hybrid and Negotiated Educational Futures

This scenario represents a hybrid and negotiated future of AI-supported education, in which artificial intelligence is neither uncritically embraced nor fundamentally rejected, but instead integrated through continuous negotiation among pedagogical values, institutional constraints, and technological possibilities. Participants describing this scenario emphasise contextual, cautious, and selective use of AI, highlighting the importance of human judgement, professional autonomy, and situational decision-making (PED1, GOV2, CHG3). AI is perceived as a flexible tool whose role varies across subjects, learner groups, and educational settings, rather than as a uniform solution applied system-wide (AI-F1, AI-F2). In contrast to efficiency-driven models, this scenario foregrounds deliberation and balance, with respondents stressing that AI should support learning only “where it makes pedagogical sense” and be limited where it risks undermining relationships or learner agency (CMP3, ETH3). As one participant explained, “AI can be useful, but only if teachers decide when and how to use it—it cannot work the same way in every situation” (R21). Inclusion in this scenario is understood as a dynamic and negotiated practice, shaped by teachers’ professional judgement and local knowledge of learners’ needs rather than solely by algorithmic recommendations (INC5, INC2). Emotional responses associated with this future are predominantly ambivalent but reflective, combining cautious optimism with awareness of risks and responsibilities (EMO3). Within the futures cone framework, this scenario is most frequently positioned as plausible (CONE-PLAUS), as it aligns with current transitional practices and incremental change rather than radical transformation or technological regression. However, respondents also acknowledge that sustaining such a balanced approach requires ongoing professional development, institutional trust in teachers, and adaptive governance structures capable of responding to rapid technological change (GOV1–GOV3; CHG2). This scenario thus illustrates a future in which AI integration is shaped through continuous sense-making and negotiation, positioning educators not as passive adopters of technology but as active co-constructors of evolving, context-sensitive educational practices.

Table 4. Scenario 4: AI as Hybrid and Negotiated Futures – Core Configuration

Element	Description
In the centre	Pedagogical judgement mediating AI use
Teacher	Active professional agency; contextual and ethical decision-making
Learners	Diverse needs addressed through situational and flexible support
AI tools	Selective and context-sensitive use; supportive but non-dominant role
Governance context	Adaptive frameworks enabling professional discretion
Value base	Balance between inclusion, responsibility, and institutional feasibility

Table 5 summarises Scenario 4, which depicts a hybrid and negotiated configuration of AI-supported inclusive education. In this scenario, AI use is neither fully embraced nor rejected, but mediated through teachers’ professional judgement and contextual decision-making. Teachers occupy a central role in determining when and how AI meaningfully supports learning, while learners’ diverse needs are addressed through flexible and situational practices. This scenario reflects a pragmatically plausible future in which inclusion is pursued through ongoing negotiation between educational values,

institutional constraints, and sociotechnical possibilities.

A comparative synthesis of the four scenarios (see Table 5) highlights how AI-supported inclusive education is configured across different future imaginaries. The table illustrates clear differences in the core orientation of AI use, understandings of inclusion, teacher roles, emotional orientations, and futures cone positioning. Scenario 1 represents a learner-centered and care-oriented configuration in which AI functions as a pedagogical mediator aligned with equity and well-being. In contrast, Scenario 2 reflects a system-centred and efficiency-oriented trajectory, where AI-driven optimisation and monitoring dominate, and inclusion is framed instrumentally within governance and accountability structures. Scenario 3 delineates a boundary of unacceptable futures, emphasising risks related to surveillance, bias, and the erosion of professional and relational dimensions of education. Scenario 4 occupies an intermediate position, depicting a pragmatically plausible future in which AI use is selectively negotiated through teachers' professional judgement and contextual decision-making.

Taken together, Tables 1 - 4 and the accompanying figures demonstrate that teachers' future imaginaries of AI-supported inclusive education are not uniform or linear, but structured along a spectrum of desirable, probable, possible, and plausible futures. Rather than converging on a single anticipated trajectory, participants articulate multiple, sometimes conflicting, orientations toward AI, revealing how values, emotions, institutional logic, and perceptions of professional agency intersect in anticipatory reasoning.

Across open-ended responses, teachers consistently contrasted future AI-supported educational visions with current teaching and learning practices by emphasising limitations of standardisation, frontal instruction, and textbook-centred approaches. The present educational process was frequently described as oriented towards uniform content delivery and assessment, often neglecting learners' individual needs and experiential engagement. In contrast, future visions articulated by teachers foregrounded AI-supported personalisation, visualisation, and real-time feedback as mechanisms for transforming abstract learning into experiential understanding. Respondents provided detailed examples of how AI could reshape subject teaching. In mathematics education, one teacher envisioned a learning environment in which "an AI model would monitor students' actions and understanding in real time and provide individualised tasks together with feedback supported by visual explanations" (translated), contrasting this with current practices focused primarily on formula derivation and uniform problem-solving. Similarly, another respondent emphasised the value of immersive learning, stating that "students could experience much more without leaving the classroom, for example by virtually moving into a Renaissance-era environment" (translated).

Teachers' responses also revealed a strong desire to move away from predominantly passive learning modes. Current classrooms were described as spaces where "students listen to the teacher's explanations, take notes, but have very little opportunity for independent work" (translated). In future-oriented imaginaries, AI-supported environments were associated with increased learner activity, experimentation, and inquiry. At the same time, ambivalence was evident, particularly regarding the risk that AI might replace rather than support cognitive effort. One respondent observed that "more and more students no longer try to think or search for answers themselves, relying instead on ChatGPT" (translated), reflecting concerns about overreliance on automated assistance. The data further highlight a reconfiguration of teacher roles. While the current educational context was described as placing a heavy mechanical workload on teachers, future visions positioned AI as alleviating routine tasks and enabling renewed focus on pedagogical quality. As one participant stated, "teachers' preparation time could be reduced, allowing greater focus on the quality of content rather than its quantity" (translated). In this context, teachers envisioned their role shifting toward mentoring learners in how to learn, reflect, manage their time, and develop values, rather than primarily delivering content.

However, these aspirations were frequently accompanied by concerns about dehumanisation and the loss of relational contact, underscoring persistent tensions between technological potential and educational values. Taken together, these empirically grounded contrasts demonstrate that teachers use future imaginaries of AI-supported education as a means of critically reflecting on current educational shortcomings. The translated excerpts reinforce the scenario-based analysis by showing how normative aspirations, perceived probabilities, and pragmatic concerns intersect in teachers' anticipatory reasoning about inclusive educational futures.

Table 5. Comparison of scenarios of AI-supported inclusive education

Scenario	Core orientation of AI use	Understanding of inclusion	Role of teachers	Dominant emotional tone	Futures cone positioning	Key tensions and gaps
Scenario 1: AI as an Enabler of Inclusive Education	AI as a pedagogical mediator enabling personalised learning, universal design, and learner-centred support (AI-F1, AI-F2, AI-F7)	Inclusion understood as equity and meaningful participation for all learners, particularly those with diverse needs (INC1–INC5)	Teachers as facilitators, mentors, and relational agents; AI complements but does not replace pedagogical judgement (PED5, GOV2)	Positive (hope, inspiration, reduced stress) (EMO1)	Desirable; partially plausible (CONE-DES; CONE-PLAUS)	Normative–probabilistic gap; limited teacher agency at system level; ethical and capacity constraints (GAP1, GAP5, ETH1–ETH2)
Scenario 2: AI as an Instrument of Efficiency and Control	AI used for automation, assessment, monitoring, and optimisation of educational processes (AI-F3, AI-F4)	Inclusion framed instrumentally through identification and management of "at-risk" learners (INC4)	Teachers as implementers of AI-driven recommendations; partial erosion of professional autonomy (GOV2, CMP3)	Ambivalent (cautious optimism mixed with concern) (EMO3)	Probable (CONE-PROB)	Tension between efficiency and relational pedagogy; risk of surveillance and standardisation (CMP5, ETH3)
Scenario 3: AI as a Source of Risk and Regression	AI perceived as amplifying surveillance, bias, and dehumanisation (ETH1–ETH3)	Inclusion undermined through categorisation, labelling, and reinforcement of inequalities (INC4)	Teachers experience loss of agency and increased resistance to imposed technologies (CHG3, GOV1)	Negative (anxiety, distrust, frustration) (EMO2)	Possible; partly plausible (CONE-POSS; CONE-PLAUS)	Ethical gatekeeping failures; distrust in governance and regulation; fear of systemic harm (GAP3, GAP4)
Scenario 4: AI as a Catalyst for Hybrid and Negotiated Futures	AI selectively integrated based on pedagogical relevance and contextual judgement (AI-F1, AI-F2)	Inclusion treated as a dynamic, context-dependent practice shaped by professional judgement (INC2, INC5)	Teachers as active decision-makers and co-constructors of AI use (CHG3, GOV2)	Reflective ambivalence (cautious optimism and responsibility) (EMO3)	Plausible (CONE-PLAUS)	Need for continuous negotiation, professional learning, and adaptive governance (CHG2, GOV1–GOV3)

4. Discussion

The findings demonstrate that teachers do not perceive AI in education as either entirely positive or entirely negative. Instead, participants articulate complex and reflexive future imaginaries shaped by ethical concerns, institutional conditions, and pedagogical values. The desirable future scenario strongly emphasises inclusion, learner agency, and equitable participation. In this vision, AI supports rather than replaces pedagogical relationships and professional judgement. Such findings align with critical perspectives arguing that educational technologies should remain human-centred and ethically grounded [7], [10]. At the same time, teachers perceive efficiency-driven and data-oriented AI systems as the most probable future trajectory. This reflects broader institutional trends towards accountability, optimisation, and datafication in education. Participants' ambivalence towards these developments demonstrates tensions between technological efficiency and educational values. Between these normative aspirations and probabilistic expectations lies a pragmatic space in which teachers seek to synchronyse values with everyday professional realities. This pragmatic orientation is most clearly

articulated in the hybrid scenario, where AI is selectively integrated based on pedagogical relevance, contextual judgement, and professional discretion. Teachers position themselves as active mediators who decide when and how AI can meaningfully support learning, rather than as passive implementers of externally imposed technologies. This emphasis on professional judgement aligns with conceptualisation of teacher agency [2] as central to educational professionalism, while also highlighting that such negotiated futures depend on enabling conditions such as institutional trust, supportive governance, and sustained professional development [8]. The study additionally highlights the importance of futures literacy in educational transformation. Futures literacy enables teachers to critically evaluate possible futures, reflect on ethical implications, and imagine alternative educational pathways rather than accepting technological change as inevitable.

5. Conclusion

This study explored teachers' visions of AI-supported inclusive education through a scenario-based futures literacy perspective. The findings demonstrate that teachers distinguish between desirable, probable, plausible, and risk-oriented educational futures. Teachers predominantly perceive AI as a pedagogical support tool capable of enhancing personalised learning, accessibility, and learner participation. However, participants also express concerns regarding surveillance, standardisation, dehumanisation, and the erosion of professional autonomy. The analysis reveals that inclusive AI futures depend not only on technological capability but also on ethical governance, institutional support, and professional agency. Hybrid and negotiated forms of AI integration emerged as the most plausible educational pathway, highlighting the continuing importance of teachers' professional judgement in shaping inclusive and human-centred educational futures.

Navigating Ambiguity: A Comparative Study of AI Policies and Student Ethical Frameworks in Romanian, Bulgarian and Swiss Higher Education

Roxana Rogobete[1], Karla Csuros[1], Madalina Chitez[1]

[1]West University of Timisoara, Romania

Abstract

This research examines the intersection of institutional Artificial Intelligence (AI) policies in Romania, Bulgaria, and Switzerland with the real-world perceptions and experiences of students using these technologies in academic writing.
Institutional frameworks across these countries increasingly emphasize a balanced approach, promoting responsible use through transparency, mandatory disclosure, and data privacy. If several institutions mandate detailed documentation of AI use, other universities are establishing regulations that differentiate between permitted aids – like brainstorming and editing – and prohibited actions, such as generating entire works.
In contrast, student experiences reveal a significant alignment gap, as learners often navigate these GenAI tools through personal experimentation and peer learning due to inconsistent or nascent formal guidance. Students primarily justify the use of ChatGPT and/or other AI writing tools as a means to increase efficiency and linguistic quality, particularly for non-native speakers, utilizing tools for text refinement, translation, and overcoming writer's block. However, they remain highly cautious, framing ethical boundaries around intellectual ownership and expressing concerns regarding AI "hallucinations," over-reliance, and the potential decline of critical thinking skills.
The findings suggest that while policies focus on regulation and academic integrity, students prioritize practical utility. This highlights a critical need for more adaptive institutional frameworks that move beyond mere prohibition to foster comprehensive AI literacy in European Higher Education.

Keywords: *Higher Education Policies, Academic Writing, Generative Artificial Intelligence, Student Perceptions, Ethical Frameworks*

1. Introduction – AI Use in Academia

The landscape of university policies regarding Generative Artificial Intelligence (GenAI) has evolved rapidly since the release of ChatGPT from OpenAI in late 2022, and it moved from initial reactions of concern and uncertainty to more thoughtful strategies for effective integration [1], [2]. According to current literature, the majority of higher education institutions (HEIs) have adopted an "open but cautious" approach. They seek to balance the innovative potential of generative AI (GenAI) in writing with considerations regarding academic integrity, ethical usage, and data privacy [1]. Most universities have avoided banning GenAI tools completely, recognizing that such prohibitions are largely unfeasible and potentially counterproductive [1], [2]. Rather than adopting uniform institutional policies, universities have opted for more flexible, and inconsistent, approaches, in order to distribute responsibility across various levels of the academic hierarchy.
The most common approach is the one in which the institution delegates decision-making authority to individual faculty members, allowing them to determine the terms of AI use based on the specific objectives of their courses and the framework of their disciplines [1]. The advantage of this method is represented by the flexibility it grants the instructor, who can calibrate the most appropriate AI policy for their discipline and course objectives. However, the method is highly inconsistent and can turn even a single institution into a very uneven environment: students can deal with different – and sometimes contradictory – rules from one course to the other.
Another approach would be the opposite, a restrictive policy imposed by the institution: forbidding AI use unless an instructor permits it in the syllabus. While this method could help create an ethical ecosystem, students would not have the opportunity to engage with AI tools in an official manner. Inevitably, they would use AI, even though it is prohibited.

The last case is when universities allow the use of GenAI tools, provided that students follow strict citation and attribution rules [1], [2]. This transparency regarding the nature and extent of AI involvement treats AI as a legitimate research assistant and holds students responsible for the final submission.
This disparity in regulation is defining the current worldwide academia. At the international level, there is a significant difference in the perception of GenAI between institutions operating in various states. Moreover, at the national level, even where governments have begun to issue recommendations, these rarely translate into coherent independent policies, due to institutional autonomy. And at the institutional level, students are often confronted to ambiguity in AI regulations and recommendations provided by professors.

2. Project TRAI – A Three-fold Perspective

In order to map this landscape empirically, the present study selected three countries – Romania, Bulgaria, and Switzerland – as comparative case studies, all participating in a MAPS (Multilateral Academic Project, funded by SNF – Swiss National Science Foundation) project titled *TRAI*, "Exploring the Triad of Academic Writing, Critical Thinking and AI Literacy: Interdisciplinary Perspectives on Undergraduate Thesis Writing" (https://trai.uvt.ro/). The project aims to understand, analyse, describe, and extract information relevant to Higher Education regarding the relationships within the triad formed by academic writing, critical thinking, and the use of artificial intelligence, since students are already widely using Large Language Model tools, such as ChatGPT, even though institutional policies regarding their use are still under development. For each country, all publicly available AI-related policies and guidelines issued by higher education institutions were identified and analysed, with the aim of producing a comprehensive picture of how GenAI is currently being regulated (e.g. ZHAW – Zurich University of Applied Sciences, ETH Zurich, University of Bern and University of Zurich for Switzerland; Sofia University "St. Kliment Ohridski" and American University for Bulgaria; West University of Timisoara, Politehnica University of Timisoara and "Carol Davila" University of Medicine and Pharmacy for Romania).

3. AI Institutional Regulations

In HEIs from Romania, Switzerland, and Bulgaria, institutional policies regarding the use of GenAI revolve around several principles: transparency in use, human accountability for outputs, and the preservation of academic integrity. A common statement emerges from the official regulations: AI may assist students in research and writing, but it may not replace their critical thinking and authorship. Most institutions across the three countries position GenAI as a legitimate tool, capable of supporting tasks such as brainstorming, text editing, language refinement, but they explicitly forbid its use in in ways that would substitute the student's own intellectual contribution, particularly in the production of original arguments, critical analysis, or written works submitted for assessment.
In Bulgaria, an interesting aspect extracted from the institutional policies is related to the necessity of developing AI literacy among both students and professors. There is a strong recommendation for taking AI literacy courses for the academic community, in order to understand the limitations and ethical risks of the AI technology. Moreover, both faculty and students are required to disclose AI use to maintain intellectual honesty (see American University in Bulgaria, [3]). Overall, the Bulgarian institutions focus on an ethical commitment of academia.
In the Romanian context, institutions tend to require students to produce formal written declarations attesting to the degree and manner of AI use (see especially the West University of Timisoara case, [4]). The prioritization of an administrative procedure reflects a commitment to transparency, it risks tipping into administrative overreach, a factor that is actually traditionally embedded in the Romanian educational system. In a higher education system already marked by significant bureaucratic overload, the risk is that transparency becomes an end in itself, reduced to a signed form rather than a reflective practice. However, the three Romanian institutions examined in this study represent different academic profiles – a comprehensive, theoretically oriented university, a medical university, and a technical university – and their AI policies reflect, perhaps unsurprisingly, the distinct epistemological cultures. The medical university adopts the most permissive approach among the three and explicitly enumerates the tasks for which GenAI is considered appropriate, such as: generating outlines and structures for scientific articles or thesis chapters, assisting with the formulation of clear and concise paragraphs, correcting grammatical, stylistic, and logical coherence errors, and refining academic language to meet the precision standards required for publication in high-impact international journals [5]. This granularity reflects a field in which writing is understood primarily as the communication of knowledge, and the

institution does not seek to develop academic writing skills per se. The comprehensive university has a more decentralized approach, creating a general framework and delegating decision to individual faculties, allowing each to develop guidelines calibrated to the specific demands and conventions of their discipline. This flexibility acknowledges the differences between specific fields of knowledge (for instance, Philology vs Computer Science), but imposes the risk of inconsistency [4]. The technical university has a median position, emphasizing transparency and process documentation, but raising awareness regarding authorship and intellectual property [6].

Swiss institutions have adopted a proactive strategy, and the country is the most policy-rich ecosystem among the three countries examined, in terms of both the volume of available institutional documents and the degree to which they address the specifics of GenAI. Swiss higher education institutions appear to be considerably more advanced in their policy development. They have moved beyond general ethical statements and now have detailed, practical frameworks that address the technical, legal, and pedagogical aspects of AI use. For instance, the University of Bern requires students to "create a log that keeps track of which tools are used for which section" [7]. ZHAW, University of Zurich and University of Bern state that the use of AI tools in the context of academic work, however minor or peripheral, must be explicitly acknowledged and documented [8], [9].

To sum up, the Swiss institutional culture underlines an emphasis on technical process documentation. Many Swiss universities require verifiable evidence of the writing process itself – including logs of AI interactions, records of the prompts submitted at different stages of the task, and successive versions of the text, that allow reviewers to trace the evolution of the paper from initial AI-assisted draft to final submission.

Table 1. Summary Table of Institutional Policies

Policy Aspect	Bulgaria	Romania	Switzerland
Responsibility and decision-making	Human	Human	Human
Disclosure and transparency	Mandatory at the beginning of assignments, proper citation needed	Mandatory for every task – in some cases, students fill in a transparency statement regarding the use of tools based on GenAI	Mandatory, often requires logs or transcripts as annex
Syllabus	Teachers must define specific permissions in the Syllabus	Teachers must define AI rules in the Syllabus for every task	Departmental specific guidelines
Data Privacy	Adherence to GDPR	Adherence to GDPR	Adherence to GDPR

4. Students' Perceptions

In order to examine the extent to which these institutional policies actually are implemented and internalised, three students were interviewed from each of the countries included in the study, resulting in a total of nine interviews across the three national contexts (three from ZHAW, three from Sofia University "St. Kliment Ohridski", three from West University of Timisoara). This interview component aimed to see students' perspectives regarding the use of GenAI and whether the institutional policies are sufficiently spread among students. More specifically, the interviews aimed to analyse students' own understandings and experiences of GenAI use in academic writing, their awareness of the policies from their respective institutions, and their assessments of whether GenAI can change an more epistemological dimension: how the use of AI tools shapes their relationship to knowledge itself, whether engaging with AI-generated text changes the way they read, evaluate, and assimilate information; whether the externalization of certain cognitive tasks to AI affects their sense of intellectual ownership over the final work.

An important note is the temporal context of the interviews: conducted in 2025, they took place at a moment when several of the institutional policies examined in this study were either newly issued or still in the process of being formally implemented. This is why student experiences reveal a significant alignment gap, as learners often navigate these GenAI tools through personal experimentation and peer learning due to inconsistent policy.

Among the students interviewed, ChatGPT appears to be the most widely used AI tool, but students often combine it with more specialized applications, like Perplexity for evaluating sources, and DeepL for translation and the refinement of academic language.

Despite the differences in national policy contexts and institutional cultures, the students interviewed across Romania, Bulgaria, and Switzerland develop several common beliefs or practices:

- Autonomy: Students permanently position themselves as the decision-maker in any AI-assisted task – the one who sets the direction, evaluates the outputs, and has the responsibility for the final submission.
- Assisted Writing: The role of the student in the writing process becomes more and more that of an editor – AI-assisted writing means that AI tools are used for literature review, evaluating, correcting, and refining the text.
    - A major application of AI is improving the academic language of a text and translating content between languages. Students who are not native speakers of the language they are writing in often rely on AI to correct grammar or choose appropriate vocabulary.
    - AI acts as an advanced search engine that helps students find relevant literature for their topic.
    - Students frequently use AI to summarize academic papers or abstracts, using these summaries as a preliminary filter to assess whether a source is relevant enough to their topic.
- Risks in Academia: Students are concerned about AI dependency [12], AI hallucinations and academic integrity, and therefore are aware that they need to verify information provided by AI.

A closer reading of the interviews reveals that students from Bulgaria, Switzerland, and Romania slightly differ in how they engage with AI tools, especially because of their distinct disciplinary contexts. Among the Bulgarian students interviewed, AI use is predominantly related to technical and often repetitive tasks (such as document formatting in LaTeX, debugging and optimizing programming code). Moreover, Bulgarian students tend to have a selective approach: they use AI only in areas where they already have a background knowledge to recognize, intuitively, whether the output is plausible and consistent with what they know. This technically oriented pattern of AI use reflects the disciplinary profile of the Bulgarian students interviewed. Swiss students exhibit a more sophisticated model, viewing themselves as a “conductor of an orchestra”. What is more, there is a high level of technical literacy regarding AI among Swiss students: they are aware of prompt engineering techniques and often use one AI to optimize prompts for another AI to ensure a better output. Among the Romanian students interviewed (predominantly from the fields of Languages and Literatures) use AI for thematic brainstorming (e.g., exploring certain motifs; see also [10]) and explaining complex theoretical concepts. In this case, AI functions less as a writing assistant than as a thinking partner Also, the responses showed a strong emphasis on the fear of “imposture”, which reflects a more personal anxiety related to intellectual property, authentic authorial voice and domain-specific standards. The ethical dimension of AI use in this field is experienced more as a question of personal and professional integrity.

5. Discussion and Conclusions

From the institutional policies examined in Romania, Bulgaria, and Switzerland, three common principles emerge: citation of AI-generated content, fact-checking, banning presenting AI-generated work as one's own independent contribution. A strong consensus among interviewees is represented by the belief that AI should primarily function as a tool, instead of replacing intellectual work.

All institutions examined are consistent in their position that AI outputs do not represent scientific sources and may not be treated as such. Where AI has contributed to a text students have to acknowledge the use of AI in accordance with established academic citation standards. However, since standard citation formats were not originally designed for AI outputs, students are often left to navigate ambiguity about how precisely to cite a tool rather than an author. Nevertheless, university policies require students to verify the accuracy of any content produced or suggested by an AI tool since students are fully responsible for the factual integrity of their work. This fact-checking practice acknowledges that AI outputs are not yet reliable sources and that students need to develop the critical evaluation skills necessary for this task.

The convergence between the three countries marks the fact that there are common shared values prioritized by institutions, but there is an uneven development of implementation [11], which leaves a considerable interpretive space for both faculty staff and students to navigate.

Abstract

Artificial Intelligence (AI) is rapidly reshaping teaching practices and learning processes. While offering unprecedented opportunities for personalized innovation, AI poses new risks to cognitive development, critical thinking, and the overall well-being. Drawing on insights from previous digital revolutions (e.g. smartphone and social media), this paper argues that the future of education demands combining technical AI literacy with the development of inner skills, such as presence, awareness, critical reflection, and ethical responsibility. Building on successive European university initiatives (StudentWell, AI4Well, and AI4WellEdu funded by EUniWell), this research presents a transdisciplinary educational approach aligned with the Inner Development Goals (IDGs) framework. The paper introduces the Well-being-oriented AI Literacy Framework, an experiential paradigm where technical competence and inner development are mutually reinforcing. Preliminary findings from Mindfulness-based Focus Groups involving students and educators highlight that cultivating internal human capacities is not an optional addition, but an essential foundation to ensure that AI enhances, rather than diminishes, human development and flourishing.

Keywords: *AI in education; AI literacy; Well-being in education; Inner skills; Digital teaching and learning; Responsible and mindful AI adoption.*

1. Introduction

Written language has always been one of the most transformative innovations in human history, shifting how knowledge is preserved and transmitted across space and time. Yet, what we now consider an indispensable foundation of culture was initially met with philosophical scepticism. Socrates, for instance, left no written records, viewing philosophy as a living practice grounded in spoken dialogue. In his view, writing carried structural risks: it was inherently static and unable to clarify itself when questioned, it risked weakening human memory by shifting reliance to an external medium, and it risked creating an illusion of knowledge, where the accumulation of information is mistaken for genuine understanding. As writing evolved through paradigm shifts, from the printing press to the web and, ultimately, to AI, the core of the Socratic warning remains profoundly relevant. Every cognitive tool must be approached critically, balancing its clear opportunities against its structural risks. The challenge is not to reject innovation, but to govern it responsibly. Today, we face an unprecedented technological wave: first with smartphones and social networks, and now with AI. While mobile devices and social platforms facilitated real-time connection and instant access to information, their pervasive use among younger generations has frequently replaced essential developmental activities like free play and direct social interaction. Extensive literature now links this digital saturation to an increase in anxiety, depression, and socio-emotional fragility among Generation Z, highlighting how technological tools can fundamentally reshape human cognitive and psychological development [1]. Today, the rapid rise of AI represents a new and powerful challenge that calls for careful consideration, particularly with regard to how and when it should be integrated into the educational process. It is imperative to understand and mitigate the possible risks, such as critical thinking erosion and cognitive dependency, while actively guiding its development toward its beneficial potential. To address this challenge, the *AI4WellEdu* project analyzes the integration of AI within the educational sector from a transdisciplinary perspective. Building on the cumulative experiences of the *StudentWell* (Student Well-being) [2, p. 150-177], and *AI4Well* (Artificial Intelligence Ethics for Well-being) [2] projects, all funded within the initiative of the *EUniWell* (European University for Well-being) alliance this project proposes a *Well-being-oriented AI Literacy Framework*. Aligned with

the *IDGs framework* [3], this approach integrates technical AI training with the structured cultivation of inner skills (e.g., awareness, deep listening, critical reflection). The *AI4WellEdu* framework argues that inner skills is not an optional extra, but an essential foundation to ensure that AI enhances, rather than diminishes, human development and intellectual autonomy. The paper is structured as follows: Section 2 introduces the concept of inner skills, while Section 3 presents the *StudentWell* project and its main findings. Sections 4 and 5 address the challenges posed by AI to well-being and education, presenting the AI4Well and AI4WellEdu projects. Specifically, Section 5 analyses systemic risks within the education sector and outlines concrete strategies for adopting AI in a way that promotes human development rather than inhibiting it. Finally, Section 6 presents the main conclusions drawn from this first phase of the *AI4WellEdu* project's research.

2. Inner Skills

Inner Skills refer to the psychological, emotional, and cognitive capacities that enable individuals to manage their internal complexity in order to act efficiently and ethically in the world, while fostering well-being for themselves and others. Within this paradigm, personal transformation is the fundamental prerequisite for collective change: the maturation of internal competencies naturally manifests as responsible external action. Rather than optional extras, these skills represent the human foundation necessary to navigate global changes, a perspective strongly reinforced by the *2023 UNESCO Recommendation*, which advocates for cultivating inner development to foster behaviors, communication, and relationships based on openness, inclusion, and reciprocity. This process requires "*returning to one's home: listening deeply to the body, emotions, and complexity. This process allows one to embrace personal diversity, conflict, and suffering, reflecting the challenges of the external world. Such inner care naturally extends to the outer world, fostering relationships based on interconnectedness*" [4, p. 61]. In order to put this approach into practice, the *IDG Framework* [5] offers a multidisciplinary model linking inner change growth with global change. Developed in alignment with the *UN Sustainable Development Goal*s (SDGs), the *IDG Framework* recognizes that systemic, macroeconomic change requires individual psychological evolution. The framework is articulated through 25 core skills organized into five macro-dimensions: *Being* (e.g., self-awareness, presence), *Thinking* (e.g., critical thinking, systems thinking), *Relating* (e.g., Connectedness, Empathy and Compassion), *Collaborating* (e.g., Relationship-Building, Inclusive Mindset and Intercultural Competence), and *Acting* (e.g., Courage, Hope and Optimism).

3. StudentWell Project: Inner Skills and Mindfulness

StudentWell (Supporting and measuring student well-being through cross-university interventions) aimed to enhance student well-being by addressing stress, anxiety, and mental health challenges while fostering inner skills. The project has implemented initiatives focused on well-being at universities and has launched a pilot approach to define and test the so-called *Well-being Working Methodology* [2, p. 153]. Specifically, *StudentWell* demonstrated that the mindfulness-based protocol, developed and tested at the University of Florence, shows that a path based on awareness is capable of developing nearly all the inner competencies included in the *IDG Framework*, and an improvement in participants' well-being, measured via the Well-being Numerical Rating Scales (WB-NRSs) [6].

3.1 The 7-week Mindfulness-based Protocol

The 7-week Mindfulness-based Protocol [2, p. 156-158] is a secular intervention rooted in the mindfulness teachings of Zen Master Thich Nhat Hanh [7]. The protocol is designed to enhance participants' psychological resilience and well-being through an experiential and transformative curriculum. By integrating meditation, physical relaxation, and deep listening with practices from bio-natural disciplines, the program operates on the principle that cultivating present-moment awareness is a fundamental prerequisite for transforming one's inner state. The intervention consists of seven weekly sessions, each lasting 90 minutes, and is systematically divided into two developmental phases that bridge somatic awareness with behavioral transformation: *Phase 1: Inhabiting the Body (Weeks 1–3)* - Focuses on shifting from mental activity to bodily awareness through breathing, grounding, and posture correction. *Phase 2: Inner Transformation and Action (Weeks 4–7)* - Aims to cultivate advanced meta-competencies, such as concentration, deep listening, and emotional regulation, to face academic, professional, and personal daily challenges. Each session follows a standardized, reproducible pedagogical flow alternating an initial presentation, body exercises, deep relaxation, a brief impulse,

contemplative insights, and reflective sharing in groups designed to leverage collective intelligence. *StudentWell* demonstrated that this structured, awareness-based path is capable of developing nearly all the inner skills included in the *IDGs Framework*, while simultaneously generating a measurable improvement in participants' well-being.

3.2 Results

To evaluate the pedagogical efficacy of the training, qualitative 30-minute interviews with the teaching staff were paired with structured questionnaires mapping the *IDG framework* [2, p. 172-177]. The qualitative data underscored a positive transformation in both individual well-being and collective classroom dynamics. Teachers have noticed a marked increase in engagement and concentration; as the sessions progressed, external distractions have gradually disappeared. There has been no use of mobile phones at any point. This shift directly enhanced students' concentration, intuition, and emotional awareness. Furthermore, the structured protocol fostered a culture of reflective inquiry and deep listening, which significantly lowered academic anxiety, reinforced group solidarity, and promoted prosocial behaviors such as empathy, ethical conduct, and collaboration. Findings also indicate a generalized increase in well-being scores among all participants (Fig. 1).

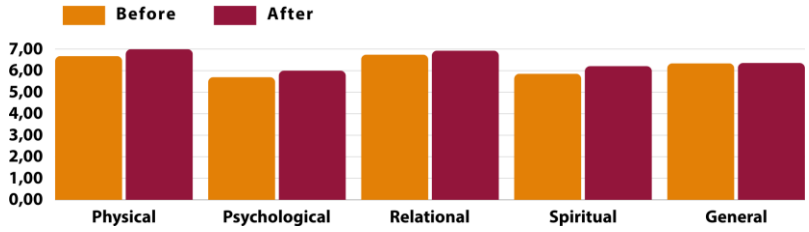

Fig. 1. The impact on well-being measured after the 7-week *Mindfulness-based Protocol (WB-NRS scale)*.

Although the limited sample size (n = 14) of this pilot study precludes broader generalization, the data demonstrates that the WB-NRS successfully captured fluctuations in well-being within a small cohort. Future research involving larger sample sizes is required to validate and expand upon these preliminary pilot results.

4. AI4Well Project: Inner Skills and Artificial Intelligence

AI4Well (Artificial Intelligence Ethics for Well-being) [2] builds on the PhD thesis *"Artificial Intelligence Ethics for Well-being based on the Sustainable Development Goals"* [8], and examines how ethical principles can be implemented across the entire AI ecosystem, from design to adoption. By integrating psychology, anthropology, computer science, communication, education, well-being, and mindfulness, the project highlights that responsible AI requires more than regulatory compliance; it depends on cultivating the inner skills needed to act ethically in technologically mediated environments. Grounded in the *IDGs framework*, *AI4Well* positions AI ethics within a broader vision of human flourishing and ecological responsibility, proposing a model for universities and policy actors to navigate technological disruption. To translate these theoretical principles into practice, the project implemented a dual approach combining action-research methodologies and educational pilots: 1) *Mindfulness-based Focus Groups* - A series of focus groups was conducted to explore stakeholders' perceptions of AI. Structurally, these sessions paired introductory technical insights with short mindfulness practices and silent contemplation key themes, creating a reflective space that stimulated deep collective sharing and dialogue among participants [2, p. 198-199]. 2) *The Unlock the Potential of AI for Well-being Workshops* - This pilot training programme was delivered in four fully online workshops to test scalable educational models. Rather than focusing exclusively on technical AI literacy, the workshops integrated technical modules with inner development practices. The curriculum systematically guided participants through sequential phases: establishing presence and somatic grounding, mapping digital well-being through self-reflection, analyzing the geopolitical and environmental impacts of AI, and engaging in transdisciplinary co-creation [2, p. 199-204]. By blending technical competence with inner skills, these training courses demonstrated that promoting a conscious and responsible use of AI is not merely a matter of institutional compliance, but of cultivating the human capacities required to guide technology toward sustainable and well-being-oriented outcomes.

4.1 Results

Evidence emerging from the AI4Well workshops and mindfulness-based focus groups shows that navigating the integration of AI into education requires a profound pedagogical shift, centered on a conscious-oriented approach rather than passive adoption [2, p. 206-213]. A key finding of the research is that traditional technical training alone is wholly insufficient to handle the multi-faceted cognitive and ethical complexities of an AI-driven environment. Without structured oversight, over-reliance on AI-powered generative tools risks eroding students' critical thinking, analytical depth, and capacity for original insight. Consequently, the project's main result highlights the urgent necessity of redefining AI literacy through a holistic triad that blends technical proficiency, ethical awareness, and inner skills. Grounded in the logic of the *IDG framework*, the findings advocate for making inner skills training an essential component of educational curricula, positioning these human competencies as critical cognitive anchors. Much like the systemic challenges faced by the *SDGs*, AI adoption currently suffers from a significant gap between theoretical ethical frameworks and concrete, day-to-day action. The *AI4Well* results confirm that cultivating an alliance between technical competence and inner development is an effective strategy to bridge this gap, ensuring that technological adoption is actively guided toward human flourishing, intellectual autonomy, and responsible digital citizenship.

5. AI4WellEdu Project: Artificial Intelligence in Education

AI4WellEdu (Artificial Intelligence for Well-being in Education) builds on the foundations of *AI4Well* and seeks to tackle the pressing challenges of AI for well-being in educational settings. Because AI is currently having a highly disruptive impact on education, it is imperative to closely examine its long-term effects on human development and well-being [9][10][11]. Although the impact of digital technologies on education and well-being has been extensively investigated in recent years [1][12], with studies highlighting both the potential benefits and the structural risks associated with AI [13][14], there remains a widely acknowledged and critical call for further research to address these emerging issues [15][16]. While many studies underscore AI's potential contribution to well-being and human development [17], its practical application, particularly within educational environments, still faces significant challenges that must be addressed. Recently, the *EU AI Act* [18] has sought to address these challenges through regulatory measures; however, top-down legislation alone is insufficient. It is equally necessary to cultivate the internal human capacities and inner skills required to design and adopt AI responsibly [2]. *AI4WellEdu* addresses these specific educational challenges by designing a structured training program that develops inner skills alongside targeted technical training on AI. This approach is firmly rooted in the *Well-being Literacy Framework*, which was designed and piloted in *AI4Well* [2, p 199-204.]. *AI4WellEdu* aims to further develop and test this methodology with a larger and more diverse group of participants. The objective is to deliver three sessions consisting of four workshops each, from which additional feedback will be gathered for both qualitative and quantitative analyses. Furthermore, while the original *AI4Well* workshops "Unlock the Potential of Artificial Intelligence for Well-being" were delivered exclusively online, *AI4WellEdu* plans to conduct at least one in-person session over three consecutive days. Implementing these two distinct delivery modes will allow for a rigorous comparative analysis of the results obtained. As in *AI4Well*, a multidisciplinary expert group (comprising specialists in AI, ethics, mindfulness, pedagogy, psychology, and neuroscience) will guide the definition and structuring of the course content based on the core concept of well-being. To further support the content design and the pedagogical methodology adopted in *AI4WellEdu*, at least five series of focus groups will be conducted. These sessions will adopt a transdisciplinary approach involving experts from a wide variety of disciplines. Notably, several focus groups will be dedicated exclusively to students to capture their direct perspectives and experiences, a contribution we consider fundamental to this initiative. The expert committee will also be actively involved in the subsequent data analysis phase. The *AI4WellEdu* project launched in mid-December 2025. To date, the first expert group meetings and initial focus group sessions have taken place. This paper presents and analyses the empirical findings that have emerged from these initial stages of the project.

5.1 Mindfulness-Based Focus Groups: Views of Students, Educators, Researchers, and Experts

Building on the methodology established in *AI4Well*, a series of *Mindfulness-based Focus Groups* was conducted within *AI4WellEdu* to deeply explore the psychological, cognitive, and systemic impacts of generative AI in education. Currently, three focus groups have been completed using identical structure and timing parameters. These sessions involved a total of nine researchers, experts, and lecturers from

various disciplines, including psychology, neuroscience, mindfulness, well-being, and AI, alongside five students from different degree courses, such as psychology, communication, and economics. By embedding short contemplative practices and deep listening within a multidisciplinary group setting, the sessions encouraged participants to reveal their authentic emotions, fears, and daily habits regarding AI. The thematic analysis of the qualitative data yielded a complex map of emotional, cognitive, relational, and structural dynamics, which can be synthesized into five key themes: 1) *The Emotional-Relational Dimension and Students' Needs* - In an environment marked by academic pressure and structural uncertainty, students frequently turn to generative AI not just as a study aid, but as an emotional buffer, virtual companion, or pseudo-therapist. While this highlights unfulfilled listening needs within traditional higher education, it raises critical concerns regarding emotional dependency, technology anthropomorphization, and exposure to harmful or inaccurate outputs without professional guidance. In this regard, students highlighted that if AI is to be explored as a tool for emotional regulation during stressful exam sessions, its biases and risks must be strictly evaluated and explained by certified psychotherapists. 2) *AI, Learning, and Critical Thinking* - A prominent tension emerged regarding cognitive automation (e.g., text generation, summarizing). The data revealed deep anxiety that bypassing the productive effort of independent study might progressively erode memory, analytical depth, and intellectual autonomy. While participants recognized AI's potential for self-assessment and content exploration, they stressed that it must enhance human faculties rather than substitute for mental effort. 3) *Acceleration, Productivity, and Time Management* - AI is perceived as an intense driver of systemic acceleration. Rather than freeing up quality time, its capacity to maximize efficiency often traps students, educators, and professionals alike in a vicious cycle of performance pressure and constant availability, where the machine dictates unsustainable academic rhythms. Reclaiming spaces for pauses, intentional disconnection, and inner listening is identified as an urgent prerequisite to maintaining conscious control over technology. 4) *Communities of Dialogue and Educational Relationships* - A significant barrier identified by students is the tendency to use AI covertly due to a perceived climate of institutional judgment or mistrust. This finding underscores the vital need to foster safe, non-judgmental spaces, interdisciplinary seminars, and shared training pathways where students and teachers can openly analyze the ethical and relational implications of digital tools, safeguarding empathic listening from digital impoverishment. 5) *Critical Literacy, Ethics, and AI-Augmented Education* - Participants expressed a strong demand for an interdisciplinary AI literacy curriculum that extends far beyond mere technical aspects. This framework must integrate psychological, neuroscientific, and ethical dimensions, including a critical analysis of the corporate economic interests driving AI development and the risks of a widening digital divide. Ultimately, both cohorts recognized that the transition is not merely technical, but represents an actual anthropological and neural transformation that demands immediate, aware management and deep ethical questioning. Finally, this evidence converges toward the structural proposal of a conscious, *AI-augmented education* that subordinates technological productivity to the preservation of human well-being, inner competencies, and intellectual freedom. To provide an overview of how these dimensions manifest differently across university cohorts, the specific psychological triggers, operational habits, and perceived risks are contrasted in the comparative matrix in Table 1.

6. Results

The preliminary findings from these focus groups indicate that the adoption of AI in education is perceived not merely as a technical matter, but as a phenomenon that encompasses emotional, cognitive, relational, and ethical dimensions. On the one hand, particularly among students, AI appears as a tool capable of offering immediate support in studying and emotional regulation; on the other hand, there emerges a risk of cognitive and emotional dependency, atrophy of critical thinking, and an excessive delegation of one's own abilities, with potential repercussions on the development of autonomy and trust in human skills. This dynamic often leads students to a form of cognitive avoidance, summarized by the provocative question: "Why bother putting in the effort?". Concurrently, educators and researchers emphasize the necessity of maintaining a *human-in-the-loop* approach, in which AI remains a support rather than a substitute for effort, reflection, and personal processing. For professionals and experts alike, managing the integration of AI requires a strategic investment of time to foster conscious adaptation, effectively guiding AI rather than being driven by it. Academically, institutions must avoid building rigid barriers and ignoring AI's systemic impact on learning communities. From this perspective, participants converge on the importance of promoting spaces for dialogue, critical literacy, and multidisciplinary training, integrating inner skills, ethical awareness, and self-regulation capacities, so as to guide a truly mindful, relational, and well-being-centered use of AI in education. The comparison between the data emerging from the focus groups of the two participant groups highlights

areas of strong convergence, as well as significant interpretative and emotional discrepancies regarding the introduction of AI in educational processes. Table 1 provides a comparative summary of the key dimensions of this phenomenon.

Table 1. Comparative Summary of Perspectives Emerged from the Two Groups.

Dimension of Analysis	***Evidence in the Student Group***	***Evidence in the Group of Educators, Researchers, and Experts***
Prevalent Emotional Experience	Academic performance anxiety; search for safety and a protective relational connection.	Operational frustration; anxiety stemming from work overload and pressure for immediate reactivity.
Relationship with the Machine	Anthropomorphization of the tool; utilization of AI as a therapist or an amicable surrogate.	Necessity of maintaining a *Human-in-the-Loop* approach and safeguarding a mindful presence.
Perception of Effort	Tendency towards cognitive avoidance as a strategy to cope with exam pressure.	Recognition of effort as an irreplaceable neural exercise essential for consolidating logic.
Time Management	Utilization aimed at acceleration and immediate synthesis to demonstrate the acquisition of knowledge.	"Time trap": the more time we save, the more time we remain connected, at the expense of relationships and self-care.
Academic Obstacles	Furtive and hidden use due to the fear of sanctions and moralizing judgment from educators.	Structural difficulty of universities in keeping pace with the velocity of the technological transition.
Proposed Solutions	Creation of sharing groups and horizontal seminars to explore the use of AI in educational contexts.	Transdisciplinary curriculum reform; technical literacy integrated with inner skills.

7. Conclusion

This paper explores a comprehensive, multi-year research programme that started with the *StudentWell* project (2022–2024) and is now being advanced through the ongoing *AI4WellEdu* project. The findings consistently demonstrate that mindfulness-based training effectively cultivates essential inner skills, proving that enhancing internal competencies directly nourishes personal well-being, which subsequently translates into broader societal and academic benefits. Within this cumulative framework, *AI4Well* and *AI4WellEdu* have successfully implemented the *Well-being-Oriented Literacy Framework* applied to AI, presenting an experiential pedagogical methodology that effectively integrates technical expertise with inner development. A key contribution of this research is the mapping of the convergent yet contrasting socio-emotional dynamics among university cohorts. While students frequently turn to generative AI as an emotional refuge to alleviate academic isolation and performance anxiety, academics, researchers, and professionals face extreme systemic pressures to accelerate workflows, navigating professional over-saturation and cognitive overload. For both groups, strengthening an *inner compass* through mindful presence and self-listening serves as an indispensable barrier against cognitive dependency, technological fragmentation, and alienation. Integrating technical literacy with robust inner skills represents one efficient direction for ensuring that the adoption of AI contributes to genuine human well-being. To tackle these challenges in higher education in a practical way, *AI4WellEdu* proposes the following circular, experiential and scalable training framework, structured in two phases, designed to develop both technical and inner skills: 1) *Orientation and Values* - This phase leverages peer-to-peer and intergenerational dialogues between faculty and students to collectively redefine concepts of productivity, creativity, and learning, identifying which uniquely human faculties must be actively preserved. This aligns with the students' demand for a stadial, circular, and participatory approach to seminars on AI use in educational contexts. 2) *Technical and Transdisciplinary Integration.* This phase deploys a co-designed curriculum involving computer scientists, psychologists, pedagogists, and neuroscientists to provide the scientific and psychophysical frameworks needed to safely integrate AI tools into daily study and work routines. Finally, *AI4WellEdu* highlights that the challenges posed by generative AI cannot be solved through restrictive regulations or rigid institutional compliance. Instead, universities must actively promote a paradigm of *AI-augmented education*. By creating structured spaces for pauses, deep listening, and continuous dialogue, the academic community can leverage these powerful technologies to maximize scientific efficiency and creativity while firmly safeguarding

intellectual autonomy, critical thinking, and mental health. To address the risk of social isolation highlighted by the participants, these training programmes must actively promote non-digital interactions and rebuild fundamental interpersonal skills through collaborative teamwork and collective problem-solving.

An Academic View of Generative Artificial Intelligence Use in Higher Education as Copyright

Maria Markova

University of National and World Economy, Bulgaria

Abstract

The purpose of this paper is to present an application of GAI in academic creativity in terms of copyright works like academic courses, academic papers and creative results regarding the copyright in the primary and in the secondary works. The goal is to examine different theses, approaches, and identify unsolved problems and to propose solutions, results of students' acceptance and the general answer of the main question: who's is copyright in the creation of student's works as master thesis and other academic written works through GAI use?
Generative artificial intelligence /GAI/ as a technology based model presents many abilities to students to achieve their academic goals rapidly and efficiency. They use models like LLMs, ChatGPT, open AI and more deep research data bases in their work.
The main questions are raised in this research paper are the following:
- *overall assessment of GAI use in higher education;*
- *who is the copyright owner created with GAI use works.*

In this paper are analysed many questions regarding the copyright owner answered by economics students groups of special course ''Intellectual property and creative industries'' of UNWE.
The complex approach and methods are used by author to present and to prove her author thesis:
A GAI as a machine is not a legal entity, it not an author proprietor of copyright. The student is this individual – an author who creates an idea and implements it with the help of a GAI. The students are responsible for the correct citation and for the volume of the used other's author text, which should not exceed 20-30%.

Keywords: *generative artificial intelligence, higher education, intellectual property and copyright*

Introduction

The field of artificial intelligence was founded in the 1950s, and artists began to create art and literature with artificial intelligence faster and effectively. The main question here is related to the nature of collaboration "human–AI in art and literature"
The GAI boom of the 2020s, text-to-image models such as Midjourney, Stable Diffusion and others became widely available to the public, allowing users to quickly generate imagery with little effort and discussing creativity. Commentary about AI in art and literature in the 2020s has often focused on issues related to copyright, IP deception, its impact on the traditional writers and artists and their rights in the earlier created copyrights works.
This paper is focused on application of GAI in academic creativity in terms of copyright works like academic courses, academic papers and creative results regarding the copyright in the primary and in the secondary works. The goal is to examine different theses, approaches, and identify unsolved problems and to propose solutions.

1. Main Methodological Points

1.1 Review of Different Points

There is no single and simple answer to this question: Who is a proprietor of the copyright?
Two theses are advocated:
1. GAI cannot be a rights holder. Justification: it is a machine trained by computer models to combine databases of copyrighted works of other media, and its creativity lies in skillfully combining known and accessible works through keywords.
2. GAI can be a rights holder.

Supporters of thesis 1 claim and argue as follows:
1.GAI has no legal personality, no rights in IP.
2.GAI is a mashine with software generated and completed by a human.
3.GAI creates an artistic work under idea concept, assignement of manager – human.
GAI working in visual artwork generates through the implementation of artificial intelligence programs, most commonly using text-to-image models. The process of automated art-making has existed since antiquity.
In August 2023, the US Supreme Court ruled that AI art is ineligible for copyright due to failure to meet human authorship. In March 2026, it declined to hear a case over whether AI-generated art can be subject to copyright.

Supporters of thesis 2 claim and argue as follows:
1. AI already creates films, books, drawings.
2. AI has a creative approach and result.
3. AI has autonomy in developing the creative idea and reaches a result.
At first glance, a recently granted South African patent relating to a “food container based on fractal geometry” seems fairly mundane. The innovation in question involves interlocking food containers that are easy for robots to grasp and stack.

I deep observing, the patent is anything but mundane. That’s because the inventor is not a human being – it is an artificial intelligence system called DABUS.

DABUS (device for the autonomous bootstrapping of unified sentience) is an AI system created by Stephen Thaler, a pioneer in the field of AI and programming. The system simulates human brainstorming and creates new inventions. DABUS is a particular type of AI, often referred to as “creativity machines” because they are capable of independent and complex functioning. This differs from everyday AI like Siri, the “voice” of Apple’s iPhones.
Based on the USPTO position ‘’Every patent office and court that has examined the issue so far has ruled that DABUS is not entitled to be named as an inventor on a patent application. But the exercise has raised broader questions about the impact of AI-assisted inventing on the patent system.
You might think the inability to name an AI system as an inventor on a patent application for an invention— created wholly or in significant part by that AI system— implies such an invention can’t be patented at all.
That was the argument made by Lawrence Lessig and others in the amici curiae brief they submitted in the DABUS case before the US Supreme Court: “if… the Court does not recognize AI inventorship, there will be no inventor, resulting in no patent protection, and no technology ownership.”

1.2 Author’s View Regarding AI Use of the Previously Created / Primary Works:

1. The author of a work in literature and art - always is a natural person.
2. The author has the exclusive rights to be named, cited in all forms of use of the work.
3. The use of parts or the whole of the copyrigh works belongs to the author as copyrigh holder and as an options of permission for use. He may authorize others for works use in various modes and purposes.
4. The use of works or parts of them as DB/models in AImust be with the consent of the author. This is not free use in a legal meaning. The author of printed books or art works is also entitled to such remuneration when they are reproduced in a reprographic manner for personal use.
5. Free use, which does not require the consent of the copyright holder and without payment of remuneration, is any of the following actions:

• use of quotations from already published works;
• use of parts of published works for the purposes of analysis, commentary or otherwise for scientific or educational purposes;
• public presentation or performance of published works in schools or other educational institutions;
• reproduction of already published works from libraries, schools, museums and archival institutions, as well as reproduction in Braille.

6. Fair use of a copyrighted work would be when the author of the first work is indicated and remuneration is paid to the rights holders

USA judge Stein concluded that the level of detail in the AI’s response was sufficient to allow the copyright infringement claims to proceed as a class action.

The court will later decide whether OpenAI can defend itself on a “fair use” argument.
Earlier this year, in a similar case, a federal court in San Francisco ruled that the use of copyrighted books by the company Anthropic to train its language models fell within the scope of “fair use.”

2. Case Studies and Questions Discussed with an Audience

2.1 Case Studies

1. “The Day a Computer Wrote a Novel”(2015) – a Japanese short novel partially written by an artificial intelligence program in 2015, the novel was written by a team of humans who developed the AI program. Hitoshi Matsubara and his team at Future University Hakodate in Japan selected words and sentences and set the parameters for the creation before letting the AI robot “write” the novel itself. For the past few years, the Hoshi Shinichi Literary Award has technically been open to non-human entrants. In total, 11 of the 1,450 entries in the competition in Japan were written at least in part by non-humans.

2. „Window Seat“ (2023): Touted as the first fully AI-generated feature film, it is a 61-minute film created by one person (Hooroo Jackson) using 4,000+ machine-generated shots. It follows a narrative about a psychological battle on a plane.This video is the trailer for the AI feature film "Window Seat":

3. George R. R. Martin has won the first battle in his lawsuit against OpenAI for copyright infringement related to his cult series "A Song of Ice and Fire", which is also the basis for the series "Game of Thrones". In September 2023, Martin and several other writers filed a class action lawsuit against the company behind ChatGPT. They claim that OpenAI infringed their copyrights by using their books without permission to train its language models, which, the plaintiffs say, resulted in the generation of texts that resembled their copyrighted works.
4. regarding DABUS: Device for the Autonomous Bootstrapping of Unified Sentience—has been named as the sole inventor. Every patent office and court that has examined the issue so far has ruled that DABUS is not entitled to be named as an inventor on a patent application. But the exercise has raised broader questions about the impact of AI-assisted inventing on the patent system. You might think the inability to name an AI system as an inventor on a patent application for an invention— created wholly or in significant part by that AI system— implies such an invention can’t be patented at all. USA court does not recognize AI inventorship, there will be no inventor, resulting in no patent protection, and no technology ownership.”

2.2 Questions for Discussion

There are a number of other issues arises in the field of copyrights such as following:

1. Which is the content of copyright for already printed literature and art works?
2. How can and may be used legally the copyright works by the students/academians in the training and teaching process ?
3. How we can accept and explain a term "free use" in the case of academic use by students and academians in their works?
4. What are good or bad academic experience?

Students are highly aware that intellectual products created by GAI are intellectual property of others – natural persons, and GAI only combines alreay known achievements and databases/ results.
Analysing the whole list of the students answers following results may present a table bellow:

Table 1.

Q and A	YES – natural person is the author	NO AI is the author	BOTH: human and AI jointly authors	no answer
The author of copyright work, created by AI under idea and created under humans directions	180	12	15	8

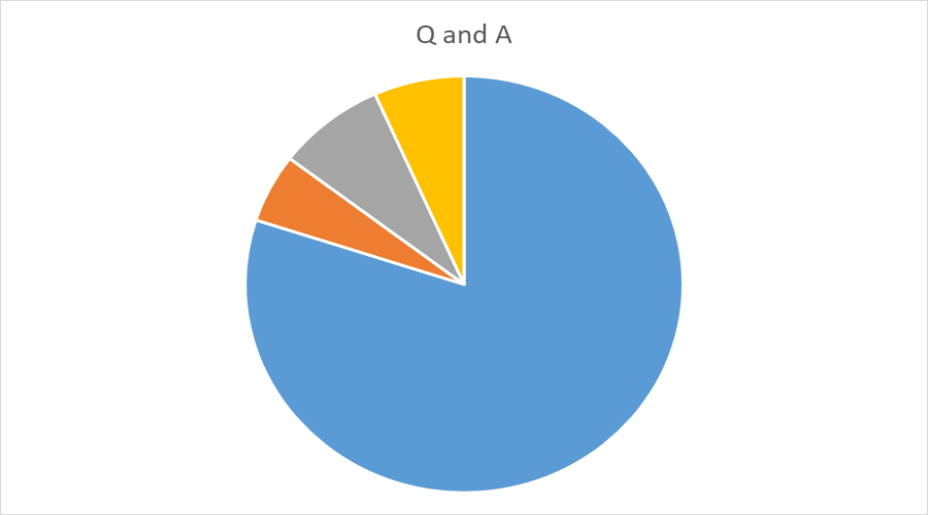

Fig.1. Answers of the question regarding the authorship

More than 85 % of students and academians are awarereness that the author of the created copyright work always is human as natural person.

2.3 Author's Comment:

1. Most AI systems are low-risk models and can contribute to solving many societal challenges.
2. Some AI systems pose risks to personal data and biometrics that you need to address.
3. Draft legislation provides some protection for personal data. Unfortunately, they do not focus on the problems of intellectual propertyand to the specific challenges that AI systems can create in inetllectual property field.

Regulation (EU) 2024/1689 of the European Parliament and of the Council of 13 June 2024 laying down harmonised rules on artificial intelligence – focus: hile ensuring a high level of protection of health, safety, fundamental rights as enshrined in the Charter of Fundamental Rights of the European Union (the 'Charter'), including democracy, the rule of law and environmental protection, to protect against the harmful effects of AI systems in the Union, and to support innovation. This regalation is not regarding to IP rights, CR and related rights.

Conclusions

1. AI has no legal personality, no rights in IP.
2. AI is a mashine with software generated and completed DB by a human.
3. AI creates an artistic work under idea concept, assignment of manager – human.
4. There is a need to form legislation in GAI focused on CR and related to CR.

5. There is a need to disseminate IP culture in areas of creators of software, musicians. artists and writers.
6. The responsibility of the higher education institutions is to teach and train students – future creators and innovators, on IP rights, CR and related to CR.

A Case Study of EFL Learners' Experiences of Using Interactive Fiction with ChatGPT: A Sociocultural Perspective

Emma Aleksanyan[1], Irshat Madyarov[2]

[1,2]American University of Armenia, Armenia

Abstract

This study explored how ChatGPT mediated English as a foreign language (EFL) students' lexico-grammatical development through speaking and writing tasks in Interactive fiction (IF), and how the interaction between learners and ChatGPT with IF tasks changed over time. Sociocultural theory (SCT) framed the analysis and interpretation in this study. The research examined three EFL learners (two aged 20 and one aged 14) who completed IF-designed tasks with ChatGPT. The study lasted four weeks and was conducted within a one-on-one private tutoring context. Data collection tools were ChatGPT logs, semi-structured interviews, class audio recordings, and teacher notes. The data were analyzed inductively through the lens of the SCT theoretical concepts. The study revealed that initial interactional patterns were not aligned with SCT principles. After several iterations, adjusted prompts gradually created learning experiences approximating those considered optimal within SCT. IF tasks also mediated the learning, creating an immersive context for practicing the language. Therefore, the IF tasks with ChatGPT can support EFL learners' lexico-grammatical development through speaking and writing tasks, fostering engagement, self-regulation, and reflection, revealing that ChatGPT can act as a dialogic partner and a mediator within students' Zone of proximal development (ZPD), when the prompt is well-designed. The study also discusses practical pedagogical and methodological implications.

Keywords: *Sociocultural theory (SCT), Interactive fiction (IF), ChatGPT-assisted language learning, English as a foreign language (EFL)*

1. Introduction

From a sociocultural theory (SCT) perspective, language learning is effective when learners are engaged in meaningful social interactions and use language as a tool for communication, rather than as an isolated skill to be developed [1]. Research suggests that IF tasks create a meaningful context for practicing speaking and writing skills. However, to gain fruitful results, learners must be digitally literate, and the task design must be well-structured [2], [3].

Similarly, ChatGPT acts as an IF platform, which, until now, has been realized through specialized websites and apps such as Twine and Inklewriter. Learners make choices, solve problems, and co-construct stories, which enhances engagement and creativity [2], [3]. From the SCT perspective, IF acts as a mediating tool, creating a meaningful context for interaction, encouraging authentic language usage [2].

Unlike these IF tools, ChatGPT is a more flexible system that allows learners to have real-time interactions and mediates the learning process. Nevertheless, it can cause cognitive load, overreliance, and ethical concerns [4], [5]. ChatGPT acts as a mediating tool and a More Knowledgeable Other (MKO), providing feedback and prompts to move learners along their ZPD.

While interactive tasks and ChatGPT are promising tools for language learning, a key pedagogical challenge remains unresolved: EFL learners still lack engaging and structured activities to develop speaking and writing skills, and teachers need guidance on how to design technology-mediated tasks that promote meaningful language use without excessive cognitive load. The literature is promising yet scarce and inconclusive, and there are no studies combining IF with ChatGPT to enhance EFL learners' speaking and writing skills.

2. Methodology

Research Design

SCT has long been used to frame studies on second language development with the help of computer-based and more recent digital tools [15]. It is a theory that explains how humans learn, and how various

tools mediate this process. ChatGPT and IF are examples of such mediating tools. In this study, SCT informed the research methodology as well as the design of IF tasks and ChatGPT prompts to promote meaningful language practice, interaction, and to mediate language learning within students' ZPD. Therefore, SCT addressed "how" ChatGPT, with IF-designed tasks, mediated and scaffolded the language learning process and acted as an MKO within students' ZPD, addressing the following research question: How does ChatGPT mediate EFL learners' lexico-grammatical development through speaking and writing tasks in Interactive fiction?
The theoretical framework and research question required in-depth analysis and explanation of processes, mediation, and meaning-making [6], [7]. A case study design within the online tutoring context and with a small number of participants allowed the researcher to gather deep insights into how the students interacted with IF and ChatGPT-designed tasks [8]. Examining three cases gave a profound understanding of the question that the researcher aimed to address.

Research Participants

The classes were conducted in an online private tutoring context. The teacher-researcher held one-on-one English classes and designed ChatGPT prompts tailored to the students' levels and needs. The lessons took place twice per week via Google Meet and lasted 20-50 minutes.
Three EFL learners participated in the study: Sue (20, B1), Alex (20, B2), and Ani (14, B1). The participants were selected with a maximum variation sampling. Their profiles differed in age, gender, nationality, and language proficiency. Pseudonyms were chosen for the participants. To start the research, the teacher-researcher obtained oral assent. The data were kept confidential following ethical considerations. Only the researcher and supervisor had access to the data, and it was destroyed one month after graduation.

ChatGPT-based IF Tasks

The research aimed to design ChatGPT prompts to create learning experiences for EFL students that approximate the pedagogical principles of SCT to mediate within their ZPD, help them move through other- to self-regulation using ChatGPT as an MKO. Initially, students had three classes with a template that was not in line with SCT. After this piloting period, updated templates were created. They had multiple sections, including the topic, the role for ChatGPT, and the student; six system rules for designing the IF story; task integration and progression; feedback rules; vocabulary rules; and pedagogical requirements.
ChatGPT acted as an EFL instructor and an IF story generator through the lens of SCT. The task progressed from shared to independent performance. The language difficulty of the narrative was based on the participant's language proficiency. Moreover, the student's gender and age were also mentioned to generate relevant texts. The branching narrative had two story paths, and the tasks alternated between speaking and writing tasks. The feedback was also changed throughout the classes from explicit to implicit.

Data Collection and Analysis

After piloting, ChatGPT prompts were redesigned. The data collection lasted four weeks. Participants completed four classes with an updated ChatGPT template. From the initial number of participants, these three individuals were selected based on certain criteria such as age and gender. Classes lasted 20-50 minutes and included post-task semi-structured interviews. Moreover, tasks were audio-recorded for later analysis and redesigned for each participant. The data was collected from ChatGPT logs, semi-structured interviews, teacher notes, and class audio recordings.

3. Results

What follows below are the findings presented as themes that emerged throughout the study.

3.1 Designing Mediation

First, all classes had the same structure, and ChatGPT guided students by introducing six scenes, A/B story paths, task instructions, and two reflective questions. Throughout the classes, the predictable task structure alternated between speaking and writing tasks, helping students reduce cognitive load and

focus on the story creation rather than the structure of the tasks. This did not happen after the first class. All three participants needed time to internalize the structure. After the preparation period, the teacher's notes confirm that students took control of the tasks, even ignoring reading the instructions, completing the tasks quickly, and automatically alternating between speaking and writing tasks. This type of task design structure and instructions align with SCT viewing them as mediating tools that promote goal setting, language learning, and thinking. Moreover, students' behavior became self-regulated over time, showing that the mediating tools were internalized [7]. Second, another type of regulatory mediation was the type of feedback that guided and controlled the learning. The feedback was changed throughout the classes for all three participants.

Class 1
The feedback was designed to provide graduated feedback after each scene. However, ChatGPT corrected mistakes explicitly. With this prompt, ChatGPT was not natural at providing SCT-informed feedback and mediation, and students heavily relied on other-regulation. For example:
Sue: I always did my tasks on the right time.
ChatGPT: I always did my tasks on time" is more natural than "on the right time [21].

Class 2
For the second class, the prompt was adjusted to remove feedback after each scene. The students received final feedback, which identified 4-5 priority areas of improvement, and encouraged them to reflect. For example, Alex confused "fun and funny, satisfied and satisfying" in class 2. After completing all the scenes, ChatGPT corrected the student's mistakes explicitly and, for enhancing vocabulary, suggested, "You sometimes use adjectives in unnatural combinations (e.g., funny and satisfied trip → better: fun and satisfying trip) [21].
Providing feedback at the end of the task allowed students to perform without interruption, revealing students' ZPD, what they could do alone, and what help they needed. Although the feedback was delayed and it was provided when the students completed all the scenes, the chatbot provided correct answers, instead of supporting the student in co-constructing knowledge, which was not consistent with SCT. Thus, ChatGPT was still unable to provide gradual and contingent mediation in error correction.

Classes 3-4
ChatGPT gave final feedback after scene 6. The chatbot gave implicit error correction, asked guiding questions to explore, notice mistakes, and self-correct. For example:
ChatGPT: Verb Forms & Tense. You wrote: "When i finally reach the spectacular viewpoint, and saw…" Hmm… "reach… and saw…?" Do the two verbs match the same time? Can you check which tense you want for both? Try correcting that part. Just the verb forms, not the whole sentence [21].
Sue: 1- reached, saw
ChatGPT: Verb Forms: You wrote: "reached, saw" These look like the correct forms, but think about how they fit into your full sentence: "When I finally reached…, and saw…" The pair looks good — just check: Do both verbs follow the same pattern in that sentence? Does anything feel missing before "saw"? Take a quick look at your sentence and see if you want to adjust anything.
Sue: When i finally reached the spectacular viewpoint, i saw that illustration in front of me i felt like i own the city.
Aligning with SCT principles, ChatGPT acted as the MKO and asked questions within ZPD to help them find out the correct answer themselves, notice, rethink, internalize forms, and move from other- to self-regulation [7], [9]. Here, the feedback mediated thinking rather than providing correct answers, and ChatGPT guided the students to fix mistakes. Therefore, the teacher was able to redesign the prompt so that the mediation came proximate to SCT expectations. This approach for feedback supports the graduated and contingent mediation suggested by [9], where the support is adjusted and removed according to the students' language development and autonomy. ChatGPT's error correction improved, but it tended to be verbose, which could disempower students and leave less room for autonomous exploration. For example, teacher notes confirmed that Alex's behaviour sometimes revealed that he did not want to read the feedback because he scrolled up and down to see the length of the feedback, and said, *"I think it's end?"* However, he did not stop the class and continued interacting with the chatbot to fix errors, after the teacher's instruction, *"Let's correct the mistakes."* The other students also shared their opinions about the feedback during the interview. They said that the guiding questions were more useful because they helped think, explore correct forms, and remember better. In addition, Ani reflected that the feedback at the end of the tasks did not distract from thinking of the story creation. There were cases when students did not know how to correct mistakes. They fixed errors through the

teacher's mediation. For instance, Ani, during Class 3, was able to understand her mistake, *"a good advice"* only after the teacher's guiding questions, *"Is advice an uncountable or countable noun?", "Should you use article "a" with uncountable nouns?"*
These findings also revealed that prompt design shaped the quality of mediation, promoting SCT-aligned learning experiences, mediating the students' lexico-grammatical development through speaking and writing tasks, regulating the interaction, and structuring students' activity [7]. ChatGPT acted as a regulatory mediator whose support guided students in the early stages, and later it was internalized by the students [7], [9]. This suggests that for the prompt to function effectively for ChatGPT, careful, SCT theory-driven prompt engineering is necessary to advance noticing, reflection, and help students go through other- to self-regulation. Therefore, the teacher's role remains central in designing and testing the prompt to ensure the chatbot provides developmentally appropriate mediation within students' ZPD.

3.2.1 Lexical Mediation

ChatGPT used the target vocabulary mentioned in the template in the story scenes and paths. This promoted noticing and internalization of vocabulary. Moreover, ChatGPT recycled the words throughout the scenes, which gave students a chance to reuse the words in various contexts and recycle the vocabulary. These results demonstrated that ChatGPT mediated vocabulary development, providing the vocabulary in the story scenarios and paths, encouraging the students to use the same words in different situations. According to [10], this promotes noticing, retrieving, and developing lexis. Additionally, this supports SCT principles, highlighting that recycling of vocabulary shows how mediation works in the ZPD [7], [11]. Moreover, this finding aligns with previous research [2], [3], suggesting that well-designed digital stories create meaningful environments and individual experiences to practice and develop vocabulary. However, students did not fully master the target vocabulary. For example, Participant 2 confused "fun and funny, satisfied and satisfying" in class 2. Participant 1 did not use "commitment, and getting things done" in class 2. Participant 3 did not use "embarrassed, exhausted, annoyed, annoying, relaxing, satisfied, satisfying" in class 1. The results demonstrated participants' lexical strengths and weaknesses, and this is consistent with the principles of dynamic assessment, showing what the learners can do and where they need more assistance [9]. Therefore, ChatGPT mediated students' vocabulary development within their ZPD, integrating what the students already know and pushing them to expand their word stock. This aligns with SCT principles of viewing the language as a tool for thinking and an object for learning new vocabulary [11].

3.2.2 Grammatical Mediation

The analysis of four classes revealed inconsistent findings on grammar development. However, students benefited from different types of corrective feedback and demonstrated micro-level self-regulation and internalization. ChatGPT's error correction evolved from explicit to delayed and implicit feedback. Aligning with SCT principles, ChatGPT did not initially provide graduated feedback supporting students in moving from other- to self-regulation. Providing delayed feedback at the end of the task allowed students to perform independently. The students came up with longer and more complex ideas, showing developmental patterns in grammar. This type of error correction revealed what forms are internalized, and what areas need improvement [12]. When the prompt was adjusted to change from explicit to implicit feedback, ChatGPT acted as the MKO and asked questions within the students' ZPD to help them find correct answers, rethink, internalize the forms, and move from other- to self-regulation. Nevertheless, teacher-researcher notes also stated that when the participants did not know the correct form, they did not know how to correct the mistakes. They relied on the teacher's or the chatbot's help, so the teacher or ChatGPT continued explaining and guiding the students to fix the mistakes. This aligns with the principle of graduated assistance that the less explicit error correction is effective when the students are ready and independent enough to take control of it [9]. To sum up, although the findings were not consistent, there were cases of micro-level self-correction through ChatGPT's mediation. Moreover, the teacher also mediated during implicit error corrections, helping the students understand and fix errors. Therefore, ChatGPT mediated cognitive-linguistic skills such as micro-level self-correction, reflection, and reasoning despite uneven grammar development.

3.3 Metacognitive Mediation

Findings revealed metacognitive mediation through reflective questions, guiding students to rethink their choices, expand their speaking and writing, and show more awareness of their decisions. The template

of the task involved two reflective questions after scenes 2 and 4. These questions align with SCT's conceptualization of metacognitive mediation, which guided the participants to explore "why" in their choices, promoting deeper thinking, reflection, and evaluation. This mirrors one of the ideas of SCT that advanced thinking is firstly mediated by others, then it slowly becomes self-regulated [7], [11], [13], [14]. Sue and Ani's responses demonstrated that ChatGPT can be used as a digital environment for metacognitive reflection to expand spoken and written replies. These results also support recent studies that AI functions as a mediation tool, promoting higher-order thinking and learner autonomy [15], [16], [17]. For Alex, reflection questions in classes 3 and 4 were embedded with the story instructions, and he overlooked them. However, he justified the answers, showing awareness of his choices. This shows that the task was not well designed to make the questions visible. These findings are in line with the research on Interactive fiction and AI tools, stating that the students want to reflect and have analytical talk when the questions function well, they are clearly separated from other tasks, and when they are noticeable [18], [2], [19].

3.4 Interactive Fiction as a Mediator: Affective and Motivational Dimensions

Another type of mediation that was revealed by analyzing the results is affective mediation. ChatGPT interacted with a friendly tone, which reduced anxiety and stress, making students feel comfortable and motivated to produce the language. The praise words in the feedback helped students be more confident about their answers. However, in some cases, students ignored reading the praise words to focus more on continuing and creating the story. Moreover, Interactive fiction stories themselves mediated the learning, creating an engaging context for students to speak or write about their own paths. Interviews and teacher notes indicate that participants were emotionally immersed, imagining that they were experiencing those moments in real life. According to SCT, symbolic and cultural artifacts, such as narratives, also mediate language learning, showing how the learners feel, think, and use the language [7], [14]. In this study, Interactive fiction tasks created a meaningful context that helped the participants to be immersed in the story creation process, to imagine the scenes, experience various emotions, and show problem-solving, risk-taking, reflecting, reasoning, and management skills. All of this contributed to the willingness to produce the language and enhance their speaking and writing skills within their ZPD. Students did not use the language mechanically. Additionally, story paths made the story creation more personalized. Students made decisions, gave reasons, examples, and reflected, which promoted higher-order thinking and more extended responses. In addition, they internalized the task design by skipping reading the instructions and choosing to read or to listen to the chatbot's input independently. These findings align with previous research, indicating that IF tasks foster engagement, autonomy, and create an environment for purposeful language use [18], [2]. In conclusion, affective mediation was shaped by Interactive fiction stories, ChatGPT's friendly tone, personalized, and choice-driven responses. These elements reduced stress and encouraged students to participate in the tasks and produce language within the ZPD. However, students sometimes skipped reading ChatGPT's praise words, showing that the chatbot's affective mediation sometimes had a secondary role.

3.5. From Dependent to Independent Task Performance

The results show how participants went through other- to self-regulation, becoming more independent, confident, and using complex sentences. These findings line up with Vygotsky's ZPD and the principles of graduated and contingent mediation, explaining how this transition happened.
Earlier: All participants relied heavily on ChatGPT's prompts during the first preparation class. They were not confident and read everything carefully. Moreover, students kept asking questions to make sure they were doing everything correctly. Class recordings revealed these questions, for instance, *"Should I read the task? Should I say now or record first? Should I read now? How should I start it?*
"Should I listen or read?"
Later: Over time, they became more engaged and confident, producing longer and more complex sentences without asking questions about the task structure, and feeling more independent. Students did not read the instructions and completed them quickly. Teacher-researcher's notes show participants skipped instructions during the last two classes and immediately produced their answers. Therefore, these findings demonstrate how students went through other- to self-regulation by internalizing the structure of the tasks [11].

3.6 Summary of the Findings

The study addressed the following research question: How does ChatGPT mediate EFL learners' lexico-grammatical development through speaking and writing tasks in Interactive fiction? ChatGPT failed to provide mediation independently. The teacher redesigned the prompt for ChatGPT to function according to SCT-like principles. Consequently, ChatGPT functioned as the MKO that mediated the learning process with minimal teacher intervention. IF tasks also mediated the learning, creating a meaningful context for the participants to practice the language. From an SCT perspective, these findings demonstrated that IF and ChatGPT's mediation shaped students' lexico-grammatical development through speaking and writing tasks.

The language, ChatGPT, and IF stories were cultural and symbolic tools that students used to process and express ideas, plan, and evaluate. In line with Vygotsky's view of language as the main tool for thinking, ChatGPT acted like a dialogic partner engaging the students in meaningful conversations, promoted noticing, and encouraged them to reformulate responses and elaborate on them [7], [14], [11]. In this regard, students' lexico-grammatical development through speaking and writing tasks can be seen as the growth within their ZPD. Tasks were appropriate for the students' language proficiency. The students gradually demonstrated internalization, self-regulation, confident production, and application of more complex structures without hints. Aligning this with previous SCT research, it comes to light that first, higher-order mental and language skills are developed from interaction with tools or people, and later these skills are internalized by an individual over time [13], [15]. Therefore, the findings demonstrate that when properly designed, ChatGPT prompts integrated with IF can facilitate the lexico-grammatical development through speaking and writing tasks according to SCT principles.

Over time, the students started answering with more detailed and complicated sentences, although they made mistakes in their replies. This shows that the students were working within their ZPD, stretching their skills with the help of IF and ChatGPT's mediation to take risks and use complex sentences [20]. The shift from explicit to implicit error correction is in line with graduated and contingent mediation that the support should be changed according to the students' needs and removed when they show progress [9]. Thus, the interactional changes show internalization of language and task structure, which is aligned with SCT principles that development happens when the students repeatedly do mediated and meaningful tasks until they can handle them alone.

To sum up, the findings demonstrated that ChatGPT with IF tasks and SCT lens supported the EFL learners' lexico-grammatical development through speaking and writing tasks, and promoted engagement, self-regulation, and reflection. Moreover, if the prompt is well-designed, ChatGPT can act as a dialogic partner and a mediator within students' ZPD. As a result, this study supports the integration of AI in language learning to enhance EFL learners' language development, technology literacy, autonomy, and engagement.

3.7 Pedagogical Implications

The findings suggest implications for EFL teachers, curriculum designers, educational institutions, and other practitioners to integrate IF tasks with ChatGPT into language teaching. First, storylines with branching plots (A/B options) encourage decision-making and reasoning. Then, ChatGPT's mediation was contingent on how the prompt was designed to function as an MKO and mediate learning within the students' ZPD. The prompt included the following sections: ChatGPT's role, IF structure, task design and progression, language focus, feedback principles, and mediation rules. Therefore, the prompt design should be viewed not only as providing technical instructions to the chatbot, but also as part of the pedagogical process, similar to how teachers sequence tasks and scaffold the learning. This study suggests an SCT-aligned prompt design to practice lexico-grammatical features through speaking and writing tasks while completing IF tasks with ChatGPT. Next, the students benefited from graduated feedback. Provide an example of the format you expect for implicit feedback in a prompt. In this study, ChatGPT frequently misinterpreted the concepts of "implicit/explicit" feedback when an example was not provided. Practitioners may apply this type of feedback because it helps students go through other- to self-regulation and promotes internalization of the forms. Moreover, teachers, curriculum designers, and educational institutions can adjust the prompt to make the reflective questions more visible. This allows the students to rethink their choices, feelings, and elaborate their responses, showing reasoning and deep awareness of their choices. Then, teachers and curriculum designers can intentionally add recycling of the target vocabulary throughout one class. This supports noticing, internalization, and retention of the vocabulary. Each task should include a lexical or grammatical component, avoiding excessive demands and instructions that cause cognitive load, and adjusting the language difficulty

according to the students' proficiency. Next, students benefited from a fixed task structure and design. Teachers can follow the same approach because this reduces cognitive load, anxiety, and stress, helping students to be focused on producing the language and creating meaning. Moreover, storytelling can include visual cues to promote engagement and comprehension. Additionally, in larger classes, interactive reading can be assigned as shared homework in ChatGPT, for students to create groups in the bot and collaborate on storytelling and reporting. Finally, the interaction between students and ChatGPT will be successful when the participants are aware of ChatGPT's features. The teacher-researcher conducted an introductory session on IF and ChatGPT, which fostered the students' literacy in the topic and the tool. Practitioners can follow the same approach to ensure students have basic knowledge of the topic.

3.8 Limitations

One major limitation is that ChatGPT did not mediate learning independently. The effectiveness was contingent on human pedagogical input and revised prompts. As a result, ChatGPT cannot be considered an independent MKO, since the effective mediation was co-constructed through teacher intervention. The study also tracked how learners gradually shifted from other- to self-regulation over four weeks of completing IF tasks with ChatGPT, allowing the observation of developmental changes at a micro-level. However, as the study lasted for a limited period, it restricts insights into longer-term processes of internalization.

Although IF acted as a mediating cultural artifact, fostering engagement and meaning-making, its narrative format also imposed limitations. In some cases, complex storylines, overly detailed feedback, or embedded reflective questions increased cognitive load, distracted students from focusing, because learners had to think about too many things at once. This finding underscores the story's dual function as a mediator that can both facilitate and constrain learning, a distinction that was not explored in this study. While affective mediation could be identified based on learners' interaction with the chatbot, engagement, interview answers, and behavioral indicators, ChatGPT could not perceive non-verbal cues such as hesitation, silence, confusion, or facial expressions. In several cases, when ChatGPT failed to recognize emotional states, learners required the teacher's mediation. As a result, AI-mediated interaction alone cannot fully represent or manage affective regulation and emotional dimensions of the ZPD.

3.9 Recommendations for Future Research

Based on the study's findings and limitations, this section recommends future research to focus on the amount and timing of feedback, which may cause cognitive load and weaken the mediation effect. Moreover, delayed or immediate feedback may have a significant influence on how students notice and internalize feedback. Other theories may shed more light on these issues, such as Cognitive Load Theory (CLT) or Multimedia Learning Theory (MMLT), which provide more explicit accounts of how the amount and timing of feedback impacts learning outcomes in digital contexts and students' cognitive processing. Finally, future research should also focus on the use of affective mediation. Praise emerged in the data, but there was limited scope to explore it in more depth within the focus and SCT framework. As praise was often ignored, this indicates that affective support should be studied in terms of its impact on learners and learning, rather than its presence.

The Role of Artificial Intelligence in Promoting Accessibility for Students with Disabilities: The Landscape of Inclusion in Vocational and Higher Education

Vitor Gonçalves[1], Leila Maria Araújo Santos[2]

[1]CITeD, Instituto Politécnico de Bragança, Portugal
[2]Universidade Federal de Santa Maria, Brazil

Abstract

The inclusion of students with disabilities in Vocational and Technical Education (VTE) faces challenges that go beyond physical barriers and encompass communication and pedagogical limitations. This research investigates the potential of Artificial Intelligence (AI) and digital technologies as strategic tools to promote accessibility at the Federal University of Santa Maria (UFSM). The research was motivated by the need to overcome the still-nascent adoption of these technologies in educational institutions, with a view to the ethical and critical training of teachers and the empowerment of students with disabilities. The central objective was to investigate and systematise innovative pedagogical practices that utilise AI technologies to personalise educational support and adapt content to students' specific needs. Methodologically, the research adopted a mixed-methods (quantitative and qualitative) approach of an exploratory-descriptive nature. Data collection involved a population of approximately 800 students with disabilities (physical or motor, visual, hearing, intellectual, multiple, ASD (autism spectrum disorder), high abilities or giftedness, fibromyalgia and similar conditions) studying at the EPT at UFSM, of whom 45 participated. In the quantitative part, as of December 2025, we characterised the initial landscape of the use of Artificial Intelligence (AI) resources and other digital technologies to promote accessibility for people with disabilities or specific educational needs in Professional and Technological Education and in Higher Education at UFSM. The data reveal low adoption and limited awareness of Artificial Intelligence (AI) tools among respondents. The majority state that they do not use, or have never heard of, specific applications for academic support, such as chatbots, literature review tools, writing assistants, tools for creating visual content and presentations, or tools for adapting teaching materials to improve accessibility. A lack of, or very low, knowledge of the subject predominates, with frequent responses indicating a lack of prior reflection on the impact of AI on accessibility. The study highlights a critical need for digital literacy and institutional support, bearing in mind that, whilst this research aligns with the Sustainable Development Goals (SDGs 4 and 10), it also reinforces the commitment to equity and social justice within the academic environment.

Keywords: *Accessibility; Artificial Intelligence; Digital Technologies; Inclusion.*

1. Introduction

In the last three years, the rapid integration of Generative Artificial Intelligence (GenAI) in education has moved from a peripheral curiosity to a central systemic challenge. Since the public release of Large Language Models (LLMs) in late 2022, the educational landscape has faced an unprecedented disruption. The democratisation of Artificial Intelligence (AI) has facilitated access to the production of digital resources and the automation of processes across multiple sectors, including education. The rapid diffusion of a technology with such profound impact has revealed the need for a regulatory framework, but has also raised fundamental ethical questions about its application: where, how, and with what meaning and limits can or should AI be used? International organisations, such as UNESCO, have defined core principles for the responsible use of AI, while the European AI Act has established legal safeguards to protect citizens from abusive uses by companies and institutions.

For students with disabilities in Vocational and Technical Education (VTE), this disruption presents both a risk of further marginalisation and a transformative opportunity for inclusion. In this research, we believe we should take advantage of the opportunities it may offer, while minimising the risks that still haunt its use, usually among certain special audiences.

The inclusion of students with disabilities remains a multifaceted challenge that requires integrated approaches involving effective public policies, innovative pedagogical practices, and the strategic use

of assistive digital technologies. Despite institutional advances, barriers related to communication, pedagogy, and technology persist, compromising the access, retention, and academic success of these students. Data from Portuguese and Brazilian higher education institutions reveal that dropout rates among students with disabilities exceed the general average, largely due to limited digital accessibility and insufficient pedagogical support.

AI is rapidly transforming education, but its effective integration depends less on the tools themselves and more on pedagogical clarity, assessment redesign, and human-centred competencies. This research examines the potential of AI and other digital technologies as strategic tools to promote accessibility at the Federal University of Santa Maria (UFSM). It aims to investigate and systematise innovative pedagogical practices that use AI to personalise educational support and adapt content to specific needs. Furthermore, it seeks to contribute to future teacher training guided by ethical and critical principles, aligning with Sustainable Development Goals (SDGs) 4 and 10 to promote equity and social justice in the academic environment.

2. Theoretical Background

AI has rapidly evolved from a set of specialised computational techniques into a pervasive socio-technical infrastructure shaping how individuals learn, work, and interact, with recent advances in GenAI marking a shift from passive consumption of digital content to active, large-scale production of knowledge, media, and services. Across society, AI systems are embedded in domains such as healthcare, finance, transportation, research and education, enabling data-driven decision-making, personalisation, and automation, while also raising critical ethical, bias, transparency, and digital inequality concerns.

In the educational sphere, AI is increasingly aligned with the principles of Inclusive Education and Universal Design for Learning, supporting more flexible, adaptive, and accessible learning environments. For students with special educational needs, particularly those with visual, auditory, cognitive, or motor impairments, AI-powered tools such as intelligent tutoring systems, speech recognition, text-to-speech, computer vision, and real-time captioning are transforming access to content and participation in learning activities. We can also highlight persistent challenges, including the need for robust evaluation of accessibility outcomes, teacher training, ethical safeguards, and equitable access to AI technologies, ensuring that their transformative potential effectively reduces, rather than reinforces, educational disparities.

2.1 The Evolution of AI in Educational Contexts

The integration of AI in education is fundamentally aimed at facilitating personalised learning experiences. By leveraging data-driven insights, AI tools can identify a student's specific knowledge gaps in real time and provide tailored resources, enabling them to progress at their own pace. Historically, educational technology focused on digitised content and learning management systems; however, the shift toward GenAI marks a transition from "tools for consumption" to "tools for production," as Sarah Wang and Shangda Xu discuss on the Andreessen Horowitz (2024) website [1].

The evolution of AI in education can be understood in three overlapping phases [2]:

- Reactive AI and Chatbots (2021-2023): Characterised by the mass adoption of models used primarily as conversational search engines, with a focus on academic integrity and cheating.
- Contextual Generative AI (2024-2025): Introduced Retrieval-Augmented Generation (RAG), enabling institutions to ground AI responses in verified data and mitigate issues such as "hallucinations".
- Agentic AI (2026-Present): AI agents capable of executing complex sequences of tasks, autonomously planning curriculum units, and monitoring student progress in real-time.

But it is commonly accepted that AI should not drive pedagogy; pedagogy should guide AI use. Reflective practice is essential. Short, iterative reflections on classroom AI use help teachers build context-specific evidence and develop metacognitive awareness, which is more valuable than relying on external claims about tools. Additionally, it is estimated that a strong consensus rejects AI detection tools as unreliable and unfair [3]. Instead, the literature emphasises: (i) process-based assessment; (ii) authentic and oral evaluation; (iii) reflection and transparency in AI use. Frameworks such as the AI Assessment Scale [4] and the “third path” approach [5] propose scaffolded AI integration, in which use is permitted but bounded by learning goals. So, we should be able to understand why we use a particular AI platform or tool, why we chose it over alternatives, the learning goal it serves, and how it strengthens the way you already teach the lesson. In other words, as we move into the era of Agentic AI, the focus

must remain steadfastly on pedagogical intentionality rather than technical capability. By prioritising reflective practice and process-based assessments, educators can go beyond AI detection and move toward gradual integration.

2.2 Pedagogical Framework: I-TPACK

Traditional models like TPACK (Technological Pedagogical Content Knowledge) focused on the intersection of content and technology. The emergence of AI requires a new dimension: Intelligent-TPACK (I-TPACK), which integrates ethical knowledge and algorithmic literacy into the teacher's core competencies [6].
The transition from TPACK to I-TPACK signifies that technological proficiency is no longer enough; educators must now possess algorithmic discernment. This new layer of "Intelligent" knowledge requires a shift in the teacher's role from a consumer of educational software to an auditor of automated logic. Teachers must now understand how algorithms process information to avoid bias and ensure that AI-generated feedback is pedagogically sound. It involves not only knowing how to use an AI tool but also understanding the underlying data structures that may inadvertently marginalise specific student cohorts. Consequently, professional development must evolve to include ethical troubleshooting, ensuring that when AI acts as an intermediary in the classroom, it does so through a lens of equity and pedagogical rigour that only a human educator can provide.
Furthermore, literacy in the age of AI is being redefined as the ability to navigate "digital plastic" [7], the malleable nature of AI-generated content, where the human role is that of a critical curator and editor. The concept of "digital plastic" highlights a fundamental change in our relationship with information. Because AI-generated content is inherently fluid and prone to hallucination, the modern educator acts as a critical gatekeeper, transforming raw machine output into reliable instructional material. This is particularly vital for inclusive education, where the stakes of AI adoption are highest. While the potential for AI to automate accessibility, such as real-time captioning or text simplification, is immense, its current underutilization underscores a critical implementation gap. Bridging this gap requires moving beyond viewing AI as a productivity shortcut and instead embracing it as a highly malleable scaffold that, when curated correctly, can dismantle traditional barriers to learning.

2.3 The Responsible Use of AI in the Educational Context

In the European Union, the main framework comprises documents such as the European Commission's Ethical Guidelines on the use of AI and data in teaching and learning for educators [8], as well as the broader legal framework of the EU AI Act [9]. The educational guidelines (2022, updated in the context of the Digital Education Action Plan) focus on the ethical use of AI by teachers and institutions, promoting principles such as transparency, data protection, fairness, inclusion, and the development of students' critical thinking. These guidelines offer teachers practical support in integrating AI pedagogically, ensuring that students understand both the potential and the risks of these technologies. Complementarily, the AI Act establishes a risk-based legal framework, classifying AI systems and imposing stricter requirements for high-risk applications – including some used in education (e.g., automated assessment). The European model is based on the idea of "trustworthy and human-centred" AI, balancing innovation with fundamental rights, safety, and accountability.
The Framework for the Responsible Development and Use of Artificial Intelligence in Education, developed by the Brazilian Ministry of Education (Ministério da Educação do Brasil) [10], provides a vital framework for institutional policies in Brazil. It emphasises that while AI offers opportunities for efficiency, it poses risks of "metacognitive laziness" and requires a fundamental reconstruction of the teacher's role. Responsible use involves ensuring that technologies promote equity and do not reinforce existing social and educational inequalities. This framework establishes guidelines to support the ethical, safe, and inclusive adoption of AI in Brazilian educational systems. The document acknowledges the transformative potential of AI to personalise learning, support educational management, and expand access to education, while emphasising that its implementation must align with principles such as equity, transparency, privacy, data protection, and respect for human rights. It also highlights the importance of ensuring that AI does not deepen existing inequalities and of promoting accessibility and inclusion, particularly for students in vulnerable situations. Furthermore, the framework underscores the need for continuous training for teachers and school leaders to foster critical, pedagogically grounded uses of AI and to develop digital and ethical competencies. It also proposes adopting governance, evaluation, and monitoring mechanisms to ensure the quality and contextual appropriateness of AI technologies used in education. Finally, the document stresses the importance of collaboration among government,

academia, the private sector, and civil society to promote responsible innovation focused on student well-being and the improvement of teaching and learning processes.
In Portugal, there isn't an "AI education framework" as specific as in Brazil, but there is the national AI Portugal 2030 strategy, which frames the development and use of AI in various sectors, including education [11]. This strategy strongly emphasizes the qualification of the population, digital literacy, and AI training from basic levels to higher education, recognizing education as a central axis for the country's digital transformation. On the ethical and social level, the document also highlights principles such as inclusion, equity, transparency, and respect for fundamental rights, aligning with the European model. It also promotes lifelong learning, professional retraining, and collaboration between academia, the public and private sectors, with the aim of preparing citizens and institutions for a responsible and sustainable use of AI, including in the educational context.
In short, the European Commission presents a normative approach with ethical guidelines, i.e., a strong regulatory component (AI Act). From this perspective, Portugal follows a strategic approach (capacity building, education and innovation), while Brazil follows an applied educational framework, with a direct focus on pedagogical practice.
Being more pragmatic about ethical and responsible use of AI in academic work, guidelines across sources converge on three principles: (i) transparency (disclosing AI use); (ii) process documentation (keeping interaction logs); and (iii) reflection (evaluating AI's impact on learning). These approaches shift the focus from policing to pedagogical accountability [12].

3. Materials and Methods

The research adopted a mixed-methods, exploratory-descriptive approach using both quantitative and qualitative data. The field of study was the UFSM, a Brazilian federal university in Santa Maria, Rio Grande do Sul.
Data collection involved a population of approximately 800 students with disabilities at UFSM from November 27th to December 26th, 2025. This population includes individuals with physical or motor, visual, hearing, intellectual, and multiple disabilities, as well as those with ASD, high abilities/giftedness, and fibromyalgia.
A digital questionnaire was the primary instrument for collecting data, including questions on AI awareness, the frequency of use across various AI categories (e.g., chatbots, literature review, writing assistants), and ethical concerns. The survey also explored the use of assistive technologies with and without AI.
A total of 45 students participated in the quantitative phase, even though they were finishing their classes and were near the Christmas and Summer holidays. This convenience sampling, or accessibility sampling, is a non-probabilistic method that allowed participants to be selected based on their immediate availability and ease of access for the researcher. The small, non-probabilistic sample size (n=45 out of ~800) limits the generalisability of the results, but does not invalidate the exploratory value of the study.
The graphic of Fig. 1 refers to the level of education of the respondents: 5 students (11,1%) are Integrated secondary education (Vocational and Technological Education); 4 students (8,9%) Technical course (Vocational and Technological Education); 23 students (51,1%) Undergraduate degree (Higher Education); and 13 (28,9%) are Postgraduate degree (Higher Education).

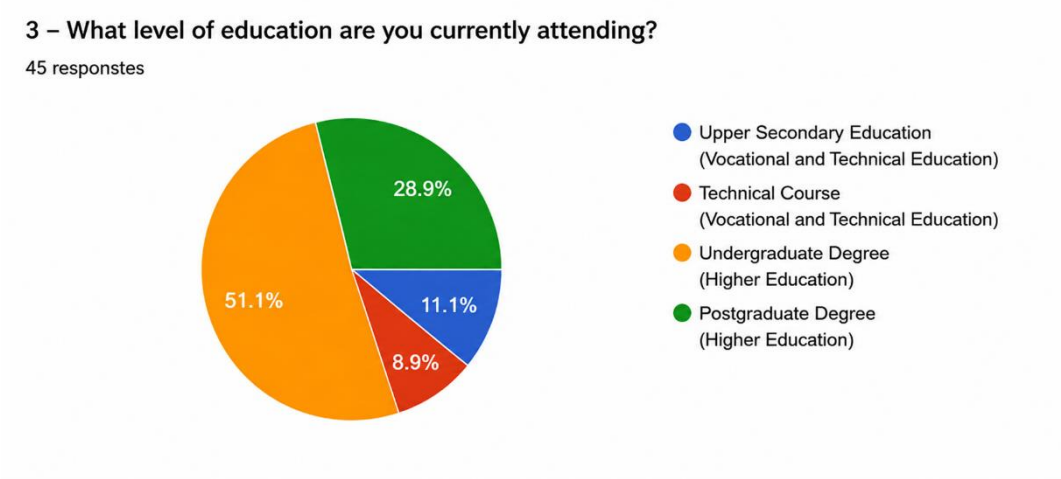

Fig. 1. Level of education of the respondents

The quantitative data were analysed to characterise the initial landscape of AI use for accessibility as of December 2025. This involved assessing adoption rates, familiarity with specific tools like ChatGPT, Gemini, and Canva, and the perceived impact of AI on student autonomy.

4. Results

Generally, the data collected from UFSM students reveal a landscape characterised by low adoption and limited awareness of AI tools specifically designed for accessibility and academic support.
Although 95.6% (43 students) had heard of AI and 73.3% (33 students) had already used some AI-based tool or application, only 4.4% (2 students) admitted to having advanced knowledge, 22.2% (10 students) intermediate knowledge, and 57.8% (26 students) basic knowledge about AI and its applications. Even so, 15.6% (7 students) admitted to having no knowledge whatsoever.
The most common types of activities performed using AI tools were: (i) obtaining answers to relatively simple questions (23 students (51.1%)); (ii) searching for and summarizing articles (19 students (42.2%)); (iii) generating images, graphs, or diagrams (17 students (37.8%)); and (iv) creating presentations (13 students (28.9%)).
Regarding the use of AI tools (chatbots and search assistants), despite their low frequency, they are the most used. All other categories of suggested AI tools (tools for searching and reviewing literature; for academic writing and editing; for presenting and creating visual content; for extracting information and interacting with documents; for learning and organising knowledge; or even for creating activities that meet inclusion and accessibility requirements) showed non-use or lack of awareness rates above 66.67% (30 or more out of 50 students).

Table 1. Frequency of AI Tool Usage among UFSM Students with Disabilities

Tool Category	Most Common Response	Tool most used
Chatbots & Research Assistants	Frequently	Gemini
Literature Search & Review	Rarely	Perplexity AI
Writing & Academic Editing	Rarely	Grammarly
Data Analysis & Visualization	Never	---
Visual Content & Presentations	Rarely	Canva and Gamma AI
Accessibility & Inclusive Adaptation	Rarely	paracasainclusivo.com.br

(0) Never, (1) Rarely, (2) Sometimes, (3) Frequently, (4) Always when I need

Key findings from the quantitative survey include:

- **Awareness vs. Depth:** While most students have heard of AI, their level of knowledge is often classified as "Basic" or "Intermediate".
- **Primary Activities:** Students use AI primarily to obtain answers to simple questions, search for and summarise articles, and create presentations.
- **Specific Accessibility Tools:** There is a stark lack of knowledge regarding specific accessibility tools. Only 5 students admit to using tools such as Be My Eyes and paracasainclusivo.com.br. Most participants (40 students) selected "Never" (Do not use). Nevertheless, 53.3% (24 students) admit that these tools can offer greater autonomy and decision-making power to a person with a disability, and 55.6% (25 students) believe that AI enables a person with a disability to recall or deepen prior knowledge, thereby facilitating the acquisition of more advanced knowledge.
- **Assistive Technology Gaps:** Nine students use traditional assistive technologies (e.g., noise-cancelling headphones, screen readers) without AI integration.

Taken together, these findings depict a landscape in which awareness of AI is widespread, yet its application to accessibility and inclusion remains marginal. Students predominantly use AI for generic productivity tasks, while specialised tools designed to support people with disabilities remain largely unknown or unused. This gap between general AI awareness and accessibility-specific practice, alongside the persistent reliance on traditional assistive technologies without AI integration, frames the discussion that follows.

5. Discussion

The results indicate that while there is an initial openness to AI tools, their potential to promote accessibility remains largely untapped at UFSM. The high frequency of "Never" responses for specialized academic and accessibility tools suggests that students are currently using AI for general productivity rather than as a tailored assistive resource.

In the context of this research, the most used chatbot and research assistant is Gemini, followed by ChatGPT and CoPilot. This may be because UFSM students are eligible for a 12-month free trial. For literature searches and reviews, the most used tool is Perplexity, but it is rarely used, even though students and researchers at UFSM can get 1 year of free access to the advanced AI research tool Perplexity Pro. In the context of visual content and presentations, as well as accessibility and inclusive adaptation, the most used tools (even rarely) were Canva or Gamma AI and paracasainclusivo.com.br, respectively. This can be explained by a workshop on these three tools that took place the previous month, and some of the participants were probably there.
Despite current low usage, 78% of respondents in the initial abstract findings (and corroborated by survey comments) agree that AI can offer greater autonomy and decision-making power to people with disabilities. However, a significant portion of the participants (e.g., those with ASD) expressed concerns that AI might "worsen a system that is already extremely flawed" if those developing the AI do not have disabilities themselves, potentially amplifying programmer biases.
Ethical concerns are a major theme. Students reported fears regarding the use of content "without real foundation" (hallucinations) and the "outsourcing of critical thinking". These findings align with the "Slow AI" concept, suggesting a need for a more considered, critical adoption of these technologies in the academic environment.
Finally, institutional role cannot be ignored. This study highlights a critical need for institutional support and digital literacy programs. The lack of prior reflection on the impact of AI on accessibility – as evidenced by frequent "I have not yet reflected on this" responses – suggests that the university must move beyond providing tools to fostering a culture of critical and creative AI use. The UFSM, like many other universities worldwide, has intensified its training initiatives in Artificial Intelligence (AI), ranging from the qualification of trainers to the creation of seminars and training courses for students.
The single-institution design limits the generalisability of these findings, but the transferable methodology – combining a mixed-methods survey with alignment to UDL and inclusive education frameworks – offers a valuable practical reference for educators and researchers seeking to replicate this approach in other institutional contexts.

6. Conclusions

This research demonstrates that, while AI offers promising tools for personalised teaching and content adaptation, its implementation for students with disabilities at UFSM remains incipient. The gap between AI's theoretical potential to promote accessibility and its current practical application is significant.
Although the findings are grounded in the specific institutional context of UFSM, the underlying methodology and the issues identified – limited awareness of accessibility-oriented AI tools, persistent reliance on non-AI assistive technologies, and a lack of critical reflection on AI's ethical implications – are unlikely to be unique to this setting. As such, the approach adopted here offers a transferable framework that other higher education and vocational institutions, particularly those engaged in similar inclusion efforts, may adapt to assess and address comparable gaps in their own contexts.
Key recommendations based on the findings include:

- **Targeted Training:** Implementing training programs for students and teachers focused on specialised AI accessibility tools.
- **Ethical Framework Adoption:** Using the Framework for the Responsible Development and Use of Artificial Intelligence in Education to guide institutional policies and mitigate risks of bias and "metacognitive laziness".
- **Inclusive Development:** Ensuring that the development and deployment of AI training courses or even AI tools involve the active participation of people with disabilities to avoid the amplification of existing prejudices.

Ultimately, the goal is to transform the pedagogical landscape from one of consumption to one of critical production, ensuring that AI serves as a bridge rather than a barrier to equity and social justice in Vocational and Technological Education.
In this line, the work in progress is planning and developing a training seminar on AI tools for students with disabilities and a training unit on Artificial Intelligence for professionals from the University's Accessibility centres (also open to professors).
This study has limitations that should be acknowledged. The sample size (n=45), drawn through convenience sampling from a single institution, restricts the generalisability of the findings, and the timing of data collection, near the end of the academic term, may have affected response rates and depth of engagement. Future research should pursue larger and more diverse samples, incorporate a qualitative phase to deepen understanding of students' lived experiences, and explore comparative

studies across institutions and countries, such as between UFSM (Brazil) and IPB (Portugal), to assess the broader applicability of AI-driven accessibility initiatives in Vocational, Technological, and Higher Education.

An Online and Onsite Training for University Teachers' Professional Development: Methods and Data from the TED-SOEP Project

Alice Roffi[1], Claudia Baiata[2], Stefano Cuomo[3], Gabriele Biagini[4], Maria Ranieri[5]

[1,2,3,4,5]University of Florence, Italy

Abstract

STEM teaching in higher education is increasingly challenged by uneven student engagement, persistent learning gaps and the difficulty of supporting lecturers in the adoption of student-centred pedagogies. Within this scenario, the Erasmus+ project "Transforming STEM Teacher Education in South Africa through Self-Directed Open Educational Practices" (TED-SOEP) was designed to strengthen the teaching competences of South African university lecturers and professors by promoting the integration of Open Educational Resources (OER) and Open Educational Practices (OEP) within a self-directed learning perspective. This contribution presents the design features and the evaluation outcomes of the professional development pathway implemented by the University of Florence as part of the project. The pathway is structured as an integrated blended training, combining an online environment that supports flexible, self-paced exploration of innovative pedagogical strategies, and a five-day onsite experience that consolidates theoretical principles and contextualises them through collaborative design activities. The 4Ts game, a serious game developed at CNR-ITD, was adopted during the onsite phase to scaffold lecturers' co-design of new teaching scenarios. The training is articulated in five thematic modules dedicated, respectively, to OER and OEP, Inquiry-Based Learning, Problem-Based Learning, Simulations of real-world scenarios and Game-Based Learning. Quantitative and qualitative data collected from 325 online participants and 25 onsite participants from five South African universities show that the integrated design supported differentiated learning trajectories, fostered the appropriation of innovative tools and methods, and enabled high levels of engagement and participants' intention to transfer the practices into their teaching contexts. Beyond presenting evidence on training effectiveness, the paper argues that the integration of self-directed online learning, in-presence consolidation and gamified collaborative design constitutes a methodologically grounded model of professional development for STEM educators.

Keywords: *Open Educational Resources, Open Educational Practices, STEM, Higher Education, Self-Directed Learning, Blended Teacher Training, 4Ts Game.*

1. Introduction

Science, Technology, Engineering and Mathematics (STEM) higher education is currently navigating a phase of profound transformation. Universities worldwide are confronted with the simultaneous demand to widen access, sustain the quality of instruction, and align curricula with rapidly evolving disciplinary and societal needs [1]. In this scenario, lecturers are expected not only to transmit specialised knowledge, but also to design learning experiences that are inclusive, student-centred and capable of mobilising digital tools, real-world data and active learning strategies. Yet, several investigations indicate that the pace of pedagogical innovation among university teaching staff is slower than the rate of change required by these expectations, and that traditional, transmissive teaching still represents a default option in many STEM departments [2].

These tensions are particularly acute in South Africa, where higher education institutions face the dual challenge of redressing structural inequalities inherited from the past and renovating their pedagogical approaches in STEM disciplines. Persistent gaps in student engagement, in scientific literacy, and in the preparation of future teachers represent obstacles for the development of an inclusive scientific workforce. Recent literature has stressed the importance of investing in academic professional development as a lever for systemic change in STEM education and has highlighted the role of Open Educational Resources (OER) and Open Educational Practices (OEP) in promoting more accessible, flexible and collaborative teaching [2].

The Erasmus+ project "Transforming STEM Teacher Education in South Africa through Self-Directed Open Educational Practices" (TED-SOEP, ERASMUS-EDU-2024-CBHE-STRAND-1) responds

precisely to these challenges. The project gathers two European universities (University of Florence and Polytechnic Institute of Bragança) and five South African universities (North-West University, University of the Witwatersrand, University of Pretoria, Sol Plaatje University, and University of South Africa). Its overarching goal is to enhance the teaching competences of South African STEM lecturers, professors and pre- and in-service teachers through training experiences and tools centred on the integration of self-directed OEP and OER.

Within this consortium, the University of Florence designed and implemented a comprehensive professional development pathway, structured as a blended programme consisting of an online course and a five-day onsite training experience. The pathway is intentionally articulated to combine flexibility and depth: the online phase offers each participant the opportunity to engage with a structured corpus of resources at their own pace, while the onsite phase, hosted in Florence in May 2025, consolidates the theoretical groundwork through immersive workshops, expert-led sessions and collaborative design activities. A central feature of the onsite week is the use of the 4Ts game, a serious game developed by the Italian Institute for Educational Technology of the Italian National Research Council (CNR-ITD), conceived to support teachers in the conceptualisation of collaborative learning activities [3]. While the design and outcomes of the online course and of the onsite training have been documented separately in earlier contributions [4], [5], the present paper adopts a more integrative perspective. Its aim is to present the full training package as a unitary intervention, to discuss its rationale in light of the literature on self-directed learning, OER/OEP and teacher professional development, and to bring together quantitative and qualitative evidence emerging from the two phases. By doing so, the paper contributes to the discussion on how blended models can effectively support pedagogical change in STEM higher education, especially when knowledge transfer between different geographical and institutional contexts is at stake.

2. Theoretical Background

2.1 Self-Directed Learning and Open Education in STEM

Self-Directed Learning (SDL) has long been considered a foundational concept in adult education. According to Loeng [6], SDL designates a process in which learners progressively take ownership of their learning by identifying their own needs and goals, selecting strategies and resources to address them, and finally evaluating the outcomes of their efforts. In this perspective, the learner becomes the protagonist of the educational process, while the teacher plays a facilitative role, scaffolding autonomy rather than dispensing prescriptive content. Far from being limited to learners, this paradigm is also relevant for university lecturers themselves, who are increasingly expected to act as autonomous, reflective designers of their own teaching practice.

OER have emerged in recent decades as a powerful infrastructure to support such SDL processes. Defined as freely accessible learning materials that can be reused, adapted and shared, OER include textbooks, multimedia content, datasets, simulations and assessment instruments. Hilton [7], in a synthesis of empirical studies, reported that OER are associated with student outcomes that are equal to, or in some cases better than, those obtained with traditional commercial materials, while at the same time reducing economic barriers to access. The complementary notion of OEP broadens this perspective: it shifts the focus from artifacts to the pedagogical practices through which open resources are designed, integrated and re-elaborated within authentic teaching contexts.

In STEM higher education, OER and OEP are particularly promising. They allow lecturers to integrate up-to-date scientific content, interactive simulations, and inquiry-oriented activities, while preserving the flexibility needed to adapt materials to local contexts. Kleinschmit and colleagues [2] have documented how the development and dissemination of OER through linked communities of practice can act as a sustainable engine for STEM teaching reform, fostering both faculty professional growth and student engagement. At the same time, the long-term sustainability of OER initiatives remains a research topic in its own right: as Tlili et al. [8] point out, the integration of OER into the everyday fabric of teaching, research and community engagement is what ultimately makes openness viable beyond pilot projects.

2.2 Blended Models for Teacher Professional Development

A growing body of evidence suggests that blended models, combining online and in-presence components, are particularly effective for teacher professional development [9]. Synthesising qualitative research on the topic, scholars have identified key components of effective blended programmes, including the alignment between online and onsite activities, the explicit support for collaboration among

participants, the modelling of innovative teaching strategies and the provision of opportunities for transfer to participants' own classrooms [10].
Within blended programmes, the online component is particularly suited to address the diversity of the audience: participants typically vary in disciplinary background, prior experience with educational technologies and degree of familiarity with student-centred approaches. A modular, asynchronous environment can accommodate this heterogeneity by allowing each user to progress according to their starting point and goals. The onsite phase, in turn, offers an irreplaceable opportunity for situated learning, social interaction, and joint design with peers and experts, thereby compensating for the more individualistic nature of online study.

2.3 Collaborative Design and the 4Ts Game

A specific challenge in teacher professional development is to translate theoretical knowledge into concrete pedagogical decisions. To address this gap, several research groups have proposed structured tools and serious games that scaffold learning design processes. Among these, the 4Ts model and the related 4Ts game, developed at CNR-ITD, have been widely studied as instruments to support teachers in the conceptualisation of collaborative learning activities [3], [12]. The model identifies four interrelated dimensions: the Task that learners will undertake; the Time over which the activity unfolds; the Team configurations that organise students' work; and the Technology that mediates and supports the interaction. By making these dimensions explicit and inviting designers to negotiate them with their peers, the 4Ts framework operationalises learning design as a deliberate, evidence-informed activity.

3. Methodology

This section describes the design and the implementation of the training package. It first illustrates the underlying instructional architecture, before detailing the online and the onsite components, the role of the 4Ts game, the participants involved, and the evaluation procedures adopted in each phase.

3.1 Architecture of the Training Package

The TED-SOEP training package designed by the University of Florence is organised around five thematic modules, each focused on a teaching strategy considered particularly relevant for STEM higher education: (1) OER and OEP, (2) Inquiry-Based Learning (IBL), (3) Problem-Based Learning (PBL), (4) Simulation of real-world scenarios, and (5) Game-Based Learning (GBL). The same five modules are addressed both in the online course and in the onsite training, but with complementary emphases and methodologies. The online phase prioritises individual exploration, theoretical grounding and gradual application; the onsite phase prioritises consolidation, contextualisation in participants' disciplines and collaborative design.
This articulation reflects an intentional pedagogical choice. Rather than juxtaposing two separate experiences, the package is conceived as a continuum: the online environment activates prior knowledge and introduces the conceptual building blocks of each strategy, while the onsite week deepens these foundations through expert-led sessions, demonstrations from STEM disciplines, and structured design tasks. Together, the two phases enact the cycle of activation, demonstration, application, and integration that lies at the heart of Merrill's principles [11].

3.2 The Online Course

The online course is hosted on the project platform (https://www.tedsoep.org/TR_online.php) and is freely accessible to South African STEM lecturers, professors and pre- and in-service teachers. Each of the five modules follows a common four-phase structure inspired by Merrill's First Principles of Instruction: an Activation phase, which introduces the topic and stimulates motivation; a Documentation phase, which presents two video lessons supplemented by automatic subtitles, and written transcripts in order to accommodate different learning preferences; an Application phase, which suggests interactive platforms and digital tools that can be used by lecturers and their students to design or carry out activities; and an Integration phase, which synthesizes the key contents and offers self-evaluation checklists. Each module is composed of a five-item multiple-choice test, administered before and after the learning activities, allowing participants to monitor their own progress and provides the research team with quantitative indicators of skills acquisition.

The five tests are aligned with the specific learning objectives of each module. For instance, in Module 1 participants are asked to recognise the criteria that allow the quality of OER to be evaluated; in Module 2 they reflect on the goals of the conceptualisation phase of inquiry-based activities; in Module 3 they identify the role of the teacher within problem-based scenarios; in Module 4 they discuss the skills that simulations can foster in STEM; in Module 5 they consider the alignment between game-based learning and the goals of higher education. Through the entire course, the design embraces a self-directed perspective: learners can navigate modules in different orders, revisit content asynchronously, and integrate the suggested applications into their own professional reality.

3.3 The Onsite Training

The onsite training, titled “Innovative STEM Teaching in Higher Education: from Theory to Action”, was held in Florence from 26 to 30 May 2025. It was organised over five working days, with each day dedicated to one of the five thematic modules, and articulated into a morning and an afternoon session. The mornings hosted expert-led lectures, demonstrations and example analysis delivered by professors, researchers and research fellows of the University of Florence active in different STEM areas. The presentations illustrated concrete applications of each strategy in real disciplinary contexts: for example, the integration of artificial intelligence in the design of OER; the use of LEGO-based hands-on tasks to support inquiry-based learning in engineering; the simulation of complex systems through NetLogo for game-based learning; the deployment of 360-degree video in agricultural studies; and the implementation of problem-based scenarios with the support of digital technologies.
The afternoons were dedicated to collaborative workshops in which participants, organised in small groups, were invited to design new STEM teaching activities through the 4Ts game framework [3]. Each group worked iteratively on the four dimensions of Task, Time, Team, and Technology, transforming the theoretical inputs of the morning into concrete teaching scenarios that could be deployed in their home institutions. The game served as both a scaffold for design decisions and as a shared language across participants of different STEM disciplines, supporting the negotiation of pedagogical choices and the exchange of expertise.

3.4 Participants

A total of 325 South African professors, lecturers, pre-service and in-service STEM teachers completed the online course. According to their pre-test scores in each module, they were grouped into three profiles to allow a more nuanced analysis of the impact of the training: Low-skills users (0–2 correct answers, with limited or no prior knowledge), Medium-skills users (3–4 correct answers, with moderate prior knowledge or experience), and High-skills users (5 correct answers, with consolidated prior knowledge). This profiling acknowledges the heterogeneity of the audience and supports the interpretation of pre/post variations in light of different starting points.
The onsite training in Florence involved 25 university lecturers from the five South African partner universities, with five participants per institution. Their academic profiles ranged from Lecturers (14) and Senior Lecturers (7) to Associate Professors (3) and Full Professors (1); two of them held additional roles as Directors or Deputy Directors of their Department. The disciplinary backgrounds were equally distributed across Mathematics education (28%), Science education – including natural science, life science and chemistry education (28%), Technology education (28%), with the remaining 16% spread across Computer education, Physics, early science and Mathematics education, and teacher education. This composition deliberately mirrors the variety of fields that compose STEM in higher education and feeds the project's ambition to disseminate good practices broadly.

3.5 Evaluation Procedures

The two phases of the training were monitored through complementary evaluation strategies. The online course used pre/post multiple-choice tests at module level: each test consisted of five closed-ended items aligned with the module's learning objectives. The variation between pre- and post-test scores was interpreted differently depending on the user profile: as a learning gain for Low- and Medium-skills users, and as a consolidation of prior knowledge for High-skills users.
At the end of the onsite training, participants completed a satisfaction questionnaire articulated in five dimensions, each rated on a 1–10 scale: (i) relevance of the training contents, (ii) effectiveness of the teaching methodology, (iii) accessibility of the didactical resources, (iv) clarity of the training contents, and (v) competence of the trainers. The questionnaire also included open-ended fields, where

participants could elaborate on what they considered most valuable, what could be improved and how they intended to use the experience in their own work.

4. Results

4.1 Outcomes of the Online Course

The analysis of pre- and post-test scores in the online course highlights a positive impact on participants' competences, with patterns that vary across the three user profiles. Low-skills users show consistent improvements across all five modules: their average pre-test scores, ranging from 1.3 to 1.7 correct answers, rise to post-test averages between 3.5 and 4.3. The largest gain is observed in Module 1, dedicated to OER, where the mean increases from 1.5 to 4.0, and in Module 5, on Game-Based Learning, where the mean rises from 1.6 to 4.3. Medium-skills users show more contained but still discernible improvements, generally moving from average scores around 3.5–3.7 to post-test means between 4.0 and 4.4; the only exception is Module 4 on simulations, where the variation is marginal (from 3.6 to 3.7). High-skills users, who already obtained the maximum score in the pre-test, tend to confirm their performance in the post-test, signalling a consolidation rather than a learning gain.
These trends are reinforced when the focus shifts from group to the proportion of users who improved (or maintained the maximum) between pre- and post-test, as summarised in Table 1. The percentage of Low-skills users who increased their correct answers exceeded 80% in four modules out of five, peaking at 93% in the OER module. Among Medium-skills users, the proportion of participants who improved their scores ranges from 51% (Module 4, Simulations) to 72% (Module 3, PBL). High-skills users maintain the maximum score in 79% to 86% of cases, depending on the module. Taken together, these results indicate that the online course supported differentiated learning trajectories: bridging gaps for less experienced users, refining knowledge for intermediate ones, and consolidating expertise for advanced participants.

Table 1. Percentage of online course participants who improved or consolidated their performance, by user profile and module.

Profile / Indicator	Mod 1 OER	Mod 2 IBL	Mod 3 PBL	Mod 4 SIM	Mod 5 GBL
Low-skills users (% improving)	93%	84%	75%	85%	92%
Medium-skills users (% improving)	64%	64%	72%	51%	62%
High-skills users (% maintaining max score)	84%	83%	84%	86%	79%

The marked variation between Module 4 (Simulations) and the other modules among Medium-skills users deserves particular attention. The smaller gain may be related to the intrinsic complexity of simulation-based teaching, which requires the integration of disciplinary content, technological tools and reflection on cognitive processes. It also resonates with feedback collected during the onsite phase, which suggested that the simulation module would benefit from additional space for case-based discussion and from more practical examples drawn from participants' own disciplines.

4.2 Outcomes of the Onsite Training

Engagement during the five-day onsite training was high. Participants attended morning and afternoon sessions consistently and contributed actively to discussions and design tasks. The satisfaction questionnaire confirmed a very positive perception of the experience. The dimension that received the highest score was “competence of the trainers”, with an average of 9.2/10, signaling appreciation for the involvement of professors and researchers from different STEM areas. Relevance and clarity of contents were rated 8.6 and 8.5 respectively, while effectiveness of the teaching methodology and accessibility of the resources received 8.2 and 8.1. The overall mean score across the five dimensions was 8.5/10. Table 2 summarizes these results.

Table 2. Average scores attributed by onsite participants to each dimension of evaluation.

Dimension of evaluation	Mean score (1–10)
Relevance of the training contents	8.6
Effectiveness of the teaching methodology	8.2
Accessibility of the didactical resources	8.1
Clarity of the training contents	8.5
Competence of the trainers	9.2
Overall average	**8.5**

Beyond the quantitative ratings, the qualitative answers provided by participants offer a richer picture of the perceived value of the experience. Three thematic clusters emerged consistently. The first cluster concerns the discovery of new digital tools, with particular emphasis on artificial intelligence applications, simulation environments and AI-supported creation of OER. Approximately eleven respondents out of twenty-five made explicit reference to this dimension, mentioning the intention to integrate the new tools into their teaching practice as soon as they returned home. The second cluster concerns the appropriation of innovative teaching strategies. Several participants stressed the value of being exposed to different active-learning approaches and indicated that they would translate them into modules for pre-service teacher education at their universities. The third cluster concerns the perceived expertise of the trainers and the multidisciplinary nature of the offer, which several respondents associated with the variety of perspectives proposed across the five days.

An additional aspect worth highlighting is the dual orientation towards teaching and research, that participants attributed to the experience. A subset of respondents reported that the training was inspirational not only for their classroom practice, but also for their research agenda, suggesting potential collaborations with European partners and stimulating new lines of inquiry. The collaborative climate of the workshops, supported by the 4Ts game and by the constant interaction between trainers and trainees, was likewise mentioned as a factor that strengthened the learning experience and that fostered a sense of community among participants from different institutions.

Critical observations were limited but informative. A few respondents noted that the overall duration of the training was demanding, given the density of contents addressed every day. Others suggested that more space could be allocated for participants to share their own experiences and to discuss how each strategy could be adapted to their local contexts. Some participants asked for additional practical examples in specific modules, in line with the more limited gains observed in the simulation module of the online course.

5. Discussion

The integrated reading of the online and onsite phases offers several insights for the design of professional development programmes for STEM higher education. A first point concerns the complementarity of the two components. The online course supported a flexible, self-paced exploration of the five strategies and demonstrated the ability to address users with very different starting points, providing measurable gains. The onsite training, in turn, situated these contents within concrete disciplinary practices, gave space to peer interaction and modelled how innovative strategies are negotiated, refined and adapted to specific teaching contexts.

A second point concerns the role of the 4Ts game. The game enabled participants to translate the morning lectures into structured design exercises, providing shared vocabulary across very different disciplinary backgrounds and supporting the kind of conceptualisation work that is at the core of effective learning design [3], [12]. From a methodological standpoint, the systematic use of the 4Ts framework across the five thematic days produced a recognisable pattern of activity – input, design, refinement, sharing – that contributed to the perceived coherence of the week. The high score attributed to the competence of trainers and to the clarity of contents is consistent with this interpretation: the game offered a robust scaffold within which trainers' expertise could be effectively channelled into design-oriented tasks.

A third point concerns the alignment of the package with the principles of self-directed learning. By offering modular online materials, embedded self-evaluation, and the possibility for participants to revisit content according to their needs, the online course is consistent with the SDL perspective described by

Loeng [6]. The onsite phase complements this by promoting self-directed micro-decisions within the design tasks: participants negotiate task complexity, technology choices and team configurations as a function of the contexts they will eventually return to. In this sense, the package not only teaches innovative pedagogical strategies, but also models a self-directed approach to professional development, in line with Kleinschmit and colleagues' [2] argument about communities of practice as drivers of sustainable change in STEM education.

A fourth point relates to the broader transferability of the model. TED-SOEP is built around the explicit ambition of facilitating the circulation of expertise between European and South African universities. The trained lecturers and professors, in turn, were expected to act as multipliers within their own institutions through national workshops, reaching additional colleagues, and progressively diffusing the practices acquired in Florence. The intention to apply the methods, repeatedly expressed in the qualitative answers, suggests that this multiplier function is plausible. At the same time, the suggestions for additional spaces of experience-sharing and for further practical examples reinforce the importance of explicitly designing for adaptation: when programmes are intended to circulate across very different cultural and institutional contexts, opportunities for participants to recontextualise contents are not optional features, but constitutive components of the design.

Some limitations need to be acknowledged. The evaluation strategies adopted in the two phases are different in nature: the online course relied on multiple-choice tests aligned with module learning objectives, while the onsite training was assessed through a satisfaction questionnaire and qualitative comments. While the two perspectives are complementary, they do not allow a direct comparison of skills acquisition between phases. In addition, the empirical evidence collected so far focuses on participants' immediate reactions and on short-term changes in declarative knowledge; medium- and long-term effects, including the actual implementation of the strategies in participants' classrooms, will need to be investigated in subsequent project activities. Finally, the analysis of qualitative data was based on a relatively small number of respondents and identified recurring themes rather than statistically robust patterns; further data collection during the national workshops will help to refine these findings.

It is also worth noting that the integration of the 4Ts game with the five thematic modules helped to mitigate a recurrent risk in teacher education programmes, namely the gap between exposure to innovative content and its actual translation into classroom practice. By systematically requiring participants to design new activities at the end of each daily session, the workshops produced concrete artifacts that could be discussed, refined and shared among groups. This rhythm – input, design, refinement, sharing – contributed to a culture of evidence-informed pedagogical decision-making which is consistent with the broader objectives of the TED-SOEP project and with the literature on linked communities of practice in STEM education [2].

6. Conclusions

This paper presented the integrated training package designed by the University of Florence within the TED-SOEP project, with the goal of strengthening STEM teaching competences among South African higher education lecturers and professors. The package combines an online course, organised in five modules and grounded in Merrill's First Principles of Instruction, with a five-day onsite training in Florence that consolidates contents through expert-led sessions and gamified design workshops based on the 4Ts framework. The two phases share the same conceptual scaffolding – the five themes of OER and OEP, Inquiry-Based Learning, Problem-Based Learning, Simulations and Game-Based Learning – but mobilise different methodological resources to address them.

Quantitative and qualitative evidence indicates that the package supported differentiated learning pathways. The online course produced measurable gains for less experienced users, more contained but visible improvements for intermediate users and consolidation effects for advanced participants. The onsite training was rated very positively across all dimensions of evaluation, with particular appreciation for the competence of the trainers, the relevance and clarity of the contents, and the opportunity to engage with innovative tools and methods within a collaborative environment. Participants explicitly indicated their intention to transfer the acquired strategies to their own classrooms and, in some cases, to their research practice.

Beyond its specific outcomes, the experience suggests that integrated blended designs that combine online SDL, in-presence consolidation and gamified collaborative design can constitute a viable model of professional development for STEM educators. Future iterations of the package will benefit from the suggestions emerged during the evaluation: more space for sharing participants' experiences, additional practical examples in selected modules, and refined strategies for follow-up beyond the training week.

As the project moves forward, the lessons learnt within TED-SOEP can inform similar initiatives where pedagogical innovation needs to travel between higher education institutions, disciplines and geographical contexts, while preserving the autonomy and the contextual sensitivity of the lecturers it aims to support.

Prompting Disciplinary Literacy: A Case Study of Gen AI as a Scaffold for Specialized Text Production in Environmental Studies

Francesca Ripamonti

University of Milan; Liceo Scientifico "G. Gandini", Italy

Abstract

This study explores the integration of Generative Artificial Intelligence (GenAI) as a pedagogical tool to support undergraduates in the bachelor's degree in Human Sciences of Environment, Landscape, and Territory in understanding and producing specialized disciplinary texts in English. Since the course syllabus combines geography, anthropology, environmental studies, and spatial planning, students often encounter difficulties with the linguistic and rhetorical conventions required for academic and professional communication. To address these challenges, a semester-long intervention based on prompt engineering and iterative co-writing with GenAI tools (e.g., ChatGPT-4 and CoPilot 365) was implemented with 42 second-year students. Through scaffolded workshops, students learned to create discipline-informed prompts, analyse model texts, identify specialized lexicon and syntactic patterns, and critically revise AI-generated outputs. Qualitative and quantitative analyses of writing samples, students' reflections and assessed final tasks, demonstrated notable improvements in terminology precision, argumentative organisation, genre awareness, and confidence in using academic English within disciplinary contexts. Enhanced metalinguistic awareness reflected students' ability to apply appropriate rhetorical and lexical-grammatical strategies to disciplinary communication. The preliminary findings suggest that GenAI can function as a collaborative mediator in disciplinary writing development, providing a replicable framework for integrating AI into EMI (English as a Medium of Instruction) contexts through prompt literacy and critical revision practices.

Keywords: *Generative Artificial Intelligence (GenAI); EMI (English as a Medium of Instruction); Specialized literacy; Prompt engineering*

1. Introduction

Generative AI tools can support undergraduates who struggle with academic discourse and specialized terminology by making language patterns more visible and manageable. Rather than automating learning, these tools scaffold it, helping students focus on structure, register, and rhetorical conventions that are often difficult to grasp through analysis alone. As Hyland argues, "academic writing is as much about rhetorical control as linguistic accuracy" (Hyland, 2004, p.134), while Flowerdew observes that "learners benefit from guided exposure to disciplinary discourse" (Flowerdew, 2015, p.15). Thus, GenAI acts as a cognitive and linguistic aid, enabling students to engage more confidently with academic language without replacing the learning process itself.

2. Background

The present study was conducted with a group of 42 second-year undergraduates enrolled in a Bachelor's degree in Human Sciences at the Faculty of Human Sciences of Environment, Landscape and Territory, University of Milan, Italy. The participants were attending an English for Academic Purposes (EAP) mandatory course (40 hours; 4 CFU) and an English for Specific Purposes (ESP) elective workshop (20 hours; 2 CFU) during the first and second semesters of the 2024/2025 academic year. All participants had an assessed language proficiency at B2 level (CEFR), which provided a sufficiently advanced baseline for engagement with complex academic and disciplinary texts and with AI-mediated language tasks. Both the EAP and ESP components were conceived as semester-long programmes aimed at fostering students' production and comprehension of academic and discipline-specific texts within the broader field of environmental sciences. The EAP course focused primarily on academic literacy practices such as reading research articles, synthesising sources, and producing structured written assignments, while the ESP workshop concentrated on the linguistic and genre features of professional and disciplinary communication relevant to environment, landscape, and territory studies. These parallel strands created a rich context for observing how students struggle with

both general academic conventions and the more specific discourse practices related to the environmental disciplines, and also how, conversely, they manage to negotiate academic and disciplinary discourse when supported by both traditional and AI-mediated scaffolding.

3. Learning Challenges and Research Questions

3.1 Environmental Studies' Interdisciplinary Demands

The Bachelor's degree in Human Sciences of Environment, Landscape, and Territory positions undergraduates at a complex intellectual crossroads, integrating the contents of geography, anthropology, environmental studies, and spatial planning within a single degree course. This convergence forces students to simultaneously navigate each disciplinary constituent. Spatial planning alone, for instance, interfaces with institutionalist theory, critical discourse analysis, and policy-oriented argumentation to examine how environmental narratives are embedded in territorial governance. Preparing students to operate within this multidisciplinary field, therefore, requires more than subject-matter competence; it demands an awareness of how knowledge is constructed and communicated across disciplinary boundaries.

3.2 EAP-ESP Communication Complexity

The interdisciplinary nature of the degree program creates a complex set of communication requirements in academic English and English for Specific Purposes (EAP/ESP). Students are expected to produce texts that simultaneously integrate technical vocabulary derived from environmental and land-use sciences with interpretive writing in line with the rhetorical conventions of urban and regional planning documentation. As research on ESP writing consistently demonstrates, the difficulty lies not only in linguistic accuracy but in mastering the discipline-specific conventions, styles, and genre structures that constitute credible academic discourse within each field (Hyland, 2022, p. 202). Genre-based studies confirm that even advanced L2 writers struggle with the organisational and stylistic dimensions of disciplinary writing when these features are not made explicit through targeted instruction. The resulting communicative burden is particularly heavy in programs that span multiple disciplines, where no single genre framework can serve as a stable reference point.

3.3 Linguistic Barriers

Students enrolled in the Environmental degree program face a dual acquisition challenge: they must build domain-specific content knowledge while simultaneously developing the specialised English register through which that knowledge must be communicated. This accounts for three interrelated areas of linguistic difficulty: terminological precision in environmental discourse, rhetorical conventions governing territorial analysis and genre awareness in policy-oriented writing. These barriers point to a fundamental gap between conceptual understanding and discursive competence that standard content-area instruction rarely addresses and, EFL students frequently grasp.

3.4 Learning Objectives and Research Questions

The three convergent pressures described above -interdisciplinary cognitive demand, multi-genre communicative expectations, and layered linguistic barriers- together generated a critical pedagogical problem. Students in Human Sciences programs may demonstrate conceptual grasp of environmental, territorial, and anthropological content, yet lack the discourse resources to materialize that understanding in academic specialised English. This gap between content knowledge and discursive performance constitutes the epistemic core of the present study.

A growing body of research suggests that Generative Artificial Intelligence (GenAI) tools, when integrated into structured pedagogical contexts rather than used simply as writing aids, can serve as interactive mediators for the development of disciplinary writing (Barrot, 2023, p. 2). Furthermore, improved writing outcomes have been documented when students engage in recursive and iterative interaction with AI tools, rather than using them simply as editorial assistants, with the most significant effects emerging when AI support is combined with self-paced learning strategies. Research specifically in EAP (English for Academic Purposes) contexts (Barrot, p. 4) also demonstrates that prompt-guided GenAI use fosters awareness of text genre and academic register. This positions GenAI as a pedagogical mediator capable of supporting the transition from implicit content knowledge to explicit

discursive performance, a function of fundamental importance in the context of the degree program under consideration.
Against this backdrop, the present study is framed by four research questions that target the most critical and underexplored dimensions of disciplinary ESP/EAP writing for students in Human Sciences of Environment, Landscape, and Territory:
RQ1 — *Terminology*: How accurately can students deploy environment-specific terminology in ESP/EAP written discourse?;RQ2 — *Rhetorical Conventions:* To what extent can students master the rhetorical conventions of territorial analysis in academic English?; RQ3 — *Argumentation & Genre*: How effectively can students construct genre-appropriate argumentative structures in urban policy writing?; RQ4 — *GenAI as Mediator:* Can GenAI function as a pedagogical mediator for specialised disciplinary writing?
Therefore, the learning goals of this study addressed the four dimensions of L2 academic writing:
1) to implement the academic vocabulary gap in advanced EFL learners within environmental science;
2) to face the rhetorical hurdles caused by cross-linguistic and disciplinary differences in argumentation;
3) to foster the students' ability to produce genre-appropriate, policy-oriented urban planning texts; and
4) to introduce the potential of GenAI to mediate and bridge the gap between conceptual understanding and academic discursive competence.

4. Pedagogical and Theoretical Framework

4.1 CALP and the Academic Language Horizon

The communication difficulties described in the previous sections cannot be adequately addressed with interventions that treat the language difficulty as a superficial grammatical problem. Cummins's (1981) fundamental distinction between basic interpersonal communication skills (BICS) and cognitive academic language competence (CALP) provides an essential diagnostic framework for understanding the depth of the difficulty. While BICS -the conversational, contextualized register of everyday interaction - typically develops within two years of exposure to a new language, CALP operates at an entirely different cognitive level: it is abstract, context-free, and requires the simultaneous use of specialized vocabulary, complex reasoning, and discipline-specific modes of expression. It is crucial to emphasize that Cummins's model consistently demonstrates that the full development of CALP requires five to seven years of sustained academic exposure and that students may display apparent oral fluency while remaining significantly unprepared for the cognitive and discursive demands of academic writing. For students in the Bachelor's Degree in Human Sciences of the Environment, Landscape, and Territories, who must simultaneously navigate the CALP registers of geography, anthropology, environmental policy, and territorial planning, and do so in English as a second language, the developmental gap between communicative competence and mastery of academic discourse is therefore both structurally predictable and practically urgent.

4.2 Scaffolding and the Zone of Proximal Development

If CALP theory identifies the nature and depth of the linguistic challenge, Vygotsky's (Chaiklin, 2003) framework offers the primary pedagogical response through the interconnected concepts of the Zone of Proximal Development (ZPD) and scaffolding. The ZPD designates the productive space between what a learner can accomplish independently and what becomes achievable through structured interaction with a more knowledgeable interlocutor -a space in which, according to Vygotsky, the most meaningful learning occurs-. Scaffolding translates ZPD theory pedagogically: it refers to the temporary, calibrated support (such as pre-teaching specialised vocabulary, providing visual organisers, modelling analytical moves, and supplying sentence frames) that allows learners to engage successfully with tasks that lie beyond their current independent capacity. Critically, the scaffold is not permanent: as students become more proficient, the scaffold is gradually removed, ensuring that support fosters independence rather than dependence. In the present study context, scaffolded instruction targets the three most demanding registers of disciplinary English for students: terminological precision in environmental discourse, the rhetorical conventions of territorial analysis, and the genre-appropriate argumentative structures of urban policy writing, each requiring distinct lexical, syntactic, and organisational scaffolds to activate productive performance within the ZPD.

4.3 GenAI Prompt Engineering as Collaborative Scaffold

The emergence of Generative AI as a pedagogical resource represented a significant extension of the scaffolding theory into technologically mediated learning environments, enabling forms of iterative, responsive support that were previously difficult to achieve at scale in disciplinary writing instruction. In our framework, GenAI was not conceived as an autonomous writing aid or a replacement for discursive agency, but as a collaborative interlocutor supporting noticing, drafting, and revising: the three recursive processes through which writers develop awareness of genre conventions, lexical choices, and rhetorical organisation. Prompt engineering, the practice of designing structured, purposeful instructions that guide GenAI outputs toward disciplinary norms, thus functioned as a metacognitive scaffold in its own right: it required students to make explicit decisions about register, genre, audience, and argumentative stance before engaging with AI-generated responses, thereby activating the higher-order thinking that defines CALP. A semester-long intervention integrating prompt engineering and iterative co-writing with GenAI tools in a BA in Human Sciences of Environment, Landscape, and Territory programme produced measurable improvements in "terminology precision, argumentative organisation, genre awareness, and confidence in using academic English within disciplinary contexts," as well as enhanced metalinguistic awareness in students' deployment of rhetorical and lexical-grammatical strategies. These findings confirm that GenAI, when embedded within a principled scaffolding framework aligned with ZPD theory and CALP developmental targets, can function as a collaborative mediator in disciplinary writing development.

5. Methodology

The proposed methodology adopts a genre-based, GenAI-integrated pedagogical framework designed to systematically develop students' English for Specific Purposes (ESP) competence. This approach is structured across four interconnected phases—Learning, Scaffolding, Production, and Evaluation—culminating in targeted follow-up activities that prepare students for multimodal academic assessments.

5.1 Learning: Developing GenAI Prompt Literacy

The foundational phase focuses on cultivating students' GenAI prompt literacy, transforming them from passive consumers of AI output into active, strategic users of the technology. Students are explicitly taught how to craft precise prompts that require them to first identify and articulate core components of academic communication, including communicative purpose, target audience, genre conventions, and relevant disciplinary terminology. By engaging with GenAI agents in this analytical capacity, learners develop a metacognitive awareness of how disciplinary communication is structured. This phase ensures that students understand the underlying rhetorical patterns of their field before attempting to generate or manipulate text, thereby grounding their AI interactions in sound pedagogical principles rather than mere text generation.

5.2 Scaffolding: Deconstruction and Noticing through GenAI

Building on this foundational literacy, the scaffolding phase employs GenAI as a dynamic discourse analysis tool to facilitate the "noticing" of key linguistic and rhetorical features. Students are guided to deconstruct authentic, discipline-specific model texts with the assistance of GenAI prompts designed to highlight specific elements. Through this collaborative deconstruction, learners systematically identify and analyse rhetorical moves, specialized lexicon, discipline-specific collocations, and pragmatic hedging patterns. This structured noticing process makes the implicit conventions of academic writing explicit, providing students with a clear, analysable blueprint of the target discourse before they are expected to produce it themselves.

5.3 Production: Iterative GenAI Co-writing

The production phase shifts the focus from analysis to active creation through iterative, collaborative co-writing. Rather than relying on GenAI to produce finished drafts, students engage in continuous refinement cycles characterized by active human-machine interaction. Students draft sections of their ESP texts and then use GenAI to critique, suggest structural improvements, or propose lexical enhancements. This cyclical process of drafting, prompting, evaluating, and revising fosters a collaborative writing environment. It encourages students to maintain authorial agency while leveraging

AI to push the boundaries of their linguistic and rhetorical competence, ultimately leading to more sophisticated and polished academic texts.

5.4 Evaluation: Critical Review and Human-in-the-Loop

Integral to this methodology is the evaluation phase, which emphasizes critical digital literacy and the "human-in-the-loop" paradigm. Students are trained to critically review and audit AI-generated or AI-assisted outputs for stylistic accuracy, disciplinary reliability, and academic integrity. This involves cross-referencing AI suggestions with authentic corpus data or course materials to

6. Classroom Practices

These examples illustrate how GenAI can be employed in various stages of Specialized Language Learning (ESP), providing concrete support to students, particularly in the context of environmental and territorial studies.

6.1 Terminological Expansion and Context

Scenario: A student encounters a technical term in a specialized text and needs to understand its nuances and usage in different disciplinary contexts. Example of Interaction with GenAI:
Student Prompt: "Explain the term '*ecological resilience*' in an urban planning context, providing 3-4 related synonyms or concepts and an example sentence where it is used correctly in a technical report".
GenAI Output (synthesized): "*Ecological resilience in urban planning refers to the capacity of an urban ecosystem to absorb disturbances and reorganize while essentially retaining the same function, structure, identity, and feedback. It's not just about returning to the original state, but about adapting and persisting"*. Pedagogical Value: This example shows how GenAI can act as a dynamic and contextualized glossary, helping students build a richer specialized vocabulary and understand the pragmatic use of terms.

6.2 Re-phrasing and Register Adjustment

Scenario: A student has written a paragraph with overly informal or generic language and needs to elevate its register to make it suitable for an academic or professional audience. Example of Interaction with GenAI:
Student Prompt: "Rewrite the following paragraph in a more formal and academic tone, suitable for a scientific publication in the field of human geography. Avoid colloquialisms and use more precise language: 'People are moving from the countryside to cities too much, and this creates a lot of problems for the environment and how we live". GenAI Output (synthesized): "'*The current trend of demographic migration from rural areas to urban centres is generating complex socio-environmental impacts. Such accelerated urbanization raises critical issues related to ecological sustainability and the quality of life in metropolitan areas*". Pedagogical Value: AI helps students practice rephrasing, a key skill in ESP, allowing them to compare their own style with academic style and identify lexical and syntactic differences.

6.3 Comparative Analysis of Model Texts

Scenario: Students need to understand the rhetorical and structural conventions of different specialized text genres (e.g., technical report vs. research article). Example of Interaction with GenAI:
Student Prompt: "Compare the typical structure and linguistic characteristics of an 'Environmental Impact Assessment (EIA) Report' and a 'Research Article on Landscape Ecology'. Highlight the differences in terms of purpose, audience, use of verb tenses, and presence of specific sections (e.g., methodology, recommendations)". GenAI Output (synthesized): • "*EIA Report: Practical/ decision-making purpose, mixed audience (stakeholders, decision-makers), predominant use of present and future tenses for recommendations, key sections: project description, impact analysis, mitigation measures, conclusions, and recommendations. Prescriptive language"*. *Research Article: Informative/theoretical purpose, academic audience, predominant use of past tense for methodology and results, key sections: introduction, literature review, methodology, results, discussion, conclusion. Analytical and objective language".* Pedagogical Value: GenAI facilitates textual genre analysis, a

fundamental aspect of ESP, enabling students to internalize the expectations of different professional communicative contexts.

6.4 Hypothesis Generation and Terminological Brainstorming

Scenario: A student is starting a research project and needs ideas for possible hypotheses or a brainstorming of key terms for a specific topic. Example of Interaction with GenAI:
Student Prompt: "I am an environmental science student preparing a project on plastic waste management in coastal areas. Generate 5 possible research hypotheses and a list of 10-15 key terms I should consider for my research". GenAI Output (synthesized): *"Research Hypotheses:1.1 The implementation of circular economy programs significantly reduces the accumulation of microplastics on urban beaches. 1.2 Public awareness of marine plastic risks is directly correlated with the adoption of waste reduction behaviours among coastal residents. Key Terms: micro-plastics, macro-plastics, marine pollution, circular economy, coastal waste management, ecotoxicology, bioaccumulation, single-use plastic directive, citizen science, upcycling, biodegradation, anthropogenic impact, sensitive coastal zones".* Pedagogical Value: AI acts as a brainstorming partner, stimulating creativity and providing a structured starting point for research, including relevant terminology for the field.

7. Final Assignments and Rubric

Student practice is structured around targeted online activities (*e-tivities*) designed to build and test foundational academic and professional competencies. The first e-tivity requires students to analyze and describe charts, graphs, and diagrams, compelling them to utilize formal academic vocabulary and integrate reliable sources. This task is specifically designed to hone their data interpretation and academic writing skills. The second e-tivity involves the creation of a professional e-portfolio. In this activity, students must effectively present their academic achievements, developed skills, and personal interests, thereby fostering digital literacy and professional self-presentation in a modern academic context. Building upon these foundational skills, students are tasked with compiling a comprehensive academic research project on a topic of their choice. This project must strictly adhere to established academic conventions, encompassing essential components such as an abstract, methodology, literature review, data analysis, and findings. To complement the written document, students are also required to deliver a visual presentation of their research. This assignment must align with academic design conventions, paying careful attention to appropriate font choices, text size, cohesive colour schemes, and the strategic, professional use of images to enhance clarity and audience engagement.
The evaluation of these assignments is guided by a comprehensive rubric that emphasizes both academic rigor and the strategic, transparent integration of Generative AI. Assessors will evaluate the presence of identifiable research project moves and specialized discourse, alongside the effective application of academic and technical language. A key criterion is the effective use of GenAI prompting to scaffold specialized register and language, with the prompting process required to be openly visualized. Furthermore, students are assessed on their ability to communicate their results effectively and their conscious, ethical use of safe and free GenAI tools to successfully meet their linguistic and academic objectives.

8. Findings

The findings from this GenAI-integrated ESP initiative reveal substantial quantitative and qualitative gains in student performance, validating the effectiveness of the pedagogical approach. Most notably, there was a significant improvement in terminology precision, with students demonstrating a marked enhancement in their accurate and confident usage of domain-specific vocabulary. This lexical growth was directly facilitated by targeted GenAI prompting, which allowed learners to iteratively refine their word choices. Furthermore, students exhibited an enhanced argumentative structure, particularly in the organization of complex territorial analyses. The scaffolding provided by AI tools helped them logically sequence their methodology, data, and findings, resulting in more coherent, rigorous, and professionally structured academic arguments. Beyond structural and lexical improvements, the intervention fostered profound stylistic and cognitive developments. Students displayed heightened genre awareness, evidencing a clear and effective distinction between the formal conventions of academic research and the pragmatic, persuasive styles required for professional communication, such as in their e-portfolios. This was closely linked to significant metalinguistic growth; learners developed an increased ability to critically evaluate and explicitly justify their linguistic choices based on specific disciplinary standards.

Rather than passively accepting AI-generated text, students actively engaged in critical revision, consciously articulating why certain registers or terminologies were appropriate for their specific academic or professional audiences.
Ultimately, these results underscore the efficacy of positioning GenAI not merely as a text generator, but as a dynamic mediator in ESP learning. By transparently visualizing the prompting process and emphasizing the conscious, ethical use of safe tools, the curriculum successfully cultivated autonomous and critically aware learners. The combined quantitative and qualitative gains confirm that when GenAI is strategically integrated alongside clear rubrics and deliberate scaffolding, it significantly elevates students' mastery of specialized discourse, thoroughly preparing them for the rigorous demands of both academic research and professional practice.

9. Conclusions

Ultimately, the true power of Generative AI in English for Specific Purposes lies not in its ability to produce flawless text, but in its capacity to illuminate the hidden mechanics of specialized discourse. When educators thoughtfully weave together prompt literacy, rigorous discourse analysis, and reflective revision, the Large Language Model transcends its role as a mere text generator. Instead, it emerges as a dynamic mediator of disciplinary meaning—a collaborative, interactive partner that helps students decode, experiment with, and master the intricate conventions of their specific fields.
This represents a profound paradigm shift in language education. The core educational value of GenAI does not reside in automating or replacing student writing, but in rendering the writing process radically more visible and profoundly more teachable. By externalizing the cognitive steps of drafting, refining, and justifying linguistic choices, AI tools transform abstract writing rules into tangible, hands-on learning moments. Students are empowered to move beyond passive consumption of language, becoming active, critical architects of their own academic and professional voices.
In conclusion, embracing GenAI in the ESP classroom requires a deliberate commitment to pedagogy over mere convenience. By championing transparent prompting and critical engagement, educators can harness these technologies to foster deep metalinguistic awareness and authentic genre mastery. As we look to the future of language teaching, our goal remains clear: to equip learners not just with the ready-made answers an AI can provide, but with the critical literacy to question, refine, and ultimately own the specialized discourse that will define their future careers.

Language Teaching and Learning

The Future of Rhetoric in Public Speaking: L2 Education

Richard Miles

Nanzan University, Japan

Abstract

Existing research on the rhetoric used in English-language speeches by Japanese activists is rare. Nevertheless, exploring the techniques which contribute to effective public discourse is vital to empowering Japanese speakers as they seek to disseminate their messages to a global audience. Therefore, this study conducts a rhetorical analysis of speeches by recent Japanese gender equality activists. A qualitative research design with descriptive data was employed, and the study was framed by the key research question: What are the rhetorical techniques and message-framing approaches utilized by Japanese gender equality activists? Speech transcripts from five Japanese TED Talk presenters were analyzed in two stages using MAXQDA 2020 software. Firstly, established rhetorical language techniques were identified and coded in the transcripts by using a modified version of the University of Kentucky's official glossary of rhetorical terms [1] as a framework for analysis. Secondly, the overall message-framing approaches [2] used by the speakers were analyzed. Findings indicate that the gender equality activists in this study used a range of rhetorical language techniques, often in combination, and that certain techniques were more prominent than others. Subtle patterns were also observed in how the speakers adhered to certain message-framing approaches to reinforce their speeches. The pedagogical implications drawn from these findings for English language instructors preparing presentation skills courses in Japanese higher education are then discussed.

Keywords: *Public speaking, Rhetoric, Second language teaching*

1. Introduction

The concept of rhetoric dates back to ancient Greece and the Sophists [3] but has evolved over more than 2,500 years. Rhetoric can be defined in public speaking as a technique where the speaker aims to sway the minds of the listeners and influence their opinions, decisions, or actions" [4]. Plato famously portrayed the use of rhetoric as disingenuous in many of his works, but others systematically described how rhetoric worked and catalogued a repertoire of techniques available to speakers. Aristotle later devised several models in his work, the *Art of Rhetoric*, most famously featuring the three types of proof: ethos, logos, and pathos [3]. Roman rhetors, such as Cicero and Quintilianus, later further modified our understanding of rhetoric. While Toye [3] disputes the notion that rhetoric largely disappeared during the Middle Ages, it did not play a prominent or significant role in society again until the last several hundred years, with the emergence of democratic states in the West and the age of reasoning. The relatively recent spread of the Internet and globalization has necessitated an even greater resurgent interest in rhetoric and the role it plays in shaping communication, particularly the digital forms, in all facets of our daily lives. While rhetoricians need to study rhetoric through a historical lens [5], it is also necessary to analyze and assess the current usage of rhetoric. One avenue of recent exploration is to determine the use of rhetoric outside the realm of the English-speaking world.

Aside from a few limited studies, little research has been conducted on the use of rhetoric in Japan. Okabe [6] notes that traditional adherence to cultural norms and collectivism has a significant impact on how Japanese speakers and their arguments are perceived. Research on English rhetoric in the Japanese context to date has largely focused on written texts and how they are structured or perceived, but findings do tentatively support Okabe's position of cultural differences shaping rhetorical approaches [7]. However, other studies have shown that these differences are frequently minimal when Japanese speakers use English. Miles [8] detailed how a small sample of Japanese activists utilized rhetorical techniques that mirror their Western counterparts. Additionally, a study by Feldman [9] uncovered how Japanese politicians frequently employed the all-too-familiar rhetorical strategy of equivocation when faced with potentially uncomfortable questions in interviews.

The Japanese Government has recognized the necessity of university graduates being able to communicate effectively in English if Japan is to maintain its competitiveness in a rapidly globalizing world [10]. Furthermore, according to Koike et al. [11], Japanese companies with international

connections need to hire graduates with practical English language skills for business negotiations and public speaking activities. University students also seem to know the necessity of learning public speaking skills [12]. While English language skills are taught to almost all Japanese students in their first year of university, until relatively recently, the focus has largely been restricted to reviewing basic grammar and developing daily conversation skills. Rhetoric seldom appears as part of the English language instruction in Japanese higher education.

Responding to needs and the government's initiative, researchers and instructors have begun to research and teach more English presentation and public speaking skills (particularly in university courses) in Japan in recent years. However, Omotedani and Sannomiya [13] stated that few studies have identified metacognitive knowledge regarding what learners or EFL teachers perceive constitutes a good oral presentation. The same researchers later showed that educational interventions can help facilitate improvements in presentation skills [14]. Oshima [15] detailed how TBLT could be used by Japanese university students in oral presentation preparation to encourage them to utilize all four skills—listening, speaking, reading, and writing—for a real-world purpose. Using smartphones to record, reflect, and practice presentations has also proven effective in increasing the quality of the final presentation [16]. Furthermore, rehearsing oral presentations has a positive impact on the speaking performances of students, by helping them identify and rectify their linguistic mistakes [17]. Showcasing public speaking skills at speech contests can be intrinsically motivating and provide students with perceived opportunities for personal growth [18]. One aspect of presentation skills that has not been explored in the Japanese context is how or if rhetoric can be a part of students' repertoire. In a recent study, Miles [19] showed that although rhetoric was briefly covered in some oral presentation skills courses in university English classes, it was never done so explicitly. The lack of rhetoric in Japanese university curricula is unfortunate, as one study in South Korea has shown that teaching rhetoric as part of traditional lectures enhances the academic performance of undergraduate business students [20]. If rhetoric becomes a more integral part of the English language curriculum in Japanese higher education institutions, it may help learners facilitate more effective interactions in society when they are part of the workforce (e.g., negotiating business deals, messaging government policies, and developing advertising strategies).

One other realm in which rhetoric can be important for speakers to utilize is social activism. One such example is the gender equality movement. While this movement has traditionally been more subdued in Japan [21], it is rapidly becoming more prominent and is already part of mainstream discussions in many other countries. Loosely defined as a movement focused on establishing equal rights for women, it is generally accepted that feminism started to take root in Japan with the opening of the country to outside influences during the Meiji Restoration in 1868. Women were given the right to vote in 1945, but it was not until 1999 that the Basic Law for a Gender Equal Society was passed in Japan. However, few public figures have been readily associated with the gender equality movement in Japan, other than Mitsu Tanaka, widely considered to have been the leader of the women's liberation movement since the early 1970s [22]. As in other countries, laws promoting gender equality in Japan have at times faced a backlash [23]. Partly because of this, the gender equality movement has progressed slowly in Japan, compared to neighbouring South Korea, with most Japanese activists remaining anonymous and advocating for modest goals [24]. Recently, however, videos of speeches advocating gender equality in Japan have become more readily available online. Learning about rhetoric through modelling these speeches allows Japanese university students to develop their own skills.

Given the dearth of research on the use of English rhetoric by Japanese speakers, there is a need for this study to establish whether rhetoric is employed in speeches and which rhetorical techniques are employed. Establishing the presence of rhetoric in speeches would allow instructors to then incorporate authentic materials in the classroom and begin to meet the government's desire to foster better English communication skills among students graduating from university.

2. Methodology

This study employs a qualitative research design, incorporating descriptive statistics, and is framed by the key research question: What are the English rhetorical techniques and message-framing approaches utilized by Japanese gender equality activists? The study represents a continuation of earlier research investigating the use of rhetoric across a range of different forms of activism in Japan [8]. However, the scope of this study is more refined and seeks to identify how Japanese gender activists utilize rhetoric when speaking in English and then proffer pedagogical lessons for educators seeking to enhance presentation skills classes in university English courses.

Five speeches were chosen following a strategic and purposive online search for TED Talk videos of Japanese activists speaking in English about gender-related issues. This represents a comparable case selection approach [25]. The speeches can be classified as examples of deliberative rhetoric (as defined by Aristotle) in that the speakers are making what they believe to be 'truth claims' in order to persuade an audience to take action [26]. The videos are readily accessible online, and details of the five speeches analyzed are provided in Table 1.

Table 1. Speeches analyzed in this study

Activist	Time	Speech title
1. Selina Shibata (2021)	7:49	"Gender Inequality in Japan"
2. Shu Matsuo (2021)	5:45	"Why Paternity Leave Benefits Everyone"
3. Kumi Sato (2014)	6:48	"Choices Women Make - Why Can't Japanese Women Have It All?"
4. Shiho Otomo (2017)	16:32	"Towards Gender Equality"
5. Rena Suzuki (2017)	11:16	"Why I Lean in and Become a Feminist"

A transcript of each speech was made by the researcher, with the accuracy verified through two subsequent viewings. The speeches were transcribed in chunks of language on separate lines, defined as complete utterances or phrases of language [27], instead of complete sentences, to more accurately reflect how the speech was delivered. Mistakes and false starts were transcribed verbatim, and utterances of Japanese words were simply written phonetically. The completed transcripts were then imported directly into the software program MAXQDA (version 2020), where they were coded. The coding process comprised two stages. In the first stage, the rhetorical language techniques were coded, adhering to definitions from the University of Kentucky's official glossary of rhetorical terms [1] with modifications to incorporate elements of Rowland's [28] model of language techniques. Table 2 provides a list of the rhetorical language techniques and definitions.

Table 2. Rhetorical language techniques

Language technique	Definition
Alliteration	Repetition of the same sound beginning several words in a sequence.
Allusion	An indirect reference to existing rhetoric, literature, history, or cultural norms.
Anaphora	Repetition of a word or phrase at the beginning of successive phrases.
Antithesis	Opposition, or contrast of ideas or words in a balanced or parallel construction.
Asyndeton	Lack of a conjunction between coordinate phrases, clauses, or words.
Euphemism	Substitution of an agreeable or at least non-offensive expression for one whose plainer meaning might be harsh or unpleasant.
Hyperbole	Exaggeration for emphasis of rhetorical effect.
Irony	Expression of something which is contrary to the intended meaning.
Metaphor	Implied comparison achieved through a figurative use of words.
Oxymoron	Paradox achieved by the juxtaposition of words which seem to contradict one another.
Paradox	An assertion seemingly opposed to common sense, but that may have some truth in it.
Personification	Attribution of personality to an impersonal thing.
Rhetorical question	A question that does not need to be answered.
Simile	An explicit comparison between two things using 'like' or 'as'.
Tricolon	The use of words, phrases, or clauses in patterns of three.

In the second stage of the coding process, the transcripts were coded for their message-framing approaches. As defined by Fairhurst [2], framing involves shaping the meaning of a subject or message, defining its character and significance, and emphasizing the overall message by including and excluding specific meanings. It can be considered a skill, and framing is "the capacity to be articulate and persuasive more or less on demand" [2: 30]. The message-framing coding process requires a holistic thematic coding approach, which, through coding "extended phrases and/or sentences" [29: 376], can identify values and concepts. The transcripts were coded twice to ensure accuracy. For the purpose of this study, framing can be considered as a seemingly indefinite series of dichotomies that encompass the overall theme of the message being promoted by the speaker. For example, a speaker campaigning for lower taxes could take either a positive framing approach (emphasizing the benefits to the economy and individuals of lowering the tax rate) or a negative framing approach (emphasizing the dangers of not reducing taxes). Another example of framing approaches includes a politician advocating for change, who could adopt a future-focused framing approach (emphasizing new policies to be implemented) or a past-focused framing approach (emphasizing a return to previous policies).

In a study that parallels gender activism, Gough [30] provides a rhetorical framework for analyzing the messaging in environmentalist speeches - another form of activism. Gough's two approaches, which essentially represent positive and negative framing, are called the 'garden scenario' and the 'wasteland scenario', respectively. Both are future-oriented approaches and present the audience with a choice for the future. In the garden scenario, "humans interact with the natural world to preserve and manage it" [30: 52], while in the wasteland scenario, "human activity destroys the earth" [30: 52]. To achieve their goals, environmental activists present the audience with another choice. Humanity can either adopt top-down strategies (starting with change on the international stage and from the governmental level) or bottom-up strategies (starting with change from individuals). For this study, framing approaches related to the concept of 'change' were coded, as this pertains to the main objective of activists' speeches. Gough's definitions were modified to more accurately reflect a gender equality focus. Table 3 contains the six framing approaches and their definitions.

Table 3. Framing approaches

Framing approach	Definition
Positive framing (Garden scenario)	Emphasizing the benefits to be gained by taking action.
Negative framing (Wasteland scenario)	Emphasizing the drawbacks and problematic consequences resulting from inaction.
Top-down strategies	Placing the onus for taking action on international bodies or national governments.
Bottom-up strategies	Placing the onus for taking action on individuals in society.
Future-focused framing	Emphasizing a forward-looking approach to addressing issues.
Past-focused framing	Emphasizing a backward-looking approach to addressing issues.

Figure 1 provides a screenshot from Selina Shibata's transcript (LL5-10) to illustrate the coding process.

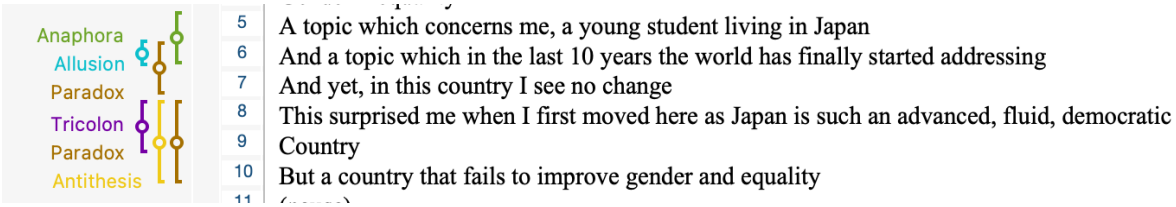

Figure 1. Coding example

3. Findings and Discussion

The key finding in this study is that rhetoric (both language techniques and message-framing approaches) was prominent in all the speeches analyzed. Some aspects of rhetoric featured more often than others, and there are key pedagogical takeaways from these findings. Findings relating to the rhetorical language techniques (Stage 1) will be detailed first. The frequency counts for the language techniques coded in the five speeches are presented below in Table 4.

Table 4. Language technique results

Technique	Kumi Sato	Rena Suzuki	Selina Shibata	Shu Matsuo	Shiho Otomo
Alliteration (3)	1	1	1	0	0
Allusion (15)	2	4	5	1	3
Anaphora (21)	2	7	6	1	5
Antithesis (27)	2	15	5	0	5
Asyndeton (3)	0	0	1	1	1
Euphemism (5)	0	3	2	0	0
Hyperbole (11)	3	2	2	3	1
Irony (5)	1	1	2	0	1
Metaphor (13)	0	5	2	5	1
Oxymoron (0)	0	0	0	0	0
Paradox (8)	0	0	4	2	2
Personification (2)	0	1	0	0	1
Rhetorical question (22)	8	3	4	0	7
Simile (6)	0	5	1	0	0
Tricolon (15)	3	3	1	3	5
Totals (156)	22	50	36	16	32

The most significant finding from this frequency count is that all five speakers utilized a wide range of rhetorical language techniques, with each speaker using more than six different techniques. In total, Rena Suzuki exhibited 50 instances of rhetorical language techniques, while Shuo Matsuo exhibited only 16. Given that he spoke for just under six minutes, this still equates to more than two language techniques per minute. In terms of the overall frequency, the techniques most commonly used by the speakers were antithesis (27), rhetorical question (22), and anaphora (21). All three of these techniques are simple to use and typically serve an emphatic purpose in speeches. Tricolons (15) were used frequently and also generally serve to emphasize the speaker's message. Interestingly, one speaker (Shu Matsuo) did not use either an antithesis or a rhetorical question.

The only technique not used in any of the speeches was an oxymoron. Other infrequently utilized techniques were personification (3), alliteration (3), and asyndeton (3). Irony (5), euphemism (5), and simile (6) were also not employed often. Many of these techniques can be described as more 'poetic', rather than emphatic, thereby potentially undermining the speaker's sincerity towards a sensitive topic, such as gender equality, if overused. This possible explanation is supported by the finding that the sole male speaker in the study used far fewer techniques than the four female speakers. When considering how the audience perceived his ethos, he was possibly aware of his potentially delicate position as a male speaker, speaking about women's rights, and therefore adopted more of a factual and explicitly sincere approach, which was less reliant on rhetoric.

In the second stage of the study, the speakers' framing approaches were coded. Table 5 provides the frequency counts for coded instances of each speaker's framing approach.

Table 5. Framing approach results

Framing approach (total)	Kumi Sato	Rena Suzuki	Selina Shibata	Shuo Mastuo	Shiho Otomo
Positive framing (18)	1	4	0	10	3
Negative framing (22)	4	6	5	1	6
Top-down strategies (2)	0	0	1	1	0
Bottom-up strategies (14)	2	3	3	1	5
Future-focused framing (7)	3	3	0	0	1
Past-focused framing (2)	0	1	0	1	0
Total (65)	10	17	9	14	15

The findings above reveal that each speaker favoured different underlying approaches to delivering similar messages, with most relying on a combination of framing approaches. Primarily, the speakers employed positive and negative framing to contrast their message of reality with an ideal position. Encouraging a bottom-up approach as a solution, especially at the end of their speeches, was another common tactic. The female speakers tended to use more negative message-framing approaches, often punctuated with personal anecdotes, whereas the male speaker focused primarily on positive framing, supported by anecdotes that showed his more enlightened approach to gender issues and the subsequent positive effects he envisioned if others adhered to a similar approach. While he may have utilized relatively fewer rhetorical language techniques, the frequency of his use of framing approaches mirrored that of the female speakers.

Two framing approaches rarely utilized were top-down strategies and past-focused framing. The latter is not surprising, as the speakers viewed the current status quo for gender rights as inadequate at best, and they were all advocating for a better future, not for a return to the past. The lack of top-down strategies presented was surprising and stands in contrast to climate change activists, who frequently urge national governments to take action. Instead, the activists advocated for a bottom-up approach.

To better illustrate the framing approaches used by the speakers, two examples are provided below in Table 6 for each approach. Each quote is referenced according to the lines in the respective transcript from which it was drawn. Commas have been added to the quotes to assist the reader.

Table 6. Message framing examples

Speaker	Positive framing excerpts
Rena Suzuki	I'm glad to have my husband calling himself feminist, and we are both feminists, because we want each other to have the same options, either me pursuing my career, or him becoming a stay-at-home dad (LL146-148)
Shu Matsuo	men who take paternity leave experience a stronger bond with their babies, research shows that the longer the paternity leave, the more engaged the father is in the first few years of a child's life (LL38-40)
	Negative framing excerpts
Kumi Sato	now, given that we have an aging population, where one of four people are going to be over 65, is it really fair for the wife or the daughter, to ask somebody, or a parent, who is 65 or older to be chasing a toddler and doing household chores (LL25-27)
Selina Shibata	these problems pile up one after the other and this whole system just seems like a trap (LL64)
	Top-down strategies
Selina Shibata	the government has to focus on providing a flexible environment for working parents (LL92)
Shu Matsuo	we need more countries to set up systems that allow all parents to take paid childcare leave (LL88)
	Bottom-up strategies
Kumi Sato	so, if you believe in this and agree with me, let's voice this and talk to people, so one day, maybe, a public policy maker will agree with it and something will be made to change it (LL76-77)
Selina Shibata	that is why I am reaching out to all the Japanese women out there, we have a voice and we must put it to use, we must come together to create gender equal society (LL99-101)
	Future-focused framing
Rena Suzuki	so I said to my boyfriend at that time that I wanted to change the society so that all women and men can be truly equal (LL17-18)
Shiho Otomo	we can make improvements by making small changes around us, these small changes we make will become a seat for a worldwide movement (LL161-162)
	Past-focused framing
Rena Suzuki	I went Keio because I wanted to achieve something great, and wanted to have a successful career in business, so imagine my surprise when I hear about the research showing that 80% of female co-eds at my faculty wanted to become housewives (LL35-38)
Shu Matsuo	like most men in Japan, I grew up being told that masculinity is supposed to look a certain way, you're supposed to be stoic and strong, dominant and in control; the breadwinner for your family (LL9-10)

Attention can now be turned to more conclusively addressing the research question framing this study: What are the rhetorical techniques and message-framing approaches utilized by Japanese gender equality activists? Overall, it can be said that the speakers frequently utilized rhetoric in their speeches, both in terms of rhetorical language techniques and overall message-framing approaches. There are also additional related sub-findings and distinctions worth noting.

Firstly, all five speakers utilized various rhetorical language techniques in their speeches. They employed them to punctuate their messages, to make their arguments more persuasive, and to engage with the audience. A closer analysis revealed that the simpler and more emphatic techniques were utilized more frequently. This is not surprising as such techniques are relatively simple to implement, especially for L2 speakers. Additionally, the underlying purpose of the speeches was to persuade the audience, and as such, emphatic techniques were likely considered more appropriate by the speakers, demonstrating an acute awareness of how to use rhetoric. Also potentially significant is that many of the rhetorical language techniques utilized by the speakers in this study closely mirror those typically used by Western speakers in similar such speeches [31]. This finding suggests that rhetoric could be determined more by the language being used than by the cultural background of the speaker.

Secondly, the use of a wide range of message-framing approaches was evident in all the speeches, and they were often used in combination. They were typically interwoven throughout the speech, with the most vivid example being the contrast between the ideal world where gender equality is realized (positive framing) and the reality of the current situation (negative framing). Western activists incorporate similar combinations in their speeches [31]. Interestingly, the gender equality activists exhibited differences from climate change activists concerning which message-framing approach they prioritized (bottom-up approaches instead of top-down approaches and less reliance on future-focused framing). Additionally, gender differences were found between how the male speaker framed his speech and how the female speakers framed their speeches (more focus on positive framing).

The limited scope of the investigation precludes any definitive conclusions from being established until further work is conducted. Nevertheless, it can still be concluded that despite differences in how each speaker delivered their message, all five activists featured in this study delivered a strong rhetoric-infused message that largely mirrored the approaches and techniques found in speeches outside of the Japanese context [31]. The study can also conclude that the form of activism likely shapes the message-framing approach adopted by the speaker. This suggests an avenue for further research, exploring the rhetorical approaches of speakers outside Japan and across differing genres of activism.

4. Implications

Pedagogical implications for language learners and educators can be drawn from this study. While it has been traditionally argued that for learners to competently utilize rhetoric, a significantly high level of English proficiency is required, this study suggests otherwise. Two of the speakers analyzed in this study were high school-aged, and none of the speakers could be described as completely fluent. None of the five speakers is considered a professional speaker, yet all implemented rhetorical techniques frequently throughout their speeches. From this, it could be inferred that learning such techniques is not beyond the reach of L2 learners at the university level. Furthermore, rhetorical techniques are often more compelling when composed of simple English vocabulary. The vast majority of the language techniques coded in this study exemplified this point. For language instructors, videos of these speeches offer a chance to provide learners with materials to analyze. Modelling the techniques and approaches found in these speeches (and others) would represent the incorporation of authentic materials into the learning process, which is known to facilitate language learning [32]. It would also illustrate for L2 learners in higher education that rhetoric is simple to implement in public speeches.

Although rhetoric may appear relatively easy to implement into language courses in Japanese higher education, one daunting obstacle is that language educators in Japan often possess little background training in how to teach rhetoric - it is seldom covered in L2 training courses. This issue needs to be addressed first before rhetoric can be featured in second language curricula at the university level [19]. Awareness of this fact would be the first step. Given the frequency with which second language learners are required to present in English in Japanese university courses [11], successfully infusing rhetorical techniques into their presentations should be considered a mandatory skill to learn.

The findings from this study also proffer implications for activists. As the speakers in this study largely exhibited similar rhetorical techniques and approaches to activists outside Japan [31], it can be assumed that rhetoric has a universal appeal extending beyond the domain of Western nations or English-as-a-first-language speakers. Findings from this study also suggest that the appropriateness of the techniques used by activists can fluctuate according to the genre of activism. Japanese activists need to learn to synthesize their approaches and techniques with the expectations of the audience when pitching their climate change, gender equality, or poverty relief messages.

5. Conclusion

This study demonstrates that the use of rhetoric (language techniques and message-framing approaches) is not the sole domain of speakers for whom English is a first language. L2 activists also use rhetoric as a tool for public speaking, often in a similar manner as their Western counterparts. However, to support Japanese speakers using English in the public realm, rhetoric needs to be seen as more than a peripheral subject when taught in higher education English language courses in Japan.

Embodied Language Learning in the Age of AI: Insights from Five Years of Scaffolded Language Emergence

Katerina Strnadova

University of West Bohemia in Pilsen, Czech Republic

Abstract

What is the place of physical elements in the language classroom in the age of artificial intelligence? This paper summarizes the results of five years of implementing the Scaffolded Language Emergence (SLE) approach in foreign language teaching, with a particular focus on the role of physical elements in learning. SLE is an approach that promotes language emergence in adult learners and was developed by Dr. Donald Kiraly at the University of Mainz. To date, it has been applied to more than fifteen languages, including minority and endangered languages.

The paper presents experiences from the Institute of Applied Language Studies at the University of West Bohemia in Pilsen, where SLE has been used in foreign language instruction, as well as its application in supporting the teaching of Lower Sorbian, an endangered West Slavic minority language. Drawing on concrete classroom examples, the paper demonstrates how physical interaction, movement, objects, and other embodied activities contribute to learner engagement, meaning-making, and sustained language development.

The findings underscore the continued importance of face-to-face teaching contexts that facilitate the integration of physical elements, particularly at a time when language instruction is increasingly shifting to virtual environments. The paper argues that embodied, socially situated learning practices offer distinct advantages that complement digital and artificial intelligence–based learning tools, and that SLE provides a viable framework for maintaining these benefits in contemporary language education, offering also critical advantages for the revitalization, maintenance, and teaching of minority and endangered languages.

Keywords: *SLE, Scaffolded Language Emergence, language learning and acquisition, language teaching, embodied activities*

1. Introduction

The rapid expansion of artificial intelligence (AI) in education has significantly transformed language learning environments. AI-driven tools now offer adaptive feedback, automated assessment, and personalized learning pathways, reshaping how languages are taught and acquired. While these developments bring undeniable advantages, they also raise important questions about what may be lost as language learning increasingly shifts toward virtual, technology-mediated contexts.

One key concern is the diminishing role of physical, embodied interaction in the language classroom. Language is not only a cognitive system but also a socially and physically situated practice, deeply connected to movement, gesture, space, and material interaction. In this context, approaches that foreground embodiment may offer valuable counterbalances to purely digital learning environments.

This paper explores the role of physical elements in language learning through the lens of Scaffolded Language Emergence (SLE), an approach developed by Donald Kiraly. Drawing on five years of implementation at the Institute of Applied Language Studies at the University of West Bohemia in Pilsen (UWB) and in the high school context, the study examines how embodied activities contribute to learner engagement, meaning-making, and sustained language development. It also considers the relevance of SLE in teaching minority and endangered languages, with particular reference to Lower Sorbian.

The paper addresses the following research questions:

- How do embodied activities support language emergence?
- What is the role of SLE alongside AI-based tools?
- How can embodied approaches contribute to the teaching and revitalization of minority languages?

2. Theoretical Background

2.1 Language Learning in the Age of AI

AI has become a central component of modern language education. Empirical studies report a medium-to-large overall effect on language learning outcomes, with the strongest impact on vocabulary, followed by reading, writing, listening, and speaking. At the same time, these findings highlight limitations, indicating that explicit instruction and scaffolding remain necessary, particularly for skills requiring long-term practice or metacognitive control [19].
AI-based learning environments often lack the social and embodied dimensions characteristic of face-to-face interaction. Although some studies explore integrating AI into physical activities [8], these solutions are not yet widely accessible in educational settings.
According to Ethnologue, a research institution that extensively studies the survival of the world's languages, 44.6% of the world's 7,170 living languages are currently endangered [2]. While AI performs well in high-resource languages, its application to minority and low-resource languages remains limited due to data scarcity, lower performance, and insufficient cultural contextualization. These constraints limit its ability to capture the social and embodied nature of language learning.
AI should therefore be regarded as a complementary tool rather than a substitute for human-centered, community-based approaches, particularly in the preservation and teaching of endangered languages.

2.2 Embodied Cognition and Language Learning

Embodied cognition emphasizes that cognitive processes are grounded in bodily experience and interaction with the environment. In the context of language learning, this perspective highlights the role of movement, gesture, and sensory engagement in constructing meaning.
Empirical research has demonstrated that learning through physically meaningful interaction – such as role-play, drama-based techniques, arts-based activities, object manipulation, and movement-oriented tasks – can positively influence multiple aspects of language development, including vocabulary acquisition, grammatical competence, and pronunciation. Furthermore, such approaches have been associated with improvements in memory retention, comprehension, and affective factors, including learner motivation and emotional engagement.
A systematic review of studies published between 2019 and 2020 [3] indicates that embodied approaches to language learning can facilitate holistic learner engagement while supporting the development of key language competencies. At the same time, the review identifies several gaps in the existing research, particularly regarding the application of embodied learning in secondary education contexts and its impact on intermediate and advanced learners beyond vocabulary acquisition.

2.3 Scaffolded Language Emergence (SLE)

The SLE approach was developed by Donald Kiraly during his tenure as a senior lecturer at the School of Translation, Linguistics and Cultural Studies (FTSK) at the University of Mainz. Conceived as an andragogical approach to additional language acquisition, SLE emerged from approximately fifteen years of pedagogical experimentation with a range of language teaching methods, including the Silent Way, the Structural-Global-Audio-Visual approach, the Natural Approach, the Whole Language Movement, Suggestopedia, and Communicative Language Teaching [6], including also Total Physical Response [4].
SLE foregrounds the co-construction of language through social interaction and guided participation. In contrast to approaches that prioritize explicit instruction and predefined learning outcomes, SLE emphasizes emergent language use, learner agency, and collaborative meaning-making. The approach is grounded in a set of pedagogical assumptions about adult language learning, from which a series of didactic precepts are derived [7].

Table 1. SLE assumptions and didactic precepts [7]

ASSUMPTIONS	PRECEPTS
1. Percieved authenticity aids motivation	Seek authenticity and encourage authentication
2. Linearity constrains learning	Embrace complexity in the classroom
3. Affordances rather than input are the primary stimuli for learning	Take advantage of affordances rather than merely trying to provide input
4. Knowledge is often socially constructed	Promote autonomy and collaboration, provide scaffolding
5. Language is embodied	Emphasize linguistic/corporeal connections
6. Affect is a key factor in learning	Welcome emotions in classroom activities
7. Grammaticalization depends on induction and abduction	Encourage inductive and abductive reasoning

These principles are operationalized holistically in the SLE classroom. Embodied learning plays a central role, as activities are designed to integrate physical movement with language use, thereby activating motor memory and reinforcing learning processes. Learners engage in physically grounded tasks, ranging from simple commands (e.g., “sit down”, “stand up”) to more complex sequences involving coordinated actions (e.g., “touch your toes with your hands”, “take three jumps forward”).
A wide range of activity types can be incorporated into the SLE framework, including classroom objects, miming, role-playing, acting out stories, spatial navigation tasks (e.g., fly swatters, labyrinths), and simulations of real-world environments. Whenever possible, learning is extended beyond the classroom through engagement with authentic settings where the target language is used [4] [5] [7]. The learning environment itself is treated as flexible and dynamic: students may work in circles or semicircles, and classroom space can be reorganized to support interaction and participation. In this context, the teacher assumes the role of facilitator rather than instructor, guiding complex, emergent activities shaped by learner interaction. For this reason, SLE is more appropriately described as an approach rather than a method.
The SLE approach was successfully implemented at the University of Mainz between 2013 and 2019 in courses introducing translation students to fifteen different languages. Subsequently, between 2020 and 2022, further development took place through a series of intensive workshops at the Institute of Applied Language Studies at UWB in the Czech Republic. These workshops, conducted by Kiraly and colleagues, included instruction in Spanish, English, Italian, Russian, and Czech. As part of this initiative, a series of didactic videos demonstrating SLE principles was produced and later integrated into the university's regular study programs [12] [13] [14] [15] [16] [17] [18]. The author of this paper also implemented SLE in high school teaching.

2.4 Lower Sorbian

Among the languages employed in the series of exemplary language classes at the UWB was Czech, a West Slavic language closely related to Lusatian Sorbian. Lusatian Sorbian (Lower and Upper) is classified as an endangered minority language. The Czech Republic maintains historical and geographical ties to the region of Lusatia, which is primarily located in Germany and Poland but also extends marginally into Czech territory. Efforts to preserve and promote the Lusatian Sorbian language and culture have a long-standing tradition in the Czech Republic, notably through the activities of the Spolek přátel Lužice (Society of Friends of Lusatia), which organizes cultural events and maintains dedicated resources, including a website and library.
In the Lusatia region, Lower Sorbian is currently spoken fluently by approximately 400 speakers. In response to the ongoing decline of the language and its associated cultural practices, the Sorbian community has intensified efforts to raise awareness of its linguistic and cultural heritage. Within the formal education system, a key institution is the Niedersorbisches Gymnasium (NSG) in Cottbus, established in 1952. This bilingual secondary school requires all students to achieve proficiency in Lower Sorbian by the completion of their studies and currently enrolls approximately 500 students. However, concerns regarding the effectiveness of instructional methods in Lower Sorbian education have been documented [9].
A significant recent initiative is the Zorja project, launched in 2022 by Maximilian Hassatsky, a specialist in the Lower Sorbian language and culture. Supported by a €2.5 million grant from the German government over a nine-year period, the project aims to develop advanced proficiency (C1 level) in Lower Sorbian among adult learners. Its long-term objective is to increase the number of fluent speakers by approximately 1,000 by 2040. The program is designed as an intensive course comprising 30 hours

of instruction per week over ten months, supplemented by a one-month internship at a Sorbian institution and by independent research.
During the preparatory phase, a range of language-teaching approaches was evaluated to foster communicative competence, positive learner attitudes, and sustained intrinsic motivation. Following this review, the Zorja teaching team adopted the SLE approach on a trial basis, particularly during the initial 150 hours of instruction. This initiative represents the first known attempt to systematically implement the SLE approach within a long-term foreign language learning program [20].
The need for increased attention to pedagogical approaches in the preservation of Lusatian Sorbian is further underscored by the limited scope of existing research. Previous studies have predominantly addressed linguistic aspects, including phonetics, lexicon, syntax, grammar, and etymology. Sociolinguistic aspects of Lower Sorbian [1] have also been explored in previous research, alongside studies examining the regional distribution of speakers [10] and the training of specialists at the Institute of Sorbian Studies at the University of Leipzig [11]. However, there remains a notable gap in research concerning teaching methodologies and instructional practices.

3. Methodology

3.1 Research Context

This study draws on five years (2021-2025) of implementing the SLE approach at the Institute of Applied Language Studies at UWB and in a high school context (Conservatory of Pilsen). Additional data were collected during the initial phase of the Zorja project. The research involved high school, university, and adult learners with diverse linguistic backgrounds and covered both regular foreign language courses and an intensive course format.

3.2 Data Collection and Analysis

Data on the implementation of the SLE approach, which incorporates physical elements, were collected through two primary methods: a final questionnaire administered to participants and classroom observation conducted during the teaching process. The final questionnaire was not specifically designed to investigate physical activity; however, it included items assessing perceived effectiveness and satisfaction with the teaching approach.
A qualitative research design was adopted to identify recurring patterns in embodied interaction, learner engagement, and language emergence. The analysis aimed to relate observed practices to relevant theoretical frameworks, particularly those of embodied cognition and the SLE approach.

4. Findings

4.1 SLE in High School Context

The students were asked to identify which aspects of their classes they would retain, modify, or eliminate. Of the 31 respondents, 8 indicated that they would keep all aspects of their classes, expressing general satisfaction without further elaboration. A further 18 students explicitly highlighted the teaching methods, particularly those incorporating “games,” “interesting activities,” and “interactivity.” These were described as “an original and active way of presenting the material,” with comments such as: “I always enjoy games invented by the teacher more than exercises from the workbook.”
Several responses emphasized the physical dimension of these activities, which students associated with game-based learning. Representative statements included: (a) “group and physical activities,” (b) “group work and not sitting at desks at the beginning of class, working with the interactive whiteboard, creative lessons, and games,” (c) “various activities during class (games, exercises in the classroom, etc.),” (d) “lots of practice activities, interactivity, playing theater,” (e) “group interactions (games, conversations, etc.) and dancing or any other movement,” and (f) “the fact that we don’t sit at our desks the whole class, that we actually learn through play, and that we talk more than we write.”
In the remaining five cases, students referred to aspects unrelated to physical activity, such as speaking predominantly in the target language, using visual materials, working with textbooks, incorporating songs, and engaging in conversation. Only one student expressed a preference for a more traditional instructional approach, stating: “I prefer the traditional school system; I don’t feel the need for lessons in the form of fun activities like games, flashcards, or memory games.”

When asked what they would change, 13 out of 31 students reported that no changes were necessary. The remaining responses did not emphasize physical activity; instead, they included requests such as more systematic note-taking of grammar (n = 4), increased use of textbooks (n = 3), more music and songs (n = 3), and greater inclusion of films and videos (n = 2). Other suggestions appeared only once (e.g., more conversation, more frequent testing, use of Kahoot, digital textbooks, and translation of teacher instructions). Only one student explicitly requested an increase in physical activities.
Regarding elements to be omitted, 21 out of 31 students indicated that nothing should be removed. Four students suggested eliminating textbooks and workbooks. Other isolated suggestions included reducing activities in which only a few students are active, limiting vocabulary testing on the interactive whiteboard, avoiding reading aloud when called upon, and excluding creative text-composition tasks. Only one response referred to removing a movement-related activity ("facial expressions and gestures").

4.2 SLE in University Context

During the five-year period under review, only a small percentage of the total 275 students – between 0 and 20 % per semester – participated in the final evaluation. Students expressed overall satisfaction with the course (content, teaching methods, format, and credit hours), with an average of 88 %. For the statement "I was impressed by the instructor's approach during the class/seminar," the response was selected in 100 % of cases.
The open-ended responses included comments such as: "A very engaging course. I was apprehensive at first, but my concerns proved unfounded. The professor has a very creative approach to teaching, which is highly interactive and gave me a new perspective on how a foreign language can be taught. The classes were playful and interactive, yet packed with information." The comments also mentioned how "fun" the classes were and the fact that the students "enjoyed the lessons," as well as how easy the material was to remember: "I was able to easily remember the material thanks to plenty of repetition during group work, mini-interviews, and games. Every class was interesting in its own way."
None of the comments specifically mentioned physical activities, but the methodological approach was viewed positively as a whole: "I really enjoyed the teaching methods. Every lesson was carefully prepared; we always played different games and did fun activities that helped us practice what we'd learned, and none of them were repeated throughout the entire semester – I really appreciate that. Not only did the lessons give me a great foundation in the language, but I'm also taking away lots of ideas for activities I can use when teaching a foreign language."
None of the comments that raised objections (teaching in the target language from the very beginning, the lack of structured grammar notes in the workbook) concerned the inclusion of physical activities in the learning process.

4.3 SLE in Lower Sorbian Context

After completing 150 hours of instruction using the SLE approach, the respondents (N = 10) were asked to evaluate the extent to which their communicative competence had improved. The majority reported positive development: 5 respondents indicated that their competence had "greatly improved," and 4 reported it had "considerably improved." Only 1 respondent perceived very little improvement, and none expressed uncertainty.
Regarding the main focus of instruction, the majority of respondents (n = 7) perceived a balanced approach between language structure and communication, while 3 indicated that the focus was mainly on communication. None reported a primary emphasis on language structure or expressed uncertainty.
The perceived effectiveness of the teaching approach was highly positive. Six respondents rated it as "amazingly effective," and 3 as "very effective," while only 1 considered it "fairly effective." None of the respondents evaluated the approach as ineffective or not very effective.
Similarly, respondents strongly agreed that the teaching team had adopted an effective approach. Eight respondents indicated that this was achieved "to a great extent," while 2 selected "to a moderate extent." No respondents expressed negative evaluations or uncertainty.
Finally, when asked which aspects of the teaching approach might require improvement, responses were more varied. Three respondents did not provide an answer. Among the remaining responses, communicative practice was mentioned by 3 respondents, while both collaboration among teachers and grammar instruction were each identified by 2 respondents.

4.4 Classroom Observations

Observations indicate that incorporating physical elements into classroom instruction can enhance student engagement compared to more passive learning situations, in which students remain seated – often partially obscured behind desks or computer screens.
A comparison across the observed sample suggests that integrating physical activities is generally more straightforward with younger learners. Adult learners, by contrast, may initially experience discomfort or hesitation. For this reason, it is advisable to clearly explain the rationale and potential benefits of incorporating movement-based activities into the learning process. At the same time, teachers should remain attentive to the group's needs and adapt activities flexibly to ensure a supportive learning environment.
The following types of activities have been implemented repeatedly and have received positive feedback:

- exercises involving body awareness and movement (e.g., warm-up activities at the beginning of class, coordination exercises aimed at integrating brain hemispheres)
- interaction with physical objects (e.g., pointing to, touching, lifting, or manipulating items)
- movement-based tasks such as running or quickly locating items (e.g., using fly swatters, images, objects, or information fixed on classroom walls)
- miming and dramatization of stories (e.g., daily activities, basic hygiene, study activities)
- spatial navigation activities within the classroom (with eyes open or closed)
- role-playing and simulations of real-life situations (e.g., purchasing tickets, ordering food)
- hands-on practical activities (e.g., simple cooking tasks)

5. Discussion

The findings across the high school, university, and Lower Sorbian contexts indicate that the SLE approach was perceived positively by learners of different ages and educational settings. In the high school context, students particularly appreciated interactive, game-based teaching methods, often referring to movement, group work, dramatization, and activities outside the traditional desk arrangement. These responses suggest that learners associated effective and enjoyable language learning with active participation and social interaction.
The university findings support these conclusions. Students described the classes as engaging, creative, interactive, and memorable, often emphasizing how games, repetition, and collaborative activities helped them retain the material more effectively. Interestingly, respondents rarely referred directly to physical movement itself; rather, they evaluated the teaching approach as a whole. This may suggest that, in adult education, movement-based activities become integrated into broader communicative methodology rather than being perceived as separate techniques, in accordance with the SLE theoretical framework. Some comments also indicated that students were initially uncertain about the unconventional format but later evaluated it positively after experiencing its benefits.
Similarly, the Lower Sorbian data demonstrated highly positive perceptions of communicative improvement and instructional effectiveness. Most respondents considered the instruction balanced between communication and language structure, suggesting that the SLE approach did not lead learners to perceive grammar instruction as neglected. Nevertheless, some participants still identified communicative practice and grammar explanation as areas requiring further development, again highlighting the importance of balancing experiential and form-focused instruction.
The classroom observations further confirmed that incorporating physical activities can increase student engagement and participation compared to more passive learning situations. Activities involving movement, role-play, dramatization, object manipulation, and spatial interaction were consistently received positively. However, the observations also suggested that younger learners adapted more naturally to movement-based instruction, whereas adult learners sometimes showed initial hesitation. This highlights the importance of creating a supportive classroom environment and clearly explaining the purpose of embodied activities when implementing SLE with older learners.

6. Implications for Language Teaching

While AI tools offer valuable support for language learning, they cannot fully replicate the embodied and socially situated nature of SLE practices. A balanced integration of AI tools and embodied approaches offers a promising direction for language education. Hybrid models can combine the strengths of both, ensuring flexibility without sacrificing depth of learning.

SLE ensures that learners engage in meaningful, context-rich interaction that supports deeper learning. Classes that incorporate physical activity can be perceived as playful, fun, and interactive. Language teachers – especially but not only at the high school level – should consider incorporating:

- Movement-based activities
- Use of physical objects
- Spatially organized tasks

Embodied approaches are particularly valuable in teaching minority and endangered languages. They support cultural transmission, community building, and meaningful engagement, all of which are essential for language maintenance.

7. Conclusion

This paper examined the role of physical and embodied elements in language learning through five years of implementing the Scaffolded Language Emergence (SLE) approach in high school, university, and minority-language contexts. The findings indicate that learners generally perceived SLE positively, particularly valuing its interactive, communicative, and experience-based character. Activities involving movement, role-play, games, dramatization, object manipulation, and spatial interaction were associated with increased engagement, enjoyment, and memorability of the learning process. At the same time, the results demonstrated that learners also continue to value explicit structure and grammar support, suggesting that embodied approaches are most effective when balanced with more systematic instructional elements.

The study further confirms the relevance of embodied cognition theories in contemporary language education. Classroom observations and learner responses suggest that physical participation can support attention, emotional involvement, social interaction, and meaning-making in ways that extend beyond purely cognitive or screen-based learning environments. These findings are particularly significant in the context of increasing digitalization and the growing presence of artificial intelligence in language education. While AI-based tools provide important advantages, including adaptive feedback, individualized practice, and flexible access to learning materials, they cannot fully replicate the embodied, interpersonal, and socially situated dimensions of language learning observed in SLE classrooms.

The findings are also relevant for the teaching and revitalization of minority and endangered languages, such as Lower Sorbian. In such contexts, language learning is closely connected to community, identity, and cultural practice. Embodied and collaborative activities may therefore play an important role not only in developing communicative competence but also in strengthening learner motivation, social belonging, and meaningful engagement with the language. The positive evaluations of the Zorja project participants suggest that SLE offers considerable potential for long-term minority-language education focused on communicative use and sustainable learner involvement.

Rather than positioning embodied learning and AI-driven learning as competing paradigms, this paper argues for their complementary integration. AI tools can effectively support repetition, vocabulary development, pronunciation practice, and autonomous learning, while embodied approaches such as SLE contribute social interaction, contextualized communication, emotional engagement, and physical experience. Future language education may therefore benefit most from hybrid models that combine technological innovation with human-centered, embodied pedagogy. In this respect, SLE represents a valuable framework for preserving the interpersonal and experiential dimensions of language learning in an increasingly digital educational landscape.

Honoring Human Variation at Scale: Reimagining School through Facilitated Interdependent Learning

Thomas E. Welch

National Council of State Supervisors for Languages (NCSSFL), United States

Abstract

Facilitated Interdependent Language Learning (FILL) is a proficiency-centered approach to world language education that replaces pacing guides and teacher-directed curricula with a flexible system organized around what learners can do with language. In a FILL classroom, instructional authority shifts decisively toward the learner: students choose the language and topics they wish to study, set proficiency-based goals, select resources, and reflect on their progress, while the certified teacher operates as a facilitator who designs the conditions for language acquisition rather than directing daily learning. Graduation credit is earned through demonstrated proficiency rather than seat time, positioning learners as accountable agents in their own growth. Students function as autonomous yet interdependent learners, articulating proficiency targets through NCSSFL/ACTFL Can-Do Statements [1] aligned with ACTFL proficiency frameworks [2]. Proficiency serves as both the organizing principle for learning and the primary metric for assessment, prioritizing communicative ability over content coverage. Artificial intelligence plays a central, transformative role by enabling personalization at scale: learners use AI to generate level-appropriate texts, design individualized practice, explore linguistic structures, and engage in written and spoken interaction aligned to their goals and interests. Positioned not as a shortcut but as an adaptive learning partner, AI supports exploration, strategy development, and iterative refinement. Rigor and transparency are ensured through externally benchmarked proficiency assessments (e.g., Avant's STAMP test), providing independent validation of growth and allowing proficiency to carry institutional meaning beyond the classroom. This session presents FILL as a transferable framework with implications extending beyond world language education, demonstrating how learner-centered, AI-supported, proficiency-based systems can expand access to less commonly taught and heritage languages without adding staffing or programs. For under resourced schools in particular, FILL offers a sustainable model for broadening opportunity, preserving rigor, and redistributing power toward learners while maintaining accountability at scale.

Introduction

1. The Persistence of Structure

"So… what are we learning this week?"
The familiarity of the question lies not in its content, but in the assumptions it carries. It presumes that learning has already been determined, sequenced, and owned by the system. When the response shifts to "What do you want to be able to do?", the underlying architecture begins to change. The focus moves from content delivery to capability, from curricular coverage to learner intention.
This shift is occurring against a backdrop of profound transformation. Learners now inhabit environments saturated with access to information, tools, and global networks. Artificial intelligence has accelerated this transformation, offering learners the ability to generate explanations, engage in simulated interaction, and receive immediate feedback. Knowledge is no longer bounded by institutional walls; it is distributed across platforms, communities, and contexts.
Yet despite these changes, the structural features of schooling remain largely intact. Courses continue to define what is to be learned, calendars determine when, and grades serve as proxies for success. These structures persist not because they reflect how learning occurs, but because they provide administrative coherence.
The central question, then, is not whether learning has changed. It has. The question is whether the systems designed to support learning have evolved accordingly. This paper argues that they have not, and that meaningful progress requires a shift from refining instruction within existing structures to

reimagining the structures themselves. Facilitated Interdependent Language Learning (FILL) is presented as one such reimagining.

2. The Structural Mismatch between Learning and Schooling

Educational reform has historically focused on improving instructional practice. Curriculum alignment, pedagogical refinement, and assessment design have all been the subject of sustained attention. While these efforts have produced important gains, they have not resolved a fundamental mismatch between how learning occurs and how schooling is organized.

Research in second language acquisition has consistently demonstrated that learning is nonlinear, emergent, and highly individual Ellis [3] and Larsen-Freeman & Cameron [4] Learners progress at different rates, respond differently to similar input, and develop proficiency through complex interactions between exposure, use, and feedback. Cognitive science similarly emphasizes the role of prior knowledge, attention, and meaningful engagement in determining whether learning persists [5]

Despite this, schooling remains organized around uniform progression. Courses are sequenced, time is fixed, and learners are expected to move together. This design reflects historical priorities of efficiency and scalability rather than alignment with learning processes.

Time, in particular, functions as the dominant metric. Completion of a course becomes evidence of learning, even though time is only indirectly related to proficiency. As a result, systems often measure what is easy to quantify rather than what is most meaningful. This leads to what might be described as an epistemic substitution: time stands in for learning, and completion stands in for capability.

The consequence is a persistent tension. Educators recognize variability in theory, yet systems constrain it in practice. Learners adapt to structures that do not fully reflect their developmental trajectories, and assessment systems often capture compliance more effectively than growth.

3. Learning in a Networked World: Connectivism as Context

The rise of digital technologies has fundamentally altered the ecology of learning. Knowledge is no longer centralized; it is distributed across networks. Siemens [6] and Downes [7] have described this shift through the framework of connectivism, which positions learning as the process of forming and navigating connections within a network of information sources.

In such environments, the ability to locate, evaluate, and integrate information becomes as important as the acquisition of content itself. Learning is less about internalizing static bodies of knowledge and more about participating in dynamic systems of meaning-making.

However, while connectivism provides a useful descriptive framework, it does not by itself restructure schooling. Many educational systems continue to operate as though knowledge must be delivered sequentially and controlled through curriculum.

FILL can be understood as a structural response to this tension. Rather than treating networked learning as external to schooling, it incorporates it into the design. Learners engage with a wide range of resources—digital platforms, authentic texts, community interactions, and AI-supported tools—forming a network through which learning occurs. The role of the teacher shifts from delivering content to facilitating navigation within this network.

4. The Human Element: Meaning, Memory and Motivation

In a learning environment increasingly defined by access to information, the central challenge is no longer exposure but connection. The question is not whether learners can encounter content, but whether that content becomes meaningful enough to be retained, applied, and extended. This distinction lies at the heart of cognitive theories of learning, which consistently demonstrate that knowledge is not simply received but constructed through interaction with prior experience, purpose, and context [8].

Traditional instructional models often assume that relevance can be designed externally. Curriculum is sequenced, topics are selected, and examples are provided with the expectation that learners will find meaning within them. While such approaches can produce short-term performance, they frequently fail to generate durable learning. Information that is processed without personal significance tends to remain inert, accessible for assessment but not for application. In this sense, much of what is learned in traditional environments is, at best, temporarily held—sufficient for completion, but not integrated into the learner's cognitive framework.

Facilitated Interdependent Language Learning challenges this assumption by repositioning the learner at the center of meaning-making. Drawing on the conceptual framing articulated in *Putting Ourselves*

Back in the Equation [9], FILL environments position the learner as the source of context rather than the recipient of it. FILL environments begin not with predetermined content, but with the learner's interests, goals, and identity. Context is not imposed; it is generated. This shift has profound implications for both motivation and memory.

Consider the learner who chooses to study Korean because of an interest in K-pop. In a traditional course, exposure to Korean language and culture might include a limited set of teacher-selected themes, only loosely connected to the learner's motivation. In a FILL environment, however, the learner's interest becomes the organizing context. Vocabulary, listening tasks, reading selections, and communicative goals emerge from engagement with K-pop itself—lyrics, interviews, fan communities, and media content. The language is no longer abstract; it is embedded in a domain that already holds meaning for the learner.

Similar patterns emerge across other learners. A student interested in Minecraft seeks to communicate with players in Japan, shaping goals around interaction within that community. Another learner pursues French in order to engage more fully with Canadian hockey culture, selecting resources and communicative tasks aligned with that interest. In each case, the learner is not simply engaging with content; the learner is constructing a pathway in which language serves a purpose that is already valued.

Cognitive theory provides a clear explanation for why such approaches are effective. Learning that connects to existing schemas—structures of prior knowledge and experience—is more readily encoded and retrieved [10]. When new information is integrated into a meaningful framework, it is more likely to be retained and transferred. Conversely, information presented in isolation, without connection to prior knowledge or purpose, is less likely to persist.

Motivation research reinforces this dynamic. Deci's Self-Determination Theory [11] identifies autonomy, competence, and relatedness as key drivers of intrinsic motivation. Pink [12] extends this framework by emphasizing autonomy in time, task, team, and technique. FILL environments operationalize these principles in concrete ways. Learners determine what they study, how they approach it, the pace at which they progress, and the communities with which they engage. This alignment between design and motivation is not incidental; it is foundational.

Importantly, this does not imply that all learning must originate solely from existing interests. Rather, it suggests that meaningful engagement emerges when learners are positioned as active participants in shaping context. The role of the teacher is critical in this process. Through careful facilitation, learners are guided to expand their interests, connect them to broader domains, and develop goals that extend beyond initial motivations. What begins as an interest in music, gaming, or sport can evolve into deeper linguistic, cultural, and intellectual engagement.

The implications for memory are equally significant. Bjork's research on "desirable difficulties" suggests that learning is strengthened when learners engage in effortful processing within meaningful contexts [13]. When learners are invested in the outcome, they are more willing to persist through challenge, revise their understanding, and integrate feedback. In contrast, when tasks are externally imposed and lack personal relevance, learners are more likely to disengage or adopt surface-level strategies aimed at completion rather than understanding.

In this sense, the distinction between temporary and durable learning becomes central. Temporary learning is often sufficient to meet external expectations but does not endure. Durable learning, by contrast, becomes part of the learner's repertoire—available for use, extension, and transfer. FILL environments are designed to support the latter by ensuring that context, purpose, and motivation are not peripheral considerations but central elements of the learning process.

As learning environments continue to evolve in response to technological and societal change, the importance of meaning will only increase. Access to information can be expanded indefinitely, but without relevance, such access has limited value. By placing the learner at the center of context creation, FILL offers a model in which meaning, memory, and motivation are aligned, increasing the likelihood that learning will not only occur, but persist.

5. Facilitated Interdependent Language Learning as Structural Innovation

Facilitated Interdependent Language Learning represents a departure from course-based organization toward a proficiency-based model that aligns more closely with how learning actually develops. In FILL environments, learners pursue proficiency in languages of their choice, guided by clearly defined descriptors such as the NCSSFL-ACTFL Can-Do Statements [1]. These descriptors provide a transparent framework for goal-setting, progress monitoring, and the accumulation of evidence over time.

The role of the teacher shifts accordingly. Rather than delivering a uniform curriculum, the teacher functions as a facilitator, drawing on expertise in language acquisition, feedback, and assessment to support learners whose pathways diverge in language, pace, and focus. Curriculum becomes one resource among many. Time becomes flexible rather than fixed. Progress is measured through demonstrated ability rather than completion of prescribed units.

What distinguishes FILL from many conceptual models of personalized learning is that it has been implemented in operational settings with measurable outcomes. In work documented by Welch and Allen in *The Language Educator*, FILL classrooms have demonstrated that learners working across multiple languages within a single facilitated environment can achieve externally validated proficiency outcomes that equal or exceed those typically associated with traditional course sequences. In one such setting, learners participating in FILL achieved proficiency gains verified through the STAMP (Standards-based Measurement of Proficiency) assessment, with some students earning the equivalent of multiple years of language credit within a single academic year through demonstrated proficiency rather than seat time [14].

This distinction is critical. Because STAMP is an external, standardized assessment aligned to ACTFL proficiency levels, it provides independent validation of what learners can actually do with the language. These results suggest that when learners are given agency, supported through interdependent structures, and guided by clear proficiency targets, they are capable of achieving significant growth without reliance on traditional course sequences.

The implications extend beyond language learning. What FILL makes visible is not simply an alternative instructional approach, but a different organizing logic—one in which learning trajectories are defined by evidence of capability rather than by time spent in a system. In this sense, FILL functions not as an innovation within the existing structure, but as a prototype of a structurally different system.

6. Interdependence and the Social Dimension of Learning

A persistent misconception surrounding personalized learning is that it leads to isolation—learners working independently, often mediated primarily through technology, progressing through predetermined pathways at their own pace. This model, while efficient in certain contexts, risks reducing learning to an individual transaction between learner and content. Facilitated Interdependent Language Learning stands in direct contrast to this interpretation.

FILL is not independent learning in which students sit in front of a computer working through a prescribed sequence. It is a dynamic, socially mediated process in which learner agency is situated within a network of relationships that includes the teacher, peers, and a broader ecosystem of resources. The distinction is critical. Independence suggests separation; interdependence reflects connection.

At the center of this structure is the teacher, whose role is not diminished but fundamentally redefined. Rather than delivering content, the teacher operates as a facilitator grounded in expertise in second language acquisition theory and proficiency development. Research in SLA underscores that language development is a complex, nonlinear process shaped by meaningful input, interaction, and feedback [3]. Within a FILL environment, the teacher draws on this expertise to guide learners in setting goals at an appropriate level of proficiency, ensuring that targets are both challenging and attainable.

This guidance extends beyond goal-setting. Learners are supported in identifying and evaluating resources aligned with their objectives, whether those resources take the form of authentic texts, digital tools, community interactions, or AI-supported environments. The teacher also plays a critical role in helping learners select and refine artifacts that genuinely reflect their progress. In this sense, assessment becomes a collaborative process, grounded in shared understanding of proficiency rather than unilateral judgment.

The student-teacher relationship is therefore transformed. Authority does not disappear, but it shifts from control over content to expertise in process. The teacher becomes a partner in learning, one who observes, questions, guides, and challenges, ensuring that learners remain aligned with meaningful progress rather than superficial completion.

Equally significant is the role of peers in shaping the learning environment. The social dimension of FILL is not incidental; it is integral to its design. Learners regularly engage in discussions about their progress, sharing strategies, suggesting resources, and reflecting on challenges. These interactions create a community of practice in which learning is distributed across participants rather than centralized in the teacher.

Specific classroom practices further reinforce this interdependence. In one implementation, learners are asked to engage weekly with a current event drawn from a primary source in their chosen language. This task serves multiple purposes. It provides authentic input, connects language learning to real-world

contexts, and introduces cultural perspectives. When learners come together to discuss these events—often in a shared language such as English—they are able to examine how the same event is represented differently across linguistic and cultural contexts. This not only deepens language awareness but also fosters intercultural understanding, aligning with broader educational goals.

Shared thematic work can also anchor the learning community. For example, a class might engage with a common focus such as one of the United Nations Sustainable Development Goals. Within this shared frame, learners adapt their individual Can-Do goals to align with the broader theme, working in their respective languages while contributing to a collective inquiry. This creates a layered learning experience: individualized in execution, but communal in purpose.

What emerges from these structures is a form of social learning that is no longer mediated solely through the teacher. Instead, it becomes dynamic, distributed, and responsive. Learners interact with one another directly, drawing on diverse experiences and perspectives. The teacher remains central, but not as the sole conduit of knowledge. Rather, the teacher supports the conditions under which meaningful interaction and learning can occur.

This reconfiguration reflects broader insights from sociocultural theories of learning, which emphasize the role of interaction, collaboration, and shared activity in cognitive development. Learning, in this view, is not an individual accumulation of knowledge but a process of participation in socially mediated practices.

In a networked world, where knowledge is distributed and constantly evolving, such a model becomes not only desirable but necessary. Interdependence is not simply a pedagogical choice; it is a reflection of the conditions under which learning now takes place. FILL makes this visible by embedding interdependence into the structure of learning itself, demonstrating that personalization and community are not opposing forces, but mutually reinforcing dimensions of a coherent system.

7. Assessment as Evidence: Reframing Error, Growth, and Proficiency

Perhaps the most consequential shift in a FILL approach lies in how assessment is understood. In traditional systems, assessment frequently functions as a mechanism of judgment. Grades summarize performance, averages determine outcomes, and errors are treated as deficits to be minimized. While these practices provide a sense of order, they often obscure the developmental nature of learning and limit opportunities for growth.

A substantial body of research challenges the assumption that errors are simply indicators of failure. In second language acquisition, errors are widely understood as evidence of developmental progress, reflecting the learner's evolving internal system of language [3]. Similarly, Selinker's research on interlanguage development suggests that learners must pass through stages characterized by approximation and restructuring, during which errors are not only inevitable but necessary [15].

Cognitive science reinforces this perspective. Productive struggle—engaging with challenges that are within reach but not yet mastered—has been shown by Bjork and Bjork to strengthen learning and retention [16]. When learners are allowed to attempt, fail, receive feedback, and try again, they engage in processes that deepen understanding and support long-term memory formation. Conversely, environments that penalize error too quickly can lead learners to avoid risk, reducing opportunities for meaningful learning.

Within this context, FILL reframes assessment as the accumulation of evidence rather than the assignment of judgment. Learners collect artifacts that demonstrate what they can do across interpretive, interpersonal, and presentational modes of communication, guided by proficiency descriptors. Tools such as LinguaFolio support this process by enabling learners to set goals, reflect on their progress, and curate evidence over time [17].

External assessments, including STAMP, play a critical role by providing independent validation of proficiency. Because these assessments are not tied to a specific curriculum or pacing structure, they allow learning that emerges through diverse and individualized pathways to be recognized with credibility. This is particularly important in FILL environments, where learners are not following a uniform sequence of instruction.

An asset-based perspective underlies this approach [18]. Rather than focusing on what learners cannot yet do, assessment emphasizes what they can demonstrate and how they are progressing. Errors are reframed as data—signals that inform next steps rather than endpoints that define capability.

This shift has significant implications for learner behavior. When assessment is experienced as judgment, learners often aim to avoid mistakes and complete tasks efficiently. When it is experienced as evidence, learners become more willing to take risks, revise their work, and engage in sustained effort. The focus moves from performance to growth, from correctness to capability.

In this sense, assessment becomes not a separate phase of learning, but an integral part of it. It documents progress, informs decisions, and supports the development of proficiency in ways that more closely align with the realities of learning.

8. Artificial Intelligence as Structural Catalyst

Artificial intelligence has introduced new capabilities that challenge existing educational structures. Learners can access explanations, generate practice, and receive feedback without relying exclusively on formal instruction. These developments highlight the limitations of systems centered on content delivery.

In many contexts, responses have focused on restricting or regulating AI use. An alternative approach is to redesign learning environments so that such tools become integral to the process. In FILL environments, AI functions as one of many resources available to learners, supporting engagement rather than replacing it.

This perspective shifts the focus from tool management to system design. The question is not how to control AI, but how to create structures in which its use supports meaningful learning.

9. Emerging Developments in Higher Education

While FILL has developed primarily in secondary education, related approaches are emerging in higher education. Institutions such as the University of Washington and the University of Nebraska have contributed to the development of tools supporting learner-centered, proficiency-based approaches. Research in self-regulated learning at institutions including Michigan State University further supports the importance of goal-setting, reflection, and autonomy.

These developments remain emergent, but they indicate a growing recognition that traditional course-based structures may not fully align with contemporary learning needs. They suggest the possibility of broader systemic change.

Conclusion: Scaling Learning in a Human System

Efforts to honor human variation have often focused on adapting instruction within existing systems. Historically, scale has been achieved mechanically. Standardized curricula, synchronized pacing, and uniform assessments allow systems to manage large numbers of learners by minimizing variation. This approach produces efficiency, but it does so by constraining the very differences that characterize how individuals learn. A FILL approach suggests a different conception of scale—one that is not imposed through uniformity but emerges through the system's capacity to support variation. In such an environment, learners are not required to follow identical paths in order for the system to function. Instead, diverse trajectories are expected, supported, and connected through shared structures of proficiency, facilitation, and evidence. Scale, in this sense, is not achieved by reducing difference, but by designing for it. What appears complex at the level of the individual becomes coherent at the level of the system, not because it has been standardized, but because it has been intentionally structured to accommodate the full range of human learning.

Implementing Discussion-Based Pedagogy in the EFL Classroom: Frameworks, Practices, and Emerging Challenges

Hilda Terlemezyan

Plovdiv university 'Paisii Hilendarski', Bulgaria

Abstract

This paper synthesizes recent research on discussion-based pedagogy in English as a Foreign Language (EFL) classrooms, with particular attention to the period from 2016 to 2025. It examines how discussion-based learning supports communicative competence, critical thinking, motivation, and intercultural awareness, and it considers the classroom conditions that enable or constrain these outcomes. The review is informed by key perspectives in language education, including Communicative Language Teaching, Sociocultural Theory, Translanguaging Pedagogy, and Interactional Competence Theory, all of which frame classroom discussion as a socially situated process of meaning-making. Across the literature, five major discussion types emerge: critical and analytical discussions, translanguaging-based discussions, drama and role-play discussions, task-based and problem-solving discussions, and global or online discussions. The review also shows that technology has widened the scope of discussion through blended learning, online platforms, and AI-mediated interaction. These innovations can extend participation, provide feedback, and support multilingual communication, but their pedagogical value depends on teacher mediation and digital literacy. At the same time, the literature identifies persistent challenges, including unequal participation, tension between fluency and accuracy, limited teacher preparation, assessment constraints, and the influence of exam-oriented or teacher-centered educational cultures. The paper concludes that discussion-based pedagogy remains one of the most effective and adaptable approaches in EFL education, provided that it is scaffolded carefully, aligned with curriculum and assessment, and supported by institutional and technological resources.

Keywords: *discussion-based pedagogy, EFL, communicative competence, translanguaging, online discussion*

1. Introduction

The rise of communicative and learner-centered paradigms has significantly reshaped English as a Foreign Language (EFL) education. Within this shift, classroom discussion has emerged as a central pedagogical practice for promoting authentic interaction, critical engagement, and collaborative meaning-making. Rather than treating language as a set of isolated forms, discussion-based pedagogy positions it as a social resource through which learners express ideas, negotiate understanding, and participate in meaningful exchange [1], [2].

This orientation reflects broader developments in contemporary language teaching, particularly the emphasis on communicative competence, task-based learning, and intercultural communication. Through discussion, learners apply linguistic knowledge in purposeful contexts, bridge form and meaning, and build confidence in using English as a medium of interaction. At the same time, discussion supports wider educational aims by encouraging perspective-taking, reasoning, and learner agency [3], [4].

Despite these advantages, discussion-based pedagogy is not always easy to implement. In many EFL settings, teachers work within exam-oriented systems, large classes, or instructional traditions that still favor teacher-fronted delivery and accuracy-based assessment. As a result, discussions may be constrained by limited teacher preparation, unequal participation, and insufficient institutional support [5]. This paper examines discussion-based pedagogy as both a promising and a complex approach to EFL teaching.

2. Literature Review

Research consistently demonstrates that discussion-based pedagogy is highly effective in EFL education, particularly for developing communicative competence, motivation, and intercultural awareness. Across diverse contexts, structured discussions improve both linguistic accuracy and

communicative fluency by engaging learners in purposeful interaction [6], [7]. These findings are supported by key perspectives in language education: Communicative Language Teaching positions discussion as authentic language use; Sociocultural Theory explains learning through interaction, mediation, and scaffolding; Translanguaging Pedagogy highlights the role of learners' full linguistic repertoires; and Interactional Competence Theory emphasizes the conversational skills developed through participation [1], [2], [8], [9].

2.1 Discussion and Communicative Competence

A substantial body of research identifies discussion as central to communicative competence. By requiring learners to express opinions, negotiate meaning, and respond spontaneously, discussions promote language use that is functional, contextualized, and socially meaningful. Al Zahrani and Elyas found that structured discussion tasks improved discourse organization and the ability to articulate opinions, while Park showed that discussions based on authentic news texts enhanced vocabulary development, sociocultural understanding, and critical engagement [6], [10]

From a sociocultural perspective, discussion creates opportunities for learners to build knowledge collaboratively through feedback, mediation, and scaffolding within interaction [8]. Meta-analytic evidence likewise confirms that oral interaction remains one of the most effective means of fostering communicative competence, especially when discussions are guided by meaningful prompts and clear communicative goals [7]. Task-based discussions are especially effective because they embed language in problem-solving and shared goals, leading to gains in fluency, accuracy, and learner engagement [11].

2.2 Technology, Multimodality, and AI-Mediated Discussion

Recent studies show that technology has significantly expanded the scope of discussion-based pedagogy. In blended and flipped learning environments, learners can engage with materials before class and use classroom time for deeper interaction, reflection, and feedback [12]. Online and blended discussion platforms enhance learner autonomy and communicative depth, while digital discussion boards promote reflection and peer collaboration [13], [14]

These developments also reinforce the multimodal nature of contemporary EFL communication, where interaction increasingly combines spoken language, writing, visuals, and digital tools. Within this context, AI has emerged as a major development. AI tools, including ChatGPT, can support reflective discussion, provide reformulations and prompts, and facilitate translanguaging through translation and adaptive feedback [15], [16]. Such tools may lower anxiety, increase confidence, and widen participation, especially when their use is carefully mediated by teachers.

2.3 Teacher Readiness and Digital Literacy

The effectiveness of discussion-based pedagogy depends heavily on teacher readiness. As discussions become more technologically mediated, teachers must combine digital competence with sound pedagogical judgment. This includes designing meaningful discussion tasks, maintaining communicative authenticity, and ensuring that participation remains equitable [3], [17]. Without deliberate facilitation, discussion spaces–especially online ones–can reproduce unequal participation patterns, with more confident or proficient learners dominating exchanges [18].

From this perspective, the teacher's role is less that of information provider and more that of mediator, organizer, and interactional guide. Teachers need to scaffold discussion, manage turn-taking, support quieter learners, and assess communicative performance in ways that value interaction as well as accuracy. They must also foster critical digital literacy so that learners can participate responsibly and effectively in digital and intercultural communication [8], [19].

2.4 Motivation, Inclusion, and Intercultural Growth

Beyond linguistic gains, discussion-based pedagogy has a strong affective dimension. Research indicates that discussions can reduce foreign language anxiety and increase willingness to communicate by creating supportive, collaborative environments in which learners can test ideas without excessive fear of correction [20]. Small-group interaction is particularly helpful in this regard, as it lowers performance pressure and encourages peer support.

This motivational value is reinforced when learners are given space to express personal views and draw, when necessary, on familiar linguistic resources. Translanguaging-informed discussion practices can enhance both inclusion and confidence, particularly for learners with lower proficiency [21], [16]. Discussion-based pedagogy also contributes significantly to intercultural communicative competence. Discussions centered on cultural themes and global issues foster intercultural sensitivity, empathy, and critical cultural awareness [22], [23]. Cross-border online discussions, in particular, improve communicative flexibility and global perspective [24].

3. Findings: Types and Implementation of Discussions

The literature identifies five major forms of discussion-based pedagogy in EFL classrooms: critical and analytical discussions, translanguaging-based discussions, drama and role-play discussions, task-based and problem-solving discussions, and global or online discussions. Although each type emphasizes different learning goals, all are grounded in interaction, learner agency, and collaborative meaning-making.

3.1 Critical and Analytical Discussions

In classroom practice, these discussions are most effective when they are carefully staged rather than introduced as free debate from the outset. Pre-discussion reading, question prompts, and role allocation help learners move from comprehension to analysis and finally to position-taking. This structure is especially important in EFL settings where students may have ideas to share but lack the discourse markers, rhetorical language, or confidence needed to sustain argument in English. When teachers model useful phrases for agreeing, disagreeing, qualifying claims, and citing evidence, learners are better able to participate in academically oriented discussion without losing spontaneity.

Critical discussion also supports disciplinary literacy by familiarizing learners with the language of reasoning, comparison, and evaluation. In this sense, its value extends beyond speaking practice. Students learn how to formulate defensible positions, respond to challenges, and organize ideas coherently for an audience. These abilities are central not only to oral communication but also to academic writing and presentation tasks, making critical discussion a particularly productive bridge between language learning and broader educational outcomes [6], [10].

Critical and analytical discussions include debates, Socratic seminars, and thematic discussions that require learners to justify opinions, evaluate ideas, and respond to alternative perspectives. These formats are especially effective for developing higher-order thinking alongside linguistic competence [6], [10]. They move learners beyond comprehension toward interpretation and argumentation, supporting participation in academic and intercultural discourse communities.

3.2 Translanguaging-Based Discussions

A further strength of translanguaging-based discussion is that it can be strategically controlled rather than left entirely open. Teachers may, for example, allow learners to brainstorm in the first language, compare concepts bilingually, and then report or summarize in English. Such sequencing preserves English as the target language while recognizing that multilingual learners often think through complex ideas more effectively when they can move across languages. This is particularly valuable in mixed-ability classrooms, where selective translanguaging can narrow participation gaps and help less proficient students remain cognitively engaged.

The literature also suggests that translanguaging changes the classroom climate by legitimizing learners' identities and reducing the stigma attached to partial or hesitant English production. Rather than interpreting first-language use as failure, this approach treats it as a temporary mediational resource that supports fuller participation in discussion. In digital settings, this process can be amplified through captions, translation features, and bilingual AI prompts, which make multilingual interaction more manageable and inclusive [16], [21].

Translanguaging-based discussions allow learners to draw on both English and their first language(s) to clarify meaning, build ideas, and sustain participation. In multilingual EFL classrooms, this practice has been shown to increase inclusion, reduce anxiety, and support conceptual understanding, especially for learners with lower proficiency [21], [16]. Digital and AI-supported environments can strengthen such practices by providing translation, reformulation, and multilingual feedback.

3.3 Drama and Role-Play Discussions

Another advantage of drama-based discussion is that it helps learners rehearse language for socially complex situations that are difficult to practice through ordinary classroom conversation. Simulated service encounters, job interviews, negotiations, or conflict-resolution scenarios require students to interpret roles, manage politeness, and adjust register in real time. Because meaning is carried not only by words but also by gesture, tone, and stance, these activities strengthen pragmatic and sociolinguistic awareness in ways that conventional question-and-answer exchanges often do not.

Drama-based formats also create space for reflection after performance. Post-task debriefing allows learners to analyze what expressions were effective, where misunderstandings occurred, and how different linguistic choices shaped the interaction. This reflective stage is important because it turns performance into explicit learning, linking creative participation with clearer awareness of discourse conventions and interactional choices [25].

Drama and role-play discussions introduce an embodied and performative dimension to language learning. By simulating interviews, negotiations, storytelling, or everyday social encounters, these activities allow learners to practice language in realistic and emotionally engaging contexts. They are especially useful for developing pragmatic awareness, pronunciation, and sociolinguistic sensitivity [25].

3.4 Task-Based and Problem-Solving Discussions

Task-based discussion is particularly valuable in contexts where English exposure outside the classroom is limited. Because learners are required to reach an outcome together, they have repeated reasons to ask follow-up questions, clarify intention, and reformulate ideas. These features generate rich opportunities for negotiation of meaning, which has long been regarded as one of the central mechanisms of second-language development. The collaborative nature of task completion also helps shift attention away from fear of error and toward shared accomplishment.

Not all tasks, however, generate equally rich discussion. Research indicates that open problems, decision-making tasks, and information-gap activities are generally more productive than highly predictable exercises because they require genuine exchange and multiple possible responses. The pedagogical implication is that teachers must design tasks with communicative pressure and intellectual engagement in mind; otherwise, discussion may become procedural rather than exploratory [7], [11], [13].

Task-based and problem-solving discussions are among the most strongly supported forms of discussion in literature. In these activities, learners use language to solve a problem, make a decision, or plan a project. Their effectiveness lies in the fact that language is used as a tool for achieving shared outcomes rather than as an end in itself, creating conditions for negotiation of meaning, peer feedback, and collaborative reasoning [11], [13].

3.5 Global and Online Discussions

The educational significance of global and online discussions lies not only in the expansion of interactional space but also in the diversification of audiences. When learners speak or write to peers from other institutions or countries, English becomes a real medium of exchange rather than a classroom display language. This shift often increases investment and attentiveness because students recognize that successful communication now depends on clarity, responsiveness, and intercultural sensitivity, not simply on meeting a teacher's expectations.

At the same time, online discussion introduces new demands. Learners must manage delayed responses, multimodal cues, and platform-specific conventions such as chat etiquette, camera use, or threaded replies. These demands can be pedagogically valuable because they develop digital communication skills alongside language competence. When thoughtfully moderated, online discussion therefore extends the scope of EFL pedagogy to include not only spoken fluency but also online presence, multimodal expression, and responsible participation in networked communication [15], [22], [24].

Across these five formats, a common principle emerges: discussion-based pedagogy works best when interaction is purposeful, inclusive, and matched to learner needs. Some formats privilege reasoning, others support multilingual mediation or creative role-taking, and still others foreground collaboration or intercultural exchange. Yet all require learners to listen, respond, adapt, and co-construct meaning, which explains why discussion remains one of the most productive vehicles for communicative development in EFL classrooms.

Global and online discussions represent the most recent expansion of discussion-based pedagogy. Through videoconferencing, online forums, and international collaboration projects, EFL learners can interact with peers across cultures and contexts. These formats develop intercultural awareness as well as digital and multimodal literacy, since learners often combine written, spoken, and visual communication across platforms [24], [22]. AI tools further extend these possibilities by supporting multilingual interaction, automated feedback, and individualized prompts [15], [16].

4. Discussion: Advantages and Challenges

Discussion-based pedagogy offers a comprehensive framework for developing linguistic, cognitive, affective, and intercultural competencies in EFL education. By positioning language as a tool for interaction and meaning-making, it transforms the classroom into a space of collaborative inquiry.

4.1 Benefits

Another important benefit is that discussion enables learners to integrate multiple dimensions of language performance at the same time. In a single discussion task, students may need to retrieve vocabulary, monitor grammar, interpret a peer's intention, choose an appropriate stance, and react within time pressure. This integration mirrors real communication far more closely than decontextualized exercises. For that reason, discussion often provides stronger evidence of usable proficiency than activities that isolate one language component at a time.

Discussion also supports the development of learner agency. Because students must make choices about what to say, how strongly to say it, and how to respond to others, they are positioned as active contributors rather than recipients of content. Over time, this can reshape classroom dynamics by making participation more dialogic and less dependent on teacher initiation. Such a shift is particularly valuable in EFL environments where opportunities for extended learner talk are otherwise limited.

From a longer-term perspective, the benefits of discussion-based pedagogy may be cumulative. Repeated exposure to structured discussion can build habits of listening carefully, formulating ideas under pressure, and tolerating ambiguity during communication. These are not only linguistic skills but also transferable academic and professional competencies. As a result, discussion-based learning contributes to the wider educational aim of preparing learners to participate effectively in collaborative and multilingual environments [7], [8], [9].

From a linguistic perspective, discussion-based learning promotes fluency, lexical development, and pragmatic competence. Unlike teacher-centered instruction, it requires learners to produce extended discourse, respond spontaneously, and adapt language to context and audience [13], [9]. Cognitively, it supports critical thinking and metacognitive awareness by encouraging learners to evaluate information, construct arguments, and reflect on different perspectives.

Discussion also has important affective and social benefits. It reduces foreign language anxiety, increases willingness to communicate, and fosters a sense of community through collaboration and peer support [20]. In addition, by engaging learners with cultural topics and global issues, it strengthens intercultural communicative competence and prepares students for more diverse communicative contexts [22], [23].

4.2 Persistent Challenges

A further challenge concerns the quality of discussion prompts and task framing. Even when teachers allocate time for discussion, interaction can remain superficial if questions invite only short, predictable answers or if students do not have sufficient conceptual preparation. Effective discussion depends on tasks that are cognitively engaging, linguistically accessible, and open enough to sustain multiple viewpoints. In practice, designing such tasks can be demanding, particularly when teachers work with rigid textbooks or limited planning time.

Assessment poses an additional difficulty because discussion performance is dynamic and distributed across participants. It is often easier to evaluate an individual written product than to capture the quality of contribution, responsiveness, and collaboration in a live discussion. Without clear rubrics, assessment may appear subjective, which can discourage teachers from integrating discussion regularly. Yet if discussion is not assessed at all, students may interpret it as peripheral rather than central to learning.

There are also challenges related to learner beliefs. Some students may equate good language learning with correction, memorization, and teacher explanation, and may therefore view discussion as less serious or less efficient. Others may avoid speaking because they associate public language use with

loss of face or exposure of weakness. For discussion-based pedagogy to succeed, teachers often need to address these beliefs explicitly, showing students how interaction contributes to learning and why partial, developing language can still be pedagogically valuable [5], [18], [20].
Despite these advantages, several challenges complicate implementation. Teachers often struggle to balance fluency and accuracy when providing feedback. Unequal participation is another common problem, as more confident or proficient learners may dominate discussions while others remain passive [18]. Teacher preparedness also remains a key issue, since effective facilitation requires expertise in scaffolding, interaction management, and digital pedagogy [17], [19].
Institutional constraints such as large classes, rigid curricula, and exam-oriented systems often leave limited space for open-ended discussion [7]. Cultural factors may also influence participation, especially where learners are accustomed to teacher-centered instruction and hesitate to express opinions or challenge others. These conditions make discussion-based pedagogy highly effective, but also strongly context-dependent.

5. Pedagogical Implications

The literature points to several important implications for EFL teaching. First, discussion must be scaffolded through pre-discussion support, role assignment, and gradual progression from controlled interaction to more open-ended exchange. Second, teacher development is essential. Teachers need preparation not only in language instruction, but also in facilitation, digital pedagogy, and assessment of interaction. Finally, institutions must provide supportive conditions, including reasonable class sizes, flexible classroom layouts, and assessment practices that recognize communicative performance.
These implications suggest that discussion-based pedagogy should be planned as a coherent instructional approach rather than treated as an occasional speaking activity. When discussion is added only at the end of a lesson, without preparation, follow-up, or assessment, its impact is often limited. By contrast, when it is integrated into lesson objectives, materials, and classroom routines, learners begin to understand that discussion is a central route to language development rather than a supplementary exercise.
Scaffolding is especially important at the level of discourse. Many learners know relevant vocabulary or grammar but struggle to enter a conversation, extend a turn, or disagree politely. For this reason, discussion instruction should include discourse frames, model exchanges, and explicit attention to interactional moves such as inviting a partner in, asking for clarification, or building on a previous point. These supports help transform passive linguistic knowledge into usable communicative behavior.
Teachers may also need to scaffold content knowledge. Discussions are rarely productive when learners have little to say about the topic. Short readings, visuals, case studies, or advance questions can provide the conceptual foundation needed for richer interaction. In this sense, effective scaffolding supports both language and ideas, ensuring that students are prepared to participate meaningfully rather than merely speak for the sake of speaking.
Teacher development should therefore include opportunities to observe, analyze, and rehearse discussion facilitation. Watching recordings of classroom interaction, examining transcripts, or engaging in peer observation can help teachers notice patterns that are otherwise easy to miss, such as unequal turn distribution, over-scaffolding, or missed opportunities for follow-up questioning. This kind of professional reflection is particularly useful because discussion quality often depends on subtle interactional decisions made in real time.
Facilitation also involves knowing when not to intervene. Teachers who dominate the interaction, answer too quickly, or correct every error may unintentionally reduce learner initiative. Professional development should therefore help teachers distinguish between supportive mediation and excessive control, so that discussions remain both structured and genuinely learner-centered.
In digitally mediated discussion, pedagogy must also account for access and usability. Teachers need contingency plans for uneven connectivity, different device types, and varying levels of student familiarity with online platforms. Seemingly technical issues can quickly become participation issues if some learners cannot follow the discussion smoothly or are unsure how to contribute in a particular format. Digital literacy, therefore, is inseparable from inclusion.
AI literacy should likewise include ethical and critical dimensions. Learners and teachers need guidance on when AI support is helpful, how to verify AI-generated language, and how to avoid over-reliance on automated responses that reduce authentic interaction. Used well, AI can expand practice and feedback; used uncritically, it can narrow learner agency by substituting generated language for genuine communicative effort.

Curriculum reform also requires progression. Discussion expectations should develop across levels, beginning with simple turn-taking and opinion sharing and moving toward argumentation, collaborative problem-solving, and intercultural dialogue. A sequenced curriculum makes it easier for teachers to align topics, tasks, and assessment with realistic developmental goals rather than treating discussion as a generic ability that should emerge automatically.

Similarly, assessment should balance individual accountability with recognition of discussion as co-constructed performance. Rubrics can include dimensions such as relevance, clarity, responsiveness, support for others' contributions, and strategic language use. When learners understand these criteria, they are more likely to approach discussion as a serious academic practice and not merely as informal conversation.

Institutional support also includes symbolic recognition. When school policies, timetables, and evaluation systems prioritize communicative outcomes, teachers are more likely to invest in discussion-rich pedagogy. Conversely, when oral interaction is absent from program goals or assessment frameworks, even motivated teachers may struggle to justify the time discussion requires. Sustainable implementation therefore depends on alignment between classroom practice and institutional expectations.

The literature points to several important implications for EFL teaching. First, discussion must be scaffolded through pre-discussion vocabulary work, guiding questions, role assignments, and sentence stems. Pair work and guided small-group tasks can prepare learners for more open-ended formats such as debates or intercultural discussions [8].

Second, teacher development is essential. Teachers need preparation not only in language instruction, but also in facilitation, assessment, digital literacy, and ethical AI use. Third, curricula and assessment practices should better reflect the value of oral interaction by including objectives and rubrics related to turn-taking, argumentation, negotiation of meaning, and intercultural responsiveness [7], [19].

Finally, institutions must provide supportive conditions, including reasonable class sizes, flexible classroom layouts, access to technology, and time for professional development. When these conditions are in place, discussion can function not simply as an activity but as a central mode of language learning.

6. Conclusion

Discussion-based pedagogy is one of the most significant developments in contemporary EFL education because it treats language as a tool for interaction, inquiry, and collaboration. Across the literature, it emerges as a powerful means of developing communicative competence, critical thinking, motivation, and intercultural awareness.

Its effectiveness is supported by complementary theoretical perspectives and by a wide range of classroom practices, from critical discussion and translanguaging to task-based, drama-based, and global online interaction. At the same time, its success depends on careful scaffolding, informed facilitation, technological awareness, and institutional support.

Looking ahead, digital and AI-mediated discussion is likely to play an increasingly important role in EFL education. These developments offer new opportunities for feedback, multilingual support, and cross-cultural interaction, but they should be used to extend human dialogue rather than replace it. In this sense, discussion-based pedagogy is not simply a teaching technique; it is a pedagogical orientation that places communication, participation, and shared inquiry at the center of language education.

Abstract

In today's linguistically diverse higher education contexts, teaching bi/multilingual disciplinary literacies (BMDLs) becomes more challenging when both teachers and students are non-native speakers of the language of instruction. This leads to university teachers' increased expectations for students' secondary education in disciplinary literacy (DL) development. Considerable BMDL studies [e.g. 1, 2] have focused on secondary education, yet challenges and demands in higher education settings remain significantly under-researched. This study explored university teachers' perspectives on the challenges they and their students face regarding BMDL practices. It also investigated teachers' expectations of both their students and the students' secondary education regarding BMDL development. The data were collected through semi-structured interviews conducted across countries, disciplines, and languages of instruction, and were analysed both inductively and deductively. The participants were 41 university teachers from Türkiye (n=10), Albania (n=13), the Czech Republic (n=10) and Kuwait (n=8), who taught natural (12) and social sciences (29) in a language other than their first language. The languages of instruction were English, German and Arabic. While most participants encountered challenges adapting pedagogical strategies to meet their students' needs for BMDL development, some reported difficulties stemming from teaching in a foreign language. Perceived student difficulties involved aspects of DL comprehension, learning, and application, and these reported difficulties differed across disciplines. Findings demonstrated that expectations from secondary education reflected the challenges the participants experienced; however, they varied across disciplines, mostly centring on basic discipline-specific knowledge and skills, familiarity with concepts and analytical skills, and students' equipment with the necessary language skills. By identifying challenges university teachers face in bi/multilingual classrooms and shedding light on their expectations, this study contributes to a better understanding of current issues in BMDL instruction and offers valuable insights for future pedagogical practices and policy development in both secondary and higher education.

Keywords: *bi- and multilingual disciplinary literacies, disciplinary literacies, foreign language instruction, teachers' expectations, teachers' challenges, tertiary education*

1. Introduction

The internationalisation of higher education has brought a widespread shift toward using second or foreign languages as media of instruction. In these contexts, both instructors and students must engage with complex academic content through a language that is not their first, foregrounding the importance of disciplinary literacies (DL), the capacity to think, communicate, and construct knowledge in discipline-specific ways [3, 4]. When DL must be developed across two or more languages, the concept extends to bi/multilingual disciplinary literacies (BMDLs), an integrated competence that involves the coordination of language, content, cognition, and semiotic resources [5].

Despite the scale of this shift, empirical research on BMDLs in higher education remains limited. Existing work has focused on secondary education [1], challenges in general English-medium instruction (EMI) [6], or students' perspectives [2]. What looks largely absent in the related literature is a systematic examination of how university teachers experience BMDL challenges, particularly in relation to students' secondary education preparation. This study addresses this gap by investigating: (a) teachers' challenges in BMDL instruction, (b) their perceptions of student difficulties, and (c) their expectations regarding student preparedness and the role of secondary education. Drawing on interviews with 41 university teachers from four countries, across natural and social sciences taught through three different languages (i.e., English, German, Arabic), the study offers a cross-contextual account of how BMDLs are experienced in contemporary higher education.

2. Literature Review

2.1 Challenges in BMDL Instruction

DL encompasses discipline-specific vocabulary, epistemological orientations, and modes of reasoning that go beyond general language proficiency [13]. In multilingual settings, this extends to BMDLs, navigating disciplinary meaning-making across multiple languages and semiotic resources. Dafouz and Smit's [2] ROAD-MAPPING framework illustrates how language, content, and institutional context interact in internationalised universities, and positions BMDLs as an integrated competence rather than an additive extension of language skills.

Empirical research in EMI contexts shows that teachers and students struggle to negotiate complex disciplinary meanings in a foreign language, limiting students` participation and knowledge construction [6]. Crucially, these difficulties are not reducible to language proficiency alone. Soruç et al. [6] demonstrate that language-related challenges are shaped by the interaction between English proficiency and disciplinary knowledge, while Kamaşak and Sahan [7] show that academic success reflects a combination of language proficiency, L2 attitudes, and prior disciplinary preparation. Students' struggles often reflect unfamiliarity with discipline-specific practices such as constructing arguments, interpreting evidence, and communicating in ways valued by academic communities rather than linguistic deficiency alone. Despite this growing understanding, comparatively few studies examine how university teachers navigate the interplay between disciplinary knowledge, language, and cognition, the perspective this study foregrounds.

2.2 The Secondary-Tertiary Transition and Teacher Expectations

The secondary-tertiary transition is a critical juncture at which mismatches between expectations and preparedness become apparent. Students frequently enter university with limited disciplinary thinking, insufficient academic literacy, and underdeveloped critical abilities [7]. EMI research sharpens this picture: Aizawa and Rose [8] found that limited secondary-level English exposure significantly hampered university EMI transitions, and Rose et al.'s [9] systematic review confirmed that students from L1-medium secondary schools face greater challenges, particularly in academic writing.

McKinley [10] argues that higher education preparedness must encompass disciplinary knowledge, academic socialisation, and critical engagement, rather than merely language proficiency. Wollscheid et al. [11] provide complementary evidence by showing that both staff and students perceive academic literacy demands as discipline-specific and multidimensional. Consequently, university teachers often find themselves addressing foundational gaps such as vocabulary, concept review, and analytical skills that they expect from secondary education [12]. The underlying argument emerging from this literature is that BMDLs development should be understood as a continuous trajectory rather than a stage-specific outcome. By foregrounding teachers' perspectives on the relationship between instructional challenges and students' prior preparation, this study connects BMDL challenges to broader educational trajectories across multiple countries and disciplines.

3. Methodology

3.1 Research Aims and Objectives

The study investigated the challenges tertiary teachers report in teaching BMDLs, as well as their expectations of their students and of secondary education regarding BMDLs. As the scope of this paper does not allow for a deeper cross-disciplinary analysis and exploration of differences among disciplines,

the findings are presented for two broad disciplinary domains: the social and natural sciences. Two research questions were formulated to address the aim:
RQ1: What challenges do tertiary teachers report in teaching BMDLs?
RQ2: What are tertiary teachers' expectations of their students and their secondary education regarding BMDLs development?

3.2 Sample and Data Collection Method

The selection of countries and participants was guided by a combined purposive–convenience sampling strategy. Our qualitative study employed in-depth semi-structured interviews with university teachers (n = 41) with varying length of teaching experience representing social (n = 29) and natural (n = 12) sciences, four countries – the Czech Republic (n = 10), Turkey (n = 10), Kuwait (n = 8), and Albania (n = 13), and diverse institutional settings and linguistic backgrounds (see Table 1) following a survey instrument and interviewer guidelines designed and piloted within COST Action CA21114. Ethical approval for the study was obtained from the Institutional Review Board of Boğaziçi University (ID no: 2025-27), and the ethical guidelines of the participating universities were thereafter followed. The teachers' languages of instruction were English (n = 38), German (n = 1) and Arabic (n = 2). The interviews were conducted online and in person over three months, from November 2024 to January 2025, and were recorded with participants' consent. Each participating teacher was assigned a code in this study (such as T4 or T11). The codes are used in the Findings section to cite interview extracts that illustrate the findings.

Table 1. Research Participants

Data holder (country_initials)	Code	Field	Language of instruction	Length of teaching experience in years	Programme level	Percentage of courses taught in a FL in %	Length of interview in minutes

3.3 Data Processing and Analysis

The recordings were transcribed with the help of AI tools, proofread for accuracy and analysed using thematic analysis [13]. The data coding process involved all six stages [13] and employed both deductive and inductive approaches. An initial version of a coding manual was drafted using the deductive approach, with additional codes added through inductive coding and expert discussions. As the manual included high-inference categories, validation was conducted by five coders, each of whom independently coded one full interview. The acceptable level of inter-coder reliability was set at 80% agreement, and this was achieved across all coders in two rounds of coding. The main issue that needed to be addressed during this process was the density of codes, which was lower with two of the coders but was resolved via expert discussions, after which the codes were refined, and all of the interviews were coded using NVivo qualitative data analysis software (compatible versions 14 and 15). The final coding manual included detailed examples of the research participants' utterances for each of the codes and comprised 56 A4 pages divided into two sections: (1) DL, and (2) language aspects of DL. This paper focuses on the interpretation of data collected across both sections, specifically on teachers' and students' challenges in teaching DL, the language aspects of DL, and their expectations of their students and their secondary education in both areas (see Table 2).

Table 2. Themes and Codes

Themes	**Codes**
Teachers' challenges	Challenges in teaching disciplines Challenges in teaching in a foreign language Challenges in teaching critical thinking Challenges in cultural perspectives
Perceived students' challenges	Comprehension of disciplinary literacies Learning and applying DL
Teachers' expectations of students	Coherence in writing/speaking Ability to read in a foreign language Understanding and speaking in a foreign language Knowing how to use technological tools Variety/diversity among students Analytical thinking skills Familiarity with concepts Basic disciplinary knowledge and skills Academic writing skills Awareness and basic knowledge of the field

Teachers' expectations of the students' secondary education teachers	Promoting (critical) thinking Teaching discipline-specific knowledge and practising Encouraging students to read Promoting interdisciplinary group work Teaching soft skills Promoting argumentation Designing student-oriented tasks Teaching learning strategies Curricular demands alignment Cooperation among teachers from various disciplines

4. Findings

The analysis revealed four themes: teachers' own challenges, perceived student challenges, expectations of students, and expectations of secondary education teachers. These themes demonstrate that classroom difficulties are shaped by both students' pre-university preparation and systemic factors in secondary education.

4.1 Teachers' Challenges

Teachers reported difficulties that centre on teaching subject content in a foreign language and promoting critical thinking. Many struggled to explain disciplinary terminology, attributing this to the abstract nature of the concepts or to their own unfamiliarity with the terms in the language of instruction. Others emphasised challenges arising from students' language proficiency, leading to insufficient content comprehension and limited classroom engagement. A Kuwaiti business teacher illustrated the dual burden: "You're doing dictionary work, as well as teaching the concepts – the students have to first understand what the key concepts mean in English, before they understand the application" (T27).
Additional challenges included institutional and curricular constraints, particularly limited resources and textbooks and student diversity in disciplinary backgrounds, learning experiences, and cultural orientations. Natural science teachers more frequently emphasised gaps in terminology and procedural knowledge, while social science teachers highlighted difficulties with argumentation and critical engagement.

4.2 Perceived Student Challenges

Teachers noted that students faced difficulties with comprehension, acquisition, and application of DL. Many students struggled to understand complex discipline-specific texts, limiting their ability to deepen disciplinary knowledge and participate in classroom discussions. Teachers attributed these challenges to limited language proficiency, weak academic language skills, and short attention spans. Students also lacked analytical, argumentative, and critical thinking skills needed for meaningful disciplinary engagement.
Notably, even students with reasonable disciplinary knowledge often could not transfer it to practical tasks. A Czech geography teacher explained: "Geography is a practical discipline, and that's the biggest challenge for them to apply the knowledge and skills in real life. We really teach practical things… It's about understanding, not about learning facts" (T4). Teachers attributed these difficulties to insufficient secondary education preparation and gaps in prior knowledge, and reported spending additional class time that might facilitate comprehension and skill application.

4.3 Expectations of Students

Teachers expressed clear expectations regarding students' secondary school preparation across three dimensions. First, students should possess foundational disciplinary knowledge, such as familiarity with discipline-specific concepts and the ability to use relevant technological tools. Second, they should bring adequate academic skills and language proficiency, as well as the ability to understand academic discourse and communicate effectively in oral and written forms. Third, students should have well-developed cognitive and higher-order thinking skills. As a Turkish biomedical engineering teacher stated: "My main expectation is an analytical thinking structure – to be able to take an idea and synthesise it and produce new ideas… when that analytical intelligence is not formed, the thing cannot be formed successfully" (T11). Despite these expectations, teachers consistently reported that many

students failed to meet these criteria upon university entry, resulting in a mismatch that affects both teaching and learning.

4.4 Expectations of Secondary Education

Participants articulated expectations for secondary education teachers' roles in university preparation. They stressed the importance of developing discipline-specific knowledge and terminology, promoting critical and analytical thinking, and building learning and study skills alongside soft skills. Teachers also highlighted the need for disciplinary cooperation that would enable students to transfer knowledge across subjects. Some suggested discipline-specific additions to secondary curricula: "If in the secondary school curricula, they implement some managerial skills – at least how students can manage their time, their self, their career – that would facilitate the situation" (T33). An oral medicine teacher proposed including Latin for prospective medical students (T34).
These expectations point to an anticipated disconnect between university demands and secondary education practices, positioning pre-university education as a critical but insufficiently aligned phase of BMDL development.

5. Discussion

Three cross-cutting arguments emerge from the findings, each of which connects to and extends the existing literature.

5.1 Preparedness as a Multidimensional and Unevenly Developed Construct

The data indicate that teachers conceptualise student preparedness not as a single variable, typically language proficiency, but as an interconnected set of linguistic, disciplinary, and cognitive competencies expected to develop in tandem before university entry. This aligns with Hyland [14], who argues that academic success depends on engaging with discipline-specific practices rather than general language proficiency, and with McKinley's [10] framework, which positions higher education preparedness as encompassing disciplinary knowledge, academic socialisation, and critical engagement. This study adds that these dimensions are not only multiple but also unevenly developed. Teachers report students who possess reasonable language skills but lack disciplinary thinking, or who have content knowledge but cannot articulate it in the language of instruction. This unevenness, rather than any single deficit, is what generates classroom difficulty.
Importantly, the specific configuration of this unevenness is shaped by disciplinary orientation. Natural science teachers in our sample more frequently identified gaps in procedural and terminological knowledge in students who could not work with formulae, laboratory protocols, or technical vocabulary in English, while social science teachers emphasised deficits in argumentation, critical evaluation of sources, and the ability to construct disciplinary arguments in writing. This pattern suggests that "preparedness" is not a uniform construct but is refracted through the epistemological and communicative demands of each discipline. Kamaşak and Sahan [7] similarly found that the interaction between language proficiency and disciplinary knowledge shapes academic outcomes, but their analysis did not differentiate between disciplinary domains. Our findings extend this work by showing that the weight assigned to linguistic, cognitive, and content-related dimensions of preparedness varies systematically across the natural and social sciences, with practical consequences for how teachers allocate instructional time and adapt pedagogical strategies.

5.2 Systemic Misalignment between Expectations and Preparation

A persistent mismatch between what teachers expect and what students bring structures both teaching practices and learning experiences. Teachers' retrospective expectations of secondary education closely mirror the challenges they report in their own classrooms, suggesting that these challenges are not merely individual or pedagogical but reflect structural discontinuities between educational levels. This aligns with Yusupova et al. [15] and Pitera and Bush [12] on expectation-preparedness gaps and extends them by demonstrating that the pattern holds across four countries, two disciplinary domains, and three languages of instruction. Furthermore, Soruç et al.'s [6] student-focused data showed that language-related challenges interact with disciplinary knowledge; our teacher-focused data reveal a complementary perspective: these same interactions shape how teachers organise instruction, allocate time, and define pedagogical priorities.

What is particularly striking is the circular quality of this misalignment. Teachers reported spending considerable class time on vocabulary work, concept review, and foundational thinking skills, activities they explicitly framed as belonging to secondary education. This compensatory labour not only reduced the time available for advancing disciplinary knowledge but also reshaped instructional goals: several participants described shifting from discipline-building to remediation as their de facto classroom mode. Aizawa and Rose [8] documented a similar dynamic in Japanese EMI contexts, where limited secondary-level English exposure constrained university learning. Our cross-national data suggest that this is not confined to a single educational system but constitutes a recurrent structural feature of BMDL settings. The implication is that the misalignment is not only an inconvenience but a mechanism through which gaps in secondary preparation are reproduced at the tertiary level, as teachers must repeatedly revisit skills that were expected to have been developed earlier.

This finding underscores the need to reconceptualise BMDL development as a continuous trajectory rather than a stage-specific outcome. If preparedness is understood as something achieved by a particular educational threshold and then maintained, the burden falls entirely on secondary education. However, if it is understood as a cumulative, ongoing process, then the secondary-tertiary interface becomes a site of shared responsibility requiring coordinated curricula, shared expectations, and cross-level professional dialogue. Rose et al.'s [9] systematic review confirmed that students from L1-medium secondary schools face greater difficulties at university, particularly in academic writing; our data complement this by showing that teachers at the receiving end of this transition perceive the same discontinuity and respond to it with adaptive, but often unsustainable, instructional strategies.

5.3 The Limitations of Teacher Perception

It is important to recognise that these findings are based on teachers' perceptions, which may reflect normative expectations about adequate preparedness rather than objective measures of student ability. Teachers' accounts are inevitably shaped by disciplinary conventions, institutional demands, and idealised notions of what a "prepared" student looks like. From this perspective, the identified mismatch can also be interpreted as a gap between institutional expectations and diverse student trajectories, rather than solely as a deficit in student preparation. This interpretive caution aligns with Wollscheid et al. [11] in the sense that perceptions of academic literacy demands vary across disciplines and stakeholder positions.

Nevertheless, several features of the data work against a purely constructivist reading. First, the consistency of themes across four distinct national and institutional contexts, such as Türkiye, Albania, the Czech Republic, and Kuwait, suggests that the pattern captures a structurally real aspect of the secondary-tertiary interface rather than reflecting idiosyncratic institutional cultures. Second, teachers' accounts were not uniformly deficit-oriented; many participants acknowledged the constraints of their own pedagogical repertoires and the role of institutional factors, which suggests a degree of reflexivity that tempers the risk of one-sided attribution. Third, the specificity of teachers' expectations, their emphasis on particular skills such as argumentation, disciplinary vocabulary, and analytical thinking rather than vague complaints about "student quality", indicates that their perceptions are grounded in concrete classroom experiences rather than generalised dissatisfaction. Taken together, while the perceptual nature of the data warrants interpretive caution, the cross-contextual robustness and specificity of the findings support their value as evidence of a systemic pattern in BMDL instruction.

6. Conclusion

This study contributes to BMDL research by bringing together data from four countries, two disciplinary domains, and three languages of instruction to offer a cross-contextual, teacher-centred perspective on BMDL challenges. By connecting teachers' instructional difficulties to their retrospective expectations of secondary education, it highlights a dimension, the secondary-tertiary transition, that has been underexplored in the BMDL literature.The findings also carry several implications. First, secondary education should integrate DL, academic language, and critical thinking more systematically into curricula and develop these competencies progressively rather than abruptly introducing them at university. Second, universities should provide structured transition support such as bridging courses, academic literacy programmes, and discipline-specific language support to complement, not replace, secondary-level preparation. Third, greater alignment between secondary and tertiary education is essential, facilitated through coordinated curricula, shared expectations, and cross-level professional dialogue. Finally, blended professional development programmes engaging educators across levels could support a more coherent and continuous approach to BMDL development.

The Impact of AI Avatars via Low-Immersion Virtual Reality on Foreign Language Anxiety, Motivation, and Speaking Proficiency among Japanese EFL Students

Yukie Saito

Chuo University, Japan

Abstract

In today's globalized world, speaking proficiency in English is essential for academic, professional, and social participation. However, many learners in English as a Foreign Language (EFL) contexts have limited opportunities for authentic spoken interaction and often experience foreign language anxiety (FLA), which can inhibit oral performance. This issue is especially important for students preparing to study abroad, as short-term overseas programs require immediate communicative engagement in classrooms, homestays, and daily life. Pre-departure support that allows learners to rehearse realistic communication in a low-pressure environment may therefore be valuable. This pilot study examined whether one month of AI avatar-mediated speaking practice in low-immersion virtual reality (LiVR) was associated with changes in speaking proficiency, FLA, motivation, and learner acceptance among Japanese university EFL learners preparing to study abroad. Participants were 11 students enrolled in a one-month study-abroad program in Australia. They used the Immerse VR platform via personal computers to practice spoken English with AI avatars in simulated communicative environments. Data included pre- and post-intervention Versant speaking scores for all 11 participants, as well as FLA and motivation questionnaires completed by 10 participants who provided complete pre- and post-intervention data, and a post-intervention Technology Acceptance Model (TAM) questionnaire. Results showed a statistically significant and large reduction in FLA from pretest to posttest, whereas motivation remained high and stable. Speaking proficiency showed modest improvement, with the largest gain observed in vocabulary, although this effect did not remain significant after correction for multiple comparisons. Total time spent on the platform (Time on Site; TOS) was not significantly associated with gains in speaking or changes in anxiety and motivation. TAM results indicated moderately positive learner perceptions, especially regarding enjoyment, usefulness, and ease of use, although convenience and access appeared somewhat limited. These findings suggest that AI avatar-mediated LiVR speaking practice may be a useful pre-departure support tool, particularly for reducing speaking-related anxiety among Japanese EFL learners.

Keywords: *low-immersion VR; AI avatars; foreign language anxiety; speaking proficiency; study abroad preparation*

1. Introduction

In today's globalized world, English is widely used for international communication, making speaking proficiency an essential skill for academic, professional, and social participation [1–3]. However, many learners struggle to develop speaking ability because they have limited opportunities for authentic interaction, experience speaking-related anxiety, and often lack access to immersive communicative environments [4–6].

These challenges are particularly evident in EFL contexts such as Japan, where classroom instruction often prioritizes reading and grammar over speaking. Students frequently participate in study-abroad programs with limited speaking readiness, and may have few opportunities to use English spontaneously in realistic settings before departure. This lack of communicative practice may hinder the development of speaking proficiency and may also contribute to foreign language anxiety (FLA), which has been shown to negatively affect oral performance and willingness to communicate [4, 7, 8, 9, 10]. In contrast, positive beliefs about language learning and increased self-confidence are associated with lower anxiety and greater engagement in speaking [11]. Supporting learners in reducing FLA may therefore be an important step toward improving spoken English.

The program investigated in this study was a one-month study-abroad program in Australia for Japanese university students, with goals including improving English proficiency and fostering intercultural

understanding. Because such programs provide limited time for adjustment, pre-departure tools that allow learners to rehearse realistic communication may help them engage more actively once abroad.
One promising response is the use of virtual reality (VR), which can provide safe, interactive, and context-rich spaces for language practice [12, 13]. VR enables learners to engage in simulated environments that resemble real-world communicative situations, potentially increasing engagement, motivation, and confidence while reducing affective barriers. In language education, prior research suggests that VR can support speaking development, willingness to communicate, and anxiety reduction, although findings regarding measurable gains in speaking proficiency remain mixed and context-dependent [14–18]. This suggests that VR may be particularly effective for affective outcomes, while its impact on speaking performance requires further investigation.
VR can also be classified according to the degree of immersion: low-immersion virtual reality (LiVR) is typically accessed through desktop or mobile devices, while high-immersion virtual reality (HiVR) usually involves head-mounted displays [19]. The present study used LiVR, as students accessed Immerse VR via personal computer from school or home, making daily practice more feasible than HiVR.
Recent advances in artificial intelligence (AI), especially generative AI, have expanded the possibilities of VR-based language learning. AI conversational partners can provide learners with flexible, individualized speaking opportunities without requiring a human interlocutor, which may be especially beneficial for learners who are reluctant to speak in front of others [20–24].
Several VR platforms now incorporate AI avatars for speaking practice in simulated real-world environments. Initial research on VR-based language practice suggests that such environments can be motivating and enjoyable for learners [25, 26]. Motivation is recognized as a key driver of language learning effort and achievement [27, 28], and the ideal L2 self—the vision of oneself as a successful future language user—has been proposed as a central motivational force in second language acquisition [29]. Assessing motivational change requires reliable measurement instruments such as the Attitude/Motivation Test Battery [30]. Learner acceptance of educational technology is also a critical factor, as captured by the Technology Acceptance Model [31], which has been applied in mobile-assisted language learning contexts to examine how perceived usefulness and ease of use influence continued engagement [32]. Nevertheless, relatively few studies have examined AI avatar VR as a pre-departure speaking support tool for Japanese EFL learners, and fewer still have addressed anxiety, motivation, speaking performance, and technology acceptance within a single design. To address this gap, the present study investigates whether one month of AI avatar–mediated speaking practice in VR is associated with changes in foreign language anxiety, motivation, and speaking proficiency, and examines learners' acceptance of the technology after the intervention.

1. Does practicing speaking with AI avatars in LiVR reduce foreign language anxiety?
2. Does practicing speaking with AI avatars in LiVR increase motivation to learn English?
3. Does practicing speaking with AI avatars in LiVR improve speaking proficiency?
4. How do students perceive the technology of Immerse VR?

2. Method

2.1 Participants

The participants were 11 Japanese university students preparing for a one-month study-abroad program in Australia that included homestay and general English instruction. All 11 students completed the Versant speaking test at both time points, while 10 students provided complete pre- and post-intervention questionnaire data; one participant did not complete both questionnaires and was therefore excluded from the questionnaire-based analyses. Based on pretest Versant scores, four students were classified at CEFR B1, four at A2+, and three at A2.

2.2 Intervention and Setting

The intervention consisted of one month of AI avatar-mediated speaking practice using the Immerse VR platform, which provided simulated communicative environments including airports, restaurants, parks, and supermarkets. The intervention was implemented as LiVR, as this was more accessible and feasible for sustained daily practice than HiVR, which requires head-mounted displays and involves higher cost and technical demands. Students were asked to practice speaking every day using a personal computer from school or home. To structure their practice, students kept a speaking journal in which they recorded the topic category practiced each day using an initial letter: Socializing (S), Life and Living (L), Home

and Community (H), Expressing Feelings (E), and Managing Communication (M). These five categories were pre-selected by the instructor from study-abroad-related scenes available on the Immerse VR platform. At the end of the month, students wrote an overall reflection on their experience with the platform as the final journal entry. The journal data are not analyzed quantitatively in the present study and are reported here as contextual information.

2.3 Measures

Speaking proficiency was assessed with the Versant Speaking Test (scores range from 20 to 80) administered before and after the intervention for all 11 participants, reporting fluency, pronunciation, sentence mastery, vocabulary, overall score, and intelligibility. FLA and motivation were measured using pre- and post-questionnaires completed by all students; however, one participant did not complete both time points, resulting in a final questionnaire sample of 10. The FLA scale consisted of 24 items adapted from the Foreign Language Classroom Anxiety Scale, and the motivation scale consisted of 8 items, both using a 5-point Likert format. All 11 students completed an 18-item post-intervention TAM questionnaire evaluating the VR platform (Cronbach's alpha = .85).

2.4 Data Analysis

Pre- and post-intervention comparisons were conducted using paired t tests, Wilcoxon tests, effect sizes, and Holm-adjusted p values for Versant outcomes. Questionnaire reliability was assessed using Cronbach's alpha. Correlational analyses examined associations between total time spent on the platform site (Time On Site: TOS) and changes in all major outcome variables.

3. Results

3.1 Preliminary Analyses

Questionnaire analyses were based on 10 students, as one participant did not complete both the pre- and post-questionnaires and was therefore excluded from the questionnaire-based analyses. The FLA scale (Q1-Q24) demonstrated high internal consistency at both time points, with Cronbach's alpha of .922 at pretest and .967 at posttest, indicating that the scale measured a coherent construct reliably across the intervention. The motivation scale (Q25-Q32) showed lower but usable reliability, with Cronbach's alpha of .608 at pretest and .678 at posttest. While these values fall below the conventional threshold of .70, they are considered acceptable for exploratory classroom-based research with small samples, and motivation findings should accordingly be interpreted with some caution.

3.2 Foreign Language Anxiety and Motivation

Table 1 presents the pre- and post-intervention means, standard deviations, mean differences, significance levels, and effect sizes for both the FLA and motivation scales. FLA decreased substantially from pretest to posttest. The mean FLA score fell from 3.304 (SD = 0.594) at pretest to 2.471 (SD = 0.880) at posttest, a reduction of 0.833 points on the five-point scale. This decrease was statistically significant (p = .001) and associated with a large effect size (d = -1.518), indicating that the magnitude of anxiety reduction was both reliable and practically meaningful. The increase in standard deviation from pretest to posttest suggests that students responded somewhat differently to the intervention, with some experiencing greater anxiety reduction than others.

Table 1. Pre- and Post-Intervention Foreign Language Anxiety and Motivation Scores

Measure	N	Pre M	Pre SD	Post M	Post SD	Mean Diff	p	Effect Size (d)
FLA (Q1-Q24)	10	3.304	0.594	2.471	0.880	-0.833	.0010	-1.518
Motivation (Q25-Q32)	10	4.163	0.373	4.213	0.417	+0.050	.737	0.109

Note. Higher FLA scores indicate greater anxiety; higher motivation scores indicate stronger motivation. One participant was excluded due to incomplete data.

By contrast, motivation remained high and stable at both time points. The mean motivation score increased only slightly from 4.163 (SD = 0.373) at pretest to 4.213 (SD = 0.417) at posttest, a difference

of 0.050 points that was neither statistically significant (p = .737) nor practically meaningful (d = 0.109). These results suggest that students entered the intervention with already relatively high motivation to learn English and that this motivation was maintained throughout the month of VR practice without showing a measurable increase.

3.3 Speaking Proficiency

Table 2 presents pre- and post-intervention Versant speaking scores across all six measured dimensions for all 11 participants, including paired t test results, Wilcoxon signed-rank test p values, paired effect sizes (dz), and Holm-adjusted p values to correct for multiple comparisons. Overall, scores showed modest improvements across most dimensions, though none of the changes remained statistically significant after Holm correction.

Vocabulary showed the strongest positive change, with a gain of 5.64 points and a large effect size (dz = 0.86). Although this reached significance before Holm correction (t(10) = 2.86, p = .017), it did not remain significant after correction (adjusted p = .101) and should therefore be interpreted cautiously.

The overall Versant score increased from 39.45 (SD = 6.07) at pretest to 42.55 (SD = 6.04) at posttest, a gain of 3.09 points. The effect size was moderate (dz = 0.58), and the uncorrected p value approached but did not reach conventional significance (t(10) = 1.91, p = .085; Wilcoxon p = .066). Gains in fluency (1.55 points, dz = 0.22), pronunciation (1.45 points, dz = 0.18), and sentence mastery (2.55 points, dz = 0.29) were smaller in magnitude and did not approach statistical significance before or after correction.

Intelligibility showed a negligible decrease from pretest (M = 3.36, SD = 0.50) to posttest (M = 3.27, SD = 0.47), a difference of only 0.09 points that was non-significant (p = .676) and trivial in effect size (dz = -0.13). This result indicates that intelligibility remained essentially unchanged over the course of the intervention.

Table 2. Pre- and Post-Intervention Versant Speaking Test Scores

Outcome	Pre M (SD)	Post M (SD)	Mean Diff [95% CI]	Paired t Test	dz	Wilcoxon p	Holm-Adjusted p
Fluency	33.55 (9.52)	35.09 (8.92)	1.55 [-3.07, 6.16]	t(10)=0.75, p=.473	0.22	.520	1.000
Pronunciation	39.36 (8.57)	40.82 (11.65)	1.45 [-4.08, 6.99]	t(10)=0.59, p=.571	0.18	.678	1.000
Sentence Mastery	45.36 (10.60)	47.91 (9.07)	2.55 [-3.40, 8.49]	t(10)=0.95, p=.362	0.29	.220	1.000
Vocabulary	44.09 (12.31)	49.73 (11.82)	5.64 [1.25, 10.02]	t(10)=2.86, p=.0169	0.86	.0186	.101
Overall	39.45 (6.07)	42.55 (6.04)	3.09 [-0.51, 6.69]	t(10)=1.91, p=.0847	0.58	.066	.423
Intelligibility	3.36 (0.50)	3.27 (0.47)	-0.09 [-0.56, 0.38]	t(10)=-0.43, p=.676	-0.13	.655	1.000

Note. N = 11. Positive mean differences indicate improvement from pretest to posttest. Holm-adjusted p values correct for multiple comparisons across six outcomes.

3.4 Time on Site and Individual Differences

Students' time on site (TOS) varied substantially, ranging from 0.78 to 28.83 hours (M = 8.61, SD = 7.43, Mdn = 7.02), indicating considerable individual differences in platform engagement despite the daily practice requirement. Correlational analyses examined whether greater TOS was associated with larger gains in speaking performance or more favorable changes in questionnaire outcomes. For the overall Versant score, Pearson's r was -.029 (p = .933) and Spearman's rho was -.105 (p = .759), indicating no meaningful association between TOS and speaking improvement. Similarly, no meaningful associations were found between TOS and changes in FLA (Pearson r = -.132, p = .715; Spearman rho = .042, p = .907) or motivation (Pearson r = .128, p = .724; Spearman rho = .132, p = .717). The same null pattern held for vocabulary gain (Pearson r = .421, p = .197; Spearman rho = -.200, p = .555), although the Pearson correlation was numerically larger and warrants monitoring in future studies with larger samples.

One exploratory finding warrants mention with considerable caution: TOS showed a positive association with pretest FLA scores (Pearson r = .663, p = .037). However, this result is likely sensitive to the

influence of the single highest-usage student (28.83 hours), who may have driven the correlation substantially. With only 11 participants, a single outlying data point can produce a nominally significant correlation that is not meaningful at the population level. This association should therefore not be interpreted as evidence of a reliable relationship between baseline anxiety and engagement, but rather as a hypothesis worth examining in larger future samples.

3.5 Technology Acceptance

Students completed the TAM questionnaire after the one-month intervention to evaluate their perceptions of the Immerse VR platform. The overall mean TAM score was 3.40 out of 5 (Cronbach's alpha = .85), indicating a moderately positive evaluation of the platform as a whole.
The highest-rated dimensions were enjoyment, perceived usefulness, and ease of use, each with a mean of 3.86, indicating moderately positive perceptions in these areas. Students appear to have found the platform somewhat useful and accessible, though these ratings fall in the mid-to-upper range of the scale rather than indicating strongly positive impressions. The lowest-rated item was 'I can learn English at any place with Immerse' (M = 2.43), which stood notably below the other items and suggests that location flexibility was a practical concern.

Discussion

The clearest finding of this pilot study was the substantial reduction in foreign language anxiety. Students' FLA scores decreased significantly over the one-month intervention, and the effect size was large (d = -1.518). This finding is consistent with the idea that AI avatar–mediated VR speaking practice may provide a lower-pressure environment for oral rehearsal before learners encounter real-world communicative demands [4, 7]. For students preparing to study abroad, this may be especially important because reduced anxiety may increase willingness to speak with teachers, peers, host families, and community members once abroad. Notably, the magnitude of the anxiety reduction observed here exceeded what is often reported in classroom-based interventions, which may reflect several features of the VR environment. Interacting with AI avatars rather than human interlocutors may reduce social evaluation concerns, as the perceived consequences of making errors in front of an avatar may be lower than in face-to-face communication, at least in terms of social evaluation anxiety [6]. The structure of the intervention may also have contributed to this outcome. The instructor pre-selected five study-abroad-related topic categories from the Immerse VR platform—Socializing, Life and Living, Home and Community, Expressing Feelings, and Managing Communication—ensuring that students practiced across a broad range of everyday communicative situations they were likely to encounter during their homestay and study-abroad program. This systematic rehearsal of functionally diverse scenarios may have gradually built a sense of readiness and reduced the anticipatory anxiety associated with speaking in unfamiliar communicative situations. In this sense, the present findings align with prior research suggesting that VR can support affective outcomes such as reduced anxiety and increased confidence [14, 17], even when measurable speaking gains are less consistent.
Motivation, by contrast, did not show a meaningful increase. However, this result should be interpreted carefully. Students' motivation was already high at pretest (M = 4.163 out of 5), leaving limited room for measurable growth. Rather than indicating that the intervention was ineffective, the stability of motivation scores may suggest that the VR practice helped sustain students' already strong motivational orientation during the pre-departure period. This interpretation is plausible in light of the program context: students who had already committed to an overseas learning experience are likely to have entered the study with a strong desire to improve, consistent with the notion of the ideal L2 self driving future-oriented language learning behavior [29]. Maintaining that motivation over a one-month preparatory period is itself a meaningful outcome. Future research might employ more fine-grained measures of motivational change, or capture fluctuations at multiple points across the intervention, in order to detect subtler shifts that a pretest-posttest design may miss.
The speaking results were encouraging but more tentative. Vocabulary showed the strongest positive change (5.64 points, dz = 0.86), and the overall Versant score also increased by 3.09 points, but neither remained statistically significant after correction for multiple comparisons. The pattern of gains is nevertheless noteworthy. Vocabulary showed the largest gain among the speaking dimensions assessed, though the reasons for this pattern remain speculative. One possibility is that the five topic categories may have exposed students to domain-relevant lexis across a range of everyday communicative contexts that VR environments are well suited to simulate [12]. Whether this thematic

structure contributed meaningfully to the observed gain, however, cannot be determined from the present data alone.

More broadly, this pattern is consistent with the mixed findings reported in the VR language learning literature, where positive affective outcomes tend to be more consistent than measurable speaking gains [14, 17]. One possible interpretation is that anxiety reduction may begin to emerge before detectable changes in speaking proficiency, particularly in short interventions [5]. Gains in confidence and reduced inhibition may need to accumulate before speaking improvement becomes observable, rather than co-occurring with it [5, 7], suggesting that longer intervention periods may be needed to translate affective changes into observable proficiency gains.

The lack of a clear relationship between time on site and learning outcomes also deserves attention. Greater use of the platform did not automatically lead to larger gains in speaking performance or stronger changes in anxiety and motivation. This suggests that the sheer amount of practice alone may not be sufficient to explain outcome differences. One particularly interesting exploratory finding was the positive association between baseline anxiety and time on site ($r = .663$), suggesting that more anxious learners may have engaged with the platform more frequently, possibly because the avatar environment may have felt like a less threatening space than face-to-face interaction [6]. If this pattern replicates in larger samples, it would have meaningful implications for how VR tools are positioned: not as general-purpose practice supplements, but as targeted interventions for learners who find human interlocutors especially threatening. Learner profiles and interaction quality therefore warrant closer investigation in future research.

Finally, the TAM findings support the practical feasibility of using AI avatar–mediated VR speaking practice in a pre-departure context. Students generally found the platform enjoyable, useful, and easy to use, which is encouraging given that learner acceptance is a prerequisite for sustained engagement with any educational technology [31]. These results are broadly consistent with prior findings on avatar-based VR practice, which has been reported as motivating and enjoyable by learners in similar contexts [25, 26]. At the same time, the relatively low rating for location flexibility points to a concrete design challenge. Because the intervention was implemented as LiVR on personal computers, practice was inherently tied to locations where a PC was available—a constraint that may have limited the frequency and spontaneity of engagement [19]. Transitioning to a smartphone-compatible platform could substantially increase accessibility and allow learners to practice in commuting time, at home, or in other informal contexts. This would also better align with the everyday, distributed practice patterns that second language acquisition research consistently associates with proficiency development. More broadly, these findings suggest that pedagogical promise and technical accessibility must be developed together: even a motivating and anxiety-reducing tool may underperform if practical barriers reduce the consistency of learner engagement.

Conclusion

Several limitations should be acknowledged when interpreting these findings. This was a small-scale pilot study with only 11 participants and a one-group pretest-posttest design without a comparison group, which limits causal claims. It cannot be concluded with certainty that the observed changes were caused solely by the VR intervention rather than by other aspects of pre-departure preparation or ongoing English learning. The intervention lasted only one month, time on site varied substantially across students, and some analyses were explicitly exploratory and may have been sensitive to outliers. Motivation scale reliability was also lower than that of the FLA measure, suggesting that motivational findings should be interpreted with caution. Despite these limitations, the findings suggest that AI avatar–mediated VR speaking practice may serve as a useful bridge between classroom learning and real-world communication for students preparing to study abroad, particularly in terms of reducing speaking-related anxiety. Future research should include larger samples, comparison groups, longer intervention periods, and more detailed analyses of the quality of learner interaction in order to clarify how and under what conditions AI avatar VR practice contributes to speaking development and anxiety reduction.

Note： FLA findings from this dataset were partially reported in a previous conference proceedings [Saito, Y., "The Impact of AI-Driven Speaking Practice in VR on Foreign Language Anxiety Among Japanese EFL Learners", The IAFOR International Conference on Education – Hawaii 2026 Official Conference Proceedings, pp. 319–329, 2026. DOI: 10.22492/issn.2189-1036.2026.30]. The present study extends that work by additionally examining speaking proficiency, motivation, technology acceptance, and the role of a structured speaking journal in the intervention design.

Technology's Impact on the Learning Process: Preservice EFL Teachers' Perception

Jessica Zumarraga-Avila

Autonomous University of Yucatán, Mexico

Abstract

This work examines how digital tools, online resources, and emerging technologies, such as artificial intelligence, influence on English language acquisition from both learner and future educator perspectives. This qualitative study, developed at the largest state public university in southeast Mexico, adopted a small-scale exploratory approach using a focus group discussion with 22 preservice EFL teachers who participated voluntarily. The participants recognized significant advantages in accessibility and abundant resources (e.g., TikTok educational content and YouTube videos, etc.), and engagement through interactive formats. However, they emphasized substantial limitations in developing speaking fluency, contextual interaction, and affective dimensions, such as empathy and emotional support. Key concerns included distractions in online and hybrid settings, challenges in verifying student effort, and the overuse of tools that lack human judgment. As future teachers, participants discussed the evolving role of educators, shifting from information providers to facilitators, and advocated for the balanced and well-prepared integration of technology. Findings align with broader trends in EFL teacher education to foster digital literacy and human-centered pedagogy. The results may provide beneficial insights for teacher educators, curriculum designers and decision-makers.

Keywords: *Language learning, technology integration, English as a Foreign Language, preservice EFL teachers.*

1. Introduction

For more than two decades, professional training and labour markets have experienced constant disruption due to globalisation, the dominance of English as a *lingua franca* and rapid technological advancement (ETS, 2026; OECD, 2025). Consequently, educational institutions have been compelled to adapt to these trends where English language proficiency (ELP) is no longer a privilege but a fundamental necessity. In Mexico, as in the rest of Hispanoamerica, English as a Foreign Language (EFL) plays a pivotal role in preparing students for success in an international global market (Cronquist & Fiszbein, 2017). Just like in higher education worldwide, technological disruption has forced universities to transform educational practices by incorporating technology in the teaching and learning process (UNESCO, 2025; OECD, 2025), particularly in the EFL field.

Digital platforms, applications, social media content and artificial intelligence have created new opportunities (and challenges) for accessing unlimited resources, providing teachers and learners with instant access to materials, immediate feedback and practice opportunities (Al-Senafi et al., 2024). However, in the context of EFL programmes, the implementation of these tools raises questions about their effectiveness, equity, and the preservation of essential human elements in the learning process, such as interpersonal interaction, emotional support, and authentic communication (Omidvar & Meihami, 2025).

The Autonomous University of Yucatán (UADY by its Spanish initials), the largest public state university in south-eastern Mexico, offers an undergraduate programme to prepare EFL teachers (Zumarraga-Avila et al., 2024). As future educators, their perceptions of how technology impacts language learning and teaching can engender critical reflections in the Mexican higher education system, especially in the southeastern context, which is increasingly influenced by globalisation (Despagne, 2018).

2. Theoretical Framework

The present study is situated within the Technological Pedagogical Content Knowledge (TPACK) framework (Mishra & Koehler, 2006), which posits that effective technology integration in teaching is predicated upon the dynamic interplay of technological, pedagogical, and content knowledge. Within the domain of EFL teacher training, TPACK emphasises the necessity for preservice teachers to cultivate competencies that enable them to utilise digital tools not merely as supplementary components, but as

transformative elements that facilitate language acquisition while addressing contextual realities in regions such as southeastern Mexico. This framework is of particular relevance to the UADY Bachelor's degree programme in English Language Teaching, in which future educators navigate global demands for English proficiency amid varying levels of technological access. Complementary to TPACK, the Technology Acceptance Model (TAM) (Davis, 1989) explains user adoption of digital tools through perceived usefulness and ease of use, offering insights into preservice teachers' attitudes toward AI and other emerging technologies in language learning.

Empirical literature highlights the substantial advantages of technology in language acquisition, including personalised learning pathways, immediate feedback, and expanded access to authentic materials. AI-driven applications enable adaptive practice tailored to individual proficiency levels, fostering learner autonomy and motivation through interactive simulations and real-time corrections that traditional classrooms often cannot provide at scale (Dai, 2024; Eliott, 2023). In the context of EFL, the integration of smartphones and mobile technology with digital platforms has been shown to promote immersive exposure to English as a lingua franca. This development has the potential to transcend geographical boundaries, which are often a significant challenge in Hispanic settings, and to facilitate the development of skills that are aligned with the demands of the global labour market (Cronquist & Fiszbein, 2017). These affordances align with the study's first research question by demonstrating how technology can democratise resources and accelerate acquisition, particularly for preservice teachers envisioning their future roles in resource-constrained environments.

Despite these benefits, there are notable disadvantages, including equity gaps, overreliance on tools and the potential erosion of human interaction. In Mexico and other Latin American countries, disparities in digital infrastructure can exacerbate existing inequalities by limiting access for students in the south-east of the country, for example, and raising concerns about the digital divide (Despagne, 2018). Moreover, overreliance on AI could reduce opportunities for authentic communication, emotional engagement and cultural awareness, all of which are vital for language proficiency. This could result in superficial learning and diminished interpersonal skills (Omidvar & Meihami, 2025). These challenges inform the study's exploration of pre-service EFL teachers' perceptions, emphasising the need to balance technological mediation with pedagogical practices that preserve the core human elements of teaching and learning.

Technological mediation is having a profound impact on the role of EFL teachers, transforming them from traditional knowledge transmitters into facilitators, curators and mentors in hybrid environments. Pre-service teachers recognise that this evolution requires enhanced digital literacy and adaptive strategies to effectively integrate tools while providing emotional support and encouraging critical reflection (Karataş, 2024; Lu, 2025). In technology-rich settings, educators must address AI-generated content, promote digital citizenship, and design experiences that foster 21st century competencies such as collaboration and creativity. Examining this transformation through the study's second research question positions teachers as pivotal agents in mitigating challenges such as algorithmic bias and reduced spontaneity. This ensures that technology enhances, rather than supplants, human connection in EFL education.

Together, these theoretical and empirical perspectives offer a comprehensive approach to investigating pre-service EFL teachers at UADY. By centring their voices, the study sheds light on how technology integration can equitably support language acquisition and professional development in an increasingly globalised and technology-driven landscape. It also advocates for teacher training that strengthens TPACK competencies and critical awareness. This foundation enables a nuanced analysis of the advantages and disadvantages of technology integration, as well as the evolving roles of educators in Mexico's higher education context.

3. Objectives and Research Questions

In view of the paucity of evidence regarding the impact of technology on educational processes in the context of EFL teacher training, the present study aims to explore preservice EFL teachers' perceptions of technology's impact on the English language learning process, with emphasis on both learner experiences and future educator roles. The study seeks to identify the perceived advantages and disadvantages of digital tools, online resources, and emerging technologies (including AI) in English language acquisition, and to understand preservice EFL teachers' views regarding the evolving role of educators in environments mediated by technology. In the pursuit of these objectives, these two questions were addressed.

1. What advantages and disadvantages does using technology have on language acquisition?

2. In what ways is the role of EFL teachers affected by technological mediation?

4. Method

The present study adopted a qualitative exploratory approach that allowed for the discovery of participants' lived experiences and viewpoints. This design was considered appropriate on account of the fact that it facilitates an in-depth exploration of the perceptions, beliefs, and reflections of pre-service teachers amid a context in which evidence remains limited.

4.1 Participants

The population of the research comprised people enrolled in the Bachelor's degree programme in English Language Teaching at UADY, which currently has 140 students. Participants were selected using convenience sampling (Martínez-Salgado, 2012), which resulted in twenty-two junior students, who included three men and nineteen women, aged between 19 and 24 years old, who were not employed at the time of the study. They agreed to participate voluntarily. Whilst this methodological approach may compromise the generalisability of the findings, it proved to be an effective and practical solution for exploratory purposes, facilitating the collection of narratives within the research context.

4.2 Data Collection and Analysis

Data were collected through an open interview during a face-to-face focus group session. The discussion centred on four major topics: (1) resource accessibility; (2) engagement and motivation; (3) skills development and interaction, and (4) teacher role evolution. The session was audio-recorded with participants' permission and subsequently transcribed verbatim for analysis.
The information was analysed thematically, with initial coding, searching, revising and refining of themes (Braun & Clarke, 2021). The analysis was organised according to the study's research questions and focused on identifying patterns related to the advantages, disadvantages and implications of technology use in EFL learning.
Although the findings are specific to junior pre-service teachers at UADY and should not be generalised, they offer valuable insights that could inform future research and local teaching practices.

5. Results

The research questions aimed to identify the advantages and disadvantages of using technology in language acquisition, as well as the ways in which the role of EFL teachers is affected by technological mediation. In the following sections, the results are presented according to these research questions.

5.1 Advantages of Technology in Language Acquisition

Participants identified several advantages, three of which were particularly prominent, as shown in Table 1.

Table 1. *Advantages of technology in language acquisition*

Advantages	Frequency
(a) Abundant and diverse research resources	90% (20 participants)
(b) Engagement and motivation	55% (12 participants)
(c) Accessibility	32% (07 participants)

Source: Own elaboration

(a) Abundant and diverse research resources
This was identified as the most significant advantage due to the substantial quantity of freely accessible materials. Participants were not particularly concerned about the reliability of the sources, but rather how frequently they used them and whether they were useful for their purposes. Table 2 shows the digital tools most frequently used by the 90% of participants who agreed on this advantage.

Table 2. *Most frequently used digital tools and reasons*

Digital tool	%	Reasons
TikTok	45%	Useful for learning contextual phrases and everyday language, with short, replayable videos.
YouTube videos	30%	Wide variety of educational material, enabling them to learn new skills and expand their knowledge.
Duolingo	20%	Effective for vocabulary acquisition and self-learning.
Kahoot! and Google Translate	15%	Interactive way to practise vocabulary and have a more engaging learning experience.

Source: Own elaboration

(b) Engagement and motivation.
In this regard, twelve participants praised the dynamic, visually appealing and concise nature of digital content. They noted that it helps learners to maintain attention better than traditional lectures do and allows them to review material repeatedly at their own pace.
(c) Accessibility.
Some participants highlighted that online resources and classes are very helpful for students who live far from campus or face logistical challenges, such as transport issues. Some students spend over than two hours travelling to campus.

5.2 Disadvantages of Technology in Language Acquisition

Participants also identified four significant disadvantages listed according to frequency in Table 3.

Table 3. *Disadvantages of technology in language acquisition*

Disadvantages	Frequency
(a) Weaknesses in the affective domain	72% (16 participants)
(b) Limitations in speaking fluency and authentic interaction	63% (14 participants)
(c) Distractions	50% (11 participants)
(d) Assessment and student effort	36% (08 participants)

Source: Own elaboration

(a) Weaknesses in the affective domain.
Participants emphasised that technology and artificial intelligence (AI) lack empathy, emotional support, motivation, and the ability to respond to individual or unexpected student needs.
(b) Limitations in speaking fluency and authentic interaction.
They stressed that, although apps and artificial intelligence can support initial practice, achieving real fluency and engaging in contextual communication requires face-to-face interaction with teachers and peers. A representative comment was: "*There are other aspects where you need a teacher, such as practising fluency. I think it's better in a classroom with real people*".
(c) Distractions.
Participants acknowledged that they (or their classmates) frequently experience distractions during online classes.
(d) Assessment and student effort.
Some participants expressed concern about assessment and the difficulty of distinguishing genuine student work from AI-generated content.

5.3 Ways in Which Technology Affects the Role of EFL Teachers

Participants perceived that technological mediation affects the role of EFL teachers. However, they highlighted two main aspects:

1. All twenty-two participants (100%) strongly agreed that technology cannot replace human teachers, emphasizing that educators are essential for providing empathy, motivation, emotional support, and the ability to handle complex classroom situations and individual student needs. As one participant summarised, "*AI is not going to replace teaching, it's not capable of doing everything that a teacher can do".*

2. Fifteen participants (68%) noted a clear shift from the traditional role of information provider to that of facilitator and guide, since students can now access amounts of information instantly through digital tools and applications.

However, despite the fact that participants believe technology cannot replace teachers and that it has changed their role to that of facilitators, 81% (18) of them advocated for the balanced and thorough integration of technology. They recommended combining digital tools with sustained face-to-face interaction, as well as proper teacher training, in order to maximise the benefits of technology while preserving the human element of education.

6. Discussion

The findings of this study were revealing in that the participants recognised both the advantages and disadvantages of incorporating technology into the process of learning EFL in a balanced manner. It was also interesting to note that their perspective was influenced by the fact that, as future EFL teachers, they were able to put forward objective and realistic views regarding their future teaching practice.

The participants' emphasis on plenty and diverse resources (90%) is consistent with broader trends documented in the literature. Digital tools such as TikTok, YouTube, Duolingo, Kahoot!, and Google Translate offer learners immediate, contextualised, and self-paced input that is frequently inaccessible in traditional classrooms in terms of both quantity and variety (Hendar & Amalia, 2024; Alshraideh, 2021). This accessibility advantage is pertinent in the southeastern Mexican context, where logistical challenges such as long-distance transportation and financial limitations affect physical resource availability (Cronquist & Fiszbein, 2017).

Engagement and motivation benefits (60%) further support the idea that visually appealing, concise, and interactive digital formats can sustain learner attention better than traditional methods. However, the reported disadvantages such as weaknesses in the affective domain (72%) and limitations in speaking fluency and authentic interaction (63%) highlights a critical tension. The participants consistently noted that technology lacks empathy, emotional responsiveness, and the ability to manage unpredictable classroom dynamics. These concerns resonate strongly with studies that underscore the irreplaceable role of human teachers in providing socio-emotional support and fostering genuine communicative competence (Chounta et al., 2022; Omidvar & Meihami, 2025).

The perception that technology cannot replace teachers (100% agreement) and the identified shift from "information provider" to "facilitator" (68%) reflect a maturing understanding of digital transformation in education. This approach aligns with frameworks such as the Teacher Digital Competency model addressed by Falloon (2020) which emphasises that teachers should move beyond merely delivering content towards designing meaningful learning experiences that thoughtfully integrate technology. The fact that 81% of participants advocate balanced integration, combining digital tools with sustained face-to-face interaction, suggests that they are developing the critical digital literacy and pedagogical judgement necessary for effective technology-mediated teaching.

The widely acknowledged barriers were distractions in online settings (50%) and challenges in assessing and verifying student effort (36%), which are consistent with the OECD's (2026) observations on how digital technologies and generative AI can lead to increased cognitive overload, reduced focus, and 'metacognitive laziness' when students rely too heavily on automated tools. This complicates authentic assessment practices. Similarly, UNESCO (2025) highlights threats to academic integrity and the limitations of traditional assessment models in the generative AI era, emphasising the importance of preserving human judgement and meaningful learning interactions amid digital disruption. These issues are particularly relevant in EFL contexts, where the core learning goals are oral production and authentic interaction. Therefore, the findings support calls for hybrid pedagogical models that preserve human-centred elements while making use of technological possibilities.

The study's limitations include the small, convenience sample drawn from a single institution, which restricts generalizability. The focus group format, while fostering interaction, may have encouraged consensus views rather than fully capturing dissenting opinions. Nevertheless, the depth of reflection

obtained from these junior preservice teachers offers valuable insider perspectives on an evolving educational landscape in a regional context that is under researched.

7. Conclusion and Recommendations

The study's findings indicate that preservice EFL teachers view technology as a potent yet limited asset in the realm of English language acquisition. Digital tools and AI enhance resource accessibility, engagement, and self-learning, but they are not yet able to develop speaking fluency, authentic interaction, and the affective dimensions essential to effective language learning. Participants unanimously affirm that human teachers remain indispensable and foresee an evolution in the teacher's role toward that of facilitator and guide. They advocate for intentional, balanced integration of technology rather than wholesale substitution.

These findings contribute to the growing body of evidence on technology integration in EFL teacher education, particularly in Hispanoamerica contexts where globalisation and digital disruption intersect with local educational realities. They emphasise the necessity to equip future educators with not only digital competencies but also the critical faculties necessary to uphold the human element in language education.

The following recommendations may prove useful for educators, programme designers, decision-makers and, naturally, for future research.

(1) For teachers and programme designers.

- It is imperative to incorporate comprehensive training on critical digital literacy and AI literacy into the English Language Teaching curriculum. This should include practical experience in evaluating and adapting tools such as TikTok, YouTube, and generative AI for educational purposes.
- Design hybrid methodology courses that deliberately combine technology enhanced activities with face-to-face speaking practice and affective support strategies.
- Incorporate modules on the ethical use of AI, academic integrity, and strategies for detecting AI-generated content.

(2) For decision makers at UADY and similar Mexican universities.

- Invest in reliable infrastructure and equitable access to reduce the digital divide that currently prevents students facing logistical barriers from benefiting from technology.
- Promote faculty development programmes focused on blended and hybrid pedagogies that preserve human interaction.
- Establish clear institutional guidelines for technology use in assessment to address concerns about authenticity and verification of effort.

(3) For future research.

- Conduct large-scale, mixed-methods studies across multiple Mexican universities to compare the perceptions of pre-service and in-service EFL teachers.
- Explore the longitudinal impact of specific technology integration models on language proficiency outcomes (especially speaking skills) and learner affect.
- Investigate ways of integrating global digital tools with local Mexican educational values and contexts that are culturally responsive.

By adopting a balanced, human-centred approach to technology integration, teacher education programmes in Mexico and other regions can enhance the preparation of future educators to navigate an increasingly digital yet fundamentally relational profession. The present study lends further support to the notion that technology should serve as an adjunct to, rather than a substitute for, the empathetic and responsive teaching that lies at the heart of effective language education.

From Survival to Communication: Effective Strategies for Teaching Czech to Erasmus+ Students

Pavla Kocourková

University of West Bohemia in Pilsen, Czech Republic

Abstract

The aim of this article is to present methods and practical tips for teaching Czech to students coming to the Czech Republic for one or two semesters as part of the Erasmus+ program. The Czech Republic presents a specific linguistic environment in which communicating in everyday situations solely in foreign languages can be challenging, especially outside major tourist hubs. It is therefore essential to equip students with basic socio-cultural knowledge and language skills so they can cope with everyday situations in the Czech environment. To identify the specific situations in which students need Czech, we conducted a questionnaire survey between 2021 and 2025 with 163 respondents. The findings suggest that the Survival Approach, utilizing formulaic language, best meets the identified needs of incoming students by effectively supporting their willingness to communicate (WTC). At the level of specific teaching units, we found the Scaffolded Language Emergence (SLE) approach to be particularly useful. SLE not only encourages WTC but also minimizes the reliance on an intermediary language (typically English), addressing a common issue in Erasmus+ language courses.

Keywords: *Czech as a foreign language; Erasmus+; Survival Approach; formulaic language; Scaffolded Language Emergence*

1. Introduction

Study stays by international students at Czech host universities are an important part of the internationalization of higher education institutions, a process that receives significant attention in the strategic plans of most Czech universities, individual faculties, and other university departments. In this study, we are particularly interested in the mobility of international students who come to the Czech Republic through the Erasmus+ program, as these students make up the vast majority of students enrolled in beginner-level Czech language courses.

International students come to the Czech Republic from many different countries. In addition to students from Slavic countries, whose cultures are similar to ours, we primarily work with students from completely different cultural backgrounds. Students from Slavic countries often already have at least a basic knowledge of the Czech language and Czech culture upon arrival in our country; they know basic greetings and phrases, whereas students from non-Slavic countries usually have no command of Czech at all and use English as their primary language of communication. However, in many places in the Czech Republic, it is still difficult to communicate in English even in everyday situations (shopping, services, etc.).

This study aimed to identify the situations in which Erasmus+ students most frequently need knowledge of Czech, and, based on the survey results, to select effective teaching strategies and methods for teaching Czech to non-native speakers that will help our students succeed in those situations.

2. Theoretical Background

2.1 ERASMUS+

Based on the Support Study for the Erasmus+ 2021–2027 Interim Evaluation and the Erasmus+ 2014–2020 Final Evaluation, the Erasmus+ programme is defined as follows: Erasmus+ is the European Union's (EU's) programme in the fields of education and training, youth and sport. It is one of the EU's most visible success stories. It builds on the achievements of its long history, since the Erasmus programme was originally established in 1987, and also on those of other pre-existing European programmes in the fields of education and training, youth and sport, covering both intra-European as well as international partnerships. Erasmus+ was established in 2014 as a result of the integration of all previously existing EU programmes implemented during the period 2007-2013 in the fields of education,

training, youth and sport: Lifelong Learning1, Youth in Action, Erasmus Mundus, Edulink, Tempus, Alfa and Preparatory Actions in Sport.
The general objective of Erasmus+ is to support, in particular through learning mobility, the educational, professional and personal development of people in education, training, youth and sport in Europe and beyond, thereby contributing to sustainable growth, quality jobs and social cohesion, to drive innovation, and to strengthen European identity and active citizenship. It does this through: supporting and financing the mobility of individuals (Key Action 1, KA1); cooperation among organisations and institutions (Key Action 2, KA2); support to policy development and cooperation (Key Action 3, KA3); and teaching, learning, research and debates on European integration matters (Jean Monnet Actions, JMA) [1].
International students coming to Czech universities under the Erasmus+ program generally have the option to include beginner-level Czech language courses in their study plans during their stay in the Czech Republic. These courses are a full-fledged part of the so-called Learning Agreement, are awarded ECTS credits (at the University of West Bohemia, students earn 5 ECTS credits for completing the course), and both the sending and host universities must approve their inclusion in the student's study plan. Czech language courses for Erasmus+ students are also available to students arriving as Freemovers.
The number of students in the Czech language course for beginners at the University of West Bohemia is shown in the table below:

Table 1. Number of students from 2021 to 2026.

Students / Semesters	WS 21/22	SS 21/22	WS 22/23	SS 22/23	WS 23/24	SS 23/24	WS 24/25	WS 25/26	Total
Erasmus+ and Free Movers students at the UWB	144	102	144	96	162	84	165	168	1065
Students in Czech language courses	47	42	53	46	53	36	51	47	375

2.2 Czech as a Foreign Language

According to the Foreign Service Institute (FSI), the primary training institution for the U.S. Department of State, which prepares American diplomats and foreign affairs professionals for international assignments, the Czech language is considered difficult for English-speaking native speakers to learn. Based on the average time students need to reach a "Professional Working Proficiency," the FSI has divided languages into five categories. In the US government's language, this corresponds to a score of "Speaking-3/Reading-3" (S-3/R-3) on the Interagency Language Roundtable scale, roughly equivalent to B2/C1 on the Common European Framework of Reference for Languages. The Czech language is in the fourth category. Students usually need about 44 weeks, or 1100 class hours, to reach S-3/R-3. The languages in this category are described as languages with significant linguistic and/or cultural differences from English. The Czech language is in this category, along with several other Slavic languages, such as Slovak and Croatian, as well as Hungarian, Hebrew, Uzbek, Vietnamese, and Zulu [2].
Czech is a Slavic language. It is written using the extended Latin alphabet (the complete Czech alphabet, including diacritics, has 42 letters) and follows a predominantly phonological system. Most sounds are common in other languages as well, but many international students find it difficult to pronounce words containing clusters of consonants. Distinguishing vowel length is also often a challenge. However, the greatest difficulty in Czech lies in its complex grammar and rich vocabulary. Czech is an inflected language, meaning it not only conjugates verbs but also uses declension for nouns, adjectives, pronouns, and numerals. Declension means that a single word can take on multiple endings. By choosing the appropriate ending (which always corresponds to the relevant case), the speaker expresses the word's function in the sentence and its relationship to other sentence elements, such as whether it is the subject or object of the sentence. Thanks to declension, it is not necessary to adhere to a fixed word order in Czech as strictly as, for example, in English or French; the function of a word is expressed by its form, not its position in the sentence. Word order can thus, to a certain extent, help the speaker express finer nuances of meaning, since in Czech the most important information is usually at the end of the sentence. To express even more precise relationships between words, Czech uses a rich system of prepositions. Czech uses 7 cases in both the singular and plural and three grammatical genders, masculine (animate and inanimate), feminine, and neuter. In addition to the aforementioned

declension and rich prepositional system, students, especially those who do not speak a Slavic language, often find it difficult to use verb aspect correctly and to navigate the system of prefixes.
Given the nature of the Czech language and the need for students to learn to communicate, at least in the most common everyday situations, within a short period of time, the survival approach appears to be effective for this specific audience.

2.3 Survival Approach

The survival approach in language learning is not attributed to a single author, but rather to the combined work of applied linguists, educators, and language advocates who created these systems for travelers, expatriates, and endangered language preservation. A highly regarded work in this field is the 1991 study by applied linguists Paul Nation and David Crabbe, in which they outlined a functional-conceptual approach to creating survival-oriented thematic dictionaries for travelers. In their research, they prioritized short but highly useful phrases for immediate communication: The aim of this study is to provide a list based on a principled approach that will give learners an immediate and useful return for the effort of learning. A quick survey of introductory course books indicates that their syllabus content provides poor short term return for someone with limited time to invest. There is usually too much material in the early lessons that is not relevant to immediate needs. The first chapters often deal with topics like the indefinite article, pronouns, or adjectives, before coming to something that can be immediately used [3]. Nation and Crabbe have developed a study plan for short-term stays (1–3 months). They argue that it is worthwhile to learn the local language even during this period, but that intensive courses are ineffective in this case. They selected topics for the curriculum based on four criteria: 1. needs (they conducted a needs analysis of ten respondents), 2. frequency of occurrence of terms (they compared these with An English-French-German-Spanish Word Frequency Dictionary by Helen Eaton, 1940), 3. coverage and combinability, and 4. learnability.
No consideration has been given to special needs that the visitor may have as a result of the particular reason for visiting that country, such as to do academic research, to arrange a trade deal, or to get married. Rather, attention has been focused on survival, travel and social needs which would be common to any visitor to another country. This includes getting the necessities at a good price and basic social courtesies. The syllabus thus has two focuses: a focus on spoken language, on the assumption that in the mainstream tourist areas of a country, communication will be in a spoken form, and a focus on vocabulary [3].
In 2005, researchers from the University of Málaga published a paper that expanded on the original ideas of Nation and Crabb. They transformed the original thematic model into a functional-conceptual one, which is considered more versatile: A functional-notional syllabus was implemented so that it could better suit our students' needs by taking into account particular features such as age, mother tongue, language level, background knowledge, etc. This model, with few adaptations, was designed to cope with the linguistic problems that the students usually have in their first visit to an English-speaking country. Our syllabus was developed with the following objectives in mind: 1) to remedy our students' shortcomings by means of a survival model; 2) to check the validity of a functional-notional approach for this type of course; 3) to assess the students' motivation and acceptation of our model by incorporating computer-based sessions in the language lab. All in all, our model of survival English syllabus is featured by its versatility, as it may be adopted in any teaching environment, and its coverage and scope, as it enables the students to cope with most situations in ordinary life [4].
The survival approach is essentially pragmatic and deliberately limits the breadth of the curriculum in favor of practicality. Closely related to this is the concept of formulaic speech (henceforth FS), which is used in the survival approach. FS is based on sequences of words that speakers learn and use as unified "chunks" without necessarily understanding their internal grammatical structure: A formulaic form is learned in terms of its function. In FS, function has precedence over form, it is more relevant to consider formulas from a pragmatic point of view rather than from a syntactic one. In a Second Language Acquisition perspective, FS is shown as being a temporary stage of acquisition which, among other aspects, enables the speaker to reach idiomaticity in his or her L2 and thereby
efficient communication with native speakers [5].
The survival approach is not the only one that aims to enable complete beginners to achieve a basic level of communicative competence as quickly as possible. We now turn our attention to the Scaffolded Language Emergence approach.

2.4 Scaffolded Language Emergence

The American linguist Don Kiraly (Donald C. Kiraly), who worked at the University of Mainz in Germany, is considered the founder of the Scaffolded Language Emergence (henceforth SLE) approach. In his own words, the SLE approach is: a principled approach to fostering initial language emergence in adults. It is both firmly grounded in extensive experience and supported by a growing body of theory that sees language learning as an emergent, highly authentic, and collaborative process of language creation. The SLE approach has deep roots in three domains: 1) naturalistic, immersion type language learning as exemplified in a long lineage of language teaching methods, 2) the body of general educational thought revolving around the concept of social constructivism, which dates back at least to early 20th century progressive thinkers like Lev Vygotsky and John Dewey, and 3) the school of thought in the domain of language learning and acquisition studies that focuses on the ecology and complexity of language and both social and cognitive language learning processes. From an SLE perspective, conventional approaches to language teaching often purport to offer learners carefully packaged information about language to be accumulated through deduction from linguistic rules, rote memorization, and repetitive practice. SLE, on the other hand, advocates the creation of a naturalistic immersion environment in which adult learners, in particular, can explore and, in fact, generate within themselves a previously unknown language system through collaboration with peers and with one or more facilitators who nudge, guide, and scaffold far more than they instruct [6]. In the SLE approach, the teacher acts not as an authority figure but as a guide and co-creator of the language system, building a safe “scaffold” for students by creating opportunities for action and interaction, and providing support and feedback. As students’ autonomy increases, the teacher gradually removes the scaffolding. To beginners, linking language with physical movement is essential, which is why the Total Physical Response method is widely used in the SLE approach. The facilitator also deliberately combines speech with expressive gestures, facial expressions, and movement, thereby helping students grasp the meaning of language through physical experience and eliminating the need to translate into their native language. This engagement of motor memory and multiple senses leads to more effective acquisition of basic vocabulary and supports the natural emergence of language structures through bodily experience (embodiment).
Both the survival and SLE approaches rely exclusively on the target language.

3. Research

3.1 Methodology

Between 2021 and 2025, an online questionnaire (Google Form) was sent to most Erasmus+ and Freemovers students enrolled in beginner-level Czech language courses. The questionnaire was distributed at the end of the semester, and participation was voluntary. A total of 163 students participated in the survey. One of the survey’s objectives was to identify specific everyday situations in which these students most frequently need knowledge of the Czech language.

3.2 Research Design

In the section of the questionnaire devoted to identifying specific situations in which international students arriving in the Czech Republic need at least a basic knowledge of Czech, two open-ended questions were asked:
1. In what situations did you use the Czech language most often during your stay?
2. In what situations did you miss knowing the Czech language the most?
Question number two was divided into two parts: a) spoken Czech, b) written Czech.
We have categorized the responses to the above questions and present them in the following tables, along with the number of responses and the semester and year in which each response was provided. Answers that appeared in response to all questions are highlighted in the same color. Answers that applied to only one question are shown in white.

Table 2. Situations in which students most often use Czech during their stay in the Czech Republic.

Situations / Semesters	WS 21/22	SS 21/22	WS 22/23	SS 22/23	WS 23/24	SS 23/24	WS 24/25	WS 25/26	Total
Shopping	15	17	10	9	10	12	16	18	107
Restaurants, bars	11	3	4	3	3	9	9	13	55

3.3 Analysis of the Communication Needs of International Students

The purpose was to determine in which communication situations students most often need knowledge of the Czech language. Question 1 addresses this objective. Question 2a was included to determine whether there are, even if rare, situations in which knowledge of Czech is absolutely essential for students. For many students, the answers to Question 1 and Question 2a differ; for many others, the answers to both questions are the same; and some students responded that they did not understand the question. We received the fewest responses to Question 2b, and some students also stated they did not understand the question.
An analysis of all responses to both questions clearly shows that students need the most knowledge of Czech in the following areas: shopping, restaurants and bars, interactions in public spaces, including interactions with friends and at school, transportation and city orientation, accommodation and householding, and services and leisure. In the responses to Question 1: In what situations do students most often use Czech, and Question 2a) In what situations did students most lack knowledge of spoken Czech, the same topics appeared in the top three spots (in varying order): shopping, restaurants and bars, and interactions in public spaces, with friends, and at school. This result confirms that these topics are essential in spoken language for students. In the responses to question 2b) “In what situations did students most lack knowledge of written Czech?”, the topic of transportation and city orientation appeared in third place, alongside shopping, restaurants, and bars. The topic of transportation and navigating the city ranks fourth in the overall ranking of all responses to all questions, so it is also very important. This is followed by the topics of accommodation and householding, and services and leisure. Given that our study focuses on students (who have secured housing) rather than travelers, and that in today’s age of modern technology, the need to ask for directions has receded into the background, we can conclude that our findings largely confirm the results presented in the 1991 study by Paul Nation and David Crabbe, who identified the following most common communication situations: 1. Greetings and being polite, 2. Buying and bargaining, 3. Reading signs, 4. Getting to places, 5. Finding accommodation, 6. Ordering food, 7. Talking about yourself and talking to children, 8. Controlling and learning language [3].

3.4 Choosing Appropriate Teaching Methods and Strategies

Most international students come to our university for one semester. The semester lasts 13 weeks. Czech language courses for Erasmus+ students are held twice a week for 90 minutes. Teaching methods and approaches should be chosen that enable students to communicate effectively in the most common everyday situations in a Czech-speaking environment within a short time. As explained above, these needs are met by the Survival and Scaffolded Learning approaches. In our Czech language courses for Erasmus+ students, we use a combination of both approaches, incorporating elements of other methods.
Over the years, we have gradually refined our teaching methods and the selection of specific activities based on our observations of how well the approaches and activities used in the courses worked, as well as on more spontaneous student feedback. The selection of topics reflects our ongoing evaluation of the questionnaires mentioned above. We therefore consider shopping, dining situations in restaurants, and greetings, introductions, and basic interactions in public places and with friends to be the most essential communication situations for our students.
Unfortunately, in our setting, we do not have two native speakers in our courses, as described in the SLE approach, so for introductory conversations, we either use video materials or have one instructor outline the situation. In some cases, it is possible to conduct a conversation with one of the more advanced students, typically those from Slavic-speaking countries. At least during the first two sessions, we do not use any written language materials. This approach, which promotes correct pronunciation and is used in SLE, has proven very effective for us in other language courses as well, such as French courses for absolute beginners. Students rely on their auditory memory, which is constantly stimulated in class by new but regularly recurring stimuli. However, we combine the audio track with gestures, movement, and other elements to engage as many senses as possible. We strive to adhere to the principle of using only the target language and to make the most of real-life objects and situations, as well as role-playing exercises. Each lesson concludes with an activity or game that allows students to apply what they have learned actively. As for declension, the main focus is on students’ understanding of its meaning and function. During the course, attention is given only to the accusative case, which is used when shopping and ordering at a restaurant. For review and practice at home, we prepare a range of online activities for students in the Wordwall app, such as memory games where they match an image

with a sound, and later with a written word; moving words to practice correct sentence structure; selecting the correct forms; sorting words; and so on.
Presenting the specific activities for each topic over the entire semester would be an ambitious goal that would go far beyond the scope of this article; therefore, we will provide a detailed overview of the very first lesson.

3.5 First Learning Unit - Detailed Description

We naturally introduce the "Greetings and Introductions" communication unit right at the first meeting with the students. The teacher greets the students and introduces themselves in a very simple way, using a set phrase: *"Ahoj, já jsem + name"* (Hello, my name is + name), accompanying the introduction with gestures. Then the teacher invites the students to come up, introduces themselves again, and asks, *"A Ty? Jak se jmenuješ?"* (And you? What's your name?) This question corresponds to the informal speech that students will use more frequently. Everything is accompanied by precise gestures and a distinct intonation. The teacher observes which students have understood the question, turns to them, and uses the previously employed gestures for introductions to prompt their responses. When the student responds, the teacher adds the reaction: *"Těší mě."* (Nice to meet you), again accompanied by a gesture. In this way, all students introduce themselves. Once all students understand this situation and can introduce themselves informally, the teacher explains, using gestures, that this way of speaking is informal, but that Czech also uses a formal style. Then the teacher uses the same gestures for greeting and introducing oneself, but this time accompanies them with formal language: *"Dobrý den. Já jsem + name. A Vy? Jak se jmenujete?"* (Good morning. My name is + name. And you? What is your name?) Students generally understand the difference very well. The teacher then addresses the students in both a formal and informal manner. During the exercise, the teacher suddenly says clearly: *"Promiň, nerozumím. Ještě jednou, prosím."* (Sorry, I don't understand. One more time, please.) The teacher again accompanies the speech with gestures. If the students do not understand, the teacher repeats the question and adds the previous question: *"Jak se jmenuješ?"* (What is your name?) Once all students understand the content, the teacher also uses the formal form: *"Promiňte, nerozumím. Ještě jednou, prosím."* (Excuse me, I don't understand. One more time, please.) The teacher then addresses the students in both formal and informal ways, and they complete the micro-dialogue in the same tone, depending on the form the teacher has chosen. After practicing both formal and informal ways of introducing oneself, during which all the students' names were mentioned repeatedly, the teacher surprises the students with a sentence accompanied by a gesture: *"To je + name of student."* (That's + student's name.) In this way, the teacher introduces several students and then asks: *"To je + student´s name?"* (Is this + student's name?) The teacher answers: *"Ano, to je + student´s name."* (Yes, this is + student's name), thereby showing the students the affirmative response. The answer is again accompanied by a gesture. After several repetitions, the teacher explains the negative form in the same way *(No, this is not + student's name).* The final question in this first part of the lesson is: *"Kdo je to*?" (Who is this?) The teacher points to a student, asks the question, and gestures to indicate they don´t know who it is. After a brief practice session and summary, students are invited to an Erasmus+ student party where only Czech is spoken. There, they can now get to know each other in Czech, simply ask who someone else is, introduce someone, or say that they don't understand and need the other person to repeat what was just said. Students are repeatedly encouraged to use the gestures they have learned to accompany the corresponding utterances.
In the second part of the first lesson, the teacher will introduce students to several basic concepts from everyday life, specifically a book, a notebook, a pen, a table, a chair, a window, and a door. As mentioned above, Czech uses seven cases; the goal of this section is not only to teach students the words in their basic form but also to familiarize them with the fact that every noun has multiple forms. To do this, the teacher will use specific objects, showing them to the students in various situations and commenting on these situations: *"To je kniha. Kniha je malá. Otevřu knihu. Zavřu knihu. Položím knihu na stůl. Teď je kniha na stole. Je to moje kniha."* (This is a book. The book is small. I'll open the book. I'll close the book. I'll put the book on the table. Now the book is on the table. This is my book.) At the end, the teacher asks: *"Co je to?"* (What is this?) The students usually answer correctly: *"To je kniha."* (This is a book.) In this way, the teacher introduces all the objects. At the end of each demonstration, the teacher asks: *"Co je to?"* (What is this?) and, after hearing the correct answer, uses the same question to review the entire series of already familiar objects. This is followed by a review of negation, after which the teacher invites the students to follow their instructions and manipulate the objects whose names they have just learned. During the demonstration, verbs associated with multiple objects (open/close a book, a notebook, a window, a door) were intentionally used so that students could

generally understand. This activity is very well received by the students, who are generally motivated by the realization that they understand the instructions in Czech. Next is an activity in which students keep their eyes closed and identify and name objects based on the sounds they make. The final activity is a conversation in which we simulate a meeting between Erasmus+ students and Czech students. Students try to apply everything they have learned during the lesson. In 90 minutes, they learned how to: greet others and introduce themselves (formally and informally), ask someone's name, say they don't understand, ask for something to be repeated, and name basic everyday objects. They know that in Czech we use formal and informal forms of address, as well as declension; they have mastered the third-person singular form of the verb "to be," which is irregular and often causes problems; and they understand the difference between the pronouns "co" and "kdo."

4. Conclusion

For international students who come to the Czech Republic for one or two semesters as part of the Erasmus+ program, the Czech language poses a significant challenge. Given that, outside major tourist centers, communicating in English in everyday situations remains difficult, it is crucial to equip students quickly with a functional foundation in the language. An analysis of communication needs conducted among 163 respondents clearly identified shopping, visits to restaurants and bars, and basic social interaction in public and school settings as priority areas. These real-life needs of students largely align with the themes identified by Paul Nation and David Crabbe as early as 1991. A combination of the "Survival Approach" and the "Scaffolded Language Emergence" (SLE) approach proved highly effective for this specific group of students within the limited time frame (a 13-week semester with two 90-minute classes per week). Teaching based on fixed phrases (chunks) allows students to achieve immediate communicative success, which significantly boosts their willingness to communicate (WTC) in real-life situations. Furthermore, the SLE approach effectively addresses a common problem in international courses, namely excessive reliance on a bridge language (typically English). Thanks to its emphasis on multisensory learning, gestures, facial expressions, and the Total Physical Response (TPR) method, this model eliminates the need for translation and promotes the natural "emergence" of language structures through physical experience. The practical application in the first teaching unit demonstrated that even complete beginners can master the basics of social etiquette and name several objects in the target language within 90 minutes. The proposed strategy thus represents a viable alternative to traditional grammar-centric methods and provides students with tools for effective integration into the Czech sociocultural environment.

Workplace-Oriented German Training for Engineers: A Needs-Based Practice Report from a Multinational Company

Irini Zourlantoni

STATIKS IKE, Greece
RADIN Planungsgesellschaft Tragwerke mbH, Germany

Abstract

Teaching German in a highly specialised civil engineering environment quickly showed that grammar and textbooks alone were not enough. The civil engineers needed to explain technical processes, discuss reports, solve problems, and communicate professionally between Germany and Greece. This required a more flexible and workplace-oriented approach to language teaching. This paper reflects on a longitudinal language training program developed and continuously adapted between 2022 and 2026 at STATIKS IKE in Thessaloniki, Greece and RADIN Planungsgesellschaft Tragwerke mbH in Lippstadt, Germany. Both companies operate within the same transnational engineering environment under shared management. The program originally began with nineteen participants and continues today with a core group of nine civil engineers. This development reflects both professional mobility within the company and the personal and professional development of the participants over time. The learners ranged from A1 to C2 levels and were organised into six individual level groups as well as three broader groups (A1–B1, B2–C1, and C2). The groups attended weekly ninety-minute lessons, mainly in person and, when necessary, online. One of the central pedagogical challenges throughout the program was the gap between receptive understanding and active communication. Many engineers were able to read and understand German technical documentation quite fluently but experienced difficulties when they had to explain the same content independently in speaking or writing. Addressing this gap required more than traditional communicative exercises. Over time, the program developed into a more dynamic and adaptive teaching process that continuously changed in response to the learners' professional realities, communication challenges, and workplace situations. The development of the program was therefore not linear, but shaped by ongoing reflection, experimentation, and adaptation. The training gradually combined task-based and needs-based approaches, authentic professional materials including reinforcement plans (Bewehrungspläne) and soil reports (Bodengutachten), case-based learning, intercultural reflection and, authentic professional and everyday communication in an increasingly AI-influenced workplace environment shaped by fast daily communication. The findings suggest that effective language training in technical contexts requires continuous adaptation, genuine engagement with the learners' professional environment, and a willingness on the part of the educator to learn alongside the discipline being taught.

Keywords: *Languages for Specific Purposes (LSP), workplace-oriented language training, task-based learning, intercultural communication, adaptive language teaching, engineers*

1. Introduction

General German language instruction alone often does not prepare engineers sufficiently for the communication demands of a technical multinational workplace. That observation may sound obvious, yet many language programs for professional contexts still begin with general linguistic frameworks, as I initially did myself, before gradually introducing professional content. In practice, this often produces learners who can discuss grammar but struggle to lead a technical meeting or explain complex professional problems independently [1, 6]. The program described in this paper did not begin as a specialised engineering language course. Like many DaF programs, it initially followed more traditional general language teaching approaches and materials from established DaF publishers. Over time, however, the professional realities of the engineers increasingly shaped the direction of the training and gradually transformed it into a more workplace-oriented and adaptive form of language instruction, particularly at the B2–C1 levels, while the lower A1–B1 levels remained more strongly connected to general DaF instruction. STATIKS IKE in Thessaloniki, Greece, and RADIN Planungsgesellschaft Tragwerke mbH in Lippstadt, Germany, do not function as two separate companies in partnership, but as part of the same transnational engineering environment under shared management. The Greek

engineers work on German projects, read German technical documentation, communicate with German clients, and, for those who travel to Lippstadt, often work for extended periods in an entirely German-speaking professional environment. Their need for German is therefore immediate and directly connected to their daily professional responsibilities [2, 3, 27]. I began working with this cohort in September 2022 with a group of nineteen participants ranging from complete beginners at A1 to learners at C1 level. The reduction from nineteen to nine participants over four years reflected professional mobility, including career changes and relocation. Since September 2025, the program has also included two C2-level civil engineers, one of whom is a company director within the firm. The participants were divided into two broader level groups, A1–B2 and B2–C1, while the C2 participants attended lessons together with the advanced group. Each group met once a week for ninety minutes, almost always in person. This choice was deliberate, as many of the communicative tasks that proved most valuable in this context involved spontaneous technical explanations, simulated professional meetings, and forms of interaction that required participants to think and speak simultaneously [4, 5]. At the same time, remote teaching also became part of the program when necessary. In this particular context, online lessons proved to be similarly effective, mainly because the participants were already accustomed to close professional collaboration, regular communication, and highly interactive lesson formats. Workplace communication problems frequently became teaching material themselves. A site report that used unfamiliar terminology. An AI-generated translation that had caused a professional misunderstanding. Over time, the engineering workplace itself increasingly became part of the curriculum, which made the training both more demanding and, in many cases, more effective [5, 6, 11]. Several participants undertook external German courses alongside the in-company training, pursued formal language certifications, and completed immersive work placements at the Lippstadt office for two weeks to three months [6, 15].

2. Theoretical Background

2.1 Languages for Specific Purposes (LSP) and Needs Analysis

The theoretical foundation of this program is situated within Languages for Specific Purposes (LSP), an approach based on the idea that language learning becomes more effective when it is closely connected to the real communication demands of a specific professional context [6, 10]. In structural engineering, communicative competence has a very practical meaning: the ability to read and critically assess a soil report, explain the implications of a foundation calculation to a non-specialist client, or lead a technical meeting in which questions of safety, responsibility, and project cost are discussed simultaneously [2, 3]. General linguistic competence is necessary for this, but on its own it is often not enough. Needs analysis became a central component of the program. One of the most important lessons this teaching experience revealed was that workplace needs cannot be analysed once at the beginning of a course and then treated as fixed. Professional communication practices and workplace priorities change continuously. The communicative challenges engineers faced in 2022 were not identical to those they encountered in 2025, particularly given the growing presence of generative AI in workplace communication during that period [5, 12]. For this reason, needs analysis became part of the weekly rhythm of instruction. Participants were regularly encouraged to bring current workplace communication problems and ongoing projects into the classroom, transforming professional difficulties into teaching material and creating a continuous feedback process between the engineering workplace and the language learning environment [5, 11]. Over time, this also contributed to a more adaptive form of language teaching in which workplace realities increasingly shaped lesson content and communicative priorities.

2.2 Task-Based Language Teaching, Scaffolding and Writing-To-Learn

Task-Based Language Teaching (TBLT) became one of the main methodological approaches of the program and was closely connected to the idea that language learning develops most effectively through active participation and meaningful interaction rather than passive reception [4]. A recurring challenge throughout the program was the gap between receptive understanding and productive communication. Many participants were able to understand highly complex technical information but struggled to explain it independently in German. Over time, the program therefore increasingly adopted an output-oriented perspective, encouraging learners not only to process technical language but to actively use it in professional interaction. This distinction became particularly important in workplace-related situations. When an engineer practised explaining a structural problem not as an isolated grammar exercise but as

part of a simulated professional interaction, participants often became noticeably more engaged and personally invested in the activity. In this sense, TBLT was also closely connected to scaffolding practices inspired by Vygotsky's zone of proximal development, the idea that learners progress most effectively when support is carefully adjusted to their current abilities and gradually reduced as confidence and competence grow [19]. Particular importance was also given to recurring professional expressions and formulaic language, since fluent workplace communication often depends less on isolated vocabulary knowledge than on the ability to retrieve and adapt functional linguistic patterns quickly and appropriately. Writing was integrated within a combined Speaking-to-Learn and Writing-to-Learn framework, where speaking and writing were treated not simply as a product to be evaluated but as a process that helped learners organise technical knowledge and reflect on their professional communication [1]. Engineers speaking and writing technical summaries in German were not only practising vocabulary and grammar, but also working out what they actually understood about the technical content itself.

2.3 Intercultural Competence, Translanguaging and Critical AI Literacy

Effective communication in German-Greek professional contexts requires intercultural competence alongside linguistic proficiency, a point strongly supported in the literature and repeatedly confirmed throughout this program in practice [7, 13, 14]. The differences between German and Greek professional communication cultures extend beyond grammar and vocabulary. Questions of directness, structure, and professional tone often influenced how technical communication was perceived [7]. For this reason, intercultural elements were regularly integrated into the lessons through workplace communication, current German topics and news, authentic materials, and discussions about regional language use and dialects. These aspects helped participants develop not only linguistic competence, but also a broader understanding of professional and cultural communication in German-speaking environments. At the foundational levels, Greek often became an important support tool within the learning process. It was used to clarify difficult grammatical structures, explain technical terminology, and discuss complex communication situations that would otherwise have remained unclear. Especially in high-pressure professional contexts, the strategic use of the learners' first language often reduced insecurity and helped participants process technical information more confidently [15, 16, 28]. This approach also reflects a broader shift away from older monolingual teaching models that viewed the first language mainly as interference. In practice, many participants were able to understand and discuss complex technical content more effectively when they could draw on both Greek and German as part of the learning process. The growing use of generative AI in professional communication gradually became relevant for the program, even though it had not originally been part of the teaching design. By 2023, several participants were already using AI tools for translation, emails, and workplace communication support. In some cases, the results were useful. In others, the generated texts sounded fluent but contained misleading technical terminology, inappropriate register, or factually incorrect information. As a result, AI-generated communication increasingly became part of classroom discussion. Participants compared AI-generated texts with authentic workplace communication, reflected on linguistic and technical differences, and discussed how experienced professionals would formulate similar content more appropriately. In this way, the growing presence of AI also reinforced the importance of authentic professional communication, professional language awareness, and critical reflection within the learning process [8, 9, 23].
Taken together, these theoretical perspectives helped shape a teaching approach that developed gradually in response to the communicative realities of the engineering workplace rather than through a strictly fixed curriculum.

3. Methodology

3.1 An Adaptive, Needs-Driven Framework

The methodology of this program was not fixed at the outset. It evolved through continuous contact with a specific professional environment and changed, sometimes quite substantially, as workplace demands changed and as I learned, occasionally through mistakes, what actually worked with this particular group [5, 11]. The foundational levels (A1 to B2) required a strong emphasis on linguistic stability through vocabulary development, grammatical consolidation, guided production, and scaffolding strategies that provided structured support which was gradually reduced as learners became more independent [19]. At this stage, Greek was used strategically as a cognitive bridge, consistent with current translanguaging

research [15, 16]. The advanced group (B2 to C1, together with two C2 participants) required a noticeably different approach focused more strongly on discourse competence: the ability to sustain extended technical explanations, structure complex arguments under pressure, and communicate clearly and professionally in demanding workplace situations rather than simply producing grammatically correct language [1, 6].

3.2 Task-Based Activities, Case-Based Learning and Writing

Task-based activities formed the methodological core of the program and included technical explanations, professional text analysis, phone-call simulations, structured oral presentations, and workplace-related writing tasks. In many cases, participants first presented technical topics in Greek before gradually transferring the content into German in more extended form, a strategy that allowed them to build on existing professional expertise instead of developing technical communication entirely from the beginning [15]. At advanced levels, podcast-style recordings were also introduced as an experimental but highly successful activity format. They required participants to produce extended monologic speech without conversational support and therefore simulated professional situations such as technical phone calls, project explanations, or solo client presentations quite closely [24, 25]. Case-based learning was, in my experience, one of the most effective methodologies at advanced levels and also one of the most demanding to prepare. Realistic engineering scenarios, including a simulation involving structural damage discovered after project completion, required participants to identify technical causes, assess professional responsibilities, formulate possible solutions, and communicate decisions to different stakeholders. These tasks could not be completed through linguistic fluency alone. They required the integration of technical judgement, professional ethics, and communicative precision, precisely the kind of integrated competence professional language education should aim to develop [20, 21]. Intercultural reflection and discussion were integrated throughout the program, not as isolated topics but as natural dimensions of the professional communication situations participants encountered in their daily work [7, 8, 9, 13, 14, 23]. Collaborative discussion and peer reflection also played an important role, particularly during simulations and case-based activities where participants evaluated different communicative strategies together. Recurring communicative patterns and professional expressions were recycled regularly throughout the lessons in order to strengthen fluency and communicative confidence.

4. Implementation

4.1 Curricular Flexibility and Authentic Materials

The implementation rested on a particular understanding of what a language classroom can be in a professional context: not a protected space separated from working life, but a space where the communicative challenges of the engineering workplace are brought in, examined, and worked through in the target language [5, 11]. Lesson content emerged from the intersection of published DaF materials and the participants' immediate professional realities, an approach that required constant adaptation but ensured that what happened in the classroom remained connected to what mattered outside it [1, 6]. Authentic documents were central throughout the program. Real reinforcement plans (Bewehrungspläne), soil reports (Bodengutachten), technical specifications, workplace emails, and project-related documents, not only textbook approximations, were used at every level, adapted in complexity for foundational learners and used as discourse models for advanced participants [17]. Case studies with historical and cultural depth, including the structural restoration of the Pergamon Museum in Berlin and bridge engineering projects, connected technical vocabulary to real engineering decisions and gave participants a broader sense of German engineering culture beyond their immediate professional context [7]. Current German topics and professional communication practices were also integrated regularly into the lessons in order to connect technical language learning with wider cultural and workplace realities. Several participants undertook work placements at the Lippstadt office during this period, and the communicative gains from those immersive experiences were often more significant than what equivalent classroom time alone could produce [6, 15].

4.2 Differentiation, Challenges and AI Literacy in Practice

The differentiation between level groups involved far more than differences in vocabulary difficulty. At the foundational levels, the main priority was building enough linguistic confidence and stability for

professional communication to develop gradually over time. This required scaffolding strategies, guided production, strategic translanguaging, and, above all, patience with the slower progress that adult learners under considerable professional pressure do not always find easy [15, 16, 19]. At advanced levels, the focus shifted more strongly toward discourse competence: sustained explanation, structured argumentation, and spontaneous professional interaction in technically demanding situations. Some participants also attended external German courses and pursued formal certifications alongside the in-company training, which often accelerated their development beyond what weekly ninety-minute sessions alone could realistically achieve. It would be misleading to present the implementation of this program as entirely smooth. Participants often arrived at lessons before or after full working days, concentration was sometimes limited, motivation changed over the course of the four years, and some participants were openly critical of aspects of the training at different points. Learning to distinguish between criticism that required genuine changes in the teaching approach and frustration that mainly required acknowledgement was one of the more demanding professional challenges this program presented for me as an educator [17, 18]. Some participants regularly used AI-supported translation and writing tools in their daily work, which occasionally influenced written tasks, emails, and classroom discussions. [8, 9, 23, 26].

5. Results

5.1 Communicative Development and Speaking Confidence

The most significant development across the four years was the gradual shift from passive understanding to more active and confident communication in German, a development that was difficult to measure formally but became increasingly visible in the way participants engaged with professional communication over time. Engineers who had initially avoided speaking German spontaneously, often preferring to communicate more carefully through writing, gradually became more willing and eventually more comfortable communicating in real-time workplace situations. This development did not follow a linear path. There were periods of visible progress, longer plateaus, and phases in which professional stress or workload noticeably affected participation and confidence. At the same time, there were also moments in which participants suddenly demonstrated communicative abilities that had clearly been developing gradually over a longer period of time [1, 6]. Systematic vocabulary recycling and the repeated use of functional expressions (Redemittel) provided participants with reliable linguistic tools for professional interaction: how to open a technical discussion or disagree in ways that German professional culture often perceives as direct rather than confrontational [22]. Participants also developed a growing awareness of how German professional writing differs from Greek or English professional communication styles [1, 7]. Speaking confidence developed most noticeably during authentic workplace-related tasks, presentations, and case-based simulations, which reflects findings from TBLT research on the relationship between authentic tasks and productive fluency [4, 24, 25].

5.2 Intercultural Awareness, AI Literacy and the Limits of Progress

Intercultural development was generally slower and more difficult to observe than linguistic progress, but its professional impact was often equally important. Over time, participants developed a growing understanding of how German professional communication and workplace culture function in practice, particularly regarding directness, structure, and professional interaction. The goal was not to imitate German communication styles completely, but to understand them well enough to navigate workplace situations more confidently and appropriately [7, 13, 14]. This development required time and continuous exposure to authentic communication situations, workplace discussions, and intercultural reflection throughout the program. In many cases, participants gradually became more aware of how small differences in phrasing, tone, or communicative structure could influence professional interactions in German-speaking work environments. The growing use of AI-supported translation and writing tools in the participants' professional environment also became increasingly visible throughout the program and occasionally influenced written tasks and emails. At the same time, the limitations of the program should also be acknowledged openly. Progress was not uniform across participants, motivation changed over time, and sustaining long-term engagement alongside demanding professional responsibilities remained challenging throughout the four-year period. In addition, the absence of formal outcome measurement remains one of the limitations of this practice-based account [17, 18].

6. Discussion and Conclusion

6.1 Authenticity, Educator Development and the Changing Role of the Language Teacher

The primary conclusion of this paper is one with important implications for language teacher education: teaching professional language effectively requires genuine engagement with the professional field itself. I do not come from an engineering background. Yet over the course of four years I read about bridge construction, worked with real Bewehrungspläne, and tried to understand the Eurocodes well enough to recognise why they matter to the people I teach. This investment, something no DaF teacher training program formally prepared me for and nobody explicitly required of me, was, in my experience, one of the main factors that transformed the program from a general language course into training that connected more directly to the participants' professional realities [6, 7, 17]. At the same time, this long-term collaboration also changed my own understanding of language teaching. Over the years, I developed a much deeper awareness of the communicative pressures, workplace realities, and professional ways of thinking that shape engineering environments. The program therefore became not only a long-term process of professional and linguistic development for the participants, but also a continuous process of professional and interdisciplinary learning for me as an educator.

The classroom that developed through this process was not simply a protected space for language practice, but increasingly a space connected to real professional communication and workplace problem-solving. Authentic documents, realistic case studies, workplace communication, and professional challenges became central parts of the learning process rather than additional illustrative material [4, 17]. In this context, authenticity was not simply a teaching strategy but an important condition for relevance and engagement. When participants worked with real reinforcement plans instead of simplified textbook examples or discussed communication situations closely connected to their daily professional reality, the relationship between language learning and professional action became more immediate, practical, and meaningful [1, 6]. The experiences described in this paper also point toward a broader shift in the role of the language educator in professional contexts. In increasingly multilingual, interdisciplinary, and AI-influenced workplaces, language teaching can no longer be separated easily from intercultural communication, workplace interaction, and profession-specific communication practices. As a result, the role of the language teacher becomes more adaptive, interdisciplinary, and more directly connected to real professional environments than traditional language teaching models often assume. In many cases, language educators increasingly act not only as teachers of grammar and vocabulary, but also as mediators between language, professional communication, and workplace culture.

6.2 Future Perspectives and Professional Outlook

Future research could examine more systematically how long-term workplace-oriented language programs influence professional communication, intercultural competence, and communicative confidence in multilingual technical environments. It may also be valuable to explore more closely how language educators themselves develop professionally through sustained engagement with highly specialised professional fields [8, 15, 18]. The experiences described in this paper suggest that workplace-oriented language teaching will likely become increasingly interdisciplinary, adaptive, and closely connected to authentic professional communication in the future. In multilingual and technologically evolving workplaces, professional language education may require stronger collaboration between language educators, subject specialists, and workplace institutions in order to respond effectively to changing communicative demands. The long-term nature of this program also highlighted the importance of continuity, trust, and sustained collaboration in adult professional language learning. Over several years, participants not only developed linguistic competence, but also greater communicative confidence, intercultural awareness, and familiarity with German-speaking professional environments. At the same time, the program continuously expanded my own understanding of workplace communication, engineering culture, and interdisciplinary language teaching practice.

Acknowledgements and AI Usage Disclosure

AI-supported tools were used exclusively for language correction, proofreading, and stylistic refinement during the preparation of this paper. All pedagogical observations, professional experiences, classroom examples, interpretations, and conclusions are based entirely on the author's own long-term teaching

practice at STATIKS IKE and RADIN Planungsgesellschaft Tragwerke mbH. The author reviewed and revised all AI-assisted suggestions and takes full responsibility for the content of this paper.

Linguistic Immersion and Its Role in Teaching Arabic to Non-Native Speakers: Middlebury College in the United States as a Model

Nizar Qbilat[1], Hassan Alhosani[1]

[1]Mohamed Bin Zayed University for Humanity, United Arab Emirates

Abstract

This study explores the role of universities that teach Arabic as a second language in implementing immersion programs that extend beyond traditional curricula, classrooms, and instructors. By integrating cultural education, these programs provide learners with opportunities to engage directly with the Arabic language in authentic contexts, including social interactions, community participation, and cultural practices such as traditional clothing, customs, and celebrations. This approach emphasizes experiential learning, in which learners actively use the language in meaningful situations, fostering both linguistic proficiency and sociocultural understanding.

Moreover, language immersion encourages learners to internalize grammatical structures, vocabulary, and communicative strategies naturally while promoting motivation, autonomy, and confidence. The study also addresses challenges associated with immersion, including pronunciation, conversational skills, and language fluency, and proposes strategies to overcome these obstacles effectively. Furthermore, it highlights how situational and contextualized language experiences can complement or replace conventional textbook-based instruction, leading to more effective and lasting learning outcomes.

The findings indicate that students involved in immersion programs demonstrate higher levels of fluency, cultural awareness, and integration within Arabic-speaking communities. Finally, the study underscores the crucial role of educational institutions in designing and supporting comprehensive immersion experiences that enable learners not only to acquire language skills but also to develop a deeper understanding of the social and cultural dimensions of the Arabic-speaking world.

Keywords: *Language Immersion, Arabic as a Second Language, Cultural Integration, Experiential Learning, Fluency Development.*

Introduction

Drawing on personal experience gained while working in an Arabic language immersion program for non-native speakers at Middlebury College in the United States, this paper explores an intensive educational model designed to integrate learners fully into the Arabic language through academic coursework, daily activities, lectures, and a wide range of linguistic situations encompassing social, cultural, and psychological dimensions. In this model, language learning is transferred from the confined space of textbooks into the sphere of everyday lived experience. Consequently, the non-native Arabic learner exists entirely under the umbrella of Arabic both inside and outside the classroom—in restaurants, clubs, swimming pools, offices, holiday gatherings, evening events, and social activities within a closed university campus unified by a single linguistic and communicative context.

Linguistic immersion is regarded as one of the major branches of communicative linguistics. This field first emerged in 1947 at the University of Michigan through the work of Charles Fries and Robert Lado. Research efforts later continued in other institutions, such as University of Edinburgh in 1956 and the Center for Applied Linguistics in Washington in 1957, with the aim of defining the domains included within this specialization.

In *An Overview of Applied Linguistics* (2013), Murcia and Schmitt note that the American Association for Applied Linguistics (AAAL) identified the principal areas of this field. Applied linguistics thus became concerned with the study of language, the ways in which it is learned and used to achieve communicative goals, and the search for solutions to real-world problems. Among the most prominent topics within this field are language and technology, second-language acquisition, translation and interpretation, and linguistic immersion. This raises several important questions: What is linguistic immersion? Does it have

historical roots? What are its types and strategies? And how can it contribute to solving communicative challenges?[6]

Historically, immersion predates formal educational institutions. In earlier times, parents often sent their children to live among eloquent speakers in remote desert regions or isolated environments free from linguistic interference, where language—especially Classical Arabic—remained pure and unaffected. Ibn Khaldun discussed the concept of the "linguistic faculty" (*al-malakah al-lughawiyyah*), which individuals acquire through their environment by means of listening, communication, and repetition. He explains that a child raised among a speech community naturally acquires its language and internalizes its structures until he becomes capable of using it fluently, including its grammar and rhetorical features. Ibn Khaldun further argues that this acquisition is not primarily dependent on the direct study of grammatical rules, but rather on developing the linguistic faculty through hearing, speaking, and practical use. This is the same mechanism through which language is transmitted across generations.[7] He also states: "Languages are all faculties resembling crafts; they are faculties of the tongue for expressing meanings, and their perfection or deficiency depends upon the completeness or incompleteness of that faculty."[8]

Linguistic Immersion: Linguistic and Terminological Definitions

Arabic lexicons distinguish between the terms *ghaṭs* (diving) and *ghams* (immersion). *Lisān al-ʿArab* states: "To dive and to immerse are one and the same," and "He immersed him in water." Nevertheless, the term *immersion* carries broader and more comprehensive implications than *diving*, since immersion implies prolonged presence and continuity, whereas diving generally indicates brief submersion associated with water. Accordingly, linguistic immersion is more comprehensive than mere linguistic "diving." *Al-Muʿjam al-Wasīṭ* defines the submerged part of a ship as "the lower part that disappears beneath the water."[9]

Thus, immersion in language signifies remaining, prolonged engagement, integration, and complete involvement within something. It is therefore more precise and comprehensive than related terms.[10] Linguistic immersion rests upon two essential dimensions: the language itself and the duration of time spent engaging with it. It is a language-teaching principle based on total exposure to the target language for a specified period during which no language other than the target language is used.[11]

For this reason, many experts and specialists in teaching Arabic as a second language emphasize the necessity of allocating sufficient time for learners to achieve social immersion and psychological adaptation. Some scholars argue that instructional materials, worksheets, activities, and listening exercises should extend beyond textbook pages and become lived experiences. The target language should function as a tightly monitored medium of effective daily communication, supported by strict linguistic supervision and correction by teachers or more advanced learners. In accordance with Stephen Krashen's theories, language must be used for authentic communication in order to become firmly established in learners' minds before assignments, examinations, and assessments.

From the perspective of Abdelrahman Al-Haj Saleh, language is fundamentally a skill that develops only within its natural environment—an environment in which no sound or speech is heard except the target language. The learner must be immersed in its sounds[12] so thoroughly that nothing else is spoken or heard. This leads to the conclusion that immersion means placing the learner within an appropriate linguistic environment where only the target language is heard and spoken. Linguistic immersion enables learners to acquire accurate expression smoothly and naturally, much like foreign students learning a second language. Such immersion is considered essential for acquiring linguistic competence, as learners are prevented from hearing or speaking any language other than the one through which instruction is delivered.

Types of Linguistic Immersion

According to Nadia Ibreikat in her study *Linguistic Immersion in Teaching Arabic to Non-Native Speakers*, immersion can be classified as follows:

A. Environmental Immersion

Natural Environment
This refers to a setting in which learners interact directly with native speakers of the target language, thereby acquiring both language and culture naturally and spontaneously, such as living with an Arab family.
Artificial or Virtual Environment
This refers to an environment deliberately designed by educational institutions through pedagogical strategies intended to immerse students in the target language community both inside and outside the classroom.

B. Age-Based Immersion

Early Immersion
Begins in kindergarten, where the mother tongue is postponed for several years while the second language is introduced as the primary medium of instruction.
Partial Early Immersion
Both the first and second languages are used as instructional tools from the beginning of schooling, as seen in countries such as Morocco where Modern Standard Arabic and French coexist in education.
Late Immersion
Occurs during secondary education, similar to the introduction of foreign languages such as English or Spanish into school curricula across many Arab countries.

C. Immersion Programs in the United States and Elsewhere

Partial Immersion Programs
Students spend only part of their time learning through the second language.
Full Immersion Programs (100%)
Learners spend all their time using and learning the second language.
Bilingual Programs
Linguistic minorities are immersed within the majority language community while one language remains the primary medium of instruction.
Two-Way Immersion
This is the most widespread model in the United States and incorporates two languages within the immersion system. However, the researcher's experience at Middlebury College demonstrated a stricter model in which students signed a "language pledge" prohibiting the use of their mother tongue (English) on campus. English use was permitted only during the first four weeks of the beginner level before students formally committed to the pledge.
Middlebury Language Schools as a Model
The summer program at Middlebury Language Schools in the United States is considered one of the most prominent models of intensive linguistic immersion. The program usually lasts between seven and eight weeks during the summer and aims to enable learners to acquire a foreign language rapidly through complete integration into a single-language environment.
The program follows an intensive system of study in which students complete the equivalent of a full academic year of language instruction within a short period of time. The curriculum includes daily classes in various language skills such as speaking, listening, reading, and writing, in addition to daily assignments and group projects. Teaching methods are also based on interaction and continuous practice through discussions, presentations, and practical activities rather than traditional instructional methods. One of the important features of some language programs, especially Arabic, is that instructors are often native speakers of the language, which provides learners with an authentic linguistic model that helps them acquire proper pronunciation and accurate language use in natural contexts. This factor enhances the quality of immersion and strengthens the cultural dimension alongside the linguistic one.
The program is also distinguished by the diversity of its students' educational motivations. Some study the language for academic purposes, such as pursuing graduate studies or conducting scientific

research, while others seek to develop their language skills for professional purposes or for careers that require proficiency in the language. Others participate out of personal or cultural interest. This diversity creates a rich educational environment characterized by interaction and the exchange of experiences.
Within this comprehensive linguistic immersion model, learning is not limited to classroom instruction; rather, it extends to every aspect of daily life on campus. This structure is designed to make the target language the primary—and almost exclusive—means of communication throughout the entire period of residence.
Among the most prominent academic activities accompanying classroom instruction is what is known as "Wednesday Talk," an informal weekly gathering organized on campus that allows students to discuss cultural and social topics in the target language within an interactive atmosphere away from the pressure of the classroom. These sessions are often attended by a well-known invited guest speaker from outside the institution. In addition, the program offers extended office hours during which instructors dedicate extra time outside official working hours to help students overcome linguistic difficulties and review written and oral assignments.
Furthermore, the program is rich in daily student and cultural activities, including artistic performances, theatrical productions, group discussions, and sports events. All of these activities are designed to be conducted in the target language so that the language becomes a means of social interaction rather than merely a tool for academic learning.
The campus environment in these programs is distinguished by being transformed into a fully integrated linguistic and cultural setting in which the target language is used in every aspect of daily life, from signs in the hallways to the names of classrooms and facilities. Even everyday spaces such as the library, classrooms, and cafeteria operate within a unified linguistic identity that reinforces complete immersion.
Another prominent cultural aspect is the organization of a weekly Arabic dinner in Arabic language programs, where students gather for a communal meal featuring traditional Arabic dishes. During these gatherings, the linguistic and cultural context is intentionally used to enhance learning. This dinner is not merely a dining activity, but rather a cultural experience that combines language, food, and social interaction in an atmosphere that reflects the authentic culture of the language being studied.
Thus, the program is transformed into a fully integrated educational and living environment in which academic study and daily life are intertwined within a single framework, making linguistic immersion a comprehensive experience that simultaneously encompasses language, culture, and social interaction.
As previously mentioned, the program also implements the principle of the "language pledge," whereby students are required to use only the target language throughout their entire period of residence, both inside and outside the classroom, including in university housing and daily activities. This contributes to the creation of a complete immersion environment that significantly accelerates the process of language acquisition.
Overall, the program provides an intensive and comprehensive educational experience that combines rigorous academic study with student life within a closed linguistic environment, making it an advanced model of effective linguistic immersion. See the table below.

Domain	Activity	Description
Academic / Interactive	Wednesday Talk	An informal weekly gathering for discussing cultural and social topics in the target language.
Academic / Educational Support	Intensive Office Hours	Additional hours provided by instructors to assist students with comprehension, revision, and error correction.
Cultural / Social	Student Activities	Discussions, artistic and theatrical performances, and cultural events conducted in the target language, including the talent show.

Sports / Recreational	Sports Activities	Activities and games designed to enhance linguistic communication in non-academic contexts.
Environmental / Linguistic	Campus Environment	Use of the target language in directional signs, facilities, and daily communication across campus.
Cultural	Arabic Dinner	A communal meal featuring traditional Arabic dishes used to enhance cultural and linguistic interaction among students.

Linguistic immersion programs also rely on a range of educational strategies aimed at supporting language learning beyond the boundaries of the classroom, whether inside or outside the university, by enabling learners to practice the language in a natural manner that helps reinforce what they have learned. Language learning is therefore not limited to the memorization of information and grammatical rules; rather, it also includes the practical application of speaking, writing, and communicating with others, thereby providing learners with authentic and diverse linguistic opportunities.

Among the most important of these strategies is the repetition and review of lessons, through which foreign learners are given multiple opportunities to revisit what they have learned in a natural and systematic way. This process enhances their understanding of linguistic information and grammatical structures while developing their ability to use them effectively in different communicative situations. In addition, dialogue-based instruction is considered one of the most effective strategies in this context. Dialogue is not merely a means of communication between two individuals; rather, it is regarded as an educational tool that goes beyond the exchange of speech to include the acquisition of linguistic, social, and cultural values and skills associated with communicative interaction.

Immersion programs in educational institutions have also adopted a range of practical strategies to achieve their objectives. One of the most important of these is the linguistic and cultural partner strategy, which represents an immersion component in programs that do not follow a fully intensive model. This strategy is based on employing native speakers of the language—usually university students—as companions for learners. The linguistic partner accompanies the learner outside official class hours and communicates with them exclusively in Arabic, thereby creating a natural communicative environment that enables the learner to practice the language continuously and develop the ability to use it fluently in everyday life situations.

According to the description provided by Middlebury Language Schools of its intensive summer program, assessment and testing constitute an essential component of the linguistic immersion experience. The evaluation process is conducted through several interconnected stages: the placement test upon admission, weekly assessments, and finally the exit examination.

At the beginning of the program, students undergo placement tests designed to determine their linguistic proficiency accurately upon arrival. These tests usually assess multiple skills such as reading, writing, and listening, in addition to oral interviews that evaluate students' speaking abilities and communicative interaction. The results of these assessments are used to place each student in the appropriate academic level within the program, ensuring that the learning process remains balanced and effective from the very first day.

During the summer session, however, assessment is not limited to traditional examinations. Rather, the program relies on continuous weekly oral tests and evaluations. Students are assessed regularly through class participation, their ability to engage in dialogue, oral presentations, discussions, and daily assignments. This system is intended to ensure the continuous use of the language within the immersion environment, rather than restricting language use to formal examinations alone.

At the end of the program, students undertake a final exit assessment aimed at measuring the extent of the linguistic progress they have achieved during the immersion period. This evaluation typically includes fluency in speaking, listening comprehension, and the ability to express oneself both orally and in writing. Furthermore, students' final proficiency levels are compared with their initial placement results in order to measure the amount of progress achieved throughout the summer program.

Overall, the assessment system at Middlebury College is based on a fundamental principle: language is not merely tested, but practiced on a daily basis. Consequently, examinations are integrated into the

broader immersion experience, which combines learning with continuous application throughout university life.
In this regard, Addison argues that immersion is important for distinguishing between different social communities, meaning that the application of immersion helps differentiate societies and their respective languages. He also emphasizes the importance of social language and the necessity of understanding it, stating: "The facts of language can deepen one's understanding of society, just as it is difficult to find characteristics that distinguish a society as clearly as its language does."[13]
This means that understanding the nature of language and its unique foundations within each society contributes to a deeper understanding of that society itself, since every community is distinguished by its own language, which reflects its identity and culture. Accordingly, linguistic immersion is considered one of the most effective methods of language acquisition because of its important role in creating a sound linguistic environment capable of developing learners' Arabic language skills.
In other words, immersion creates a healthy linguistic atmosphere that contributes to the development of learners' Arabic abilities, whether in pronunciation, accent, or even the use of Modern Standard Arabic. Students at Middlebury College in the United States, for example, are exposed to a wide range of pronunciation styles and accents due to the diversity of national backgrounds among their instructors, all of whom are native speakers of Arabic.
Furthermore, Jibril Bouzouina[14] discusses in his article the importance of linguistic immersion in teaching both second languages and even the mother tongue. According to him, immersion achieves the following:

- It accelerates the learning and teaching of a second language within a short period of time and with high efficiency.
- It enriches the various skills of second-language learners.
- It enables learners to connect what they hear and learn with their own personal experiences, thereby increasing their self-confidence.

Mechanisms of Linguistic Immersion and the Role of the Teacher

The mechanisms of linguistic immersion are based on a set of fundamental principles that ensure language acquisition occurs naturally and effectively. Among the most important of these principles are listening, repetition, and practice. Continuous exposure to the language in its natural contexts enables learners to become familiar with its sounds and structures and to internalize them spontaneously. Repetition, on the other hand, contributes to reinforcing these linguistic inputs in memory and strengthening the learner's ability to recall and use them correctly. Practice represents the applied dimension that allows learners to employ what they have heard and repeated in authentic communicative situations, thereby enhancing linguistic fluency and making language acquisition more stable and effective.
According to the researcher Nadia Ibreikat, the teacher's role is central to establishing the foundations of linguistic immersion, as the teacher contributes significantly to the learning of vocabulary, grammatical structures, and phonetic features. The teacher is regarded as the primary instrument in refining the learner's motor, social, psychological, and linguistic skills. Therefore, teachers are required to possess specific competencies that enhance the learner's ability to use Modern Standard Arabic accurately and effectively.

1. Articulation and Pronunciation of Sounds
The teacher must possess accurate pronunciation and should give each sound its proper value. A speaker cannot produce sounds correctly unless they possess a healthy and proper speech apparatus. It is therefore essential for the teacher to be free from speech disorders and to demonstrate correct pronunciation.

2. Clarity and Projection of Voice
Clarity of voice refers to the distinctness of pronunciation, and the teacher must be able to control the volume of their voice in order to facilitate comprehension. Clear speech enhances students' ability to

[13]Addison, *Sociolinguistics*, translated by Mahmoud Abbad, 2nd ed., Cairo: Alam Al-Kutub, 1990, p. 16.
[14]Patsy Lightbown and Nina Spada, *How Languages Are Learned*, translated by Ali Ahmad Shaaban, 1st ed., Giza, 2014, p. 63.

hear and understand the linguistic content being presented, thereby increasing their effectiveness in comprehending linguistic concepts.

3. Calmness and Deliberation in Speech

Calmness and deliberation in pronunciation refer to speaking slowly and avoiding rushing through sounds and words, which helps learners understand what they hear. This also highlights the importance of giving listeners sufficient time to absorb information. As one scholar stated: “In his speech, he does not allow the listener enough time to understand what is being heard… thus boredom overtakes the listener, who eventually stops paying attention.” This indicates that brief pauses are important in enabling learners to comprehend and interact with the material being presented.

4. The Ability to Modulate Vocal Intonation

The ability to modulate vocal intonation refers to controlling the tone of voice during speech according to different expressive modes, thereby helping listeners understand the meanings and intentions conveyed in sentences. As Zalmad Abu Zira explains: “The interrogative sentence differs in its intonation from the imperative sentence, and this in turn differs from the tone of a sentence expressing hope.”

Accordingly, teachers must pronounce every sentence correctly, including the tones associated with questions, exclamations, and other forms of expression, so that learners are able to understand the tonal distinctions that contribute to the clarity of meaning. Therefore, successful teachers should vary their teaching methods by altering the delivery of their voice, changing their gestures and movements, and varying vocal intonation in order to maintain students’ attention, stimulate their interest, and sustain their concentration while explaining linguistic material that requires familiarity with the sciences of language.

For this reason, teachers should diversify the tones of their voice during instruction so that learners do not lose focus on the intended objectives and purposes of the lesson. Teachers must therefore possess competencies in both receptive and productive language skills.

Conclusion

In conclusion, linguistic immersion is considered one of the most successful approaches to teaching Arabic to non-native speakers because it enables learners to move genuinely from theoretical learning to practical application within integrated real-life contexts. The experience of Middlebury College has confirmed the success of this model, as it succeeded in achieving remarkable linguistic progress among students within a relatively short period due to the intensive linguistic environment and continuous interaction.

This experience has also highlighted the importance of fully immersing learners in the target language through temporarily disconnecting them from their mother tongue and relying on the second language as the sole means of communication and thought. This approach contributes significantly to accelerating language acquisition, enhancing fluency, and building self-confidence, free from mental translation and dependence on the first language.

Accordingly, the success of this model emphasizes the necessity of adopting linguistic immersion programs in the teaching of Arabic, while focusing on creating a closed linguistic environment that supports the continuous use of the language. Such an environment contributes to achieving authentic and profound acquisition of the Arabic language among learners.

Popular Culture in the Age of Artificial Intelligence: An Applied Study on the Arabic Language

Loay Badran

Zayed University, United Arab Emirates

Abstract

This study aims to explore the challenges of translating popular culture (pop culture) in the context of artificial intelligence applications, through an applied study on the Arabic language. The research is grounded in the assumption that popular culture represents one of the most complex domains of translation, as it relies on deep semantic, cultural, and contextual layers that extend beyond the literal meaning of texts. With the increasing reliance on AI-powered translation systems, there is a growing need to assess their ability to handle such complexities effectively. The study adopts a descriptive-analytical approach, selecting a corpus of texts representative of popular culture, including film dialogues, youth expressions, songs, and digital content. These texts are processed through AI translation tools, and the outputs are systematically analyzed and compared with their original meanings within their cultural contexts. The analysis focuses on a proposed classification of errors, including semantic, cultural, contextual, pragmatic, and stylistic errors. The findings indicate that AI systems demonstrate considerable efficiency in translating direct and literal structures; however, they show clear limitations in handling figurative language, implicit cultural references, and idiomatic expressions. This often results in literal or misleading translations that fail to convey the intended meaning and diminish the cultural essence of the source text. Moreover, these systems lack sufficient awareness of the social and cultural context, which is essential for interpreting popular culture accurately. Beyond identifying these challenges, the study proposes utilizing AI-generated errors as a pedagogical tool in translation education. By training students to critically analyze such errors, learners can develop a deeper understanding of the distinction between surface meaning and intended meaning. The study also introduces an analytical framework that may contribute to improving translation curricula in the Arab educational context and enhance learners' critical engagement with technological outputs. The study concludes that, despite its advancements, artificial intelligence cannot replace the human translator in conveying cultural meaning.

Keywords: *Popular Culture Translation, Artificial Intelligence, Machine Translation, Error Analysis, Arabic Language*.

1. Introduction of Research

Artificial intelligence technology has witnessed rapid advancement in recent years especially in the field of natural language processing which has directly contributed to improving the performance of machine translation systems [1]. These systems based on deep learning and Neural Machine Translation (NMT) models have brought a qualitative shift in terms of translation accuracy and fluency when compared with old systems [16]. As a result, the use of these technologies has expanded across many domains such as media and education and digital communication [3]. However, despite the significant progress of this technology it does not resolve the challenges associated with these systems ability to capture context and understand the deeper meanings of texts as we see in recent literature [11].

At its core translation is more than just direct transfer of language because it is closely connected to the cultural and social context where the text is produced [10]. Meanings cannot be fully understood away from the cultural frameworks that shape them which makes the achievement of equivalence in translation depends on the ability to represent cultural and pragmatic dimensions alongside the linguistic dimension [2]. Recent studies indicate that machine translation systems despite their remarkable development still face significant limitations when dealing with these dimensions especially in texts characterized by high degree of cultural density [8].

Popular culture is considered one of the clearest domains in which these challenges become evident due to its distinctive linguistic and cultural features [1]. It relies heavily on informal expressions and colloquial terminology and implicit references that appear in film dialogues songs and circulating digital content [8]. Such texts involve multiple layers of meaning including figurative language and idiomatic expressions which are difficult to render directly into another language without losing part of their significance [10]. Studies have shown that machine translation systems tend in such cases to produce literal translations which leads to a decline in the transfer of the intended cultural meaning [2].
Despite the notable progress achieved by AI-based translation systems they still encounter clear difficulties when handling texts characterized by complex cultural content particularly texts related to popular culture [16]. While these systems show acceptable efficiency in translating direct structures, they often fail to represent implicit meanings and the cultural contexts associated with the text [11]. As a consequence, they may generate translations that appear linguistically correct but lack accuracy at the semantic and cultural levels which ultimately affects the quality of the translation and its communicative function [3].
In this context a review of the literature shows that most recent studies in machine translation have focused either on the overall performance of models or on formal and standardized texts whereas studies addressing the translation of popular culture remain limited especially within the Arab context [10]. It is also noticeable that there is a lack of studies adopting a systematic multidimensional analysis of translation errors one that encompasses semantic, cultural, contextual, and pragmatic aspects [16]. Hence there is a pressing need for applied studies that address this gap through an in-depth analysis of machine translation outputs in this type of text [8].
Accordingly, this study aims to analyze the performance of AI-based translation systems in translating popular culture texts into Arabic through an applied error-analysis approach [2]. It also seeks to construct an analytical framework for classifying these errors according to multiple dimensions including semantic, cultural, contextual, pragmatic, and stylistic aspects in addition to exploring the potential use of such errors in developing translation teaching skills [1]. The significance of this study lies in its contribution to deepening critical understanding of machine translation applications and supporting the development of related educational and practical practices within the Arab context [11].

1.1 Research Problems

Despite the rapid advancements witnessed in artificial intelligence–based translation systems particularly with the adoption of neural machine translation models their ability to effectively handle texts characterized by complex cultural dimensions remains highly questionable [17]. Empirical observations indicate that while these systems show notable performance in processing direct linguistic structures their effectiveness declines significantly when confronted with texts that contain implicit meanings or non-explicit cultural and contextual references [15]. This limitation negatively impacts both the overall quality of translation and its functional accuracy [14].
This issue becomes particularly pronounced in the domain of popular culture texts which are inherently characterized by high symbolic density and a strong reliance on idiomatic expressions figurative language and context-specific social references [5]. Translating such texts requires an advanced level of interpretive competence that extends beyond surface-level linguistic processing [4]. Within this context the present research problem lies in investigating the extent to which AI-based translation systems are capable of conveying semantic cultural, and contextual, dimensions when translating popular culture texts into Arabic [17]. It also seeks to identify the types of errors resulting from these limitations and to analyze them within a systematic analytical framework that enables a precise and theoretically grounded interpretation [5].
The linguistic gap between Arabic and English makes this problem more complex because Arabic is characterized by rich morphology and complex syntax and many dialects [14]. For example, the distinction between Modern Standard Arabic (MSA) and regional dialects like the Egyptian or Saudi dialect poses a big challenge for automated systems [4]. The systems are often trained on formal texts like news or official documents, but popular culture uses everyday language that is very different [15].

Table 1. AI Translation Challenges in Popular Culture

Feature of Popular Culture	Challenge for AI Translation	Source Reference
Slang and Youth Language	Literal translation leads to loss of nuance	[1]
Idiomatic Expressions	AI cannot find cultural equivalents	[7]
Dialectal Variation	Systems trained on MSA fail in local dialects	[15]
Implicit Emotional Meaning	AI processes text as isolated units	[1]
Pragmatic Tone	Failure to convey surprise or irony	[1]
Social Politeness	Flattening levels of respect and formality	[19]

The data suggest that even advanced models such as ChatGPT and Google Translate struggle to preserve the cultural meaning of the source text [14]. As a result, students may receive translations that appear linguistically accurate but remain semantically inadequate.

1.2 Research Questions

RQ1. To what extent are AI-based translation systems capable of translating popular culture texts into Arabic with semantic, cultural, and contextual adequacy?
RQ1.1. What are the most prominent types of errors that occur in translating popular culture texts using AI-based translation systems?
RQ1.2. To what extent do these systems succeed in conveying implicit meanings and culture-specific references embedded in the source texts?
RQ1.3. How effectively do AI-based translation systems handle figurative language and idiomatic expressions commonly found in popular culture?
RQ1.4. Does translation accuracy vary according to the type of popular culture text, such as film dialogues, song lyrics, youth slang, and digital content?
RQ1.5. What are the limitations of AI-based translation systems in representing the social and cultural context of texts?
RQ1.6. How can errors produced by AI-based translation systems be utilized to enhance translation pedagogy and foster learners' critical awareness?

1.3 Research Objectives

The study intended to achieve the following specific objectives: first to analyze the performance of AI-based translation systems in translating popular culture texts into Arabic [18]. Second to identify the most common error patterns in machine translation outputs particularly semantic cultural, contextual, pragmatic, and stylistic errors [12]. Third to examine the extent to which these systems can convey implicit meanings and culture-specific references embedded in the source texts [13]. The fourth objective is to develop a systematic analytical framework for classifying translation errors in popular culture texts [7]. And fifth to explore the popular potential of using AI-generated translation errors as a pedagogical tool for enhancing translation teaching and promoting learners' critical awareness [9].

1.4 Significance of the Study

This study has both theoretical and practical significance. From a theoretical side it contributes to advancing the scholarly understanding of artificial intelligence applications in translation particularly in relation to the translation of culturally complex texts [6]. It addresses a notable research gap reflected in the limited number of applied studies examining the translation of popular culture within the Arab context [18]. It also proposes a systematic analytical framework for classifying machine translation errors across multiple dimensions including semantic cultural, contextual, pragmatic, and stylistic aspects [12]. From a practical side the study contributes to the development of translation pedagogy by using machine translation errors as a practical entry point for training and analytical practice [7]. It assists translation students in developing critical thinking skills and in distinguishing between literal meaning and intended meaning in culturally embedded texts [9]. It also provides practical insights that can inform developers of translation systems in improving performance particularly in handling culturally loaded texts [13].

Finally, it supports the development of translation curricula in alignment with recent technological advancements [18].

2. Theoretical Framework

This study adopts a multidimensional error lens informed by recent machine-translation quality research and translation theory: critically classifiable MT failures [14] are read alongside interference-driven production patterns in Arabic–English bilingual writing [15], while core equivalence and cultural–pragmatic arguments follow contemporary translation-studies overviews [13] [12].
Machine translation is considered one of the most prominent applications of artificial intelligence in the field of computational linguistics as it enables the automated processing and transformation of texts across languages based on advanced computational models [13]. Recent studies indicate that these systems are no longer limited to literal translation; rather they have evolved to incorporate deeper processing of linguistic structures particularly with the integration of deep learning techniques which has significantly enhanced the quality and accuracy of translation outputs [10]. This trend also suggests that machine translation has become an effective tool in supporting the use of the Arabic language in academic and scientific contexts by facilitating access to knowledge and enabling its transfer across languages [12]. However, the technological progress does not eliminate the challenges associated with the nature of the Arabic language itself which is characterized by rich morphology and contextual variability [11]. These features can negatively affect translation accuracy in certain cases especially when dealing with non-standard texts or those embedded with cultural nuances [8].

2.1 Artificial Intelligence and Machine Translation

Machine translation represents one of the key applied branches of artificial intelligence within the field of natural language processing (NLP) as it aims to automatically convert texts across different languages using computational models capable of analyzing and representing linguistic structures [6]. Recent studies indicate that this field has undergone a significant transformation evolving from rule-based models to statistical approaches and subsequently to neural models driven by deep learning [9]. This progression has substantially enhanced translation quality in terms of accuracy and fluency particularly in texts with relatively straightforward structures [7].
Modern machine translation systems rely on advanced neural architectures based on the Encoder–Decoder framework which enables context-sensitive modeling of relationships between words within a sentence rather than relying on traditional word-for-word translation [2]. The Transformer model which relies exclusively on the attention mechanism has played a pivotal role in advancing machine translation systems and improving their performance across a wide range of linguistic tasks [9].
This mathematical foundation allows the model to calculate which parts of the sentence to focus on [7]. But even with this advanced math the accuracy tends to decline in languages with complex morphological structures such as Arabic [16]. The gap between Modern Standard Arabic and regional dialects poses an additional challenge for translation systems as it requires the ability to adapt to diverse linguistic and sociocultural contexts [18].

2.2 Popular Culture and Its Translation Challenges

Popular culture represents one of the most complex domains in the field of translation as it relies on intertwined linguistic and cultural elements that extend beyond the literal meaning of the text [1]. It encompasses idiomatic expressions culture-specific references and communicative patterns embedded within particular social contexts making its transfer into another language a process that requires a deep understanding of implicit meaning rather than merely surface-level linguistic structures [6].
Within the context of machine translation these challenges become even more pronounced. Intelligent systems primarily rely on the analysis of linguistic patterns without possessing genuine awareness of the cultural context which often results in literal translations that fail to convey the intended meaning. Recent studies have demonstrated that machine translation systems encounter considerable difficulties in translating dialogues and context-dependent linguistic interactions particularly when they involve communicative acts or implicit meanings.
Furthermore, translation between Arabic and English presents additional challenges due to structural and semantic differences between the two languages especially in complex constructions such as descriptive clauses and syntactic relations. For example, the Arabic language has fewer consonant

clusters and sounds like "p" or "v" don't exist. This makes students and sometimes older AI systems spell things like "bizza" or "baber" instead of "pizza" or "paper".

2.3 Translating Popular Culture in the Age of Artificial Intelligence

The translation of popular culture is closely linked to the nature of language used in everyday contexts as such texts incorporate idiomatic expressions implicit references and communicative patterns shaped within specific social and cultural environments. Several studies indicate that despite their advancements automated systems continue to struggle with capturing these dimensions particularly when translating dialogues or texts that involve communicative acts with indirect meanings.
Recent research has shown that AI-based translation systems achieve relatively acceptable performance when handling straightforward linguistic structures however they show clear limitations when dealing with texts that contain cultural elements or implicit meanings. Evidence suggests that these systems tend to produce literal translations in such cases leading to a loss or distortion of the intended meaning.
Moreover, the challenges extend beyond the cultural dimension to include structural differences between languages. Variations in syntactic and semantic structures between Arabic and English significantly affect the quality of machine translation. For instance, the "run-on" sentence is very common in Arabic writing where students use many commas and few periods. AI often follows this pattern or fails to correct it leading to confusing output.

3. Previous Studies

Study	Focus	Main Contribution
O'Brien (2022)	Professional MT	Discussed post-editing
Rico & González Pastor (2022)	Translation Education	Emphasized MT literacy
Sun et al. (2022)	Document-level NMT	Improved contextual processing
Barrault et al. (2023)	Multilingual MT	Highlighted limitations in informal language
Nagi (2023)	Arabic-English MT	Identified structural weaknesses
Qassem & Aldaheri (2023)	Dialogue Acts	Examined pragmatic transfer
Appicharla et al. (2025)	Context-aware MT	Reviewed LLM-based translation

4. Critical Review of Previous Studies

Despite the valuable contributions most of these studies have focused on general aspects of translation quality or on isolated dimensions examined independently. They have largely failed to provide a comprehensive treatment of texts characterized by complex cultural dimensions especially in relation to popular culture within the Arab context. Hence there is a big need for an analytical framework that captures semantic cultural, contextual, pragmatic, and stylistic dimensions of translation errors in popular culture texts.

5. Methodology

This study adopts a descriptive-analytical approach with an applied orientation. This approach aims to identify patterns of errors that emerge in the translation of popular culture texts and to analyze them across multiple dimensions including semantic cultural, contextual, pragmatic, and stylistic aspects.
The study corpus consists of a purposively selected sample of 150 popular culture texts categorized into four main types: 40 film dialogues, 40 common youth slang expressions, 30 song lyrics, and 40 digital content social media texts.
The study utilizes two primary tools: AI-based translation tools Google Translate and ChatGPT. All texts were processed using standard user-level access without prompt engineering. A customized analytical model was developed for classifying translation errors into five main dimensions: semantic cultural, contextual, pragmatic, and stylistic.

6. Data Analysis

This section represents the practical component of the study where the outputs of AI-based translation systems are analyzed in their handling of popular culture texts.

Table 2. Analysis of AI-Based Translation Outputs

No.	Source Text	Machine Translation	More Accurate Translation	Error Type	Brief Analysis
1	"I'm not okay, but I'll pretend I am"	"I am not okay, but I will pretend that I am"	"I am not okay, but I am hiding it"	Pragmatic + Semantic	Failure to convey the implicit emotional meaning [1]
2	He's low-key jealous	He is low-key jealous (literal)	He is subtly jealous	Cultural + Semantic	Literal rendering of a slang expression [15]
3	That's not my vibe	That is not my vibration	That does not suit me	Cultural + Pragmatic	Failure to interpret the cultural expression [1]
4	"You really went there, huh?"	You really went there	Really? Did you actually say that?	Pragmatic + Contextual	Inability to convey the intended tone [1]
5	I just need a break from everything	I need a break from everything	I need to step away for a while	Semantic + Emotional	Loss of the emotional dimension [1]
6	This situation is eating me alive	This situation is eating me alive	This situation is emotionally draining me	Figurative + Semantic	Failure to interpret figurative meaning [7]

The findings reveal a clear gap between the linguistic proficiency of AI systems and their ability to adequately represent cultural and pragmatic dimensions. The findings align with recent studies emphasizing the limitations of NMT in culturally dense texts.

Table 3. Translation Quality Evaluation Matrix

Analytical Dimension	Performance Level	Interpretation
Semantic Accuracy	Moderate	Systems show acceptable accuracy in straightforward structures [1]
Cultural Dimension	Weak	Clear limitations in interpreting culturally embedded expressions [9]
Contextual Dimension	Moderate	Limited ability to fully capture the broader context [1]
Pragmatic Dimension	Weak	Inadequate transfer of communicative intent and tone [18]
Stylistic Dimension	Moderate	Linguistically correct but lacks naturalness [1]

7. Discussion of Results

The results indicate that AI-based machine translation systems achieve acceptable performance when processing texts that are structurally simple. However, this performance declines significantly when dealing with texts that involve implicit meanings or cultural dimensions. This suggests a systematic limitation rather than isolated translation errors. Similarly, the systems lack the ability to interpret psychological and emotional dimensions as they tend to reproduce surface meaning without capturing the affective context. In our analysis a clear deficiency is observed in the pragmatic dimension where the translation fails to convey communicative tone despite being grammatically accurate.

7.1 Ethical Use of AI Tools in Academic Writing and Translation

Students and researchers should follow institutional integrity rules when they use AI drafting or translation assistance: disclose assistance where required, keep human oversight over claims and citations, and treat detector scores as imperfect signals rather than proof of authorship [20]. Recent work also stresses AI literacy and awareness of bias when generative tools shape academic reading and writing practices [22].

Table 5. Common AI Flags

AI Overused Word	Human Alternative	Why automated writing checkers may flag it	Source
Delve	Explore / Dig into	Extremely high statistical choice for ChatGPT	[22]
Moreover	Also / Plus	Robotic formal transition	[20]
In conclusion	So / Finally	Predictable structure marker	[22]
Leverage	Use	Business jargon AI loves	[20]
Foster	Help / Grow	Common AI verb for collaboration	[20]

8. Recommendations

Based on the findings the study proposes several recommendations:
AI models should be developed to incorporate cultural and pragmatic context particularly for idiomatic and figurative expressions.
Translation systems should be trained on contemporary and informal data like social media content to better process youth language.
Mechanisms for capturing implicit and emotional meaning should be integrated into the models.
Post-editing tools should be developed to support human translators with focus on cultural and pragmatic errors.
Machine translation errors should be used as a pedagogical tool in translation education to help students distinguish between surface and intended meaning.

9. Conclusion

This study analyzed the performance of AI-based translation systems in translating popular culture texts into Arabic through a multidimensional error analysis. The findings show that while these systems achieve acceptable accuracy in structurally simple expressions their performance declines significantly when dealing with complex cultural, contextual, and pragmatic dimensions. Applied analysis shows that machine translation systems tend to rely on literal translation especially in idioms and youth-oriented discourse leading to loss or distortion of meaning. Also, the findings reveal a limited capacity to represent implicit meanings and communicative tone which affects the functional quality of translation.
The study confirms that the primary challenge in AI translation is the ability to interpret meaning within its broader cultural and social context. Development of more advanced models capable of capturing deeper layers of meaning is essential but the role of the human translator remains indispensable.

Motivational Factors Affecting ELT Students' Use of ChatGPT Learning Outcomes in Preparing for Writing Tasks: A Mixed-Methods Study

Hicran Bayraktaroğlu Fırat

University of City Island, Turkish Republic of Northern Cyprus

Abstract

The rapid rise of large language models such as ChatGPT is altering the landscape of English language education, influencing how learners approach writing, speaking, reading, and vocabulary work. Despite this shift, little is known about how English Language Teaching (ELT) majors—who must balance their roles as students and future educators—engage with these tools across different skill areas. To address this gap, the present study adopts a mixed-methods design to explore what motivates ELT students to use ChatGPT, drawing on a broad theoretical base that includes Technology Acceptance Model (TAM), the Unified Theory of Acceptance and Use of Technology (UTAUT), the Hedonic Motivation System Adoption Model (HMSAM), Self-Determination Theory (SDT), Flow Theory, and Cognitive Load Theory (CLT).The quantitative phase involved 100 randomly selected ELT students studying in the Turkish Republic of Northern Cyprus, who were invited through proportionate stratified random sampling across nine universities, while qualitative insights were gathered from interviews with 12 students recruited through purposive sampling. The findings indicate that intrinsic motivation, perceived usefulness, hedonic appeal, and ease of use strongly shape students' intentions to work with ChatGPT. Writing stood out as the skill that students found most intrinsically and hedonically engaging, particularly because the tool helped reduce anxiety and support idea development. Speaking-related motivation was tied largely to affective benefits such as increased confidence and reduced communication apprehension. In contrast, reading and vocabulary use were driven more by practical, efficiency-oriented considerations. Interview data also revealed persistent ethical concerns, including plagiarism, over-dependence, and fairness in assessment, alongside professional-identity-driven reflections on the pedagogy and assessment. Overall, the study underscores the importance of strengthening AI literacy, establishing ethical guidelines, and rethinking assessment practices within ELT programs. It contributes a skill-specific, theoretically grounded perspective on how future English teachers navigate AI-mediated learning environments.

Keywords: *ChatGPT in ELT; Learner Motivation; Technology Acceptance; Language Skills; AI Literacy; Ethical Concerns*

1. Introduction

Artificial Intelligence (AI) has rapidly reshaped language education, with large language models (LLMs) such as ChatGPT now central to how learners write, speak, read, and build vocabulary. Unlike earlier rule-based Computer Assisted Language Learning (CALL) tools, ChatGPT generates contextually appropriate, human-like responses, enabling co-constructed texts and immediate feedback. This shift from static to dynamic interaction has renewed interest in how learners—especially future teachers—adopt and assess AI-mediated learning environments.

ChatGPT is widely used in EFL/ELT writing for idea generation, reducing anxiety, and supporting revision (Teng & Huang, 2023; Xu & Jumaat, 2024; Lee et al., 2025). It also supports speaking by lowering anxiety and increasing confidence (Carrera Nuñez et al., 2025; Celik et al., 2025). However, concerns persist regarding plagiarism, overreliance, and the erosion of critical thinking (Tüm, 2026).

This study addresses these gaps by examining ELT students' motivations for using ChatGPT in writing, speaking, reading, and vocabulary tasks through an integrated theoretical framework (Technology Acceptance Model [TAM, Davis, 1989], Unified Theory of Acceptance and Use of Technology [UTAUT, Venkatesh et al., 2003)], the Hedonic-Motivation System Adoption Model [HMSAM, Lowry et al., 2013], Self-determination theory [SDT, Deci & Ryan, 1985], Flow Theory [Csikszentmihalyi, 1975,1990]and Cognitive Load Theory [CLT, Sweller, 1988]). The study contributes a skills-specific, theoretically grounded understanding of how future English teachers navigate AI-mediated learning environments

and highlights the need for AI literacy, ethical guidelines, and pedagogically aligned integration strategies.

2. Literature Review

2.1 ChatGPT in Language Teaching

ChatGPT has transformed CALL by enabling open-ended interaction, co-construction of texts, and immediate feedback. Its use in EFL/ELT spans writing, speaking, vocabulary, reading, and academic support. Despite rapid uptake, motivational dynamics—especially among ELT majors with dual learner/teacher identities—remain underexplored.

2.2 ChatGPT and EFL Writing: Process Support, Student Strategies, and Motivational Patterns

Writing is the skill that has been most heavily researched in relation to ChatGPT. Teng and Huang (2025) found that ChatGPT enhances engagement, supports idea generation, reduces anxiety during writing, and increases willingness to revise (pp.12–14), which highlights ChatGPT's cognitive and emotional benefits. Similarly, Xu and Jumaat (2024) identified improvements in aspects of linguistic quality, coherence, and efficiency but they also warn against overreliance (p.110).
According to Lee et al. (2025), students use ChatGPT for vocabulary, structure, and rhetorical structure; they value its speed and availability and often perceive it as more responsive than instructor comments, but remain cautious about accuracy and ethics (pp.3-4). ChatGPT can also scaffold novice writers by providing examples, explaining grammar, and modelling academic discourse, as Ibrahim and Kirkpatrick (2024) argued. They stressed, though, that any such integration needs to be paired with explicit instruction regarding critical evaluation and ethical use (p.405).
Tüm (2026) highlighted that AI-generated essays challenge assessment validity and fairness. Issues of authorship, academic integrity and undistinguished ability from students writing raise concerns about traditional assessment systems (p.67).
Across studies such as Teng and Huang (2025), Xu and Jumaat (2024), Lee et al. (20025), and Ibrahim and Kirkpatric (2024), several writing-related motivational patterns consistently emerge:
Intrinsic: enjoyment, curiosity, reduced anxiety
Extrinsic: efficiency, improved grades, clarity
Technological: ease of use, responsiveness
Professional (ELT students): pedagogical curiosity and future teaching relevance
They align with TAM (usefulness, ease of use), HMSAM (enjoyment, immersion) and SDT (autonomy, competence).

2.3 Motivation and Technology Acceptance

Intrinsic motivation and perceived usefulness strongly predict ChatGPT use (Lai et al., 2023). Hedonic motivation and system responsiveness influence initial adoption (Alkfairy, 2024), while meta-analytic evidence shows positive effects on learning performance and satisfaction (Wang & Fan, 2025). Enjoyment and immersion are strong predictors of continued use (Wang et al., 2025). Motivation is shaped by intrinsic enjoyment, extrinsic efficiency, hedonic pleasure, and cognitive load reduction.

2.4 ELT Students, AI Literacy, and Professional Identity

Preservice teachers recognize AI's pedagogical potential but express concerns about ethics, assessment, and identity (Guan et al., 2025). They often lack foundational AI knowledge and exhibit high trust in AI outputs. Teachers appreciate AI's potential for differentiation and feedback but worry about overreliance and fairness (Üretmen K. & Doğan, 2025). Bibliometric analyses show rapid growth in AI-related teacher-education research but highlight conceptual fragmentation and limited focus on AI literacy and ethics (Kuzu, 2025).

2.5 Theoretical Framework

Technology Acceptance Model (TAM): This model explains why and how people adopt new technologies focusing on two factors: perceived usefulness and ease of use predict intention (Davis 1989; Lai et al., 2023).

UTAUT and UTAUT2: This model explains how we use and adopt technology and identifies four key factors: performance expectancy, effort expectancy, social influence, and facilitating conditions (Guan et al., 2025; Kuzu, 2025).
Hedonic Motivation System Adoption Model (HMSAM): This model explains how people adopt technologies primarily for enjoyment, curiosity, focused immersion and perceived control (Lowry, et al.,2013; Wang et al., 2025), deep engagement (Guan et al, 2025).
Self-Determination Theory (SDT): This theory explains human motivation based on three innate psychological needs: autonomy, competence, and relatedness (Deci & Ryan, 1985).
Flow Theory: This theory describes a psychological state of complete immersion, focus, and enjoyment in an activity and claims that deep engagement arises from balanced challenge and skill (Csikszentmihalyi, 1975,1990).
Cognitive Load Theory (CLT): This theory explains how limitations of human working memory affect learning and problem-solving. It emphasizes designing instructional materials that reduce unnecessary mental effort so that learners can focus on understanding and retaining information. ChatGPT reduces extraneous load but may reduce germane load when being overused (Sweller, 1988; Sweller et al., 2011).

Summary Of Gaps

Population Gap: limited research on ELT majors' dual identities (Guan et al., 2025)
Skill-Specific Motivation Gap: few studies compare motivation across writing, speaking, reading, and vocabulary (Guan et al., 2025)
Theoretical Integration Gap: frameworks rarely unified (Kuzu, 2025; Guan et al., 2025)
Teacher Education Gap: limited research on AI literacy, ethics and assessment (Guan et al., 2025; Kuzu 2025; Üretmen K. & Doğan, 2025)

3. Methodology

3.1 Research Design

This study employed a sequential explanatory mixed-methods design in which quantitative data were collected first and qualitative data were subsequently used to elaborate and explain the survey results. The design was selected because motivation toward AI-mediated learning is inherently multidimensional, involving cognitive, affective, technological, and professional factors that can be fully captured only through a mixed-methods approach. The quantitative phase identified statistical trends related to motivation, technology acceptance, and skill-specific engagement with ChatGPT in writing, speaking, reading, and vocabulary, while the qualitative phase provided deeper insights into learners' beliefs, ethical concerns, and pedagogical reasoning, thereby offering a more nuanced interpretation of the quantitative patterns. This design was guided by the theoretical frameworks outlined in the literature review (TAM, UTAUT, HMSAM, SDT, Flow Theory, and Cognitive Load Theory), enabling the study to examine both utilitarian dimensions (e.g., perceived usefulness, perceived ease of use) and hedonic dimensions (e.g., enjoyment, immersion) of ChatGPT use, alongside professional identity factors relevant to ELT majors. Combined, the two phases afforded an in-depth understanding of how ELT students interacted with ChatGPT as language learners and prospective teachers.

3.2 Research Questions

The research sought to answer the following research questions:
What motivates ELT students to use ChatGPT for writing, speaking, reading, and vocabulary learning?
How do intrinsic, extrinsic, hedonic, and technological motivations differ across language skills and relate to students' intention to use ChatGPT?
How do ELT students perceive the pedagogical, ethical, and professional implications of ChatGPT use?

4. Participants

The quantitative sample consisted of 100 English Language Teaching (ELT) undergraduates from nine universities in North Cyprus, selected among 450 ELT student-population through proportionate stratified random sampling to ensure representation across institutions and year levels. Participants ranged from 18 to 27 years old, with 53% female, 46% male, and 1% nonbinary. Their English

proficiency ranged from B1 to C1 (CEFR). Most participants had prior exposure to ChatGPT, though their frequency and purposes of use varied. The qualitative phase involved 12 students, selected through purposive sampling to represent diverse motivational profiles, skill-specific usage patterns, and ethical stances identified in the quantitative phase. This ensured that the qualitative data captured a wide range of perspectives rather than only those of highly motivated or highly critical users.

5. Instruments

5.1 Survey Instrument

A structured survey instrument was developed drawing on TAM, UTAUT, HMSAM, SDT, Flow Theory, and CLT to capture motivational and skill-specific dimensions of ChatGPT use. The instrument consisted of 42 items across nine constructs (intrinsic motivation, extrinsic motivation, hedonic motivation, perceived usefulness, perceived ease of use, social influence, ethical concerns, intention of use, and skill-specific ChatGPT use. Items were rated on a 5-point Likert scale (See Appendix A) The survey also included six demographic questions (age, gender, year of study, proficiency level, prior ChatGPT experience, and frequency of use.
Content validity was ensured through expert review and a pilot study. A pilot study conducted with 15 ELT students to evaluate item clarity, response patterns and completion time. Participants completed the full survey and provided written feedback. Minor wording changes were made (e.g. simplifying technical terms such as “focused immersion”), and two items were removed due to conceptual overlap. None of the participants reported any problems understanding the items. In addition to qualitative feedback, the pilot data were subjected to preliminary factorability checks. Exploratory Factor Analysis (EFA) was conducted using principal axis factoring with varimax rotation. The Kaiser-Meyer-Olkin (KMO) value exceeded the recommended .60 threshold and Bartlett’s Test of Sphericity was significant ($p < .001$) indicating that the correlation matrix was suitable for factor analysis. The nine-factor structure aligned with the theoretical constructs (IM, EM, HM, PU, PEOU, SI, ETH, INT, SSU), with all retained items loading above .40. Reliability analyses showed strong internal consistency across all subscales ($\alpha = .80–.91$). The instrument thus provided a robust measure of ELT students’ motivations, perceptions, and ethical awareness in AI-mediated learning. The full factor loading matrix is provided in Appendix C (Table 1) to ensure methodological transparency.

5.2 Semi-Structured Interview Protocol

Semi-structured interview protocol included 2 warms up and 16 guiding questions (see Appendix B). Semi-structured interviews were conducted to deepen the quantitative findings and gain a richer understanding of ELT students’ perceptions and experiences with ChatGPT. The interviews explored learners’ use of ChatGPT across language skills (writing, speaking, reading, vocabulary), perceived benefits and limitations, ethical concerns such as plagiarism, overreliance, and fairness, pedagogical beliefs about AI integration, and the influence of ChatGPT on their emerging professional identities. The interview protocol was informed by prior research on preservice teachers’ perceptions of AI and technology-enhanced learning (Guan et al., 2025; Üretmen K. & Doğan, 2025; Kuzu, 2025). The semi-structured format ensured consistency across participants while allowing for probing and follow-up questions to elicit deeper insights. Each interview lasted 20–30 minutes, was audio-recorded with informed consent, and transcribed verbatim for analysis.

6. Data Collection Procedures

Data were collected using a two-phase sequential explanatory mixed-methods design, whereby quantitative data were first collected and qualitative data used to elaborate upon and explain survey findings.
Phase 1: Quantitative data Collection
The target population consisted of approximately 450 ELT students, enrolled across nine universities. Proportionate stratified random sampling ensured representation from each institution: each university served as a stratum, and participants were randomly invited in numbers proportional to its ELT student population. The survey was administered online using Google Forms, and participation was voluntarily and anonymous. To minimize response emphasized ChatGPT use in language learning without highlighting motivational constructs. A total of 100 students completed the survey.
Phase 2: Qualitative data collection

Following the survey, a purposive subsample of participants (12 of 100 ELT students) was invited for semi-structured interviews to capture the variation in ChatGPT use frequency and skill-specific engagement. Interviews were conducted either face-to-face or via Zoom, depending on the participant's comfort level. Each session lasted about 20-30 minutes, was audio-recorded with informed consent, and transcribed verbatim. Thematic analysis was used to identify patterns related to learners' experiences, perceived benefits and challenges, ethical considerations, and emerging professional identities.

7. Data Analysis

7.1 Quantitative Analysis

Quantitative data were analysed using SPSS and AMOS following a sequence consistent with the explanatory design. Descriptive statistics summarized students' frequency of ChatGPT use across the four language skills. Reliability analyses showed high internal consistency for all motivational and technology-acceptance constructs (α = .86–.92), supporting the suitability of the measurement model. A structural equation model (SEM) was then tested to examine predictors of intention to use ChatGPT, including intrinsic, extrinsic, and hedonic motivation, perceived usefulness, perceived ease of use, and social influence. Finally, ANOVA was conducted to compare motivational differences across writing, speaking, reading, and vocabulary. Although motivation is often explored qualitatively, the present study operationalized skill-specific motivation quantitatively by including four parallel sets of items measuring motivation for writing, speaking, reading, and vocabulary. Because each skill had its own composite motivation score, ANOVA was appropriate for comparing mean differences across these four dependent variables. This sequenced analysis provided a solid foundation for interpreting ELT students' motivation and technology-acceptance patterns.

7.2 Qualitative Analysis

Qualitative data were analysed thematically using Braun and Clarke's (2006) six-phase framework. Coding proceeded through open coding (identifying initial meaning units), axial coding (grouping related codes), and selective coding (developing overarching themes). Themes reflected the study's focal areas: skill-specific experiences with ChatGPT, motivational factors, ethical concerns, pedagogical beliefs, and emerging professional identity. Participant descriptors (e.g., year of study, proficiency level) were used when relevant to contextualize perspectives. Triangulation with quantitative findings strengthened interpretive validity by explaining, extending, or contrasting patterns identified in Phase 1.

8. Results

8.1 Quantitative Results

Descriptive results showed clear skill-specific differences in ChatGPT use. Writing was the most frequently used skill (87% frequent/very frequent), followed by vocabulary (78%), reading (71%), and speaking (62%). Writing also elicited the strongest intrinsic and hedonic motivation, with students reporting enjoyment, reduced anxiety, and support for idea generation. Speaking motivation was shaped by affective benefits such as increased confidence and reduced communication apprehension, whereas reading and vocabulary use were driven more by extrinsic, efficiency-oriented motives.

Reliability analyses demonstrated strong internal consistency across all motivational and technology-acceptance constructs (α = .86–.92), including intrinsic motivation (α = .89), extrinsic motivation (α = .86), hedonic motivation (α = .91), perceived usefulness (α = .88), perceived ease of use (α = .90), and intention to use (α = .92). Confirmatory Factor Analysis indicated good model fit (CFI = .95, RMSEA = .05), supporting the validity of the measurement model. Table 2 gives a complete overview of reliability and validity indices.

Table 2. Reliability and Validity Results for Measurement Model

Construct	Cronbach's α	Composite Reliability (CR)	Average Variance Extracted (AVE)	CFI	RMSEA
Intrinsic Motivation	.89	.90	.65	.95	.05
Extrinsic Motivation	.86	.88	.61	.95	.05
Hedonic Motivation	.91	.92	.68	.95	.05
Perceived Usefulness	.88	.89	.63	.95	.05
Perceived Ease of Use	.90	.91	.66	.95	.05
Intention to Use	.92	.93	.70	.95	.05

Structural equation modelling further showed that intrinsic motivation (β = .41, p < .001), perceived usefulness (β = .33, p < .001), hedonic motivation (β = .29, p < .01), and perceived ease of use (β = .21, p < .05) significantly predicted intention to use ChatGPT, while social influence and extrinsic motivation were nonsignificant predictors (β = −.11 to .06). Intrinsic motivation emerged as the strongest predictor of intention (Table 3).

ANOVA results revealed significant differences in motivational patterns across the four language skills. Writing showed the highest intrinsic and hedonic motivation, while speaking was associated with affective motivation (reduced anxiety, increased confidence). Reading demonstrated the strongest extrinsic motivation, particularly related to efficiency and clarity, and vocabulary reflected a mixed intrinsic–extrinsic profile. Post hoc tests indicated that motivation for writing was significantly higher than for reading and vocabulary (p < .01), whereas differences between writing and speaking were not significant (Table 4).

Table 3. SEM Regression Weights Predicting Intention to Use ChatGPT

Predictor	β	p-value
Intrinsic Motivation	.41	< .001
Perceived Usefulness	.33	< .001
Hedonic Motivation	.29	< .01
Perceived Ease of Use	.21	< .05
Social Influence	—	n.s.
Extrinsic Motivation	—	n.s.

Note. Intrinsic motivation emerged as the strongest predictor of intention to use ChatGPT.

Table 4. Skill-Specific Motivational Patterns Based on ANOVA

Skill	Dominant Motivational Pattern	Post Hoc Comparison vs Writing
Writing	Intrinsic + Hedonic	—
Speaking	Affective (confidence, reduced anxiety)	n.s.
Reading	Extrinsic (efficiency)	Lower than Writing (p < .01)
Vocabulary	Mixed intrinsic–extrinsic	Lower than Writing (p < .01)

Note. Writing showed significantly higher motivation than reading and vocabulary

8.2 Qualitative Results

The qualitative stage added depth to the survey by examining how ELT students personify their interactions with ChatGPT and interpret its pedagogical, ethical, and professional implications. While quantitative findings revealed motivational patterns across skills, interviews clarified why students felt motivated, how they perceived benefits and risks, and what this meant for their emerging teacher identities. A thematic analysis of 12 interviews yielded five overarching themes.

Theme 1: Writing for Creativity and Confidence Students described ChatGPT as a remedy for writer's block, supporting idea generation, grammar, and vocabulary, while reducing anxiety.

"ChatGPT allows me to write without getting writer's block" (Female, 2nd year, B2).

These insights align with quantitative findings and prior studies (Teng & Huang, 2025; Xu & Jumaat, 2024; Lee et al., 2025).
Theme 2: Speaking for Confidence and Reduced Anxiety ChatGPT was seen as a non-judgmental conversation partner for rehearsing presentations and dialogues.
“I can practice speaking without feeling ashamed. It gives me courage” (Male, 1st year, B1).
This affective dimension resonates with Carrera Nuñez et al. (2025), who found reduced speaking anxiety and greater willingness to communicate.
Theme 3: Reading and Vocabulary for Efficiency Participants valued ChatGPT’s ability to simplify texts, summarize readings, and explain vocabulary quickly.
“It saves time. I understand texts faster” (Female, 1st year, B1).
These findings corroborate the efficiency-driven motivation identified in the survey and reflect CLT interpretations of reduced extraneous load.
Theme 4: Ethical Dilemmas Students expressed ambivalence, noting risks of plagiarism, overreliance, and fairness in assessment.
“My fear is that if I rely on it too much, I will become reliant” (Male, 4th year, B2).
Such concerns echo Tüm (2026), Üretmen K. and Doğan (2025), and Guan et al. (2025), underscoring the need for ethical guidelines and AI literacy.
Theme 5: Professional Identity As future teachers, participants reflected on AI’s role in pedagogy, assessment, and ethical modelling.
“We have to teach people how to relate to AI in the right way” (Non-binary, 4th year, C1).
These reflections are consistent with Kuzu (2025) and Guan et al. (2025), who highlight preservice teachers’ curiosity and concern about integrating AI.
The five themes illustrate how ELT students positioned ChatGPT as both a motivating resource and a pedagogical challenge. They reported reduced anxiety, greater confidence, and efficiency gains across writing, speaking, reading, and vocabulary, while also voicing concerns about ethics, integrity, and dependence. Reflections further revealed growing awareness of AI’s potential to reshape pedagogy, assessment, and professional roles. Overall, the findings portray ELT students as engaged yet cautious users who balance motivation and affective benefits with ethical considerations and their emerging teacher identity.

8.3 Mixed Methods Integration of Results

The qualitative themes confirmed and elaborated on the quantitative patterns: interviews showing reduced anxiety and greater creativity supported high intrinsic and hedonic motivation for writing, while survey data reinforced affective benefits in speaking. Reading and vocabulary emerged as efficiency-driven skills, and ethical concerns surfaced consistently across both phases, highlighting calls for AI literacy and responsible use. Taken together, these converging findings provide a coherent view of ELT students’ motivations and perceptions of ChatGPT, portraying them as engaged yet reflective users who balance personal drives and affective needs with ethical reasoning and their developing professional identity.

9. Discussion and Synthesis

This mixed methods study advances understanding of ELT students’ motivation to use ChatGPT and their perceptions of its pedagogical and ethical implications across writing, speaking, reading, and vocabulary. Writing emerged as the most motivating skill, with students viewing ChatGPT as a supportive “thinking partner” that reduced anxiety and enhanced fluency, consistent with Teng and Huang (2025), Xu and Jumaat (2024), and Ibrahim and Kirkpatrick (2024). Speaking motivation was largely affective, as students valued ChatGPT’s role in easing communication apprehension and building confidence, echoing Carrera Nuñez et al. (2025) and Celik et al (2025). Reading and vocabulary were efficiency-driven, aligning with TAM and CLT’s emphasis on perceived usefulness and reduced cognitive load.
Structural modelling confirmed that intrinsic motivation, perceived usefulness, hedonic appeal, and ease of use were the strongest predictors of intention to use ChatGPT, in line with Lai et al. (2023), Wang and Fan (2025), and Wang et al. (2025). Ethical ambivalence was evident, with concerns about plagiarism, dependence, and fairness (Tüm, 2026; Üretmen K. & Doğan, 2025; Guan et al., 2025), underscoring the need for AI literacy and clear guidelines. At the same time, students reflected on their dual identity as learners and future teachers, recognizing AI’s potential for differentiation, scaffolding, and assessment reform (Guan et al., 2025; Kuzu, 2025; Nunes et al., 2022).

Overall, the findings portray ELT students as engaged yet cautious users who balance motivation and affective benefits with ethical reasoning and professional reflection. ChatGPT's role is strongest in affective scaffolding for writing and speaking, while reading and vocabulary use remain efficiency-driven. These multiple dimensions suggest that AI integration in ELT programs must address not only skill-level learning but also broader concerns of integrity, responsible use, and teacher preparation.

10. Implications

This study highlights the need for individualized integration of AI into ELT programs, addressing not only skill-specific learning but also broader concerns of ethics, assessment integrity, and teacher preparation. Writing and speaking emerged as highly motivating, suggesting curricula should incorporate structured AI-supported tasks alongside explicit training in prompt design, critical evaluation, and ethical decision-making (Ibrahim & Kirkpatrick, 2024). Teacher education must prepare ELT majors for AI-mediated pedagogy, offering strategies for differentiation, feedback, and scaffolding, while modelling responsible use (Guan et al., 2025; Kuzu, 2025).

Assessment practices require rethinking to preserve authenticity, with process-based formats, oral defences, and reflective commentaries mitigating risks of plagiarism and overreliance (Tüm, 2026). Finally, future research should pursue longitudinal and intervention-based designs to examine sustained motivational change, professional identity development, and the effectiveness of AI-integrated instruction across diverse contexts (Nunes et al., 2022).

11. Limitations and Future Research

This study offers valuable insights into ELT majors in North Cyprus, yet its findings cannot be generalized to broader EFL contexts or non-teacher education programs. The reliance on self-reported survey data may reflect perceptions more than actual behaviour, and while the mixed methods design mitigated this, future work should incorporate behavioural analytics and classroom observations. The qualitative sample of 12 provided depth but limited transferability, suggesting the need for larger or multi-site studies. Moreover, the analysis captured a single time point, despite the rapid evolution of AI tools and student practices, highlighting the importance of longitudinal research. Finally, the study did not empirically test AI-integrated interventions; experimental designs are needed to evaluate impacts on language development, autonomy, and critical AI literacy. Collectively, these limitations point to the need for more extensive, longitudinal, and intervention-based research to guide responsible AI integration in ELT programs.

12. Conclusion

Based on the frameworks of TAM, UTAUT, HMSAM, SDT, Flow Theory and Cognitive Load Theory this mixed-method study investigated ELT students' use motivation for ChatGPT with writing, speaking, reading and vocabulary. The quantitative results showed that intrinsic motivation, perceived usefulness, hedonic motivation and ease of use were the strongest predictors of intention to use ChatGPT. Writing was the most intrinsically and hedonistically motivating skill, while speak motivation was similarly driven by affective factors such as lowered anxiety and increased confidence. Reading and vocabulary use were mostly extrinsically motivated via efficiency and working memory reduction.

These results were further complemented by qualitative findings indicating that students experienced ChatGPT as a cognitive and affective writing scaffold, as a confidence builder for speaking, and an efficiency-enhancing tool for reading and vocabulary. Some participants also highlighted issues surrounding plagiarism, over-reliance and the loss of real learning. Being both learners and future teachers, raised their sensitivities on pedagogical and ethical implications frequently surrounding academic dishonesty due to clouded integrity in assessment and responsible use of AI.

In summary, the findings indicate that this necessitates AI literacy and ethical guidelines as well as a reassessment of evaluation within ELT programs. With AI shaping its way into language education environments, it is integral that teacher education curricula support the training of educators who will integrate AI tools in a pedagogically sound, responsible, and critical manner. Theoretical overviews of the usage and motivation of ChatGPT are sorely lacking in applied EFL contexts, which this study addresses, as it provides an ELT-focused understanding of ChatGPT use and motivation that is also skill specific and theory driven, whilst stressing the importance to prepare future teachers for working in what will soon be AI-rich environments.

APPENDIX A

SURVEY INSTRUMENT
Title: Motivational Factors Influencing ELT Students' Use of ChatGPT Across Language Skills
Instructions to Participants

Thank you for participating in this study. The purpose of this survey is to understand your experiences and motivations when using ChatGPT for language learning. Your responses are anonymous and will be used for research purposes only.

Please answer each question honestly. For Sections 2–4, use the following scale:

1 = Strongly disagree 2 = Disagree 3 = Neutral 4 = Agree 5 = Strongly agree

SECTION 1 — Demographics and Background
(Multiple choice / short answer)
D1. Age: ___ D2. Gender: ☐ Female ☐ Male ☐ Other
D3. Year of study: ☐ 1st ☐ 2nd ☐ 3rd ☐ 4th
D4. Frequency of ChatGPT use:
☐ Never
☐ Rarely
☐ Sometimes
☐ Often
☐ Very often

D5. Have you received any AI-related training?
☐ Yes
☐ No

SECTION 2 — General ChatGPT Use Patterns
(5-point Likert scale)

GU1. I use ChatGPT for academic tasks.
GU2. I use ChatGPT for language learning.
GU3. I use ChatGPT regularly for writing, speaking, reading, or vocabulary tasks.

SECTION 3 — Motivational and Acceptance Constructs
(5-point Likert scale)
Intrinsic Motivation (IM)

IM1. Using ChatGPT is enjoyable.
IM2. I feel curious when interacting with ChatGPT.
IM3. I feel motivated to explore ChatGPT because it is interesting.

Extrinsic Motivation (EM)
EM1. ChatGPT helps me complete tasks faster.
EM2. ChatGPT improves my academic performance.
EM3. Using ChatGPT helps me achieve better results in my coursework.

Hedonic Motivation (HM)
HM1. I feel immersed when using ChatGPT.
HM2. Using ChatGPT is fun.
HM3. I lose track of time when using ChatGPT.

Perceived Usefulness (PU)
PU1. ChatGPT improves my language learning.
PU2. ChatGPT enhances my writing and speaking skills.
PU3. ChatGPT helps me learn more effectively than traditional methods.

Perceived Ease of Use (PEOU)
PEOU1. ChatGPT is easy to use.
PEOU2. Learning to use ChatGPT is simple.
PEOU3. It is easy for me to become skilled at using ChatGPT.

Social Influence (SI)
SI1. People who are important to me think I should use ChatGPT.
SI2. My instructors encourage the use of ChatGPT.
SI3. My classmates think using ChatGPT is beneficial.

Ethical Awareness (ETH)
ETH1. I worry about plagiarism when using ChatGPT.
ETH2. I believe ChatGPT should be used responsibly.
ETH3. I am aware of the ethical risks associated with using ChatGPT.

Intention to Use (INT)
INT1. I intend to continue using ChatGPT.
INT2. I plan to use ChatGPT in future courses.
INT3. I will use ChatGPT regularly in my future learning.

SECTION 4 — Skill-Specific Engagement
(5-point Likert scale)
SSU1. I use ChatGPT for writing tasks.
SSU2. I use ChatGPT for speaking practice.
SSU3. I use ChatGPT for reading comprehension.
SSU4. I use ChatGPT for vocabulary learning.

APPENDIX B — Interview Protocol

Warm-Up
1. Can you describe a recent situation where you used ChatGPT for your coursework?
2. Which language skill do you feel ChatGPT supports the most, and why?

Writing
3. How does ChatGPT support your writing process?
4. What challenges do you face when using it for writing?

Speaking
5. How does ChatGPT influence your speaking confidence?
6. How do you use it for presentation or conversation practice?

Reading & Vocabulary
7. How does ChatGPT help you understand academic texts or course materials?
8. How do you use it to learn or practice new vocabulary?

Overall Benefits & Limitations
9. Overall, what do you see as the main **benefits** of using ChatGPT for your language learning?
10. What do you see as the main **limitations or drawbacks** of using ChatGPT across different skills?

Motivation & Perception
11. What motivates you to use ChatGPT for your learning?
12. Do you enjoy using it? Why or why not?

Ethics & Responsible use
13. What ethical concerns do you have when using ChatGPT (e.g plagiarism, over-reliance, fairness)?
14. How do you decide what is an appropriate or inappropriate way to use ChatGPT for coursework?

Pedagogical Beliefs
15. How do you think ChatGPT should be used in future ELT classrooms?
16. What role do you think AI tools should play in supporting language learning?

Professional Identity
17. How does using ChatGPT influence your identity as a future English language teacher?
18. Has ChatGPT changed the way you see your future teaching practices? If so, how?

APPENDIX C- Table 1. Exploratory Factor Analysis Findings (Principal Axis Factoring, Varimax Rotation)

Item Code	Factor 1 IM	Factor 2 EM	Factor 3 HM	Factor 4 PU	Factor 5 PEOU	Factor 6 SI	Factor 7 ETH	Factor 8 INT	Factor 9 SSU

Life Sciences Education

Co-Creating Environmental Solutions through Community-Based Science Education: A Participatory Situation Analysis, Philippines

Mercy O. Manalo[1], Abegail A. Malabuyoc[2], Dorren R. Arenque[3]

[1,2,3]Polytechnic University of the Philippines, Philippines

Abstract

The rapid pace of urbanization in Metro Manila poses more environmental issues within densely populated areas, like Tondo, Manila, which suffer from the improper waste disposal, environmental pollution, and insufficient availability of green spaces. The solution of these environmental issues is not only dependent on environmental intervention but on educating people about their surroundings. This paper investigates the use of Participatory Situation Analysis (PSA), within the context of Participatory Action Research (PAR), as an educational tool used for investigating local environmental issues and promoting active community participation. This research included the participation of members of the community, barangay officials, informal waste pickers, and environmental volunteers in selected areas of Tondo, Manila. Data were collected using various means, including interviews, household surveys, observations, analysis of documentation, mapping of the community, and community participatory workshops. Results show persistent environmental issues involving waste management, pollution, and lack of green spaces. However, more significantly, participatory learning processes facilitated community member ability to analyze environmental issues and understand the interrelationship between human actions and environmental condition. Community mapping and dialogue sessions helped improve environmental awareness, fostered collaboration, and emphasized the idea of collective environmental responsibility. This study shows that the Participatory Situation Analysis not only serves as a methodological instrument but also is applicable as an environmental education strategy, promoting community empowerment and environmentally sustainable practices. These results are significant for further development of community-based environmental education since the use of participatory methods helps enhance environmental literacy and promote sustainable practices in local communities.

Keywords: *participatory situation analysis, environmental governance, waste management, community participation, sustainability*

1. Introduction

Environmental problems associated with fast-growing cities have become not just environmental or governance issues but rather educational challenges. Environmental education helps people understand environmental problems, develop an attitude towards them, and participate in environmental decision making. When it comes to urban informal communities where people face various environmental challenges, it is possible to enhance their environmental literacy through educational methods based on practical application of theoretical knowledge.

Tondo, Manila, is considered one of the densest urban areas in the Philippines, suffering from multiple environmental problems like improper waste management, water pollution, pollution, and lack of green areas. This problem negatively impacts environmental conditions and affects people's health as well as sustainability. Despite the existence of governmental programs and environmental policies, sustainable development is dependent on active involvement of local communities and their environmental awareness

Learning from the environment using the community approach enables the locals to learn through observing, communicating, reflecting, and acting together in relation to the issues. Community-based environmental learning is premised on the theory of learning based on experiences and participatory education which acknowledges the community members as important participants in learning about the environment. Participatory Action Research (PAR) and Participatory Situation Analysis (PSA) are critical to the achievement of the objective in view because they provide opportunities for integrating local experiences and science to address the issues at hand.

Though there are numerous studies focusing on the relationship between environmental management and participation of the community members, few studies have focused on the significance of Participatory Situation Analysis (PSA) to environmental education within urban areas in the Philippines. This study, therefore, aims to fill the identified gap through an analysis of how PSA can contribute to environmental education within Tondo in Manila.

2. Objectives of the Study

2.1 General Objective

To examine how Participatory Situation Analysis can be utilized as a community-based environmental education approach to enhance environmental awareness, environmental literacy, and community participation in addressing environmental issues in Tondo, Manila.

Specific Objectives

1. To identify community knowledge and practices related to waste management and environmental conservation.
2. To examine residents' understanding of environmental pollution and its effects on human health and the environment.
3. To assess community awareness regarding the importance of green spaces and urban environmental sustainability.
4. To determine how participatory learning activities influence environmental awareness and community engagement.
5. To develop community-based environmental education strategies that support sustainable environmental practices and local environmental governance.

3. Methodology

3.1 Research Design

For the current study, the methodology used was Participatory Action Research (PAR). Participatory Situation Analysis was the main methodological framework used for this purpose. The essence of PAR is that it is a research process that involves collaborative inquiry, where community members take part in problem identification and formulation of solutions.

3.2 Study Area and Participants

The study was done in selected areas of Tondo, Manila, an urbanized municipality distinguished by its congested populace, minimal infrastructure, and environmental problems. Subjects of the study comprised community members, barangay officials, waste pickers, and environmental volunteers. The use of purposive sampling was done to ensure that the respondents belonged to varied community perspectives, especially those who are directly linked with environmental activities.

3.3 Data Collection Methods

Triangulation of data involved several approaches including:

• Semi-structured interviews with community members
• Surveys of households on waste management issues
• Field observations at waste dump sites and community settings
• Barangay records and reports on environmental programs
• Workshops using community maps and environmental visi

3.4 Data Analysis

Analysis of qualitative data involved the use of thematic analysis, which focused on identifying common themes relating to the environment and patterns of community reactions. Descriptive statistics were used to analyze quantitative data collected through surveys.

4. Significance of the Study

The present study is a valuable addition to the body of research in environmental education because it shows the importance of using participatory methods for fostering environmental awareness and community involvement in urban areas. At the individual level, it enables community members to engage in reflection regarding the environmental problems that impact them directly and to get involved in solving them. At the organizational and policy-making levels, on the other hand, the results provide important information to local government units and barangay leaders about the value of supplementing existing environmental programs with efforts aimed at fostering environmental awareness and community participation through environmental education. This study also holds relevance to academic discussions in community-based environmental education and environmental literacy.

5. Conceptual Framework

The research is additionally based on the concepts related to community-based science education, which involve experiential learning, participatory investigation, and environmental understanding within particular settings. In such a case, education involves discussion, observation, reflection, and solving problems in relation to the particular community. Workshops held within PSA involved data collection but were also educational as individuals were encouraged to discuss their environments, share experiences, and establish environmental awareness. Such an approach is aligned with that proposed by Freire and referred to as dialogic education, involving learning through collective reflection and action (Freire, 1970).

6. Results and Discussion

These results indicate that participation in environmental learning activities is crucial for enhancing the practice of waste management. In particular, the community discussions and PSA sessions allowed the residents to think critically about the issue of waste disposal, its negative impact on environmental health, and their role in addressing this problem within the community. Thus, the study shows how community-based science education helps enhance individuals' awareness of environmental issues.
Besides helping to identify environmental conditions, these participatory approaches were effective in promoting environmental learning. Residents were able to consider the causes and effects of environmental problems based on their personal observations and experiences. By reflecting upon these processes, participants gained an enhanced understanding of how human actions affect environmental quality. This type of environmental learning aligns with the basic concepts of environmental education.

6.1 Waste Management Practices

Table 1. Waste Management in the Community

Waste Management Patterns	1	2	3	4	Other Answers

WM2: Waste collection and disposal methods (segregation, recycling, landfill)	They are observing waste management such as collecting the garbage every morning and afternoon (10)	There are declogging, clean up drive and recycling activities initiated by the barangay (5)	—	—	They are observing waste management such as collecting the garbage every morning and afternoon (10); There are declogging, clean up drive and recycling activities initiated by the barangay (5)
WM3: Informal waste management practices (scavenging, dumping)	There are scavengers looking for recyclable waste (4)	Dumping garbage at the back of the building (1)	—	—	—
WM4: Waste treatment facilities and their effectiveness	There are assigned street sweepers and garbage trucks collecting garbage everyday (6)	There are declogging, clean up drive and recycling activities initiated by the barangay (3)	There is a detection device for copper, bronze, and brass burning (Pagsusunod ng tanso) (2)	—	—
WM5: Environmental impacts of waste management (pollution, health risks)	Too hot weather sometimes causes fire on the mountain. It also has extracted that stink (4)	Clean surroundings provide good health (3)	The quality of soil is contaminated. Plants are difficult to grow (1)	—	—
WM6: Public awareness and participation in waste management	There are clean up drives and assigned street sweepers. There are also garbage trucks collecting garbage everyday (6)	There is a MRF project by the barangay (2)	There are designated trash cans every building (1)	—	—

From the study, it is evident that there is a dual waste management system that includes the use of both official municipal waste disposal and unofficial recovery practices. There was evidence of regular garbage collection and street sweepers in some sections of the barangay. On the other hand, there was evidence of the practice of waste scavenging for the purpose of resource recovery and recycling of recyclable materials in most waste dump sites. Waste scavengers form an important aspect of any recycling systems in developing countries. They contribute a lot to resource recovery and the circular economy process (Medina, 2007; Wilson et al., 2006). - The waste collection takes place by truck whereas bulldozers gather the rest of the waste materials. A total of 12 community volunteers handle the waste material from the MRF. The volunteers do not use personal protective equipment (PPEs), putting their lives in danger, along with that of the collectors and scavengers. Such cases have been observed in many parts of Metro Manila where the work of waste scavengers was crucial to resource recovery and recycling processes (Gutberlet et al., 2021).

While formal waste collection services are provided, illegal dumping practices were also noted during the study. Some participants stated that trash was disposed of at the back of buildings or in open areas from time to time, posing problems with foul smells, pests, and even fires during dry weather.

These results are consistent with earlier studies that have found that informal settlements in urban settings function under a mixed economy of waste systems, whereby formal waste management processes exist alongside informal recycling methods (Serrona & Yu, 2009). Although the practice of informal waste picking creates jobs, it is important for policymakers to pay attention to the issue of informal waste management governance as well. As far as involvement in environmental efforts by local communities is concerned, barangay clean-ups and street sweepings were noted as forms of engagement by community members in environmental issues. Yet, some participants were unaware about the barangay MRF, suggesting a lack of integration between current waste management policies and practices in the community.

The difficulties related to illegal dumping and waste management become more pronounced in the case of Tondo. The community encounters serious environmental threats associated with improper waste disposal practices. The lack of law enforcement results in an increase in the number of illegal dumping locations, thus posing various environmental threats. Besides, insufficient public knowledge about the issue in question adds up to existing difficulties related to waste management. It can be stated that governance problems could be successfully dealt with in Tondo.

6.2 Pollution Sources and Environmental Impacts

These activities have also offered chances for environmental learning by the citizens. The discussions enabled them to relate their environmental surroundings such as polluted rivers, toxic soil, and emission of smoke with more extensive environmental impacts on the public. This indicates how community science plays a part in turning environmental surroundings into environmental learning.

Table 2. Pollution Patterns in the Community

Pollution Patterns	1	2	3	4	Other Answers
POL1: Air pollution (sources, types, effects)	Burning of wires for copper, bronze, or brass is already prohibited (7)	Too hot weather sometimes causes fire on the mountain. It also stinks (2)	—	—	—
POL2: Water pollution (sources, types, effects)	The water from the faucet is cleaner than the water coming from the water tank. The water coming from the water tank is not potable (8)	There is a good water supply (3)	Some are buying mineral water (2)	Sometimes, when it is high tide, the water from the river stinks (1)	The plastic bottles floating on the river (1)

Pollution Patterns	1	2	3	4	Other Answers
POL3: Soil pollution (sources, types, effects)	Due to over population and crowded building, there is no place for planting (3)	Heavy rains cause landslide and soften the soil (2)	The quality of soil is contaminated. Plants are difficult to grow (1)	—	—
POL4: Noise pollution (sources, effects)	Because of over population, there is a noise pollution especially during weekends or if there is occasion (5)	The place is quiet (2)	The vehicles passing through also contribute to noise pollution (1)	—	—
POL5: Regulations and enforcement related to pollution control	Waste segregation, detection mechanism for copper, bronze, and brass burning, and dumping site (5)	Street sweepers assigned by the barangay (2)	—	—	—

The residents reported several types of pollution in their area, ranging from air, water, soil, and noise pollution. The main sources of air pollution involved the burning of metal wires and other waste products. It should be emphasized that such activities are banned, although residents report instances when burning of such materials occurs; consequently, toxic substances in the form of fumes are released into the atmosphere. This problem can be regarded as an example of difficulties that arise in the enforcement of environmental policies in informal urban settlements. Water pollution was another critical issue. According to respondents, although tap water can be regarded as clean, water in storage tanks was believed to be unsuitable for consumption purposes. Besides, during high tide, river water smelled bad and contained various plastic wastes. Such facts can be compared with results of earlier studies reporting issues associated with water quality in informal settlements adjacent to water bodies in Metro Manila (Casiw, 2020). Moreover, inadequate waste management led to the pollution of soil, making it impossible to plant any vegetation.

The study also found that heavy rainfall led to poor soil stability and soil contamination. In addition, noise pollution proved to be another environmental problem brought about by high population densities and higher incidences of human activities. Noise pollution was found to be higher when there were meetings or traffic congestion. From the results obtained, it can be seen that environmental problems in Tondo are inter-related.

6.3 Green Spaces and Urban Environmental Quality

Further small-scale planting programs showed how participatory environmental actions could be educational. The people were not only involved in the planting process itself but also in conversations about the heat in urban areas, ecology, and wellbeing within the community. These examples show that environmental education can result from community actions, rather than being confined to classroom education only.

Table 3. Green Spaces in the Community

Green Spaces Patterns	1	2	3	4	Other Answers
GS1: Types of green spaces (parks, gardens, forests)	There is an ongoing barangay project for planting (3)	Upper part of the mountain used for planting vegetables, Barangay project for vegetation (1)	—	—	—

Green Spaces Patterns	1	2	3	4	Other Answers
GS2: Accessibility and availability of green spaces	No area because the area is crowded with buildings (1)	Very few because the soil is contaminated. (1)	—	—	—
GS3: Quality and maintenance of green spaces	The barangay is clean every morning and afternoon because of the street sweepers (1)	—	—	—	—
GS4: Ecological functions of green spaces (biodiversity, climate regulation)	Solar system and generator charge problem (1)	—	—	—	—
GS5: Public use and enjoyment of green spaces	It is in order (1)	—	—	—	—
GS6: Urban planning and green infrastructure development	Barangay project for development of the community such as planting and recycling (3)	There is a mountain where they plant (2)	—	—	—

In general, it can be seen that there is a significant absence of green spaces in the community. Some of the respondents have identified that there are some planting efforts initiated by the barangay, specifically in the mountain areas. These places are used sometimes for gardening. However, there are also many areas that do not have any green space at all due to high population density and the presence of residences that occupy the area. In addition, there does not seem to be any effort in the maintenance of green spaces in the community other than those done by street cleaners. This suggests that the ecological benefits are less present in the barangay. The scarcity of green spaces in urban informal communities has been extensively studied in urban planning literature. The importance of green infrastructure in urban areas is crucial for enhancing environmental quality, cooling urban areas, and ensuring the well-being of residents (Newman & Jennings, 2008; UN-Habitat, 2020).
Nevertheless, there were indications that the community was showing interest in greening activities. The barangay's tree planting program and the planting of vegetable gardens are clear indicators that the community is willing to participate in efforts to improve the environment. These observations indicate that green community-based interventions like container gardening, roof-top planting, and vertical gardening could be viable solutions for urban environmental improvement in space-strapped communities

7. Conclusion

This study illustrates how Participatory Situation Analysis is not just a way of analyzing the environmental status of the community but also an effective environmental education tool. By means of community mapping, discussions, observations, and reflections, the residents were able to enhance their knowledge about the environmental problems and develop their sense of responsibility for environmental protection. Some of the results obtained from the study indicate the existence of persistent problems regarding waste disposal, pollution, and lack of green areas in Tondo, Manila. On the other hand, the participants of the process acquired environmental literacy and knowledge through collective learning and community engagement. Environmental education should be integrated in community-based environmental programs in order to promote responsible community involvement in environmental activities.

It can be observed that environmental governance in informal urban settlements is closely intertwined with community learning and environmental education. In this regard, Participatory Situation Analysis can be considered not just a methodological approach for conducting research but also an instrument for community-based science education, whereby residents analyzed the local environment, shared their experiential knowledge, and thought collectively about what they could do environmentally. Thus, the research indicates that participatory approaches contribute to fostering environmental awareness and promoting environmental stewardship on a local level.

In this study, Participatory Situation Analysis has been demonstrated to be not just a research methodology but also a tool for community-based science education among urban poor communities in the Philippines. Through participatory workshops and other educational methods, residents were able to engage in learning about the environment based on scientific insights.

Environmental problems related to waste management, pollution, and lack of green growth infrastructure have been identified in Tondo, Manila. The research indicates that participatory education can help foster environmental awareness and promote participation in environmental governance processes.

Though there are other studies done on participatory environmental education around the world, what is provided here is unique data gathered within the Philippine urban setting. Thus, this research adds to existing studies on community-based environmental education in its illustration of how participation in learning can contribute to environmental initiatives in underdeveloped urban communities.

For the government, it is recommended that the promotion of environmental literacy, inclusion of informal waste workers in community-based education, and implementation of participatory green infrastructure be considered for policy development.

Mathematical Sciences

Not Anxious or Confident: A Framework of Why Mathematics Apathy is a Barrier for Learning

Jamie Ben Smith

University of Lincoln, United Kingdom

Abstract

Mathematics anxiety has been widely studied as a barrier to learning and achievement [1], yet mathematics apathy, characterised by low perceived value and low perceived control, remains underexplored despite its significant impact on student engagement and achievement [2]. This paper introduces a theoretical framework situating mathematics apathy within the Control-Value Theory of Achievement Emotions [3] underpinned by principles of Social Cognitive Theory [4]. Drawing on longitudinal survey data from over 1,200 UK secondary students, this study traces how mathematics apathy develops over time.

This paper argues that mathematics apathy warrants recognition as a distinct emotional barrier with unique implications for learning. Unlike mathematics anxiety, which is activating and often distressing, mathematics apathy is deactivating: it reduces effort, persistence, and willingness to engage with challenge. This paper invites dialogue on how teacher preparation and mentality can address mathematics apathy in their students, as a systemic barrier to mathematics education.

Keywords: *Mathematics apathy; Mathematics anxiety; Avoidance behaviours; Control value theory; Teacher resilience; Professional learning; Student Mentality*

1. Introduction

For decades, mathematics anxiety has dominated discourse on emotional barriers to mathematics learning. Its effects on avoidance, performance, and long-term participation are well documented [2][5][6][7]. Yet an equally pervasive phenomenon, mathematics apathy, has received far less attention. Mathematics apathy is not simply a lack of interest; it is similarly an achievement emotion shaped by students' perceptions of control and value [3]. When students believe they have little influence over their success and see limited relevance in the subject, apathy emerges as a protective disengagement strategy.

This paper argues that mathematics apathy warrants recognition as a distinct emotional barrier with unique implications for learning. Unlike anxiety, which is activating and often distressing, apathy is deactivating: it reduces effort, persistence, and willingness to engage with challenge. In classrooms, apathetic students may appear compliant yet disconnected, completing tasks without cognitive investment. Such disengagement is particularly concerning in mathematics, where conceptual understanding requires sustained attention and iterative reasoning.

Across the mathematics education literature, mathematics anxiety and mathematics confidence are frequently presented as opposing ends of a single affective continuum [8][9][10]. These early works demonstrated strong inverse relationships between confidence and anxiety in mathematics, a pattern later reinforced by a meta-analysis showing that higher mathematics confidence is consistently associated with lower mathematics anxiety [7]. Subsequent studies [6][11] have continued to treat the two constructs as conceptual dipoles linking low self-efficacy to heightened anxiety in mathematics contexts. While this one-dimensional framing has been valuable for understanding the interplay between confidence and anxiety, it does not fully account for the broader emotional landscape of mathematics learning. When examined through the lens of control value theory, the relationship between confidence and anxiety becomes part of a wider two-dimensional space in which perceived control and perceived value interact. This shift from a single continuum to a two-axis framework reveals additional emotional profiles beyond the traditional mathematics confidence mathematics anxiety dipole, including the low control, low value state that forms the basis of the construct I propose in this study: mathematics apathy.

2. Theoretical Framework

Pekrun's [3] control value theory (CVT) provides a powerful lens for understanding mathematics apathy. CVT proposes that achievement emotions stem from two appraisals: perceived control over learning and perceived value of the task or domain. Different combinations of these appraisals give rise to distinct emotional patterns. High control and high value appraisals generate positive activating emotions such as enjoyment or pride. Low control and high value appraisals often produce anxiety and nervousness. Low value and low control, however, generate deactivating emotions such as boredom, hopelessness, or apathy.

Within this framework, control and value are understood to develop together over time. Students' academic emotions emerge from the interaction of their control beliefs and value beliefs, meaning that the emotions they experience during a learning activity depend on how capable they feel and how much the task matters to them. CVT therefore provides a coherent structure for examining the emotional landscape of mathematics learning.

Through the control-value framework, mathematics anxiety is hypothesised to develop when a student experiences low control in a mathematics activity when they also experiencing a higher value appraisal towards mathematics [12]. Students who place strong importance on mathematics but feel unable to succeed are consistently found to report the highest levels of anxiety [12][13]. Low control in this context is closely associated with lowest levels of self-belief combining lower levels of perceived competence in tackling specific academic tasks (self-efficacy) and their general belief in being a 'good mathematician' (self-confidence). Using this framework of control-value theory and its application to mathematics anxiety a profile (see Figure 1) can be built showing the location of mathematics anxiety and three interconnected mathematics achievement emotions.

3. Defining Mathematics Anxiety

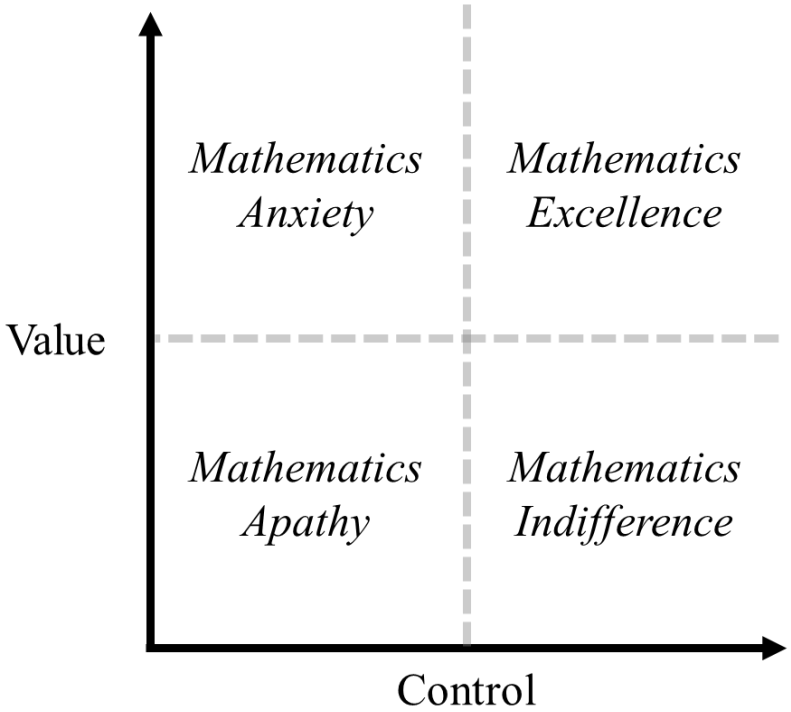

Fig. 1. Control-Value Theory Profile of Mathematics Achievement Emotions

Note. An original conceptual framework illustrating four distinct emotional responses to mathematics derived on Pekrun's [3] control-value theory: mathematics excellence (high value, high control), mathematics anxiety (high value, low control), mathematics indifference (low value, high control), and mathematics apathy (low value, low control).

Most notable is the lower left corner of the matrix corresponding to students with low levels of control and value. These students generally feel less competent (having little control over mathematics) nor invested in mathematics (attributing little value to mathematics), leading to disengagement and

emotional detachment. Control-value theory [3] predicts that when both perceived control and task value are low, students experience deactivating negative emotions. Therefore, and building on this framework, for students with low control and task value I propose the term mathematics apathy, defined originally here as:

> "A motivational deficit in which learners neither value nor expect success in mathematics – often connected to mathematics anxiety, mathematics apathy is underpinned by a lack of self-confidence and self-efficacy."

Zones of proximal development [14] offers a useful lens for understanding the emergence of mathematics apathy. When classroom tasks fall substantially below a learner's developmental level, they fail to generate cognitive challenge, resulting in limited motivation to participate or improve. Conversely, when tasks sit persistently beyond a student's perceived capability, they reinforce feelings of inadequacy and disengagement. In both cases, the misalignment between task demand and learner readiness contributes to a deactivation of effort.

Social cognitive theory [4][15] further illuminates this dynamic. Low self-efficacy diminishes students' willingness to attempt mathematical tasks, while the absence of perceived value erodes any incentive to persist when difficulties arise. Apathy, therefore, can be understood as the product of a dual erosion: students feel neither capable of success nor convinced that success matters. This combination aligns closely with the low control, low value quadrant of [3] control value theory, positioning apathy as a theoretically distinct emotional state rather than a simple lack of motivation.

As curricular complexity increases, repeated experiences of low control, such as difficulty with foundational concepts, and low value, such as limited real-world applications compound over time, reinforcing patterns of disengagement. These experiences shape the student's mathematics mentality: their combined beliefs, emotions, and expectations that frames their relationship with the mathematics.

Crucially, mathematics apathy does not always manifest as overt resistance. Many apathetic students maintain behavioural compliance while disengaging cognitively, completing tasks with minimal investment. This quiet disengagement makes apathy difficult for teachers to detect and easy for systems to overlook. Its subtlety underscores the need for teacher education programmes to address apathy explicitly as a distinct emotional barrier, equipping teachers to recognise its signs and respond with pedagogical strategies that rebuild both perceived control and perceived value.

4. Empirical Evidence

Although the present paper is theoretical in focus, illustrative evidence from a longitudinal study [18] of UK secondary students provides empirical plausibility for the proposed construct of mathematics apathy. The dataset, drawn from three secondary schools and comprising matched responses from 1,246 students aged 11–14, offers insight into how students' emotional profiles in mathematics evolve over time and how these trajectories align with the low control, low value quadrant predicted by Control Value Theory.

Two waves of data collection were conducted during the school year, with 1,545 students participating in Phase A and 1,560 in Phase B, yielding the 1,246 matched cases used for longitudinal analysis. Students completed validated measures of mathematics anxiety and mathematics confidence. Mathematics anxiety was assessed using the Modified Abbreviated Math Anxiety Scale, a nine-item instrument in which students rated their anxiety in response to common mathematics situations on a five-point scale ranging from "1 = Low Anxiety" to "5 = High Anxiety." Mathematics confidence was measured using an adapted version of the Mathematics Confidence Scale, comprising seven items rated on a symmetrical five-point agreement scale. Minor linguistic adjustments (e.g., "math" to "maths") ensured cultural relevance for UK students.

As reported in earlier analyses [18], "students' mathematics anxiety (at both the overall and component levels) decreases throughout secondary education, however there is no corresponding increase in mathematics confidence." This finding is striking because it challenges the long-standing assumption that reductions in anxiety naturally and consequently lead to increases in confidence.

Instead, the data suggest a more complex emotional shift. Students become less anxious about mathematics over time, but they do not become more confident. The emotional energy previously tied to worry, tension, and fear does not appear to be redirected into positive self-belief or engagement.

This pattern is precisely what the proposed construct of mathematics apathy predicts. When perceived control remains low—students still doubt their ability to succeed—but perceived value also declines,

reductions in anxiety do not produce positive affective states. Instead, students may shift into a deactivating emotional state characterised by detachment, low investment, and minimal cognitive engagement. The longitudinal data therefore provide a direct empirical illustration of the theoretical model: a movement from the high value/low control quadrant (mathematics anxiety) toward the low value/low control quadrant (mathematics apathy).
Importantly, this shift is not easily observable in classroom behaviour. Many students who report declining anxiety but stagnant confidence continue to complete tasks and comply with classroom routines. Yet their cognitive engagement diminishes. This quiet disengagement aligns with the theoretical definition of apathy as a deactivating achievement emotion and underscores the need for teachers and researchers to attend to emotional states that are not outwardly disruptive.
Taken together, the longitudinal patterns provide illustrative support for the conceptual framework advanced in this paper. They demonstrate that emotional trajectories in mathematics are not linear and that reductions in negative activating emotions do not guarantee increases in positive activating ones. Instead, when both perceived control and perceived value remain low, students may drift into a state of mathematics apathy—an emotional profile that has been largely overlooked in the literature but may be central to understanding persistent disengagement in mathematics classrooms.

5. Discussion

The framework proposed in this paper positions mathematics apathy as a critical, yet under recognised, barrier to learning. By situating apathy within control value theory, it becomes possible to differentiate it from related constructs such as anxiety, boredom, or low motivation. The longitudinal patterns observed in the Lincolnshire dataset highlight the developmental nature of apathy and its entanglement with students' mathematics mentality.
When anxiety is reduced but confidence does not increase, the emotional energy previously tied to fear and worry is not redirected into positive engagement. The present findings raise an intriguing and underexplored question regarding the affective dynamics of mathematics learning. Students report reduced worry and nervousness about mathematics within and between school years without the theorised corresponding increase in confidence. Instead, the emotional energy previously directed towards managing mathematics anxiety is not converted into positive self-belief, self-efficacy, or engagement, instead it dissipates resulting in a general apathy towards mathematics.
For teacher education, the implications are clear: apathy must be addressed explicitly and systematically. Cultivating teacher resilience and embedding apathy awareness into professional learning are two promising pathways for change. These approaches recognise that emotional barriers to learning are relational and contextual, requiring teachers who are both emotionally equipped and pedagogically empowered. Future research should explore intervention models that target both control and value appraisals, as well as the role of school culture in shaping students' emotional experiences of mathematics. As mathematics education continues to grapple with issues of participation, equity, and identity, understanding and addressing apathy is essential.
Mathematics apathy represents a silent but significant barrier to learning. Unlike anxiety, which signals distress, apathy signals disconnection. By integrating apathy into theoretical, empirical, and teacher education discourse, this paper argues for a more comprehensive understanding of the emotional landscape of mathematics learning. Addressing apathy is not merely a pedagogical challenge—it is a systemic imperative that requires resilient teachers, informed professional learning, and a commitment to fostering meaningful mathematical experiences for all students.

6. Implications

The proposed construct of mathematics apathy carries significant implications for theories of achievement emotions. By formalising the low control, low value quadrant within Control Value Theory, the construct expands the emotional landscape available to mathematics education researchers and challenges the long-standing assumption that confidence and anxiety form a single affective continuum. Recognising apathy as a deactivating emotion foregrounds the importance of emotional states that do not manifest as distress but as quiet disengagement. In doing so, the construct offers explanatory power for patterns of student behaviour and affect that existing constructs (e.g., mathematics anxiety) cannot adequately capture.
The construct also opens new avenues for empirical research. Future work will need to develop and validate measures capable of distinguishing mathematics apathy from related constructs, as well as model the developmental trajectories of perceived control and value that give rise to it. Research should

examine how apathy interacts with students' mathematical identities, participation patterns, and long-term engagement with the subject. Interventions that simultaneously target control and value appraisals represent a promising direction, as does research exploring how school culture and classroom climate shape students' emotional experiences. Longitudinal and mixed methods designs will be particularly valuable for tracing how apathy emerges, stabilises, or shifts over time.

Finally, the construct has important implications for teacher education. Mathematics apathy must be addressed explicitly and systematically, requiring teachers who are both emotionally equipped and pedagogically empowered. Preparing teachers to recognise and respond to apathy involves embedding apathy awareness into teacher preparation programmes, developing pedagogical approaches that rebuild perceived control through scaffolding and mastery experiences, and enhancing perceived value through relevance, authenticity, and identity affirming practices. Supporting teacher resilience (Gu & Day, 2013) is essential for sustaining emotionally responsive teaching in the face of quiet disengagement. Addressing mathematics apathy is therefore not merely a pedagogical challenge but the potential solution for mathematical engagement.

7. Conclusion

Mathematics apathy represents a silent but significant barrier to learning. Unlike anxiety, which signals distress, apathy signals disconnection. By situating apathy within Control Value Theory and integrating insights from Social Cognitive Theory and ZPD, this paper offers a theoretical framework for understanding apathy as a distinct achievement emotion. Illustrative evidence suggests that reductions in anxiety without increases in confidence may lead to emotional disengagement rather than positive affect. Recognising and addressing mathematics apathy is essential for fostering meaningful mathematical experiences and supporting students' long-term participation in mathematics.

AI Driven Prediction of Student Success in Engineering Mathematics: Integrating Course Performance, Academic Progression, and Mathematical Misconceptions

Jinendrika Weliwita[1], Mohammed Almasalmeh[2]

[1,2]Higher Colleges of Technology, United Arab Emirates

Abstract

Early identification of students at risk of academic difficulties is a major challenge in engineering education. Mathematics, as a foundational component of engineering programs, plays a critical role in determining student progression and overall academic success. This study presents an Artificial Intelligence driven framework for predicting student success in engineering mathematics by integrating course performance data, academic progression patterns, and mathematical misconception indicators. Student achievement data collected over multiple academic years were analyzed using statistical and machine learning techniques. Correlation and regression analyses were first employed to investigate relationships between foundational and advanced mathematics courses. The analysis was then extended through the development of AI-based predictive models trained on student achievement records, progression histories, and misconception assessment results. Model performance was evaluated using standard classification and prediction metrics. The results revealed significant positive correlations between foundational and advanced mathematics courses, confirming the importance of strong mathematical foundations. The AI models effectively identified students at risk of poor academic outcomes with high predictive accuracy. Feature importance analysis depicted that prior mathematics achievement, progression history, and misconception scores were among the strongest predictors of future performance. Furthermore, while mathematical misconceptions exhibited a strong relationship with immediate course achievement, their influence on later mathematics courses was reduced, suggesting that many misconceptions are progressively corrected through higher education. Analysis of underperforming students also demonstrated that a substantial proportion improved in subsequent mathematics courses, highlighting the value of timely intervention and academic support.
The proposed framework demonstrates the potential of AI and learning analytics to support evidence based decision making, personalized interventions, and early warning systems. The findings contribute to the growing field of AI in Education and provide practical strategies for improving student success, progression, and retention in engineering programs.

Keywords: *Artificial Intelligence in Education, Learning Analytics, Student Success Prediction, Mathematical Misconceptions, Predictive Modeling, Educational Data Mining.*

1. Introduction

Mathematics is widely recognized as a cornerstone of engineering education, providing the analytical, computational, and problem-solving skills required for success in engineering disciplines. Performance in mathematics courses has been shown to influence achievement in subsequent engineering and technical courses, making mathematics a critical component of student progression and retention. Despite its importance, many engineering students experience difficulties in mathematics due to gaps in prior knowledge, misconceptions, ineffective learning strategies, and challenges in adapting to university-level learning environments.

With the increasing availability of educational data, learning analytics and Artificial Intelligence (AI) have emerged as promising approaches for understanding student learning behaviors and predicting academic outcomes. Educational institutions are increasingly seeking data-driven approaches to identify students at risk of poor academic performance and provide timely interventions before failure occurs. AI-driven predictive models offer opportunities to transform traditional academic support systems by enabling personalized learning pathways and early-warning mechanisms.

Previous studies have investigated the relationship between mathematics achievement and performance in engineering programs. However, limited research has combined course correlations, student progression patterns, and mathematical misconceptions within a unified AI-driven learning analytics framework. Furthermore, there remains a need to understand how misconceptions influence

future academic performance and whether student achievement in prerequisite mathematics courses can reliably predict success in higher-level courses.
This study addresses these gaps by investigating the relationships among mathematics course performance, progression patterns of underperforming students, and mathematical misconceptions. The study further develops AI-based predictive models to identify key indicators of future academic success. The findings aim to support educators in developing targeted interventions and evidence-based strategies for improving student progression, retention, and achievement in engineering education.

1.2 Literature Review

Student performance prediction has attracted significant attention in engineering and higher education research. Several studies have demonstrated that achievement in mathematics courses is strongly associated with academic success in engineering programs. Alahmad et al. [1] examined the relationship between student performance in Calculus I and Physics I and reported a significant association between mathematics achievement and performance in science-based engineering courses.
Thomas et al. [2] investigated the influence of university entry scores on engineering mechanics performance and found that students entering university with weaker academic preparation were at a substantially higher risk of failure. Similarly, Imran and Hayati [3] reported that mathematics achievement was a stronger predictor of overall engineering performance than science-based subjects, emphasizing the critical role of mathematical competence in engineering education.
Beyond course performance, researchers have highlighted the importance of understanding student misconceptions. Weliwita et al. [4] conducted a statistical analysis of mathematical misconceptions among engineering students and demonstrated that misconceptions significantly influence student achievement. Their work further suggested that targeted pedagogical interventions can improve conceptual understanding and academic outcomes. In a related study, Weliwita and Witharana [5] emphasized the role of authentic learning and assessment practices in enhancing student engagement and improving learning outcomes in higher education.
The emergence of learning analytics and educational data mining has created new opportunities for understanding student learning processes. Siemens and Baker [6] highlighted the growing importance of learning analytics in transforming educational decision-making through data-driven approaches. Aldowah et al. [7] further demonstrated that educational data mining techniques can support early identification of at risk students and facilitate personalized interventions. Recent advances in Artificial Intelligence have extended these capabilities through predictive models capable of forecasting student performance and supporting proactive academic advising.
Despite these developments, relatively few studies have integrated course correlations, progression analysis, and misconception indicators within a single predictive framework for engineering mathematics. The present study addresses this gap by combining statistical analysis and AI-driven prediction to identify key factors influencing student success and progression in engineering mathematics courses.

2. Methodology

This study employed a combined learning analytics and Artificial Intelligence (AI) approach to investigate factors influencing student success in engineering mathematics. The methodology consisted of data collection, preprocessing, statistical analysis, AI model development, and model evaluation. The objective was to identify relationships among mathematics course performance, academic progression, and mathematical misconceptions, and to develop predictive models capable of identifying students at risk of poor academic performance.

2.1 Data Collection and Preprocessing

Student academic records were collected from engineering mathematics courses offered over 2019 to 2022. The dataset included student grades from foundational and advanced mathematics courses, progression records between courses, and results from a mathematical misconceptions assessment conducted among engineering students. Data from both male and female students were included to provide a comprehensive representation of student performance patterns. Prior to analysis, all student records were anonymized to ensure confidentiality and compliance with institutional data protection requirements. Missing or incomplete records were removed, and grade data were standardized to

enable meaningful comparison across different courses and academic years. The data were then organized into categories representing course performance, academic progression, and misconception assessment outcomes.

2.2 Statistical Analysis

Descriptive statistical techniques were used to analyze grade distributions and overall student performance trends. Correlation analysis was performed to examine relationships between foundational and advanced mathematics courses. Regression analysis was further conducted to quantify the strength of these relationships and identify factors associated with student achievement.
To investigate academic progression, students with low grades in prerequisite mathematics courses were tracked through subsequent courses. Grade transitions, progression patterns, and failure rates were analyzed to determine the extent to which early academic performance influenced future outcomes.

2.3 AI Based Prediction Model

Artificial Intelligence techniques were employed to predict student performance in advanced mathematics courses. Input variables included grades from prerequisite courses, progression history, and misconception assessment scores. Machine learning models were trained using historical student data to classify students according to their likelihood of academic success or risk of poor performance. The predictive performance of the AI models was evaluated using standard classification metrics, including accuracy, precision, recall, and F1 score. Confusion matrix analysis was also used to assess the effectiveness of the models in correctly identifying students at risk of academic difficulties. Feature importance analysis was conducted to determine the relative contribution of each predictor variable to model performance.

2.4 Research Framework

The proposed framework consisted of five stages: data collection, data preprocessing, statistical analysis, AI model development, and performance evaluation. The framework was designed to provide both explanatory insights into student learning patterns and predictive capabilities for early identification of at-risk students. The resulting system supports data-driven decision making and the development of targeted academic interventions aimed at improving student success, progression, and retention in engineering education.

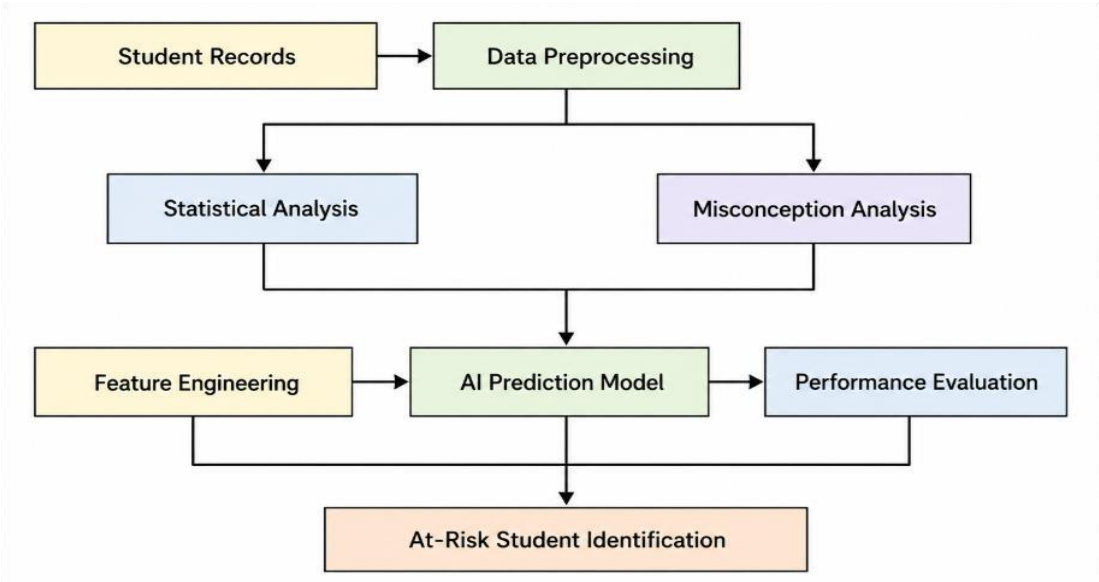

Fig. 1. AI-driven framework for predicting student success in engineering mathematics using student records, statistical analysis, feature selection, machine learning, and risk prediction.

3. Results And Discussion

3.1 Academic Progression Analysis

The progression patterns of students across mathematics levels were investigated to understand whether poor performance in earlier mathematics courses persisted throughout the curriculum. The analysis revealed that only a small proportion of students who obtained low grades in earlier mathematics levels continued to achieve similarly low grades in higher mathematics levels. In contrast, a substantial proportion of students demonstrated improved academic performance as they progressed through the curriculum.

As shown in **Fig. 2**, approximately 18% of students who performed poorly in an earlier mathematics level continued to obtain low grades in subsequent mathematics courses. However, more than 80% of students demonstrated improved performance, suggesting that early academic difficulties do not necessarily determine future achievement. These findings emphasize the importance of timely academic support and targeted interventions.

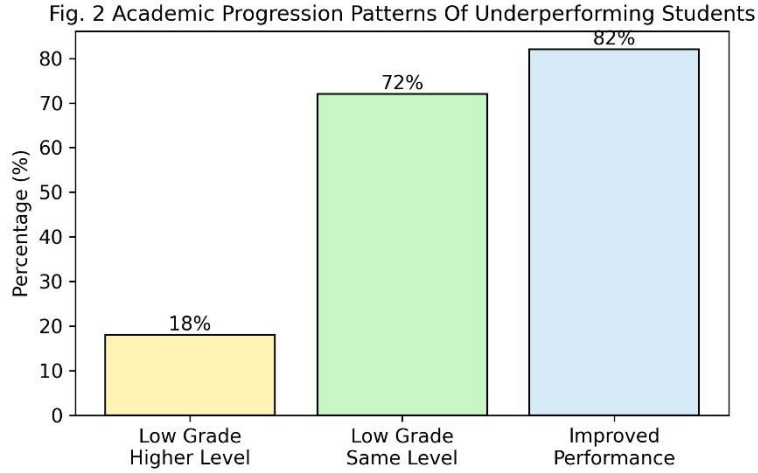

Fig. 2. Academic Progression Patterns of Underperforming Students

3.2 Correlation Between Mathematics Levels

To examine the relationship between mathematics courses, correlation analysis was conducted using student achievement data across four mathematics levels. The resulting correlation matrix is presented in Fig. 3. The analysis revealed strong positive correlations between adjacent mathematics levels. The highest correlation was observed between Level 2 and Level 3 ($r = 0.81$), followed by Level 3 and Level 4 ($r = 0.79$), and Level 1 and Level 2 ($r = 0.78$). A moderate correlation was observed between Level 1 and Level 4 ($r = 0.58$), indicating that the influence of foundational mathematics achievement gradually decreases as students progress through the curriculum.

These findings confirm that strong performance in foundational mathematics courses contributes significantly to future academic success and support the use of previous mathematics achievement as a predictor variable in AI-based learning analytics models.

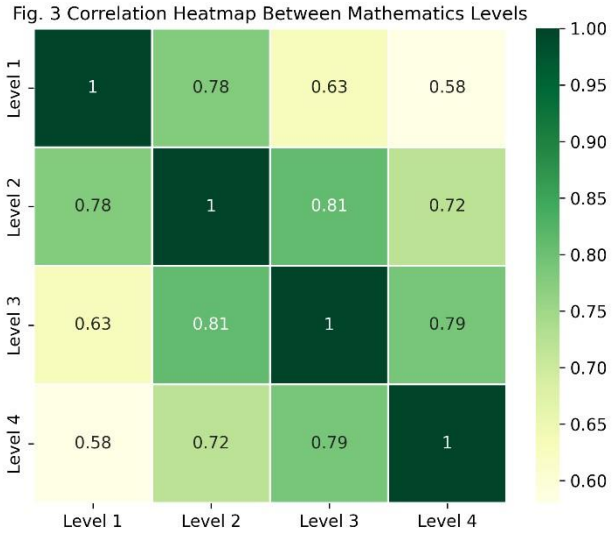

Fig. 3. Correlation Heatmap Between Mathematics Levels

3.3 Influence of Mathematical Misconceptions

The relationship between misconception scores and mathematics performance was examined using the misconception assessment data. As illustrated in Fig. 4, a clear negative relationship exists between misconception scores and academic achievement.

Students with higher misconception scores generally obtained lower grades in mathematics courses. The regression trend indicates that increasing misconceptions are associated with a reduction in overall performance. This finding is consistent with previous research, which identified misconceptions as a major contributor to poor academic outcomes in engineering mathematics.

The results suggest that misconception assessments can serve as valuable early indicators of students who may require additional support, particularly during the initial stages of their academic journey.

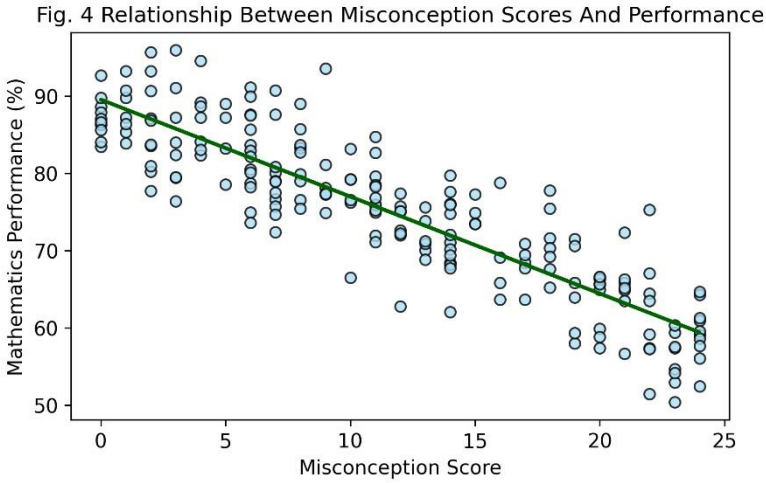

Fig. 4. Relationship Between Misconception Scores and Mathematics Performance

3.4 AI Based Prediction of Student Success

To evaluate the feasibility of early identification of at-risk students, an Artificial Intelligence framework was developed using a synthetic dataset generated from the statistical characteristics observed in the educational data. The generated dataset preserved progression patterns, misconception effects, and course correlations identified in the statistical analysis.

Several machine learning algorithms were evaluated, including Random Forest, Gradient Boosting, XGBoost, and Artificial Neural networks. Among the evaluated models, the Random Forest classifier achieved the highest predictive performance and was selected as the final model.

The confusion matrix of the best performing model is shown in Fig. 5. The model successfully identified the majority of both at risk and non at risk students, demonstrating the potential of AI techniques for supporting academic decision making and intervention planning.

Fig. 5. Confusion Matrix of The Best AI Model

3.5 Feature Importance Analysis

Feature importance analysis was performed to determine the variables contributing most significantly to student success prediction.

Table 1. Relative Importance of Predictive Features

Predictor	Relative Importance (%)
Previous Mathematics Achievement	42
Academic Progression History	25
Misconception Score	18
Semester Indicator	9
Mathematics Level	6

The analysis identified previous mathematics achievement as the most influential predictor, accounting for 42% of the predictive power of the model. Academic progression history and misconception scores were also important contributors. These findings reinforce the importance of foundational mathematics performance and conceptual understanding in determining future academic success.
Overall, the AI model achieved high predictive accuracy and demonstrated the potential of learning analytics for identifying at-risk students before academic difficulties become critical. The integration of mathematics achievement records, progression indicators, and misconception assessments provides a practical foundation for developing intelligent early-warning systems in engineering education.

3.6 Discussion and Conclusion

This study combined statistical analysis and Artificial Intelligence techniques to investigate factors influencing student success in engineering mathematics. The statistical analysis demonstrated that performance in earlier mathematics levels is strongly associated with achievement in subsequent mathematics courses. The positive correlations observed between mathematics levels indicate that foundational mathematical knowledge plays a critical role in supporting future academic progression.
The progression analysis provided an important insight into student learning trajectories. Although some students experienced difficulties in earlier mathematics courses, most improved their performance in subsequent mathematics levels. This finding suggests that poor performance at the beginning of a program does not necessarily predict long-term academic failure and highlights the importance of timely academic support and intervention strategies.
The misconception analysis further revealed that conceptual misunderstandings have a measurable impact on student achievement. Students with higher misconception scores generally obtained lower grades, confirming the importance of identifying and addressing misconceptions during the early stages of learning. As students progressed through the curriculum, the influence of misconceptions appeared

to decrease, suggesting that instructional interventions and learning experiences contribute to conceptual development.
Building upon these statistical findings, the AI-based predictive framework successfully identified students at risk of poor academic performance. Among the evaluated machine learning algorithms, the Random Forest model demonstrated the highest predictive performance. Feature importance analysis revealed that previous mathematics achievement, academic progression history, and misconception scores were the most influential predictors of future success.
The results demonstrate the potential of integrating learning analytics and Artificial Intelligence to support evidence-based decision making in engineering education. The proposed framework provides a practical foundation for developing intelligent early-warning systems capable of identifying at-risk students and enabling targeted interventions that improve student progression, retention, and academic success. Future work will focus on validating the framework using larger multi-institutional datasets and investigating advanced machine learning approaches to further enhance predictive accuracy and educational impact.

Multiculturalism and Social Inclusion

Preschool Teachers' Professional Self-Efficacy in the Context of Linguistic Diversity: A Study from Olomouc

Anna Košatová[1], Eva Šmelová[2], Kateřina Valchářová[3]

[1,2,3]Palacký University Olomouc, Faculty of Education, Czech Republic

Abstract

The growing linguistic diversity in early childhood education places new demands on the professional competencies of preschool teachers, their pedagogical decision-making, and their perceived professional confidence when working with children with a different mother tongue. This paper presents a section of a dissertation research project focused on the professional self-efficacy of preschool teachers in the context of linguistic diversity. The aim of the research was to determine how preschool teachers in Olomouc assessed their own professional self-efficacy when working with children with a different mother tongue, with an emphasis on professional competencies. Theoretically, the article is based on Albert Bandura's social-cognitive concept of self-efficacy, the concept of teacher self-efficacy, and the framework of inclusive and language-aware pedagogy. The research was conducted via an online questionnaire survey. The questionnaire focused on four areas: language support, working with the child's mother tongue, pedagogical practice, and the child's social inclusion. The research sample consisted of 11 respondents from kindergartens in Olomouc. Given the limited size of the research sample, the findings were interpreted descriptively and exploratively. The findings indicated a higher level of professional confidence in the areas of visual communication, everyday pedagogical practice, and the child's social inclusion, while a lower level of self-efficacy was observed in the area of actively working with the child's mother tongue as a pedagogical resource.

Keywords: *self-efficacy; preschool education; different mother tongue; linguistic diversity; inclusive education; research study*

1. Introduction

Linguistic diversity is becoming an increasingly significant pedagogical issue in contemporary early childhood education. Preschools more frequently encounter children whose mother tongue or home language differs from the language of education. This situation affects not only the child's language development, but also adaptation, social inclusion, peer communication, sense of safety and overall participation in the everyday life of the classroom. A child with a different mother tongue should therefore not be viewed only as a child with insufficient knowledge of Czech, but as a child entering a new linguistic, cultural and social environment.

Preschool teachers play a crucial role in this process. Their pedagogical action may significantly influence whether linguistic difference is perceived as an obstacle or as a natural part of a diverse educational environment. At the same time, teachers face a range of specific professional demands: they need to adapt communication, use visual support, create comprehensible learning situations, support peer relationships, cooperate with parents and respond to the child's emotional needs. It is therefore important to examine not only the needs of children with a different mother tongue, but also how teachers perceive their own capacity to manage such situations.

This paper is based on broader doctoral research focused on preschool teachers' professional self-efficacy in the context of linguistic diversity. While the doctoral project is designed within a broader comparative perspective of the Czech Republic and Finland, this paper focuses on a partial quantitative component carried out in Olomouc. The aim of the paper is to present findings on how preschool teachers evaluate their own professional confidence when working with children with a different mother tongue.

2. Theoretical Background

The concept of self-efficacy is grounded in Albert Bandura's social cognitive theory. Self-efficacy refers to an individual's belief in their capacity to organise and execute the actions required to manage specific situations [1]. It is therefore not a general sense of self-confidence, but a context- and task-specific

belief. In the pedagogical environment, this means that a teacher may feel highly confident in one area of her work, such as organising routine activities, but less confident in situations requiring support for a child with a different mother tongue.
Bandura emphasises that self-efficacy influences how people think, act, motivate themselves and cope with challenging situations [1]. A higher level of perceived efficacy supports persistence, willingness to overcome obstacles and the ability to perceive difficult tasks as challenges. Conversely, lower self-efficacy may lead to avoidance of demanding situations or to giving up more quickly when difficulties arise. In the context of working with children with a different mother tongue, the concept is particularly relevant because teachers often act in situations requiring pedagogical flexibility, non-verbal support, visualisation, cooperation with the family and sensitive work with the group.
In the teaching profession, the term teacher self-efficacy is used to describe teachers' beliefs in their ability to support children's learning and engagement, including in pedagogically demanding situations [2]. Tschannen-Moran and Woolfolk Hoy also point out that teacher self-efficacy is associated with persistence, professional commitment, organisation of pedagogical work, openness to new methods and teachers' classroom behaviour [2]. In relation to linguistic diversity, it is therefore important to ask whether teachers feel able to seek and use strategies that enable a child with a different mother tongue to understand, participate and experience success.
An important framework for measuring teacher efficacy in inclusive education is the Teacher Efficacy for Inclusive Practices scale (TEIP). Sharma, Loreman and Forlin developed an 18-item instrument measuring teachers' perceived efficacy in implementing inclusive practices [3]. The original scale distinguishes three areas: efficacy in inclusive instruction, efficacy in collaboration and efficacy in managing behaviour [3]. This framework is relevant to the present research because work with a child with a different mother tongue also requires specific inclusive strategies, cooperation and pedagogical decision-making in everyday situations.
In the Czech preschool context, a child with a different mother tongue is a child whose first language differs from the language of education. This may include a child with a migration background, a child from a multilingual family or a child with insufficient knowledge of Czech for full participation in educational situations. Specialists point to difficulties that these children may face in preschools, particularly in understanding a new environment and in communicating with teachers and peers [4]. Support for the child is connected with the acquisition of Czech, gradual adaptation, meeting the need for safety, socialisation and close cooperation between the family and the school [4].
Language-aware pedagogy is another important concept for working with linguistically diverse groups. It is based on the assumption that language is present in all areas of learning and that every teacher participates in supporting the child's language development. Research by Alisaari et al. shows that teachers may hold generally positive attitudes towards multilingualism, yet may not always understand children's mother tongues as an active resource for learning [5]. The authors draw attention to persistent monolingual assumptions and the need for professional development in linguistically responsive strategies [5]. An inspirational framework in this respect is provided by the Finnish National Core Curriculum for Early Childhood Education and Care, which emphasises cultural diversity and language awareness as part of the educational culture [6].
In the Czech context, work with language, communication, adaptation and social inclusion is a natural part of early childhood education. The Framework Educational Programme for Preschool Education defines the basic principles, conditions and rules for institutional education of preschool-aged children [7]. For work with children with a different mother tongue, areas connected with language and speech, socialisation, cultural awareness, cooperation with the family and the creation of conditions for individualised support are particularly significant.

3. Research Aim and Research Questions

The aim of the research study was to examine how preschool teachers in Olomouc perceived their own professional self-efficacy when working with children with a different mother tongue and to identify the areas in which they felt more or less professionally confident.
This aim was formulated in the context of the concept of self-efficacy, grounded in Albert Bandura's social cognitive theory, according to which an individual's beliefs about their own capabilities significantly influence motivation, action, persistence and coping with challenging situations. In pedagogical practice, the level of teachers' professional self-efficacy may influence their approach to working with children with a different mother tongue, their choice of pedagogical strategies and their ability to respond to these children's specific educational needs.

3.1 Research Problem

Are preschool teachers equipped with the professional competences necessary for working with children with a different mother tongue?

3.2 Main Research Question

How do preschool teachers in Olomouc perceive their own professional self-efficacy when working with children with a different mother tongue?

3.3 Specific Research Questions

1. In which areas of work with children with a different mother tongue do teachers feel most professionally confident?
2. In which areas do teachers experience the lowest level of professional confidence?
3. What factors, according to teachers, influence their professional self-efficacy when working with children with a different mother tongue?
4. How do teachers evaluate their preparedness for working with children with a different mother tongue?

4. Methodology

The research study was exploratory in character. Its aim was not to statistically generalise the results to the population of preschool teachers, but to provide an initial insight into perceived professional self-efficacy in a specific local context. Methodologically, it was a questionnaire survey, and the data were analysed using descriptive statistics. Such an approach is appropriate in pedagogical research particularly for the basic description of the research sample and for initial orientation within the studied phenomenon [8], [9].

The research sample consisted of 11 teachers from selected preschools in Olomouc. The selection was based on criterion sampling. The inclusion criteria were: qualification in preschool pedagogy, experience of working with children with a different mother tongue or knowledge of the issue, and employment in a preschool in Olomouc. All included respondents corresponded to the geographical delimitation of the study. Participation was voluntary and anonymous; the results were presented only in aggregated form.

The respondents ranged in age from 21 to 53 years, with a mean age of 32.4 years. Eight respondents worked in public preschools and three in private preschools. In terms of length of teaching experience, both beginning teachers and teachers with longer professional experience were represented. Four respondents reported 0-3 years of experience, four reported 4-10 years, two reported 11-22 years and one reported 21 years or more. Nine respondents reported current experience with a child or children with a different mother tongue in their classroom, while two respondents did not currently have a child with a different mother tongue in their class.

In terms of previous preparation for working with children with a different mother tongue, five respondents stated that they had not completed any training. Two respondents reported self-study, two reported a one-off training course or seminar, one respondent reported training as part of university studies and one reported a combination of several forms of education. The characteristics of the sample therefore indicate diversity in both professional education and teachers' experience.

This text represents a partial output of the doctoral project. The research will subsequently be expanded within the Czech Republic, and the collected data will be compared with research being prepared in Finland.

Table 1. Characteristics of the Research Sample

Characteristic	Result
Number of respondents	11
Age of respondents	21-53 years
Mean age	32.4 years
Public preschool	8
Private preschool	3
Currently has a child/children with a different mother tongue in the class	9
Does not currently have a child/children with a different mother tongue in the class	2
No completed training related to children with a different mother tongue	5
Self-study	2

Characteristic	Result
One-off training course/seminar	2
Training as part of university studies	1
Combination of several forms of education	1

4.1 Research Instrument

The questionnaire was created as an author-adapted research instrument based on the theoretical framework of teacher self-efficacy, inclusive pedagogy and language-aware pedagogy. Its construction was inspired, among other sources, by the Teacher Efficacy for Inclusive Practices scale, which focuses on teacher efficacy in inclusive instruction, collaboration and classroom management [3]. The questionnaire items were adapted to the specific conditions of preschool education for children with a different mother tongue.

The questionnaire included items focusing on respondents' basic characteristics, experience with children with a different mother tongue, completed training in this area, perceived support from the school and professional self-efficacy when working with children with a different mother tongue. The core of the questionnaire consisted of items rated on a six-point scale, where 1 indicated the lowest level of professional confidence and 6 the highest. The items were thematically divided into four areas: language support, work with the child's mother tongue, pedagogical practice and social inclusion.

Given the size of the research sample, neither factor analysis nor testing of the internal consistency of individual scales was conducted. The data were analysed using descriptive statistics, particularly means, medians, minimum and maximum values. An open-ended question was used as an additional orientating source for interpreting the quantitative findings. Before the analysis, the completeness and factual correctness of the responses were checked.

5. Analysis, Evaluation and Interpretation of Data

Given the size of the research sample, the results were interpreted descriptively. The aim was not to test statistically significant relationships between variables, but to obtain an overview of how preschool teachers in Olomouc evaluated their professional self-efficacy when working with children with a different mother tongue.

The core of the questionnaire consisted of items focused on four thematic areas of professional self-efficacy: language support, work with the child's mother tongue, pedagogical practice and social inclusion. Respondents rated individual items on a six-point scale, where 1 indicated the lowest level of professional confidence and 6 the highest. The overall mean score across all items was 4.23, indicating a rather higher level of perceived professional confidence. However, the results differed substantially across the individual areas.

The highest mean scores were found in the areas of language support, social inclusion and pedagogical practice. By contrast, considerably lower scores appeared in the area of working with the child's mother tongue. This difference suggested that the respondents felt relatively more confident in common pedagogical strategies, visual support, adapting communication and supporting social inclusion, but less confident in actively using the child's mother tongue as a pedagogical resource.

Table 2. Descriptive Statistics of Professional Self-Efficacy by Thematic Area

Area	Mean score	Median	Min.-max.
Language support	4.71	4.40	3.60-5.80
Social inclusion	4.69	4.60	3.80-6.00
Pedagogical practice	4.53	4.40	3.40-5.60
Child's mother tongue	2.98	3.00	1.40-5.60

In the area of language support, respondents achieved the highest mean score of all the observed areas. The highest confidence was reported for the item concerning the use of gestures, pictures or visual demonstrations to support understanding. The mean score for this item was 5.09. Relatively high values were also recorded for the ability to support a child with a different mother tongue in understanding everyday situations in preschool and for the ability to recognise that a child does not understand because of a language barrier.

In the area of pedagogical practice, the mean score was 4.53. Respondents felt most confident in using strategies that support children with a different mother tongue, such as repetition, visualisation and cooperation among children. High scores also appeared for the ability to involve children with different

levels of language skills in joint activities. A slightly lower, though still positive, evaluation was recorded for the ability to adapt the educational offer so that a child with a different mother tongue can participate. In the area of social inclusion, the mean score was 4.69, the second highest of the observed areas. The highest rating appeared for the item "I can help a child feel safe in the classroom despite a language barrier", where the mean reached 5.00. Respondents also rated relatively highly their ability to recognise the child's emotional needs related to the language barrier, involve the child in play and prevent exclusion from the group.

At the level of thematic areas, the lowest mean score was identified in the area of working with the child's mother tongue (M = 2.98). This value was substantially lower than the mean scores recorded in the other observed areas. At the level of individual items, the lowest mean values within this area were found for the items "I can support the development of the child's mother tongue while the child is learning Czech" (M = 2.55) and "I can support the child in using their mother tongue in natural situations" (M = 2.64). The item "I can use the child's mother tongue as support for learning, even if I do not speak the language myself" reached a mean score of 2.82. Therefore, the value 2.98 refers to the overall thematic area, whereas the lower values refer to individual questionnaire items.

Table 3. Highest and Lowest Rated Items

Item	Area	Mean score
I can use gestures, pictures or visual demonstrations to support understanding	Language support	5.09
I can help a child feel safe in the classroom despite a language barrier	Social inclusion	5.00
I can support a child with a different mother tongue in understanding everyday situations in preschool	Language support	4.82
I can use strategies that support children with a different mother tongue	Pedagogical practice	4.73
I can support the development of the child's mother tongue while the child is learning Czech	Child's mother tongue	2.55
I can support the child in using their mother tongue in natural situations	Child's mother tongue	2.64
I can use the child's mother tongue as support for learning, even if I do not speak the language myself	Child's mother tongue	2.82

The supplementary open-ended question focused on what helped respondents most when working with children with a different mother tongue. Due to the scope of the study, the responses were not subjected to full qualitative analysis, but they were used as an orientating complement to the quantitative findings. The most frequent themes were visualisation, picture material, gestures, repetition, an individual approach, a safe environment, cooperation with parents and support from another person. Respondents mentioned, for example, pictures, cards, visual aids, a translator, repetition, gestures, cooperative parents and a kind relationship built gradually with the child.

The open-ended responses provided additional support for the quantitative findings. Teachers most often reported practical and situationally usable strategies that help the child understand the environment and participate in activities. Work with the child's mother tongue as a systematic part of pedagogical support appeared less frequently in the responses. This finding is consistent with the lower score in the area focused on the child's mother tongue.

Overall, the findings indicated that respondents showed a rather higher level of professional self-efficacy in areas connected with everyday pedagogical practice, visual communication and support for social inclusion. By contrast, working with the child's mother tongue appeared to be a weaker area, especially its active use as a support for learning and the simultaneous development of the mother tongue and Czech.

6. Discussion

The findings should be interpreted with regard to the exploratory character of the study and the limited size of the research sample. On the basis of teachers' self-evaluation in selected preschools, it can be stated that there was a difference between relatively higher professional confidence in visual communication, pedagogical organisation and the child's social inclusion, and lower confidence in actively working with the child's mother tongue.

This result corresponds to the theoretical assumption that self-efficacy is a context- and task-specific construct. A teacher may feel competent in routine pedagogical situations, but less confident in tasks

requiring specific knowledge and strategies. In the case of children with a different mother tongue, professional confidence may therefore relate not only to a general ability to support the child, but also to specific areas such as working with linguistic diversity, using the child's mother tongue, communicating with parents or consciously supporting the child's multilingual identity.
The finding that teachers felt most confident in using gestures, pictures, visual demonstrations and other situational supports may be understood as a reflection of the nature of early childhood education. Pedagogical work in preschool is naturally based on activity, play, repetition, routines and immediate interaction. These elements may provide teachers with relatively accessible strategies for supporting children who do not yet fully understand the language of education.
Similarly, the higher mean score in the area of social inclusion indicated that respondents perceived the support of safety, relationships and participation in play as an area they could influence pedagogically. This aspect is essential in early childhood education because a sense of safety and the opportunity to establish peer relationships create conditions for further learning, communication and language development.
However, the lowest level of self-efficacy in the area of working with the child's mother tongue indicated, within the selected sample, the need to strengthen further education in this area. The results of self-evaluation suggested that teachers' intuition may play an important role, but that it should be supported by professional knowledge. The findings indicated that teachers may find it difficult to imagine how the child's mother tongue can be used as a pedagogical resource, especially if they do not speak the language themselves. This is consistent with international research showing that teachers may hold generally positive attitudes towards multilingualism, but may not always actively use children's home languages as part of the educational process [5].
The data also suggested that teachers' knowledge of a foreign language did not necessarily have to be the only or main prerequisite for professional confidence when working with children with a different mother tongue. More important is the ability to create a comprehensible, safe and inclusive environment, work with non-verbal and visual support, support peer relationships and cooperate with the family. Nevertheless, the question remains how to help teachers move beyond compensatory strategies and develop approaches that understand the child's mother tongue as part of their identity and as a potential resource for learning.
From a methodological perspective, the adapted questionnaire appeared to be a suitable research instrument for broader use in subsequent phases of the research. The thematic division into language support, the child's mother tongue, pedagogical practice and social inclusion made it possible to capture differences between individual areas of professional self-efficacy. The area of working with the child's mother tongue proved to be particularly research-sensitive, as it clearly differed from the other areas by a lower level of declared professional confidence.

7. Limitations of the Research Study

The main limitation of the study was the small number of respondents in connection with the local delimitation of the research. The results therefore cannot be generalised to the population of preschool teachers in the Czech Republic, but can only be related to teachers from selected preschools in Olomouc. The findings had the character of a partial empirical insight that directs subsequent phases of the research. In a follow-up study, it will be necessary to expand the research sample so that the collected data have greater explanatory value for the field of early childhood education in the Czech Republic.
Another limitation was that the data were based on respondents' self-evaluation. Declared professional confidence may not always correspond to actual pedagogical action in specific situations. Responses may have been influenced by respondents' current experience with children with a different mother tongue, the level of support in the school, previous training and subjective perceptions of their professional role. In the next phase of the research, it therefore appears appropriate to supplement the quantitative data with qualitative procedures enabling a deeper understanding of the perspectives of teachers, families and children themselves.

8. Conclusion

This paper presented the results of an exploratory study focused on preschool teachers' professional self-efficacy when working with children with a different mother tongue. The findings showed that respondents in the research sample demonstrated a rather higher level of professional confidence in the areas of language support, everyday pedagogical practice and the child's social inclusion. The

highest values appeared for items connected with the use of gestures, pictures, visual demonstrations and support for the child's sense of safety in the classroom.
By contrast, the lowest level of professional confidence was identified in the area of working with the child's mother tongue. This result suggested that teachers may be able to support a child with a different mother tongue through visual, social and organisational strategies, but feel less confident in actively using the child's mother tongue as a pedagogical resource. This area therefore appears to be an important space for further methodological support, professional education and the development of language-aware pedagogy in preschools.
The significance of the study lies primarily in capturing a partial picture of preschool teachers' professional self-efficacy in a selected region and in identifying areas that may be significant for subsequent phases of the doctoral research. The findings provide a basis for expanding the research to a broader sample of respondents and for supplementing the research with additional instruments, particularly interviews and observation.

Adult Education, Social Selectivity and Inclusion: Evidence from Slovenia and Implications for Deinstitutionalisation

Abstract

Adult education is widely promoted as a driver of personal development, social mobility and labour-market adaptability; however, participation in lifelong education and learning remains uneven. This paper examines factors associated with participation in formal and non-formal adult education in Slovenia, with a focus on social inclusion and barriers affecting disadvantaged groups. Using Labour Force Survey (LFS) data and binary logistic regression, we test how individual, educational, occupational and spatial characteristics predict participation. The results show marked social selectivity: women participate more than men; participation decreases with age; and people with higher educational attainment participate substantially more. Participation is also higher among those in managerial roles or on fixed-term contracts, while people born abroad and those living outside large cities are less likely to participate. Descriptive evidence additionally indicates a substantial participation gap by disability status. Building on these findings, we discuss a possible intersectoral approach to inclusion in the context of deinstitutionalisation in Slovenia, focusing on how existing community-learning infrastructures, such as SIAE Study Circles and selected programmes delivered by adult education centres (Folk high schools), could support participation in community life. Because outcomes are not yet known, this approach is presented as a practice-based proposal that would require monitoring and evaluation during any future implementation. A compassion-centred lens (awareness, compassion, loving-kindness and wisdom) is proposed as an enabling condition for sustainable cross-sector cooperation between social protection, adult education and local communities.
Keywords: adult education; participation inequalities; inclusion; deinstitutionalisation; people with disabilities; cross-sector cooperation

1. Introduction

Adult education and lifelong learning are widely promoted as pathways to personal development, employability and social inclusion. However, participation remains unequally distributed across social groups. The core policy challenge is therefore not only how much adults learn, but who participates and who is systematically left out.

Participation in education tends to follow identifiable social patterns: it often reflects accumulated advantages in cultural and social capital, confidence in navigating institutions and the ability to convert resources into learning opportunities. From this perspective, adult education can function as a selective field, reproducing inequalities unless compensatory mechanisms reduce barriers for those with fewer resources [1]. Participation in adult education is also shaped by barriers and constrained choices ("bounded agency") embedded in welfare regimes and social contexts [2-4]. This means that participation is not only a question of personal motivation. People who already have more education, support, information and confidence are more likely to use learning opportunities, while those with fewer resources may remain excluded because of practical, social or institutional barriers.

To examine participation inequalities empirically, we analyse Slovenian Labour Force Survey / Survey on Active and Inactive Population (LFS/ANP) data using binary logistic regression. We model how individual (gender, age), educational, occupational and spatial characteristics jointly shape the probability of participation in formal or non-formal education during the four weeks preceding the survey [5].

A critical extension of this discussion concerns people with disabilities. Lower participation in adult education is not only an educational outcome; it can also signal weaker access to social networks, community routines and low-threshold public spaces where belonging is built. This is especially relevant

when disability intersects with other exclusion risks such as lower education, rural residence or being born abroad.
Participation inequalities acquire additional urgency in Slovenia's ongoing deinstitutionalisation. The national strategy aims to support transitions from institutional care to community living while strengthening community support structures and preventing new institutional placements [6]. International guidance emphasizes that relocation alone is insufficient: inclusion requires access to mainstream services and facilities, including education, culture and leisure, on an equal basis with others [7-8].
In practical terms, successful community living requires more than housing and formal support. People transitioning from institutional settings often need meaningful activities, opportunities for social learning and accessible entry points into local community life. Instead of creating parallel programmes from scratch, we discuss a possible practice-based link between adult education and deinstitutionalisation, focusing on how existing community-learning structures, particularly SIAE Study Circles and selected programmes delivered by adult education centres (Folk high schools), could support meaningful participation in community life [9]. As outcomes are not yet known, this approach is presented as a feasible option to be monitored and evaluated during any future implementation. The partnership behind this paper reflects the idea that inclusion requires both evidence and the conditions that make practice possible. SIAE contributes the empirical adult-education research presented in this paper, together with trusted community-learning infrastructure through Study Circles. IRSSV brings knowledge of deinstitutionalisation and community-based support. The Inner Peace Institute contributes NGO-based facilitation approaches grounded in the contemplative tradition described by Dahl and Yongey Mingyur Rinpoche, where awareness, compassion, loving-kindness and wisdom are understood as trainable capacities for reducing harm and cultivating prosocial action [10-11]. These capacities are increasingly relevant in civil-society practice, where inclusion depends not only on services and structures, but also on the quality of relationships, attention and presence. Conceptually, we therefore treat inclusion as more than service coordination: it requires recognition of interdependence and an orientation toward the common good, understood as promoting 'good for all' and reducing harm. This brings into the discussion an often-overlooked dimension of inclusive practice: the inner conditions through which people, professionals and communities, become able to meet one another differently. Slovene educational scholarship similarly frames education as formation for responsible action and belonging, not only as measurable performance, especially in times of disruption [12-13]. Ethical codes in education emphasize respect, dignity and non-harm as professional obligations, resonating with the need for non-judgmental facilitation when people rebuild community life after institutionalisation [14-15]. Reflections on "overlooked time" further highlight patience and slowness as resources for learning and relationship-building [16]. Building on these perspectives, a compassion-centred lens is introduced as an enabling condition for sustained cross-sector cooperation and for the gradual transformation of institutional habits into relations of trust, participation and shared community life [10-11,17].
Objectives of the paper are to: (1) test whether participation in adult education in Slovenia can be predicted from individual, educational, occupational and spatial characteristics using LFS/ANP data and binary logistic regression; (2) demonstrate social selectivity of participation by identifying groups with systematically lower participation; and (3) discuss implications for inclusion of people with disabilities in the deinstitutionalisation process and outline a possible intersectoral approach to inclusion that draws on SIAE Study Circles as community-learning infrastructure and would require monitoring and evaluation during any future implementation.

2. Data and Methods

The paper adopts a combined methodological approach. The quantitative part analyses Labour Force Survey / Survey on Active and Inactive Population data using binary logistic regression to identify social patterns in participation in adult education. The second part is practice-based and conceptual rather than evaluative. It uses the empirical findings as a starting point for discussing why participation inequalities matter in the context of deinstitutionalisation, what deinstitutionalisation means and does not mean, and how existing community-learning infrastructures could support inclusion in community life. This design enables the paper to connect statistical evidence on unequal participation with a broader discussion of community living, access to mainstream services and the conditions needed for inclusive practice.

2.1 Data Source and Sampling

The empirical analysis is based on secondary data from the Survey on Active and Inactive Population (ANP), which in Slovenia is conducted in accordance with the harmonized methodology of the European Labour Force Survey (LFS). The sampling design is stratified, and data is collected using standardized procedures, ensuring comparability across EU Member States. For the purposes of this analysis, the analytical sample was restricted to the adult population aged 25 to 64. For model estimation, age groups include 15–24 as the reference category; therefore, the logistic regression uses the full 15–64 dataset, while descriptive indicators follow standard EU reporting for ages 25–64.
Participation in education is measured using the standard LFS indicator, which includes involvement in formal or non-formal education during the four weeks preceding the survey. The analytical sample does not include individuals living in institutional settings, as these are not covered by the survey sampling frame.

2.2 Operationalisation of Variables and Analytical Approach

The dependent variable is participation in adult education, operationalised as a binary variable distinguishing between individuals who participated in formal and/or non-formal education during the reference period (1 = participates) and those who did not (0 = does not participate). This operationalisation allows for direct modelling of the likelihood of participation in adult education.
Independent variables are selected based on prior empirical and theoretical research on social selectivity in adult education and include gender, age groups, educational attainment, country of birth, labour market status, type of employment, managerial role, and degree of urbanisation.
Where available, indicators of disability-related status are also considered descriptively as an additional dimension relevant for understanding risks of exclusion, particularly in the context of disability and deinstitutionalisation, although they are not included as a central component of the regression model.
The analysis combines descriptive and inferential statistical approaches. First, descriptive statistics are used to present basic patterns of participation. This is followed by binary logistic regression to model the probability of participation in adult education. Results are reported using regression coefficients (B), standard errors, Wald statistics, significance levels (p-values), and odds ratios (Exp(B)), allowing for substantive interpretation in terms of relative likelihoods of participation.
The model is statistically significant (χ^2 (12) = 2508.36, $p < .001$), indicating that the set of predictor variables reliably distinguishes between participants and non-participants. The explanatory power of the model is moderate, with Cox & Snell $R^2 = .127$ and Nagelkerke $R^2 = .187$.
The working-age sample (15–64) includes 30,041 respondents, while the standard EU benchmark sample (25–64) includes 24,784 respondents. The logistic regression model was estimated on the full 15–64 sample to retain the reference group aged 15–24 (often in initial education) and to illustrate the benchmark gap between those in regular education and adults; interpretive emphasis, however, is placed on the adult population.

2.3 Linking Participation Inequalities to Deinstitutionalisation

In addition to the quantitative analysis, the paper includes a practice-based and conceptual component that links the findings on participation inequalities to the context of deinstitutionalisation in Slovenia. This component does not evaluate an existing intervention and does not claim proven effectiveness. Rather, it discusses how the observed patterns of unequal participation may become relevant for people transitioning from institutional care to community living.
The discussion first clarifies deinstitutionalisation as more than relocation from institutions to smaller settings. It understands deinstitutionalisation as a broader transformation that requires access to ordinary community life, mainstream services, meaningful activities, social relationships and opportunities for participation. On this basis, the paper considers how existing adult-education and community-learning structures, particularly SIAE Study Circles and selected programmes delivered by adult education centres (Folk high schools), could serve as accessible entry points into local community life.
Methodologically, this component serves as an applied bridge between empirical findings and practice. The regression results identify groups at higher risk of non-participation, while the deinstitutionalisation discussion shows why such patterns matter for inclusive community living. Any practical use of these ideas would need to be monitored and evaluated during future implementation.

2.4 Limitations

The study does not include individuals living in institutional settings, which limits the direct empirical analysis of populations central to deinstitutionalisation processes. The practice-based component represents a conceptual and practice-oriented extension of the empirical findings. It is understood as a possible approach for further development, whose outcomes would need to be monitored and evaluated, rather than as an empirically validated solution. A further limitation is that the headline participation indicator is reported for ages 25–64, whereas the regression model includes ages 15–64 in order to retain the 15–24 reference category; this choice should be considered when interpreting age effects.

3. Results

3.1 Descriptive Patterns

Slovenia recorded a relatively high participation rate in adult education in 2024, with 23.1% of adults aged 25–64 engaged in formal or non-formal learning activities [5]. This places the country well above the EU-27 average (13.5%) and among the better-performing European systems. At an aggregate level, this suggests a comparatively strong foundation for lifelong learning.

However, aggregate performance masks substantial inequalities. Nearly 80% of adults did not participate in education or training during the observed period, indicating uneven access and engagement. Moreover, Slovenia still lags leading Nordic countries, where participation is both higher and more systematically embedded in institutional frameworks. This suggests that participation remains unevenly distributed and partly dependent on short-term or project-based initiatives rather than a fully consolidated lifelong learning system.

Descriptive patterns further indicate variation across key socio-demographic and structural characteristics, including age, education, labour market position, and place of residence, pointing to the presence of systematic participation gradients.

3.2 Main Logistic Regression Model

To examine these patterns more systematically, a binary logistic regression model was estimated to identify predictors of participation in adult education. The dependent variable captures participation in formal or non-formal education, while independent variables include gender, age, education, country of birth, employment characteristics, degree of urbanisation, and managerial responsibility.

Table 1. Logistic Regression Results

Predictor	B	SE	Wald χ^2	df	p	OR
Gender						
Female (ref. male)	0.221	0.037	34.81	1	< .001	1.25
Age (ref. 15–24)						
25–34	-1.336	0.074	325.70	1	< .001	0.26
35–44	-1.561	0.076	426.16	1	< .001	0.21
45–54	-1.637	0.075	481.69	1	< .001	0.20
55–64	-1.910	0.081	562.46	1	< .001	0.15
Education (ref. less than secondary)						
Secondary	0.439	0.096	21.12	1	< .001	1.55
Tertiary	1.390	0.098	202.33	1	< .001	4.02
Country of birth						
Born abroad (ref. Slovenia)	-0.496	0.069	52.17	1	< .001	0.61
Employment status						
Fixed-term (ref. permanent)	1.104	0.059	345.45	1	< .001	3.02
Degree of urbanization (ref. large city)						
Small town	-0.294	0.050	34.76	1	< .001	0.75
Rural area	-0.236	0.048	23.85	1	< .001	0.79

Predictor	B	SE	Wald χ^2	df	p	OR
Managerial responsibility						
No managerial duties (ref. managerial role)	-0.291	0.045	41.85	1	< .001	0.75
Constant	-0.578	0.116	24.65	1	< .001	0.56

Note. OR = odds ratio (Exp(B)). Reference categories are shown in parentheses. All p-values are based on Wald tests.

The model confirms that all included predictors are statistically significant ($p < .001$), indicating that participation is strongly structured by socio-demographic and labour-market factors.
Age emerges as the most pronounced predictor. Because the 15–24 reference group includes many individuals in initial education, this comparison should be read as a benchmark; within the adult population (25–64), participation still declines with age. Compared to the youngest group (15–24), the odds of participation decline sharply across all older age groups (OR = 0.26 to 0.15), reflecting a clear life-course gradient. Educational attainment is another key determinant: individuals with secondary education are more likely to participate than those with lower education (OR = 1.55), while tertiary-educated individuals exhibit substantially higher odds (OR = 4.02), indicating cumulative advantage in access to learning.
Gender differences are present but more moderate, with women showing slightly higher odds of participation than men (OR = 1.25). Being born abroad is associated with lower participation (OR = 0.61), suggesting structural barriers linked to migration background.
Labour-market characteristics further reinforce these patterns. Individuals with fixed-term contracts are significantly more likely to participate than those with permanent employment (OR = 3.02), which may reflect activation mechanisms or employment-related incentives. In contrast, individuals without managerial responsibilities show lower participation (OR = 0.75), pointing to the role of workplace context and job complexity.
Spatial disparities are also evident. Compared to residents of large cities, individuals living in small towns (OR = 0.75) and rural areas (OR = 0.79) have lower odds of participation, indicating the importance of local availability and accessibility of learning opportunities.
Overall, the model demonstrates that participation in adult education is not randomly distributed but follows clear structural patterns that reflect accumulated advantages and constraints.

3.3 Disability-related Participation Gap

Although disability is not included as a central predictor in the regression model, descriptive evidence reveals a strong participation gradient by level of disability. Adults without disabilities participate at a rate of 24.6%, compared to 13.4% among those with moderate limitations and only 6.7% among those with severe disabilities. The combined participation rate for people with disabilities is 11.3%, indicating substantially reduced access to learning opportunities.

3.4 Deinstitutionalisation: From Relocation to Community Participation

Building on the disability-related participation gap identified in the previous section, we now turn to deinstitutionalisation as a reform context and a possible response to exclusion. This section explains what deinstitutionalisation is, what it is not, and why it matters for participation in adult education and community learning. Table 2 provides a concise distinction between genuine deinstitutionalisation and practices that may only relocate or resize institutional care. The key message is that deinstitutionalisation requires choice, control, ordinary housing and stable support in the community. Without these elements, people may remain subject to institutional rules, transinstitutionalisation or reinstitutionalisation, even if they no longer live in a large institution.

Table 2. What deinstitutionalisation is and is not

Deinstitutionalisation IS	Deinstitutionalisation IS NOT
Choice and control over where and with whom a person lives, and support shaped around the person.	Living in group settings where people must adapt to organizational rules and do not control everyday life.
Closing or transforming institutions while developing diverse community-based supports in parallel.	Downsizing or renovating institutions without building accessible and sustainable community supports.
Moving people to ordinary homes and ensuring home- and community-based support.	Transinstitutionalisation (moving from one institution to another, including smaller institutional units).
Stable, sufficient support in the community regardless of changes in support needs.	Reinstitutionalisation (return to institutional care due to lack of support in the community).

Note. Adapted from the IRSSV guidebook on deinstitutionalisation [20].

Deinstitutionalisation is not simply a matter of moving people from institutions to smaller residential settings. It is a long-term reform process that seeks to reduce and close institutional living arrangements while developing diverse community-based support. It also requires continuous reflection on power relations and everyday practices, rather than a one-off organisational reform [18]. A key risk is that institutional culture and control practices can be reproduced in smaller community settings if institutional space remains available as a fallback. This may undermine genuine community participation and learning [18]. Within Slovenia's current reform agenda, this underscores the need to link transitions to community living with inclusive, low-threshold adult-learning and community-learning opportunities, consistent with the national strategy and human-rights guidance on access to mainstream services and facilities [6-8,17].

Across Europe, deinstitutionalisation has been pursued for decades. Complete closures of large institutions have been achieved in several settings (e.g., Trieste/Italy, Stockholm/Sweden, Scotland and Ireland), illustrating both feasibility and the time and coordination required to shift resources from institutional care to community-based support [19]. The Slovenian guidebook on deinstitutionalisation emphasizes that even when material conditions improve, institutional life remains inherently segregating: people have limited choice over where and with whom they live, daily routines are governed by organizational rules, and everyday contact with community life is constrained, resulting in a loss of ordinary life and dignity for people who have committed no offence [20].

Successful transitions therefore depend on meaningful participation in everyday community spaces, education, culture, leisure and civic life, supported by accessible, low-threshold opportunities and relationship-building [8,17,20]. In terms of adult education, community-learning formats such as Study Circles can provide structured social learning, trusted local networks and purposeful roles, helping to rebuild social ties after long periods of institutionalisation and reducing the risk of isolation or reinstitutionalisation [9,20].

4. Discussion

The results highlight social selectivity in adult education participation in Slovenia: participation is patterned by education, age, migration background, labour-market context and urbanisation. Descriptive disability-related findings show that adults with disabilities participate much less often in education. In line with the bounded agency perspective and research on participation in adult learning, adult education can reinforce cumulative advantage unless barriers are actively reduced and participation is supported for those with fewer resources [2-4]. This is also consistent with Bourdieu accounts of unequal distributions of cultural and social capital and their reproduction through education [1].

Beyond the strongest gradients by education and age, several predictors suggest where inclusion efforts may need additional practical scaffolding. Women show slightly higher participation than men, while people born abroad participate less, which may signal persistent barriers related to language, recognition of prior learning, institutional trust and social networks [2-4]. Workplace context also matters, participation is higher among those on fixed-term contracts and lower among those without managerial responsibilities, implying that training can be driven by employment-related incentives and organizational roles rather than by stable, self-directed learning opportunities [2-4]. Finally, lower participation in small towns and rural areas points to uneven local availability and accessibility of learning opportunities [2-4]. Although disability is not included as a predictor in the regression model due to the limited number of respondents with disabilities included in the sample, descriptive data show a pronounced participation gap, with adults with severe disabilities being the least likely to participate in education.

In the context of deinstitutionalisation, these patterns are particularly relevant. Many people transitioning to community living will not benefit from workplace-based training incentives. Some may also move to smaller local environments where formal learning opportunities are less available. This strengthens the case for low-threshold, locally embedded community-learning formats and supported entry points into existing networks.

For people with disabilities, the descriptive participation gap suggests that barriers in accessibility, adapted provision and supportive facilitation remain substantial. This matters for inclusion policy because participation in community learning can provide not only skills but also structured routines, peer contact and access to local networks, elements that are central to community belonging. [5]

In the context of deinstitutionalisation, these inequalities are especially salient. Slovenia's strategy anticipates transitions from institutional care to community living and emphasizes the need for strengthened community support and inclusive community development [6]. Human-rights guidance further stresses that reforms must ensure access to mainstream services and facilities and involve cross-sector measures and attitudinal change [7-8]. Adult education and community learning can therefore be treated as part of inclusion infrastructure rather than as an optional add-on.

Accordingly, we discuss a possible intersectoral approach to inclusion that draws on SIAE Study Circles as existing community-learning infrastructure, together with selected programmes delivered by adult education centres (Folk high schools). This approach is not presented as a proven model for deinstitutionalisation. Instead, it is framed as a feasible practice-based proposal whose outcomes should be monitored and evaluated during any future implementation. Feasible monitoring indicators include: (1) participation and retention (attendance across sessions), (2) participant-reported belonging and satisfaction, (3) growth of social contacts and community participation, (4) facilitator observations on accessibility and support needs, and (5) cross-sector coordination routines (referrals, feedback loops, local partner engagement).

Finally, the transition from institutional to community-based living is also a cultural transition. Building on contemplative scholarship that frames awareness, compassion, loving-kindness and wisdom as trainable capacities supporting prosocial action and reducing harm [10-11], we introduce a compassion-centred lens as an enabling condition for sustained cross-sector cooperation and for supporting culture change during transitions. This aligns with educational scholarship that re-centres the ethical purpose of education and views learning as relational and community-forming, especially in times of disruption [12-13], and with ethical codes that foreground dignity, non-harm and responsibility in educational practice [14-15]. Alongside these capacities, attention to time and relational facilitation can be treated as practical conditions for inclusive community learning and partnership work [16].

Limitations include the use of LFS data that does not cover people living in institutions and limited space for full model specification. Future work should therefore evaluate this possible approach through mixed-method monitoring (quantitative participation and inclusion indicators plus qualitative feedback from participants, facilitators and local partners).

5. Conclusion

Adult education participation in Slovenia is socially selective and predictably patterned by education, age and place. The participation gap by disability status indicates substantial barriers in mainstream learning opportunities. In the context of deinstitutionalisation, we therefore discuss a possible intersectoral approach to inclusion that draws on SIAE Study Circles as existing community-learning infrastructure, with outcomes to be monitored and evaluated. A compassion-centred lens (awareness, compassion, loving-kindness and wisdom) is suggested as a feasible condition for cross-sector cooperation and for supporting culture change during transitions to community living.

Teaching German within the Framework of Intercultural Exchanges

Melina Vouri

Aristotle University of Thessaloniki, Greece

Abstract

This paper examines the teaching of German as a foreign language within the framework of intercultural exchanges, emphasizing its educational potential in non-formal learning contexts. Grounded in theoretical approaches to non-formal and intercultural learning, the study conceptualizes language learning as a holistic, experiential process that develops through social interaction, participation, and reflection. Intercultural learning is approached as a key educational objective, fostering intercultural competence, empathy, and critical cultural awareness among young people. Intercultural exchanges are analyzed as structured yet flexible learning environments that enable authentic communication and collaborative engagement across cultural boundaries, thereby supporting the meaningful acquisition of linguistic and social skills. Furthermore, the paper highlights the role of youth institutions and international youth work organizations in designing, implementing, and sustaining intercultural exchange programs. These institutions contribute significantly to the promotion of multilingualism, democratic values, and transnational cooperation. The study concludes that teaching German in the context of intercultural exchanges not only enhances linguistic proficiency but also supports the development of intercultural sensitivity and active citizenship, positioning language education as a central component of contemporary European youth work.

Keywords: *non-formal education, youth work, youth exchanges, intercultural competence*

1. Introduction

One of the primary objectives of foreign language teaching and learning is to foster students' awareness of multilingualism and multicultural living, while simultaneously promoting intercultural communication competence (Huneke & Steinig, 2010: 199). One effective means of cultivating intercultural communicative competence among adolescent learners is participation in intercultural exchange programmes. In Greece, such opportunities have traditionally been associated mainly with Erasmus programmes, in which English is typically used as the lingua franca for communication. In recent years, however, the establishment of the Hellenic-German Youth Foundation has created new opportunities for intercultural exchanges between Greece and Germany and/or France. Through these initiatives, participants are able to come into direct contact with native speakers and use the foreign languages they have studied for several years in authentic communicative contexts, an element considered fundamental within the framework of contemporary foreign language pedagogy (Savignon, 2017). Although similar youth foundations and exchange programmes between Germany and other countries have existed for several decades, such initiatives have only recently begun operating in Greece, specifically since 2021. Consequently, the educational opportunities provided through these programmes are gradually becoming more widely recognized within both formal and non-formal education settings.

The present study aims to highlight the educational value of intercultural exchanges and to investigate their impact and effectiveness in relation to different dimensions of foreign language teaching and learning, with particular emphasis on German language education. Special attention is given to the cognitive, social, and intercultural benefits that may emerge through participation in such programmes. This focus is particularly relevant, as intercultural communicative competence (Baros, Stergiou & Chatzidimou, 2014) is increasingly considered one of the key competencies required of individuals in contemporary multilingual and multicultural societies.

2. Theoretical Background

2.1 Non-formal Education

Non-formal learning is generally defined as learning that takes place outside the framework of compulsory curriculum-based instruction and formal teaching hours. It may occur either within the school environment, for example through educational groups and extracurricular activities, or outside formal educational settings, such as in foreign language centres and youth programmes. Non-formal learning activities are highly diverse, as the objectives of non-formal education encompass a broad range of educational, social, and personal dimensions. In general, non-formal learning refers to planned educational activities that may not always be explicitly identified as "learning" in terms of learning objectives, duration, or instructional support, yet remain intentional from the learner's perspective (Cedefop, 2008: 133).

One of the distinctive characteristics of non-formal learning is its emphasis on the targeted development of personal and social competences, including initiative-taking, collaboration, communication, and active participation. In this sense, non-formal education promotes a more authentic and learner-centred approach to the learning process, encouraging learners to assume greater responsibility for their own educational development. More specifically, non-formal learning differs from formal education due to its less teacher-centred structure, while at the same time differing from informal learning because it is usually organised, facilitated by trained staff, and based on specific educational objectives and methodologies. Consequently, it may be described as an experiential form of learning and skills development grounded in voluntary participation and focused primarily on the learner's active engagement. Such approaches are widely implemented in mobility and intercultural exchange programmes, where non-formal learning constitutes a central methodological framework. In these contexts, non-formal educational practices are extensively employed by youth workers and educators, contributing significantly to young people's personal, educational, and social development.

2.2 Intercultural Learning

One of the central aims of foreign language learning is the development of learners' ability to communicate effectively, both orally and in written form, with native speakers of the target language. Nevertheless, when exposure to the target language remains limited to the classroom environment, achieving this objective often becomes challenging, since important aspects of authentic communication -such as stylistic variation, intonation patterns, spontaneity, and familiarity with cultural practices- may remain insufficiently developed. Within the framework of communicative language teaching, emphasis is placed on moving beyond traditional teaching methods and exclusive dependence on the textbook, towards a more communication-oriented and learner-centred approach (Savignon, 2017: 138). In this context, intercultural exchange programmes can function as an important complement to classroom instruction, as they provide learners with opportunities to engage in authentic communicative situations and interact directly with native speakers of the target language (Edelenbos & Kubanek, 2004: 20).

Research findings indicate that participation in intercultural exchanges may contribute positively to both receptive and productive language skills. More specifically, participants often appear to improve their listening comprehension while simultaneously developing greater confidence and fluency in oral communication by the end of the exchange experience (Edelenbos & Kubanek, 2004: 20). Such experiences reflect one of the fundamental principles of contemporary language teaching, namely the active involvement of learners in meaningful communicative situations that resemble real-life language use beyond the classroom environment (Chatzidimou & Stamovlasis, 2014: 41). Furthermore, communication within intercultural exchanges is not limited to linguistic development alone. Interaction with peers in authentic social contexts often acquires emotional significance, particularly when meaningful interpersonal relationships are formed. As Edelenbos and Kubanek (2004: 23) argue, communication experiences connected to personal interaction and emotional engagement tend to leave a more lasting impact on participants than isolated or impersonal communicative encounters. Consequently, intercultural exchanges may substantially influence learners' autonomy, self-confidence, and understanding of the culture of the "other" (Edelenbos & Kubanek, 2004: 20).

At the same time, intercultural contact encourages learners to reflect critically on their own cultural assumptions while becoming aware of alternative ways of thinking and behaving. According to Heringer (2004), encounters with individuals from different cultural backgrounds may create moments of tension or misunderstanding, precisely because participants are confronted with perspectives and behavioural norms different from their own. Such challenges become even more evident in international youth

exchanges, where participants differ not only in terms of cultural background, but also in language proficiency, communicative competence, expectations, and previous intercultural experiences. As a result, communication difficulties are often unavoidable in intercultural settings characterised by such diversity. In some cases, misunderstandings may contribute to the formation or reinforcement of stereotypes, prejudices, or insecurities among participants. However, these situations also create opportunities for reflection, negotiation of meaning, and intercultural learning.
Through intercultural learning processes (Lane, 2012), learners gradually develop intercultural communicative competence, which includes both verbal and non-verbal dimensions of communication. Participants become more aware that communicative behaviour differs across cultural contexts and, consequently, acquire strategies that facilitate more effective interaction. In addition, they develop the ability to interpret misunderstandings, negotiate meaning, and demonstrate empathy towards cultural difference (Biechele & Padros, 2003). This perspective is further supported by Byram's (2008) model of Intercultural Communicative Competence in foreign language education, according to which learners should develop, among other competences, the ability to interpret cultural phenomena within intercultural contexts and to independently acquire new knowledge regarding other cultures.

2.3 Intercultural Youth Exchanges

International youth exchanges constitute an important component of both formal and non-formal educational opportunities for young people in many countries. Their long-term impact has been examined extensively, including within the framework of the research project *Long-term Effects of Participation in International Youth Meetings on the Personal Development of Participants*, conducted by a research team at the University of Regensburg. One of the central conclusions of the study is that even relatively short intercultural experiences may have a lasting influence on participants' personal development. Beyond the improvement of foreign language skills, participation in intercultural exchanges appears to contribute positively to self-confidence, teamwork abilities, openness towards new perspectives, and, consequently, to young people's future professional opportunities.
At the same time, the demands placed upon young people in an increasingly globalised and multicultural world are becoming progressively more complex. The process of shaping one's identity and developing a stable sense of self within rapidly changing social environments often presents significant challenges. In this context, intercultural exchanges may play an important role, as they foster the development of intercultural competence and encourage participants to engage constructively with cultural diversity. Through participation in such programmes, young people are provided with opportunities to strengthen communication skills, develop empathy and adaptability, and acquire experiences that may prove valuable both in their everyday social interactions and in their future professional lives. The ability to coexist and cooperate effectively within multicultural environments is increasingly regarded as an essential competence in contemporary societies.
For these reasons, intercultural exchanges should be considered an integral element of youth work and educational practice. Their educational and social potential highlights the importance of further supporting, expanding, and systematically integrating such programmes into both formal and non-formal educational contexts.

2.4 IJAB – Specialist Office for International Youth Work of the Federal Republic of Germany e.V.

IJAB serves as a central institution for the promotion and coordination of international youth work and youth policy cooperation in Germany, both within Europe and at a global level. Its primary objective is to foster mutual understanding through the promotion of international youth exchanges and intercultural encounters, while simultaneously supporting international education, youth participation, and the prevention of xenophobia, racism, and violence. In cooperation with international partners, IJAB implements projects related to youth policy and facilitates the exchange of knowledge and expertise in the field of child and youth welfare. Furthermore, it promotes networking among institutions and organisations operating in youth work both within Germany and internationally.
In addition, IJAB provides information, counselling, and professional support to youth welfare organisations, policy makers, and public administrations. Its activities include the organisation of training opportunities, professional exchange programmes, educational resources, and specialist publications related to international youth work. At the same time, the organisation offers guidance to young people regarding opportunities for international mobility and available funding schemes. As the specialised agency for international youth work in the Federal Republic of Germany, IJAB has been operating since

1967 under the auspices of the Federal Ministry for Family Affairs, Senior Citizens, Women and Youth, in collaboration with its member organisations and other youth work institutions (https://www.dfjw.org/das-dfjw-entdecken.html).

2.5 Hellenic-German Youth Foundation

The Hellenic-German Youth Foundation (HGYF) was established following the bilateral agreement signed on 4 July 2019 between the Federal Republic of Germany and the Hellenic Republic, officially commencing its operations in Leipzig and Thessaloniki in April 2021. The Foundation functions as an international organisation dedicated to supporting and financing Greek-German youth exchanges, as well as professional exchanges among youth workers. Its primary objective is to strengthen mutual understanding and intercultural dialogue between young people from Greece and Germany by creating opportunities for meaningful intercultural encounters and cooperation.
Within this framework, the Hellenic-German Youth Foundation promotes a wide range of educational and intercultural activities, including youth exchange programmes, professional exchanges, internships, job-shadowing initiatives, and small-scale collaborative projects. Such initiatives enable young people from both countries to meet, interact, exchange perspectives, and cooperate on topics of common interest, thereby fostering intercultural learning, active participation, and international collaboration (https://dgjw-egin.org/wir-ueber-uns/).

3. Practical Background

3.1 The Aim of the Research

The aim of this study is to highlight the importance of intercultural exchanges and their potential benefits across multiple dimensions of participants' development, including social and cognitive aspects. More specifically, the study first focuses on the development of oral comprehension skills. By assessing participants' listening comprehension before and after the exchange programme, the study seeks to examine the extent to which their ability to understand native speakers of German is affected by participation in the exchange.
A further objective is to investigate the development of oral production skills. By comparing participants' oral performance prior to and following the exchange, the study aims to determine the extent to which their communicative effectiveness and fluency in interactions with native speakers have improved. Based on prior experience, it is hypothesised that more pronounced improvements may be observed among participants at A2-B1 proficiency level, as they are already equipped with a sufficient range of linguistic structures and vocabulary to manage a variety of communicative situations.
Finally, the study also explores participants' attitudes towards different cultures, as well as their broader perspectives on multilingualism and the equal status of languages.

3.2 Research Questions

The present study seeks to explore the impact of intercultural exchange programmes on foreign language learning and intercultural development, with particular emphasis on German as a foreign language. More specifically, the research focuses on participants' linguistic confidence, communicative competence, and attitudes towards multilingualism and cultural diversity. In this context, the research questions addressed in this study are the following:

1. To what extent do exchange participants feel more confident in understanding spoken German by native speakers following their participation in the exchange programme?
2. To what extent do participants feel more confident and effective in oral communication with native German speakers after participating in the exchange programme?
3. What are participants' attitudes towards the target language (German) and the corresponding culture?
4. What are participants' attitudes towards multilingualism?

3.3 Methodology and Research Tools

Regarding the methodology employed in the research component of the study, a mixed-methods approach was adopted in order to explore participants' linguistic development, intercultural

communication, and attitudes towards multilingualism within the context of a youth exchange programme.
Initially, a pre-exchange questionnaire was administered to the eight Greek participants in order to examine their perceptions regarding German language comprehension and use, as well as issues related to intercultural contact and multilingualism. The questionnaire consisted of 13 closed-ended questions.Throughout the duration of the exchange programme, a daily observation protocol was completed for each participant individually. The protocol included approximately 10 items focusing primarily on participants' interaction with peers, communication patterns, and engagement in intercultural activities. At the end of the exchange, a post-exchange questionnaire was distributed to all participants. This instrument aimed to investigate their overall experience, perceived language development, intercultural communication skills, and evolving attitudes and perspectives. The questionnaire consisted of 41 closed-ended questions and two open-ended questions, allowing participants to further elaborate on their experiences.
In addition, online semi-structured interviews were conducted a few days after the completion of the exchange programme. The participants responded to approximately 12 open-ended questions focusing on their experience of coexistence and collaboration, language development, intercultural interaction, and the attitudes and perceptions developed through participation in the exchange. Furthermore, one or two parents of each participant were also interviewed and answered 11 questions related to the cognitive, emotional, and personal changes they observed in their children following participation in the programme, including aspects such as autonomy, self-confidence, initiative-taking, and social development.

4. Discussion and Preliminary Conclusions

At the current stage of the research, the analysis and triangulation of the collected data are still in progress. Nevertheless, preliminary findings indicate an overall positive evaluation of participation in the exchange programme. More specifically, participants appeared to develop more positive attitudes towards other cultures, while also demonstrating signs of personal growth, increased autonomy, enhanced self-confidence, and a greater willingness to take initiative in intercultural settings. Preliminary findings further suggest that participation in intercultural exchanges enhanced students' motivation, strengthened their intercultural awareness, and increased their confidence in authentic communication in the German language.

5. Conclusions

Intercultural exchange programmes constitute an important educational context that combines foreign language learning with experiential and intercultural education. Through authentic communication and direct interaction with native speakers and individuals from different cultural backgrounds, learners are provided with opportunities to develop not only their linguistic competences, but also broader social, personal, and intercultural skills. In this respect, intercultural exchanges appear to support the principles of contemporary communicative language teaching by connecting language learning with meaningful real-life communication and intercultural engagement.
Furthermore, the present study highlights the importance of integrating non-formal learning practices into foreign language education, particularly in relation to the teaching and learning of German as a foreign language. The findings discussed in this paper suggest that participation in intercultural exchanges may positively influence learners' motivation, communicative confidence, intercultural awareness, and openness towards multilingualism and cultural diversity. Consequently, intercultural exchange programmes should be regarded as valuable educational initiatives capable of contributing both to language development and to the formation of active and interculturally aware citizens.

The Perception of Social Science Students on the Importance and Application of Intercultural Competencies in Education and Professional Life

Ines Hocenski

Department of Information Sciences, Faculty of Humanities and Social Sciences, Josip Juraj Strossmayer University of Osijek, Croatia

Abstract

In today's world, the term interculturality is increasingly used across various segments of life, from education to the professional environment. Modern society continuously witnesses interactions among people from different cultures, nationalities, faiths, and races, resulting in a growing need for strengthening intercultural competencies. Intercultural competencies are crucial in the educational system, where their application can significantly contribute to the development of multiperspectivity, empathy, and cognitive flexibility among pupils and students. Given that most students of social sciences will spend their professional careers in educational institutions, this paper aims to examine how well students of social sciences faculties at the Josip.Juraj Strossmayer University of Osijek are acquainted with the concept of intercultural competencies, how they value them, and in which ways they would apply them in their future professions.

The research was conducted using a survey method on a sample of 89 students. The results indicate that the majority of students recognize intercultural competencies as highly important for their future professional work, but they assess their own preparedness for their application as moderate. It was observed that a significant number of respondents have not had the opportunity to apply intercultural competencies practically during their studies. At the same time, most believe the representation of such content in curricula is insufficient. The findings confirm theoretical theses regarding the necessity of systematically integrating intercultural content into educational programs and point to the need for a strategic approach involving formal education, experiential learning, and international cooperation. The findings show that 68.5% of students believe that intercultural competencies should be more strongly integrated into higher education curricula.

Keywords: *intercultural competencies, quantitative analysis, curricula, educational system, social science students, Josip.Juraj Strossmayer University of Osijek*

1. Introduction

The contemporary globalized society assumes that intercultural competencies are becoming a key prerequisite for successful professional and personal engagement. We are witnessing increased interconnectedness of cultures and human mobility, where value pluralism changes the context of work in the educational system and other domains of social sciences. Such an environment requires from future professionals not only expertise and methodological skills but also the ability to communicate effectively and appropriately with individuals from various cultural, linguistic, and social backgrounds. Intercultural competence is defined as a set of knowledge, skills, attitudes, and values that enable constructive interaction in intercultural encounters, and it is recognized as a fundamental transversal competence in higher education [4,5,6]. The educational system plays a significant role in raising awareness of and developing intercultural competencies, as education forms the foundation for adopting values of understanding, respect, and acceptance of diversity among younger generations. New societal needs present students, especially those in the social sciences, with the requirement to acquire competencies that will enable successful performance in their future professional lives, primarily in educational institutions but also in other socially relevant settings. It is assumed that social science students will often work in multicultural environments in the future. Their ability to understand, appreciate, and respond constructively to cultural differences is essential for directly influencing the quality of professional relationships, the effectiveness of teamwork, and overall user satisfaction. Despite the widespread awareness of these concepts, research in Croatia and the region indicates inadequate systemic development of intercultural competencies within

study programs and the need to enhance them through targeted educational experiences, international mobility, and interdisciplinary projects [7,9].
Given this context, this paper aims to examine how familiar social science students at the Josip. Juraj Strossmayer University of Osijek are with the concept of intercultural competencies, how they assess and value them, and in which ways they recognize their importance and possible application in personal and professional life. Particular emphasis is placed on students' perceptions of the need to strengthen intercultural content in higher education curricula. The results of the conducted research should contribute to a better understanding of student needs and the development of educational outcomes that will enable the systematic and strategic development of intercultural competencies in higher education. In addition, this study contributes to the existing literature by providing empirical insight into students' perceptions in the Croatian higher education context.

2. Review of Relevant Literature

When it comes to the conceptual definition of intercultural competencies, it is essential to note that the term "intercultural competence" encompasses knowledge, skills, attitudes, and values that enable individuals to act effectively and appropriately in intercultural contact situations. The idea of interculturalism in education emerged as a result of the need to shape multicultural societies according to the principles of cultural pluralism, which presupposes mutual understanding, tolerance, and dialogue [2]. The literature contains several models of intercultural competence. Deardorff's process model integrates intrinsic dispositions (respect, openness, and curiosity), knowledge and skills (interpretation and relativization), and internalized outcomes (adaptation and ethical responsibility), which collectively lead to effective and appropriate communication [6]. This model has become a global reference framework in higher education. In the linguistic-educational tradition, Byram's model of intercultural communicative competence stands out, consisting of five components: attitudes, knowledge of societies and cultures, skills of interpreting and relating, skills of discovery and interaction, and critical cultural awareness [5]. Bennett's developmental model of intercultural sensitivity describes the transition from ethnocentric (denial/defense/minimization) to ethno-relative orientations (acceptance/adaptation/integration) and is often used as a theoretical basis for monitoring shifts in education [4].
It is also important to mention the European normative and curricular framework. In 2018, the Council of Europe developed the Reference Framework of Competences for Democratic Culture (RFCDC), encompassing twenty competencies grouped into four domains: values, attitudes, skills, and knowledge and critical understanding. These competencies are essential because intercultural competencies are a central element, and guidelines for higher education emphasize the necessity of their integration at all levels and forms of learning. The application of these competencies enables understanding and assessment of intercultural competencies. Comprehension and implementation of intercultural competencies are being introduced in many sectors of society, notably in education, and especially in higher education. Curriculum internationalization, student mobility, and foreign language learning are highlighted as key factors in the development of intercultural competencies [11]. Analysis of relevant literature shows that participation in international programs alone is not sufficient for significant competence development; structured learning, mentoring, and reflective activities are needed [13]. In the regional (specifically Croatian) context, available research highlights the limited integration of intercultural content in social science curricula and the necessity of its systematic inclusion in both formal and non-formal educational forms. It is also observed that students involved in international exchanges or interdisciplinary projects exhibit higher levels of intercultural sensitivity and cultural intelligence [7,9]. Further research indicates that social science students recognize the significance of intercultural competencies, primarily in the context of future professional application—especially openness to diversity, communication skills, conflict resolution ability, and the capacity to view problems from other perspectives. Analyses have shown that the level of development and perception of these competencies depend on age, gender, study program, country of study, as well as the availability of intercultural content in educational programs [3,12]. Since the importance of interculturality and intercultural competencies remains a crucial aspect of everyday life, literature frequently emphasizes these themes in the context of future professionals entering the labor market. For future experts in social sciences, intercultural competencies offer numerous professional benefits, enabling better management of diverse teams, more effective conflict resolution, adjustment of communication strategies, and increased user satisfaction [1]. According to the European Commission, the labor market has recognized intercultural competence as an essential hiring criterion, particularly in the public sector,

education, international organizations, and NGOs [8]. The literature overview points out that intercultural competencies constitute a complex set of knowledge, skills, attitudes, and values that can be systematically developed and assessed. Theoretical models, such as those mentioned above [4,5,6], provide a conceptual framework, while RFCDC offers a normative and operational framework for their implementation in educational practice. In higher education, the integration of intercultural competencies in curricula and institutional strategies is necessary.

3. Methodology

3.1 Research Design

This study employed a quantitative research design to examine social science students' perceptions of intercultural competencies, their perceived importance, and their potential application in professional contexts. A survey method was used as it enables the collection of standardized data from a larger number of participants and allows for statistical analysis of attitudes, perceptions, and self-assessments. The research focuses on identifying patterns related to familiarity with the concept of intercultural competencies, perceived importance, level of preparedness, and the perceived need for their integration into higher education curricula.

3.2 Sample

The study was conducted on a sample of N = 89 students enrolled at the Josip Juraj Strossmayer University of Osijek. Participants were undergraduate and graduate students from four faculties within the field of social sciences: the Faculty of Humanities and Social Sciences (59.6%), the Faculty of Education (23.6%), the Faculty of Economics (11.2%), and the Faculty of Law (5.6%).
Regarding gender distribution, the sample consisted predominantly of female respondents (83.1%, n = 74), followed by male respondents (13.5%, n = 12), while 2.2% (n = 2) identified as other and 1.1% (n = 1) chose not to disclose their gender.
In terms of age, the majority of respondents belonged to the 20–22 age group (51.7%), followed by the 23–25 age group (31.5%). The sample was based on convenience sampling, which limits the generalizability of the findings but is appropriate for exploratory research of this type.

3.3 Instrument

Data were collected using a structured questionnaire designed specifically for the purposes of this study. The instrument consisted of both closed-ended and open-ended questions and was divided into several thematic sections:

- socio-demographic characteristics
- familiarity with the concept of intercultural competencies
- sources of knowledge about intercultural competencies
- perceived importance of intercultural competencies
- self-assessment of preparedness for intercultural interaction
- prior experience in applying intercultural competencies
- evaluation of the representation of intercultural content in curricula
- suggestions for improving intercultural competence development

A five-point Likert scale was used to measure attitudes and perceptions, where 1 indicated the lowest level (e.g., "not important at all" or "very poor") and 5 indicated the highest level (e.g., "very important" or "excellent").
The inclusion of open-ended questions enabled the collection of qualitative insights, providing additional depth to the interpretation of quantitative findings.

3.4 Procedure

The data collection was conducted online using Google Forms in the period from May to July 2025. Participants were recruited through multiple channels, including student mailing lists, social media platforms, and direct contact during lectures.
The online format enabled efficient data collection and ensured accessibility for participants across different faculties.

3.5 Ethical Considerations

Participation in the study was voluntary and anonymous. All participants were informed about the purpose of the research prior to completing the questionnaire. Informed consent was obtained, and respondents were assured that their data would be used exclusively for academic purposes.
No personally identifiable information was collected, and the study was conducted in accordance with standard ethical principles for social science research.

3.6 Research Hypotheses

Based on the research objectives and theoretical framework, the following hypotheses were formulated:
H1: Social science students are familiar with the concept of intercultural competencies.
H2: Students perceive intercultural competencies as highly important for their future professional work.
H3: Students assess their level of preparedness for applying intercultural competencies as moderate.
H4: Intercultural competencies are insufficiently represented in higher education curricula.
H5: Students express a need for increased integration of intercultural competencies into study programs.
These hypotheses guided the analysis and interpretation of the research results.

4. Research Results and Interpretation

The results are presented in accordance with the defined research hypotheses (H1-H5). This section presents the results and interpretation of conducted research on the perception of social science students at the Josip Juraj Strossmayer University of Osijek regarding the importance and application of intercultural competencies. The results follow the established research questions: level of awareness, perception of importance, intended application, experiential application, and perception of representation in the curriculum. The analysis also includes qualitative insights from open-ended questions.

4.1 Sample Characteristics

A total of 89 students from four faculties participated: the Faculty of Humanities and Social Sciences in Osijek (59.6%), the Faculty of Education (23.6%), the Faculty of Economics (11.2%), and the Faculty of Law (5.6%). Most respondents (30.3%) were in the 2nd year of undergraduate studies, while the smallest number were in the 2nd year of graduate studies (6.7%). As for gender (Figure 1. Distribution of Responses by Gender), the sample consisted of 74 women (83.1%), 12 men (13.5%), two students who identified as “other” (2.2%), and one student who did not wish to state their gender (1.1%).

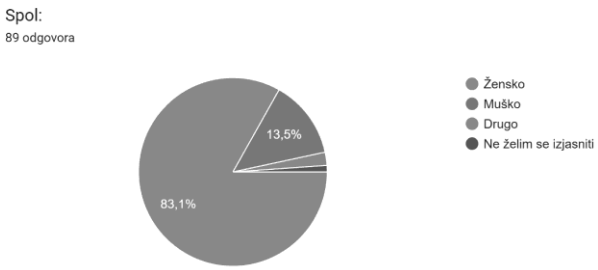

Fig.1. Distribution of Responses by Gender

4.2 Familiarity with Intercultural Competencies (H1)

Analysis of age groups revealed that the 20–22 age group dominates (51.7%), followed by the 23–25 group (31.5%). Regarding familiarity and understanding of the term “intercultural competencies,” the majority (39.3%) indicated they were familiar with the term, while 30.3% were not familiar and an equal percentage were unsure. The self-assessment of understanding “intercultural communication” (Likert scale: 1–5) averaged 3.4, indicating a moderate to good experience, although with room for further education. Detailed information is shown in Figure 2. Display of Self–Assessment Responses on Understanding the Concept of Intercultural Competence. These findings provide partial support for H1. Although a proportion of students report familiarity with the concept, a considerable number of

respondents indicate that they are either not familiar or unsure, suggesting that knowledge of intercultural competencies is not systematically developed.

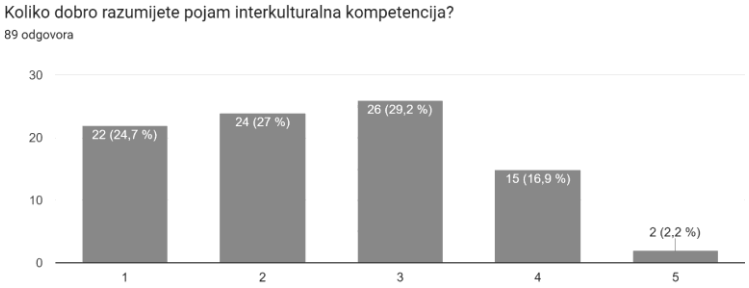

Fig. 2. Self-assessment of understanding intercultural competencies

Most respondents (42.7%) stated they had not encountered the term “intercultural competencies,” while a slightly smaller proportion (36%) heard it in lectures, and 25.8% encountered it in the media.

4.3 Perceived Importance of Intercultural Competencies (H2)

Self-assessment of the importance of intercultural competencies in today’s society, according to respondents, showed that 36% consider them very important (Likert scale score 5), 29.2% gave a score of 4, and 31.5% gave a score of 3. Similar results are seen for the question on the perceived importance of intercultural competencies in future careers, with most providing a score of 4 (33.7%), followed by score 5 (32.6%) and score 3 (30.3%). Students believe that there is a need to strengthen intercultural competencies in modern society, with 68.5% agreeing with this statement and 30.3% unsure. The characteristics most frequently highlighted by students as crucial for developing intercultural competencies are communication skills (83.1%), tolerance (76.4%), empathy (67.4%), multiperspectivity (65.2%), and cognitive flexibility (46.1%). Among all participants, 39.3% would very likely apply intercultural competencies in their future professions, 33.7% would likely do so, while 23.6% are sure they would use them. For the open-ended question regarding specific situations where they would apply intercultural competencies, most students mentioned collaboration with colleagues from other countries (e.g., Erasmus, future jobs, etc.). The results clearly support H2, as most respondents perceive intercultural competencies as important or very important in both societal and professional contexts.

4.4 Self–Assessed Preparedness (H3)

Self-assessment of preparedness for working in multicultural environments showed that most rated themselves as “good” (3)—50.6%, followed by “very good” (4)—25.8%, and “adequate” (2)—14.6%. These findings support H3, indicating that students generally perceive their level of preparedness as moderate rather than high, which points to a gap between awareness and practical competence.

4.5 Experience and Application of Intercultural Competencies

Most respondents have not yet had the opportunity to apply intercultural competencies during their studies or practice. Those who have applied intercultural competencies cited teaching students from different cultures, participating in student exchanges (Erasmus), involvement in the European Law Students’ Association (ELSA), conferences, and lectures by foreign experts.

4.6 Representation in the Curriculum (H4)

Over half of the respondents (52.8%) are unsure if the concept of intercultural competencies is sufficiently represented in their curriculum. Only 13.5% believe it is adequately represented, while 33.7% disagree, as reflected in the relevant Figure 3. The results support H4, as a relatively small proportion of students believe that intercultural competencies are adequately represented in the curriculum, while a significant number express uncertainty or disagreement.

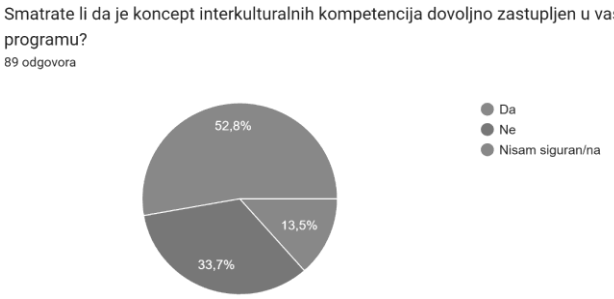

Fig. 3. Representation of Intercultural Competencies in Study Programs

4.7 Need for Improvement (H5)

Most respondents (68.5%) believe that the representation of content related to intercultural competencies should be increased, while 24.7% are unsure. These findings strongly support H5, confirming that students recognize the need for increased integration of intercultural competencies into higher education programs. Workshops or seminars (59.6%), international student exchanges (57.3%), guest lectures by experts from abroad (51.7%), and courses focused on interculturality (43.8%) are considered the most suitable forms for developing intercultural competencies. Suggestions for further improving the development of intercultural competencies within the studies mainly refer to ERASMUS programs, various educational activities and workshops with international experts, more courses dedicated to interculturality, or inclusion of intercultural topics in existing course content.

Fig. 4. Self–Assessment – Do you believe your studies adequately prepare you for work in an Intercultural Environment?

4.8 Perception of Study Preparation

When it comes to self-assessment and respondents' opinions about whether their studies adequately prepare them for work in an intercultural environment, 56.2% believe they are partially prepared, and 24.7% feel their studies do not prepare them sufficiently (see Figure 4).

5. Discussion

The discussion of the findings is structured in relation to the defined research hypotheses (H1–H5), allowing for a clearer interpretation of the results within the established theoretical framework.

The findings related to students' familiarity with intercultural competencies provide only partial support for H1. Although a proportion of respondents reported being familiar with the concept, a considerable number indicated limited or no familiarity, as well as uncertainty regarding its meaning. This suggests that knowledge of intercultural competencies is not systematically developed within higher education. Such findings are consistent with previous research in the Croatian context, which points to the insufficient integration of intercultural content into study programs [2,12]. The lack of consistent exposure to key concepts may result in fragmented understanding, where students recognize elements of interculturality without a clear theoretical framework.

In contrast, the results strongly support H2, as the majority of students perceive intercultural competencies as highly important for both societal functioning and their future professional roles. These

findings align with established theoretical models of intercultural competence, particularly those proposed by Deardorff (2006), Byram (1997), and Bennett (2017), which emphasize the central role of intercultural skills in effective communication and professional success in multicultural environments. The high valuation of intercultural competencies suggests that students are aware of contemporary societal demands and the importance of such competencies in the global labor market.

At the same time, the findings confirm H3, indicating that students assess their level of preparedness for applying intercultural competencies as moderate rather than high. This points to a discrepancy between the recognized importance of these competencies and students' perceived ability to apply them in practice. Such a gap suggests that current educational approaches may not provide sufficient opportunities for experiential learning or practical engagement. Similar conclusions have been drawn by Leask (2015) and Sobkowiak (2019), who argue that exposure to intercultural environments alone is not sufficient; rather, structured learning, guided reflection, and practical application are essential for meaningful competence development.

The results also support H4, highlighting that intercultural competencies are not perceived as adequately represented in university curricula. A relatively small proportion of students believe that such content is sufficiently included, while many express uncertainty or dissatisfaction. This finding reflects broader structural limitations within higher education systems, where intercultural competencies are often addressed indirectly or inconsistently. The absence of clearly defined learning outcomes and systematic integration into curricula may hinder the development of these competencies.

Finally, the findings strongly support H5, as the majority of students express a clear need for increased integration of intercultural competencies into higher education programs. Students particularly emphasize the importance of experiential learning formats, such as workshops, international exchanges, and guest lectures by foreign experts. These preferences are consistent with experiential learning theory [10] and models of intercultural competence development, which highlight the importance of active participation, reflection, and real-life interaction. The emphasis on practical learning indicates that students not only recognize the importance of intercultural competencies but also understand the conditions necessary for their development.

Overall, the results indicate that while students demonstrate a high level of awareness regarding the importance of intercultural competencies, there remains a significant gap in their systematic development within higher education. The findings point to the need for a more structured and strategic approach to integrating intercultural competencies into curricula, including clearly defined learning outcomes, practical training opportunities, and institutional support for internationalization. Such an approach would enable students to move beyond theoretical awareness toward the development of applicable skills necessary for functioning in increasingly diverse professional environments.

6. Conclusion

This study confirms that social science students at the Josip Juraj Strossmayer University of Osijek recognize the importance of intercultural competencies, thereby supporting hypothesis H2. However, the findings also reveal only moderate levels of self-assessed preparedness (H3), indicating a gap between awareness and practical competence development.

The results further show that a significant proportion of students have not encountered the concept within formal education, supporting hypothesis H4 regarding insufficient curricular representation. At the same time, students clearly express the need for increased integration of intercultural content (H5), particularly through experiential forms of learning such as workshops and international exchanges.

Although students demonstrate partial familiarity with the concept (H1), the findings suggest that this knowledge is often fragmented and lacks a structured theoretical foundation.

Overall, the study highlights the need for a systematic and strategic approach to integrating intercultural competencies into higher education curricula. This includes the development of structured learning opportunities, practical training, and international collaboration.

Leadership Practices for Inclusion in the Context of External School Evaluation: Findings from a Portuguese Case Study

Jennifer Silva[1], Alexandre Ventura[2], Diana Oliveira[3]

[1,2,3]University of Aveiro, Portugal

Abstract

In Portugal, the external evaluation of schools, conducted by the Inspectorate-General of Education and Science, constitutes a significant instrument for regulation, accountability and organisational improvement within an education system guided by principles of equity and inclusion. In this context, it is important to understand how school leaders make use of this evaluative mechanism to guide processes of institutional reflection, regulate educational action and sustain practices that are better attuned to student diversity. A qualitative case study was conducted in a cluster of schools in mainland Portugal, based on the analysis of the external evaluation report, key institutional documents and interviews with 12 teachers holding leadership roles. Using MAXQDA software, the data were organised and interpreted around four dimensions – strategic, organisational, pedagogical and community – in order to explore the interplay between school leadership, institutional evaluation and inclusion-oriented practices. Ethical procedures applicable to educational research were followed, including informed consent, the anonymisation of participants and the protection of the data collected. The results show that school leaders mobilise external evaluation to promote more inclusive responses through the strategic use of evaluative data, collaborative decision-making, the organisation of support structures, the monitoring of teaching practices and the alignment between school improvement processes and education policies. However, the data also reveal that this appropriation is not linear, being shaped by challenges related to the articulation between self-evaluation and planning, the consolidation of formative assessment and collaborative supervision, limited resources and family engagement. The analysis further shows that the increasing number of students of foreign nationality, together with the linguistic and cultural plurality of the school population, emerges as a particularly significant challenge, requiring contextualised and appropriately tailored responses. It is concluded that external evaluation can foster critical reflection, organisational learning and educational transformation when appropriated by school leaders as an instrument for continuous improvement, shared responsibility and the consolidation of sustainable inclusive practices. Nevertheless, its effects depend on organisational conditions, available resources and the capacity to translate the evidence base produced by evaluation into effective practices.

Keywords: *External School Evaluation; School Leadership; Inclusive Education; Linguistic and Cultural Diversity; Portugal.*

1. Introduction

Inclusive education has become firmly established on international and, in particular, European policy agendas as a structuring principle of quality, equity and educational justice [1,2]. In a context marked by increasing social, cultural and linguistic diversity among school populations, education systems are called upon to ensure not only access to schooling, but also the effective participation, learning, well-being and success of all students [2,3]. Accordingly, inclusion is understood here not as a response to a specific group of students, but as a multidimensional commitment to identifying and removing barriers that hinder students' participation, learning, well-being and success, including those related to social inequality, disability, language, culture and migration trajectories [1,3].

The OECD emphasises that phenomena such as demographic change, migratory movements, refugee crises and rising inequalities have contributed to the growing diversity of school populations, requiring more equitable and inclusive educational responses [3]. This concern is also reflected at the European level, where the integration of migrant and refugee children and young people into education and training systems has been regarded as a policy priority [4,5,6].

In Portugal, this issue is particularly relevant given the marked increase in the number of students of foreign nationality in compulsory education, which covers children and young people aged between 6 and 18, under Law No. 85/2009 [7]. In 2023/2024, 174,126 children and young people of foreign

nationality were enrolled in compulsory education in Portugal, 31,366 more than in the previous year, representing 13.6% of students in basic and secondary education, excluding adult learners [8]. Of these, 84.3% attended state schools, indicating that although cultural and linguistic diversity cuts across the education system as a whole, it is particularly relevant in state schooling [8].

Beyond this quantitative increase, the current diversity of Portuguese schools is also reflected in the multiplicity of national and linguistic backgrounds. Recent data from the National Education Council indicate that, in 2023/2024, school clusters and non-clustered schools had, on average, around 18 nationalities, with some contexts having more than 40 nationalities represented [9]. These changes do not constitute a transient circumstance, but a structural transformation of the school population, unfolding at a pace that often outstrips schools' capacity to adapt their organisation, curriculum management and pedagogical work. Understanding how schools respond to this transformation is therefore not merely relevant, but pressing.

Within the national policy and regulatory framework, Decree-Law No. 54/2018 establishes the principles and rules that guarantee inclusion, understood as a process aimed at responding to the diversity of the needs and potential of each and every student, by increasing participation in learning processes and in the life of the educational community [10]. In turn, Decree-Law No. 55/2018 establishes the curriculum for basic and secondary education and the guiding principles for its design, implementation and assessment, seeking to ensure that all students develop the competences set out in the Students' Profile by the End of Compulsory Schooling [11]. Taken together, these legal instruments support a conception of schooling oriented towards inclusion, curriculum flexibility, pedagogical differentiation and the improvement of learning. However, the existence of regulatory guidelines favourable to inclusion does not, in itself, guarantee their enactment in organisational and pedagogical practices.

Linguistic and cultural diversity makes this framework even more complex, particularly when it involves migrant or refugee students, or students whose schooling trajectories have taken place in languages other than Portuguese. Their inclusion requires welcoming practices, sociolinguistic diagnosis, language support, cultural mediation and curriculum management that is sensitive to context. In this domain, the provision of Portuguese as a Non-Native Language (PLNM) constitutes a relevant response to support students whose mother tongue or language of schooling is not Portuguese. The guidelines recently made available by the Directorate-General for Education aim to support the linguistic and curricular inclusion of migrant students with very limited knowledge of Portuguese [12]. In this context, school leaders play a decisive role in the enactment of inclusive policies, insofar as they are responsible for interpreting and translating regulatory guidelines into contextualised organisational, curricular and pedagogical practices [13]. Responding to diversity, therefore, requires strategic vision, resource management, collaborative work, engagement with families, communities, municipalities, and other local partners, as well as the monitoring and evaluation of the measures implemented.

Recent studies on the external evaluation of schools have highlighted its relationship with processes of autonomy, curriculum management and school improvement [14]. However, in the specific field of inclusive education, and particularly within the scope of the External School Evaluation Programme (PAEE), there remains a need to deepen understanding of how external evaluation is mobilised by school leaders and translated into organisational and pedagogical practices [15]. The external evaluation of schools therefore constitutes a relevant process for understanding how school organisations recognise, organise and sustain responses oriented towards inclusion. The reference framework for the third cycle of the PAEE was updated in 2023 and is structured around four domains — Self-Evaluation, Leadership and Management, Provision of Educational Service and Outcomes — allowing for a multidimensional reading of school action [16]. This framework sets out indicators related to the improvement of inclusive education, the functioning of support structures and the orientation of educational action towards the Students' Profile by the End of Compulsory Schooling [16]. However, the ways in which school leaders appropriate this evaluative process to promote contextualised inclusive practices require further examination.

Thus, this article focuses on the external evaluation of schools as a process that can foster institutional reflection and the improvement of responses to diversity, seeking to answer the following research questions: (1) How do school leaders appropriate external evaluation as an instrument for reflection, regulation and improvement? (2) How is this appropriation translated into the organisation of inclusion-oriented responses, considering the emerging challenges associated with students' linguistic and cultural diversity?

2. Methodology

This study adopts a qualitative approach, with an interpretivist orientation, suited to understanding processes, meanings and practices in specific educational contexts [17]. A case study was chosen, centred on a cluster of state schools in mainland Portugal, as it enables an in-depth analysis of a complex educational phenomenon in its real-life context: the way in which school leaders appropriate the external evaluation of schools to guide processes of reflection, regulation and improvement in organisational and educational responses [18]. The school cluster was selected intentionally, considering its participation in the third cycle of the External School Evaluation Programme and the relevance of the challenges associated with the social, linguistic, and cultural diversity of its school population. The unit of analysis focused on the action of school leaders and on the ways in which they interpret, mobilise and translate external evaluation into decisions and practices oriented towards inclusion.

The empirical corpus comprised two main sources: i) the external evaluation report produced by the Inspectorate-General of Education and Science and key institutional documents from the school cluster, namely the Educational Project, the Internal Regulations, the Director's Intervention Project, the Self-Evaluation Report and strategic planning documents; and ii) semi-structured interviews with 12 teachers holding leadership roles. The participants included the director of the school cluster and 11 coordinators with pedagogical, organisational and/or strategic responsibilities. Participants were selected intentionally, focusing on key actors who, because of the roles they perform within the school cluster, have direct knowledge of leadership processes, the organisation of support measures, the implementation of inclusive practices and institutional responses to student diversity.

The interviews took place between December 2024 and March 2025, at times agreed with the participants. The interview guide was developed in line with the objectives of the study and organised around dimensions related to school leadership, the appropriation of external evaluation, the organisation of inclusive responses, pedagogical practices, engagement with the community and the challenges arising from linguistic and cultural diversity. The interviews were audio-recorded, fully transcribed and incorporated into the analytical corpus. Documentary analysis made it possible to contextualise participants' accounts and triangulate the evidence collected, thereby strengthening the interpretative consistency of the findings [19].

The data were analysed through thematic analysis, supported by MAXQDA software. The analytical process combined deductive and inductive logics: in a first stage, categories guided by the objectives of the study and the theoretical framework were considered, namely the strategic, organisational, pedagogical and community dimensions of inclusion; in a second stage, repeated reading of the transcripts and documents enabled the identification of emerging subcategories related to collaborative decision-making, the mobilisation of evaluation data, support for teaching practices, responses to students' needs, and linguistic and cultural diversity. Coding was conducted iteratively, with successive revision of the categories, comparison across sources and selection of representative excerpts, to ensure the internal coherence of the analysis and the traceability of interpretations [20,21]. The credibility of the study was ensured through source triangulation, peer review within the research team and validation of the findings with participants [22].

The interviews were conducted in Portuguese; the excerpts presented in this article were translated into English by the authors, preserving the original as closely as possible.

The ethical principles applicable to educational research were observed. Participants were informed about the objectives of the study, the voluntary nature of their participation, the possibility of withdrawal and the conditions of confidentiality. All participants signed an informed consent form. The data were anonymised by assigning alphanumeric codes to participants, and the identity of the school cluster was omitted. The processing, storage and analysis of the information complied with the General Data Protection Regulation, ensuring the protection of personal and institutional data [23].

The limitations of the study stem from the nature of the single case, which does not allow for statistical generalisation. However, the analytical depth of the study and the transferability of the interpretations to contexts with similar characteristics constitute relevant contributions to the field [18,22]. It is also important to acknowledge that this research focuses on the perceptions of teachers holding leadership roles and on documentary analysis, without seeking to measure the effects of inclusive practices on students' learning or experiences. Even so, the study makes it possible to understand how school leaders interpret and mobilise external evaluation in the organisation of educational responses that are more closely attuned to diversity.

3. Results and Discussion

Data analysis made it possible to understand how school leaders appropriate external evaluation, mobilising it to sustain processes of reflection, regulation of educational action and improvement of responses to student diversity. Triangulation between the external evaluation report, key institutional documents and interviews reveals a dynamic relationship between institutional evaluation, school leadership and inclusion. This relationship is neither linear nor uniform; it depends on how leaders interpret the data contained in the report, articulate them with self-evaluation and convert them into strategic decisions, pedagogical practices and monitoring processes.

The most recent IGEC report awarded the school cluster under analysis a rating of Good in the domains of Self-Evaluation and Outcomes, and Very Good in the domains of Leadership and Management and Provision of Educational Service. As strengths, the report highlighted consolidated self-evaluation procedures, leadership dynamics oriented towards the mobilisation of resources and partnerships, effective resource management, the diversity of educational provision, curricular options aligned with the principles of inclusive schooling and the effectiveness of measures promoting equity and inclusion. Simultaneously, the report identified areas for improvement related to the articulation between self-evaluation and strategic planning, internal reflection on academic outcomes, the involvement of students, families and non-teaching staff, internal and external communication, formative assessment, and collaborative supervision.

The analysis of the school cluster's key institutional documents shows that several of these dimensions were incorporated into planning. The Educational Project presents inclusion as a guiding axis of educational action, linking it to academic success, citizenship, students' holistic development, self-evaluation and continuous improvement. The Strategic Action Plan translates this orientation into measures aimed at promoting inclusion, recognising the heterogeneity of students and the need to further operationalise the measures provided for in Decree-Law No. 54/2018. In the same vein, the Director's Intervention Project revisits dimensions identified in the external evaluation and reorganises them as axes of action, distinguishing areas requiring improvement — such as the academic outcomes of certain groups of students, weaknesses in communication processes and the systematisation of formative assessment — from aspects to be strengthened or consolidated, such as the participation of the educational community in the construction of key institutional documents and the development of collaborative supervision practices.

Subsequently, following the characterisation of the participants, the results are presented and discussed according to four analytical dimensions: strategic, organisational, pedagogical and community. This organisation makes it possible to show how external evaluation is appropriated by school leaders across different levels of school action, from strategic planning to the construction of educational responses oriented towards the challenges arising from students' linguistic, cultural and social diversity.

3.1 Characterisation of Participants

The empirical study was conducted in the 2024/2025 school year in a school cluster that offered education from pre-school to the secondary level, attended by around 2,500 students, approximately 25% of whom were of foreign nationality.

The study involved 12 teachers holding leadership roles: the director and 11 coordinators of pedagogical, organisational and inclusion support structures. Each participant was assigned an alphanumeric code from P01 to P12 to ensure confidentiality. The detailed characterisation of the participants is systematised in Table 1.

Table 1. Characterisation of Participants

Code	Leadership role	Length of service	Age group
P01	Coordinator of class tutors in secondary education	31–35	> 61
P02	Coordinator of class tutors in the third cycle of basic education	21–25	41–50
P03	Special education coordinator	36–40	> 61
P04	Coordinator of class tutors in the second cycle of basic education	26–30	41–50
P05	Project coordinator	36–40	> 61
P06	Coordinator of the Multidisciplinary Team for Support to Inclusive Education	26–30	51–60
P07	School sports coordinator and chair of the General Council	26–30	51–60
P08	Coordinator of the first-cycle basic education department	31–35	51–60
P09	School libraries coordinator	41–45	> 61
P10	School cluster director	21–25	41–50

P11	Citizenship and development coordinator	21–25	41–50
P12	Self-evaluation team coordinator	36–40	> 61

Source: Authors' own elaboration

Taken together, the participants represent different levels of decision-making and coordination, encompassing senior leadership, middle leadership, inclusion support structures, self-evaluation, projects, the school library and engagement with the community. This diversity makes it possible to analyse inclusion as an organisational process involving strategic decision-making, internal coordination, pedagogical monitoring and relationships with the surrounding context.

3.2 Strategic Dimension: From External Evaluation to Planning

The strategic dimension reveals that external evaluation constitutes a reference point for the leadership and institutional management of the school cluster, although its impact depends on leaders' capacity to integrate its results into planning, self-evaluation and improvement processes. The IGEC report recognises the existence of self-evaluation and data collection procedures; however, it identifies the need for stronger articulation with strategic planning and internal reflection on the results.

This tension between data collection, reflection and action is clearly present in the internal documents. The Self-Evaluation Report conceives self-evaluation as a continuous process, aimed at assessing the performance of the school cluster and defining more effective forms of action. In this sense, the document assumes the intention to identify strengths and weaknesses, analyse outcomes and establish strategic action plans that promote a culture of continuous improvement.

In the interviews, school leaders revisit this dimension as a process of progressive appropriation. External evaluation offers an external perspective that enables the confirmation of strengths, the identification of weaknesses, and the legitimisation of change. P07, for example, values the IGEC report precisely because it offers an external, objective view that complements the self-evaluation team's perspective. This perspective is linked to the role assigned to that team in the Internal Regulations, whose existence makes it possible to understand external evaluation not merely as a one-off evaluative event, but as a source of information capable of feeding internal mechanisms of reflection, monitoring and decision-making. Similarly, P01 associates external evaluation with a moment of clarification and guidance, particularly in the context of implementing inclusive education policies after 2018. The participant states that the school cluster needed to understand what should be adjusted and that, following the evaluation, support documents and clearer guidelines for teachers were produced. This interpretation shows that external evaluation was appropriated as an instrument of internal regulation, helping to translate regulatory guidelines into concrete procedures.

However, this strategic appropriation of external evaluation does not remain linear over time. The director (P10) acknowledges that the IGEC reference framework was relevant when the report was received, but that it gradually lost centrality: "over time, it ended up fading into the background, as we are constantly confronted with new challenges (...) the COVID-19 pandemic, followed by the arrival of a large number of students from migrant backgrounds, including students of foreign nationality. The school is in permanent transformation, and we hardly have time to reflect on what we have already done" (P10). Qualitatively, P10's account is relevant because it reveals a central ambivalence: external evaluation legitimises improvement, yet its influence becomes fragile when schools face successive challenges and lack protected time for collective reflection. In this sense, external evaluation operates less as a fixed prescription than as a catalyst whose effects require continuity in internal routines of reflection, planning and monitoring.

The recent partnership with an external consultancy body to support the evaluation of the Educational Project, mentioned by P07 and P10, suggests a willingness to strengthen internal capacity for organisational analysis, drawing on initial external support as part of an empowerment strategy.

3.3 Organisational Dimension: Formal Structures and Distributed Responsibilities

The organisational dimension shows that the response to diversity is sustained by a network of structures, responsibilities and coordination mechanisms. The IGEC report had already recognised the school leadership as a cohesive, dynamic team, open to dialogue and capable of mobilising resources and partnerships, while also highlighting the existence of middle leadership structures suited to the educational responses required. It further valued the rational and equitable management of resources and the existence of an overall school environment that is safe, welcoming and inclusive.

The key institutional documents confirm this organisation. The Internal Regulations formalise specific resources to support learning and inclusion, including the Psychology and Guidance Service, Special Education teachers, the Multidisciplinary Team for Support to Inclusive Education (EMAEI), the Learning Support Centre, the Reference School for Early Intervention and other forms of support. This organisational architecture shows that inclusion is institutionalised through formal structures, whose implementation depends on the articulation between these structures and teachers' practices.
The interviews make it possible to understand how this organisation is operationalised. The director (P10) emphasises that the enactment of inclusive practices depends on the involvement of middle leaders and teachers, recognising that initiatives designed by the leadership only become effective when they are appropriated by the actors responsible for implementing them.
This idea is central to interpreting leadership as a distributed process. The action of leaders is not limited to defining guidelines; it involves coordination, listening, the mobilisation of resources, the negotiation of solutions and the monitoring of responses. Inclusion is thus presented as a shared organisational responsibility, requiring a chain of mediation between the leadership team, coordinators, class councils, EMAEI, Special Education, teachers, families and external partners. The EMAEI emerges as a decisive structure in this mediation. P06 describes an ongoing process of document review, monitoring of measures to support learning and inclusion, reorganisation of the Learning Support Centre, and mobilisation of teachers from different subject areas to respond to students' specific needs.
The organisational dimension is also evident in the work of the coordinators of class tutors, who act as mediators among class councils, the leadership team and support structures (P01, P02, P04). These coordinators follow cases, guide procedures and contribute to the early identification of needs. This articulation is particularly important in a large school cluster, where the circulation of information may constitute both a condition for effectiveness and a source of vulnerability.
Despite the existence of these structures, the data reveal persistent limitations. P12 considers that the EMAEI seeks to address needs, but the lack of human resources prevents an effective response. This finding is consistent with the pressure felt by other participants regarding the shortage of psychologists, operational assistants, specialised teachers and available time for monitoring and support. Thus, the organisation of inclusive responses depends on formal structures, but also on material and human conditions that do not always keep pace with the growth of needs. This constitutes a key organisational tension: formal structures signal institutional commitment to inclusion, but they do not by themselves guarantee effective capacity for response.
In this scenario, external evaluation makes organisational strengths and weaknesses visible. The external evaluation report values leadership, resource management and partnerships, but also identifies communication and the involvement of different actors in the school cluster's strategic definition as areas for improvement. The interviews show that investment was made in meetings, internal coordination, monitoring documents and consultation with the community, while also acknowledging that the increasing complexity of the school population requires more rigorous, agile and sustained coordination.

3.4 Pedagogical Dimension: Inclusive Responses, Assessment and Classroom Practices

The pedagogical dimension makes it possible to analyse how strategic and organisational guidelines are translated into teaching, assessment and student monitoring practices. The IGEC report recognised as strengths the diversity of educational provision, participation in projects that consolidate curricular autonomy and flexibility, the articulation of learning, collaborative practices among teachers and curricular options consistent with the primacy of inclusive schooling. However, it identified two areas for improvement that are particularly relevant to the transformation of pedagogical practice: deepening formative assessment and developing systematic procedures for monitoring and regulating teaching practice, including shared observation within a logic of collaborative supervision.
The Strategic Action Plan confirms that inclusion was translated into concrete pedagogical measures. The Action Plan for Inclusion identifies student heterogeneity and different modes of access to learning as a problem, defining as objectives the improvement of student success, the dissemination of available support resources to the community and the empowerment of students for integration into active life. Among its targets, particular emphasis is placed on ensuring co-teaching in Portuguese and Mathematics in classes with students identified as requiring selective measures.
The interviews show that this orientation is implemented through measures, pedagogical differentiation, in-class support, tutoring, the Study Room, Study Support, projects and coordination among teachers. P01 refers to the use of shared grids in class councils to identify difficulties and measures to be applied, enabling more timely intervention. P07 also describes the existence of diversified responses, such as in-class support, tutoring, mentoring and other forms of support, advocating flexible management

centred on students' characteristics. Inclusion is thus understood as a monitoring process that adjusts available resources to each student's specific needs, requiring coordination between diagnosis, intervention and monitoring. However, it is in this dimension that tensions become most evident. Although formative assessment is recognised as a priority, it emerges in the interviews as a practice still undergoing consolidation. P11 states that, following the external evaluation, the school cluster sought to strengthen formative assessment practices, although the process was marked by difficulties and some resistance from teachers: "We sought to implement some measures, namely regarding student assessment, but it has been a difficult process" (P11). This excerpt is analytically significant because it suggests that pedagogical change is not experienced merely as a technical adjustment, but as a demanding reconfiguration of assessment cultures, professional routines and shared responsibility for learning.

This tension is also visible in the Director's Intervention Project, which identifies the lack of systematic use of formative assessment as a feedback instrument for students and the absence of collaborative supervision oriented towards improving teaching practices as problems. The fact that these problems are included in the director's strategic diagnosis confirms that the areas for improvement identified by IGEC were appropriated within strategic planning, even though they remain challenges in terms of implementation.

Thus, the pedagogical dimension reveals a gap between the existence of guidelines and the effective transformation of classroom practices. External evaluation contributed to legitimising priorities such as formative assessment, differentiation, supervision and the regulation of practices, but their implementation depends on time, training, resources, collaboration and continuous professional development. Pedagogical change therefore appears to be slower and more demanding than documentary or structural reorganisation. This gap makes visible the tension between declared inclusion and lived inclusion: the existence of policies, documents and leadership intentions is necessary but insufficient when classroom practices and assessment cultures are not consistently transformed.

3.5 Community Dimension: Linguistic and Cultural Diversity as an Organisational Challenge

The community dimension is particularly prominent in participants' accounts. The IGEC report had already noted that, despite investment in the teaching and learning processes of students from migrant backgrounds, namely through the provision of PLNM and pedagogical support, outcomes remained below the desirable level. The Director's Intervention Project revisits this weakness, identifying the school outcomes of these students as a challenge to be overcome.

In the interviews, the director states that the school cluster welcomes around 600 students of foreign nationality, with particularly marked growth over the last three years, characterising diversity and multiculturalism as "the greatest challenge" (P10). P01 corroborates this interpretation, describing the increase as a sudden and intense change, and listing concrete difficulties: the concentration of several students of foreign nationality in the same class, the need to adjust curricula, the management of PLNM and the gap between students' prior knowledge and curricular requirements, particularly in years subject to national examinations. The response to this challenge has involved strategic and organisational readjustments. The director refers to the revision of initiatives such as linguistic and cultural mentoring, aimed at supporting newly arrived students, as well as the allocation of mentors by the Ministry of Education, interpreted as a response to the growth in the number of students of foreign nationality and to the demands of their academic and sociocultural integration. However, participants are also clear that some of these responses are improvised, particularly in situations requiring immediate action. Recalling the arrival of refugee students, P07 observes: "in many situations, we acted almost like a 'fire brigade', trying to solve problems as they arose. Goodwill and mutual help were fundamental, but we cannot regard that as an effective management model. What is needed are well-defined procedures" (P07). The school library also emerges as a relevant structure in this process: P09 describes it as a space "of everyone and for everyone", oriented towards welcoming students and promoting intercultural activities. This account points to the need to move from reactive problem-solving to more institutionalised, anticipated and collectively shared procedures.

This dimension shows that linguistic and cultural diversity is not merely a pedagogical challenge, but also an organisational and community issue, involving welcoming practices, communication with families, cultural mediation, language support, curriculum management and articulation with local partners. However, family involvement remains fragile, being recognised by the director (P10) as one of the main challenges, particularly in the more advanced stages of schooling, in line with the area for improvement identified by IGEC concerning the need to strengthen the participation of parents/guardians, students and non-teaching staff in the school cluster's strategic choices.

4. Conclusions

This study made it possible to understand how, in this case, school leaders appropriated the external evaluation of schools to guide institutional reflection, regulate educational action and improve responses to student diversity. In the case analysed, this appropriation was reflected in the definition of priorities, the reorganisation of support structures, the valuing of middle leadership and the monitoring of educational responses. In this process, school leaders mobilise different dimensions of school action – strategic, organisational, pedagogical and community – to sustain responses that are more closely attuned to student diversity. However, these processes are still undergoing consolidation and require stronger articulation between external evaluation and self-evaluation, strategic planning and the monitoring of pedagogical practices.

Inclusion emerges as a collective process, constructed through the articulation between senior leadership, middle leadership, teachers, specialised structures, families and external partners. Linguistic and cultural diversity emerges as a particularly significant and growing challenge, showing that inclusion requires institutional, pedagogical and community conditions capable of sustaining the participation, learning and development of all students. The findings caution, however, against celebratory readings: where time for reflection, resources and family engagement fall short, inclusion risks remaining a declared principle rather than a lived practice – a risk that grows as diversity increases faster than the conditions required to address it.

It is concluded that external evaluation acquires its true meaning when appropriated by school leaders as an instrument of reflection, shared responsibility and situated organisational transformation. Its relevance lies not only in the diagnosis it produces but also in how it is transformed into empowered action. Its impact is therefore mediated by leadership practices, organisational conditions and the capacity to convert evaluative evidence into situated and sustained action. It is through this movement that school leaders can strengthen the school's capacity to respond to diversity in a more responsive, equitable and committed way, promoting the educational success of all students.

Cognitive Accessibility in Inclusive Art Education: A Cognitive Science Perspective on Students with Learning Differences

Huqiu Zhou

Sichuan Normal University, China

Abstract

Drawing upon core principles from the field of cognitive science, this paper explores how pedagogical practices can be restructured to better serve students who demonstrate atypical learning patterns. The main argument is that inclusion should not stop at physical placement in the classroom. What matters is also whether students can actually reach, work with and express what is being taught. By examining cognitive mechanisms such as selective attention, encoding, retention, comprehension, and knowledge articulation, educators can uncover obstacles that remain concealed beneath seemingly typical classroom engagement. The essay uses the concept of cognitive accessibility and places it within art education, a subject where learning often depends on visual interpretation, symbolic meaning, memory, planning and creative expression. It examines dual coding, concrete examples, retrieval practice, elaboration and spaced practice as possible design principles for inclusive teaching. At the same time, it does not treat cognitive science as a complete answer. It needs to be read together with Universal Design for Learning, culturally responsive teaching and more critical views of inclusion.

Keywords: *cognitive science; inclusive teaching; learning differences; cognitive accessibility*.

1. Introduction

Inclusive education cannot be reduced to students sharing the same classroom space. A learner might sit among peers and complete the assigned activity, yet still remain outside the real learning process. This situation typically arises when instructional designs implicitly presuppose that every learner absorbs content, structures thoughts, and expresses comprehension through uniform modalities. For learners with different cognitive needs, the obstacle is not always the diagnosis itself. It can be created by the teaching design: instructions given all at once, examples that are not clear enough, weak connections with prior knowledge, or a response format that leaves little room for difference.

The present paper contends that insights derived from cognitive science enable educators to refine inclusive pedagogy by positioning cognitive accessibility as a foundational principle in curriculum planning. Cognitive accessibility means arranging learning so that students with different cognitive profiles can access, process, remember and communicate knowledge. It is not about making the work easier. Instead, the paper explores the means by which rigorous academic objectives can be achieved via well-structured content progression, intentional material presentation, scaffolded rehearsal, and actionable feedback tailored to learners' needs. This view is close to inclusive approaches that plan for learner diversity from the beginning (Schmidt & Harriman, 1998). It also connects with UDL as a form of anticipatory design (Sewell et al., 2022), and with Kennette and Wilson's (2019) view that UDL removes learning barriers from the outset rather than adding support only after problems appear.

I develop this argument through art education. At first glance, art lessons can seem naturally inclusive because they involve images, materials and some degree of choice. But this can be a little misleading. Art learning is not only about making things. It also asks students to interpret, remember, plan and communicate meaning. An activity that appears open-ended and imaginative may nonetheless prove challenging to engage with unless learners receive guidance in linking observed elements to the conceptual understanding and outputs that are required of them. Inclusive art education therefore needs both parts: space for creative freedom, and enough cognitive structure to help students move from seeing, to understanding, to making.

2. Reframing Learning Differences as Cognitive Accessibility

2.1 From Physical Inclusion to Cognitive Accessibility

Learning differences should not be treated as fixed labels or simple measures of ability. Students differ in many ways: attention, memory, language, processing speed, planning, confidence and expression. A cognitive perspective is useful because it shifts attention away from broad labels and towards the points where learning tasks become unnecessarily difficult.

This change also reshapes the question of what inclusion means in practice. It is not enough for students to take part in the same classroom activity. The activity also has to offer a possible path into the concept being taught. One learner may finish the assigned work yet fail to grasp the underlying concept the activity was designed to cultivate. A second pupil, conversely, might comprehend the intended notion but encounter difficulty articulating that knowledge through the specific format selected by the instructor. In both situations, the difficulty does not belong only to the student. It is also linked to the way the task has been designed. The path into learning may be too limited, or the method for showing learning may not match what the student is actually able to communicate.

It also challenges support that begins only after failure. When help is added at the end, the original design remains untouched. Aleven and Koedinger (2000a) show that students do not always know when they need help or use support effectively when it is left entirely to them. The wider implication is clear: inclusive teaching should embed support from the beginning rather than rely on students to request it.

2.2 Hidden Cognitive Barriers in Learning

Several cognitive barriers are relevant here. Long explanations, crowded slides or loosely organised tasks can make attention harder to hold. When students have to remember instructions, read examples, handle materials and make choices at the same time, working memory may become overloaded. Sweller (1988) argues that learning can be hindered when problem solving places heavy cognitive load on limited processing capacity. From the perspective of inclusive pedagogy, this indicates that challenges may originate as much from how a task is constructed as from the individual characteristics of the learner. Memory, retrieval and executive function also matter, since students need to bring earlier knowledge back into use while planning and monitoring complex work.

These barriers are not limited to students with learning differences, but these students may experience them more sharply. They are also easy to misread. A pause may mean processing, not disengagement. A short answer may show difficulty organising language, not lack of understanding. A simple artwork may suggest that the link between concept, material and outcome has become unclear. Consequently, effective inclusive pedagogy must examine the cognitive architecture underpinning tasks, instead of evaluating learners solely on the basis of their end-product performance.

Cognitive accessibility does not remove difficulty. It separates meaningful challenge from avoidable confusion. Teachers can sequence explanation, reduce split attention, clarify expectations, combine visual and verbal information, build in recall and provide structures for planning and explanation. The goal is not easier learning, but better designed access to demanding learning.

2.3 Why Cognitive Accessibility Matters in Art Education

Art education makes this issue visible because artistic learning combines perception, interpretation, memory, decision-making and expression. In lessons involving cultural forms, students are not simply recognising a pattern or object; they are learning how visual forms carry social, historical and symbolic meaning. Fu (2025) treats arts and crafts appreciation as a matter of interpretation, and Sullivan (1993) similarly frames art education as meaningful, authentic, critical and pluralist rather than mere practical production.

The danger is that making can be mistaken for understanding. Studies of surface-level learning have demonstrated that learners are capable of generating accurate responses yet remain unable to articulate the underlying rationale (Aleven, Koedinger, Sinclair, & Snyder, 1998). Although the subject area is distinct, this observation holds relevance for art education: pupils can replicate a design or finish a project without grasping its cultural significance or conceptual foundation. Completion is therefore not the same as cognitive access.

A more inclusive art lesson makes the movement from seeing to understanding, and from understanding to expression, more visible. It does not impose one interpretation or restrict creativity. It clarifies what

students should notice, how form connects with meaning, how prior knowledge can be recalled and how creative decisions can be explained.

3. Cognitive Science as Inclusive Design Principles

Cognitive science is most useful for inclusive teaching when it functions as a design resource, not as a catalogue of techniques. Research on Cognitive Tutors shows how theories of cognition can inform instructional design through knowledge representation, practice, feedback and progression (Anderson et al., 1995). This essay uses that insight in a broader classroom sense: learning processes should shape inclusive design.

Weinstein, Madan and Sumeracki (2018) discuss dual coding, concrete examples, retrieval practice, elaboration and spaced practice. Here these strategies are organised around three design problems: access, memory and interpretation. This structure keeps cognitive science tied to barriers in learning rather than presenting it as a list of study tips.

3.1 Designing Access: Dual Coding and Concrete Examples

The first issue is access, or how students first meet new knowledge. Dual coding can help because it connects what students see with what they hear or read. In an art lesson, for example, a teacher might show an artwork, point out the focal area, mark contrast or rhythm, and briefly explain how these features guide attention. When cultural symbols are introduced, the image can be placed beside a few key words and a short explanation of its meaning. This is useful for students who find long verbal explanation difficult, and also for those who can see the image but need language to make sense of it.

Concrete examples give abstract ideas a visible form. Concepts such as symbolism, cultural identity or creative transformation are difficult if introduced only through general language. Hakka architecture, paper-cut designs, festival objects, traditional colours or local craft materials can become bridges between sensory experience and conceptual understanding when students observe, describe and discuss what they represent.

These strategies support inclusion only when aligned with the learning purpose. More images do not automatically improve access; crowded or decorative visuals may increase load. Examples can also encourage imitation if students are not guided to compare, question and apply them. As research on shallow learning suggests, learners may rely on surface features when teaching does not direct attention to underlying principles (Aleven et al., 1998).

3.2 Designing Memory: Retrieval Practice and Spaced Practice

The next issue is memory. Students cannot use knowledge if they cannot bring it back when they need it. In art education, for example, a cultural symbol introduced in one lesson may return later in a sketch, a discussion, or a final piece of work. Retrieval practice asks students to recall information, rather than simply look over it again (Weinstein et al., 2018). In an inclusive lesson, this does not need to feel like a test. It can be simple and low-pressure: sketching a symbol from memory, recalling the steps of a technique, naming features of an art style, or explaining an idea briefly to a classmate.

Spaced practice supports this process by returning to content over time. Instead of presenting a cultural idea once, the teacher can revisit it through observation, visual analysis, sketching and later transformation. Each return allows students to reconstruct understanding in a different form.

For students with learning differences, retrieval and spacing reduce the expectation that everything must be understood and remembered immediately. They also support transfer. Yet they should not become mechanical repetition; each return should add meaning, moving from recognition to explanation, application and creative transformation.

3.3 Designing Interpretation: Elaboration and Self-Explanation

The third problem is interpretation. Studies of surface-level learning have demonstrated that learners are capable of generating accurate responses yet remain unable to articulate the underlying rationale (Aleven, Koedinger, Sinclair, & Snyder, 1998). Although the subject area is distinct, this observation holds relevance for art education: pupils can replicate a design or finish a project without grasping its cultural significance or conceptual foundation.

Problem-solving research supports this point. Ahlum-Heath and Di Vesta (1986) found that conscious verbalisation can support transfer by making reasoning explicit. Aleven and Koedinger (2002) likewise

found that students who explained their problem-solving steps developed stronger understanding and performed better on transfer tasks. Explanation is therefore part of learning, not merely a report after learning.
In art education, students should be supported not only to make an artefact, but to explain their choices. Questions such as why a particular symbol was chosen, how a given form connects to a cultural concept, what modifications have been made relative to the source material, and what significance the final piece conveys can shift learners from mere execution toward genuine comprehension.
Such explanation still requires support. Open questions can invite rich thinking, but may overwhelm students who need linguistic or conceptual scaffolding. Aleven and Koedinger (2000b) show that useful self-explanation often depends on feedback and dialogue. Sentence starters, labelled examples, visual prompts, comparison tables and group discussion can make explanation an accessible practice rather than another barrier.

3.4 From Techniques to Design Logic

The value of cognitive science does not lie in a fixed package of methods. Its stronger contribution is a design logic. Dual coding and concrete examples support access; retrieval and spaced practice support memory; elaboration and self-explanation support interpretation. Together, they form a sequence from noticing to understanding, remembering, explaining and creating.
This design logic connects cognitive science with inclusive education. Weinstein et al. (2018) show that learning depends on how knowledge is encoded, retrieved, elaborated and revisited. Aleven and Koedinger (2002) show that deeper understanding is more likely when learners explain reasoning rather than only complete tasks. Inclusive teachers should therefore ask not only whether students participate, but whether participation builds organised and communicable understanding.
This view also connects with UDL, which emphasises multiple means of engagement, representation, action and expression (Sewell et al., 2022). Cognitive science explains why such flexibility matters: different forms of representation and expression reduce different cognitive barriers. Used in this way, cognitive science does not reduce ambition; it clarifies where a lesson pressures attention, memory, retrieval, interpretation or expression.

4. Applying Cognitive Science to Inclusive Art Education

4.1 From Visual Observation to Guided Noticing

The first application is to make visual observation more guided. Students are often told to “look carefully”, but that instruction can be too open to help. A cognitively accessible lesson needs to show what careful looking involves. The teacher might draw attention to line, colour, texture, proportion or rhythm, and then add a short verbal explanation for each feature. When looking at Hakka architecture or a local craft object, students could first notice repeated forms, then consider how these forms connect with use, belief or community memory. In this way, dual coding gives observation some structure, but it does not replace interpretation. Students are not just shown an image and left to work it out alone. They are helped to notice what matters, and why it may matter.

4.2 From Cultural Symbols to Interpretation

A second application concerns cultural symbols. Students may recognise a motif, a colour or a detail in a building without really understanding its historical meaning. So inclusive art teaching needs to help them move from recognition to interpretation. Concrete examples should not be treated as models to copy. They work better as materials for comparison, questioning and meaning-making. Students might compare several motifs, notice shared visual qualities, and then discuss how these qualities connect with social context. A second application concerns cultural symbols. Students may recognise a motif, a colour or a detail in a building without really understanding its historical meaning. So inclusive art teaching needs to help them move from recognition to interpretation. Concrete examples should not be treated as models to copy. They work better as materials for comparison, questioning and meaning-making. Students might compare several motifs, notice shared visual qualities, and then discuss how these qualities connect with social context.
Vavrus (2008) reminds us that teaching needs to take culture seriously, rather than assume learners are culturally neutral. In art education, this means cultural examples should open up dialogue, not close it down with one fixed meaning. This matters because cultural knowledge is not simply information

handed from teacher to student. It is understood through students' own experiences, language and sense of identity.

4.3 From Memory to Creative Transformation

A third application is to connect memory with creative transformation. Students cannot reshape an idea if they cannot recall it. When a cultural notion is presented only once before being immediately succeeded by an unrestricted creative assignment, certain learners risk severing the connection between the original reference and their personal output. A more supportive sequence might move from observation, to recall, to comparison, then sketching and later adaptation. In this sense, retrieval and spacing are not rote repetition. They give students repeated chances to meet the same cultural idea at different levels of difficulty. Later making can then be guided by remembered meanings, rather than only by isolated visual effects. Cognitive support does not limit creativity; it gives students something firmer to think with when making independent choices.

4.4 From Single Output to Multiple Expression

The fourth application is to broaden expression. If assessment focuses only on a polished final artwork, some students may be unable to show the thinking that occurred during learning. UDL values multiple means of action and expression (Sewell et al., 2022). Learners may evidence their comprehension through labelled drawings, spoken justification, graphic organisers, brief reflective writing, collaborative dialogue, electronic montages, or a concluding artefact accompanied by documentation of the creative process. These are not easier alternatives; they are different routes for showing the relationship between form, meaning and intention. This also makes assessment fairer: the teacher can judge not only aesthetic finish, but the quality of interpretation, decision-making and reflection behind the work.

5. Critical Discussion

5.1 The Contribution of Cognitive Science

Cognitive science helps inclusive teaching by making the learning demands of a task easier to see. It asks what students are being asked to do with attention, working memory, retrieval, interpretation and expression. This matters in art education, where taking part and finishing a piece of work can sometimes look like understanding. But they are not always the same thing. Aleven and Koedinger (2002) are useful here because their study shows that learners often develop stronger understanding when they explain their reasoning, rather than only complete the task. In this sense, cognitive science supports a deeper kind of inclusion: one concerned with understanding and transfer, not just participation. Its role is not to remove difficulty from learning. It helps teachers decide which difficulties are meaningful, and which ones simply block access.

5.2 The Limits of a Cognitive Approach

At the same time, a cognitive account has obvious limits. Inclusion is not just about making information easier to process. It is also shaped by emotion, language, identity, culture, peer relationships and the wider conditions of the institution. Lindsay (2003) warns that inclusive education is too complex to be explained through simple claims about placement or teaching method. Even a meticulously planned lesson can prove exclusionary when it treats cultural knowledge as static, or when learners do not experience a sense of trust and validation within the classroom environment. Vavrus (2008) is useful here because he stresses the need for culturally responsive teaching. Cognitive accessibility, then, has to work alongside cultural responsiveness, care in classroom relationships and a critical awareness of power.

5.3 Cognitive Science and Universal Design for Learning

Cognitive science and UDL are complementary rather than interchangeable. UDL offers a broad framework through engagement, representation, action and expression; cognitive science explains why these forms of flexibility matter for learning processes. Yet UDL should not become a checklist. Kennette and Wilson (2019) found that students and faculty perceived many UDL elements as useful, but also note that perception data do not by themselves prove learning outcomes. A cognitively informed UDL

approach should ask which barriers a lesson creates, which forms of representation or expression address them, and how teachers will know that understanding has developed. In this sense, UDL provides the inclusive orientation, while cognitive science helps test the pedagogical logic of particular design decisions.

6. Conclusion

This essay has argued that cognitive science can inform inclusive teaching by shifting attention from physical presence to cognitive accessibility. Students with learning differences may be excluded because the learning pathway is narrow, overloaded or implicit. Cognitive science helps teachers identify these hidden barriers and redesign lessons so that students can access, retain, interpret and express knowledge more effectively.

Even a meticulously planned lesson can prove exclusionary when it treats cultural knowledge as static, or when learners do not experience a sense of trust and validation within the classroom environment. Dual coding, concrete examples, retrieval practice, spaced practice, elaboration and self-explanation can support this movement from noticing, to understanding, to remembering, explaining and creating. When applied thoughtfully in combination with UDL and culturally responsive pedagogy, insights from cognitive science have the potential to render inclusive art teaching both more intentional and more equitable across diverse learner profiles.

Primary and Early Childhood Education

An Innovative Model for Mastering the Activity of Finding an Unknown Component in Equations in Primary School

Vladimira Angelova[1], Aleksandra Nikolova[2]

[1,2]Plovdiv University 'Paisii Hilendarski', Bulgaria

Abstract

One of the expected outcomes set out in the mathematics curricula for second, third, and fourth grades (general education) in the Republic of Bulgaria is the acquisition of skills for finding unknown addends and unknown multipliers (second grade), unknown minuend and unknown dividend (3rd grade), and unknown subtrahend and unknown divisor (4th grade).
This publication focuses on the acquisition of skills by 8-10-year-old students for finding unknown components in equations. Its aim is to present the author's model for teaching primary school pupils (aged 8-10) to effectively master the activity of finding unknown components in equations. To test the effectiveness of the model, a long-term pedagogical experimental study was conducted in the period 2022–2025, covering three consecutive school years. It involved 250 students, 125 of which in a controlled group and 125 students in an experimental group tracked from second to fourth grade, which allowed for an analysis of the sustainability and accumulation of results over time.
The analysis of the results obtained from this study shows that the implementation of the author's model in mathematics education of the experimental group from 2nd to 4th grade supports a more conscious and in-depth mastery of competencies for finding unknown components in equations.
The application of systematic training in finding unknown components also helps students aged 8–10 to apply these competencies more easily and effectively when solving problems for composing equations with unknown numbers in mathematical texts and when solving word problems.

Keywords: *primary school, mathematics, unknown component*

1. Introduction

The mathematics curricula for the primary stage of education in Bulgaria [1], [2], [3] provide for the derivation of rules for:

- finding an unknown addend and an unknown multiplier in second grade;
- finding an unknown minuend and an unknown dividend in third grade; and
- finding an unknown subtrahend and an unknown divisor in fourth grade.

The aim of the present publication is to present the author's approach to teaching primary school students to effectively master the activity of finding an unknown component in equations.
Different symbols, letters, etc. may be used to denote the unknown component. In primary school practice in Bulgaria, the most common way of denoting it is by means of an empty square (□).
Primary school students determine the unknown component in equations in two ways:

1. Based on their knowledge of arithmetic operations, by "guessing" the unknown number and checking whether their choice is correct;
2. Based on rules for finding the unknown component. These rules are formulated on the basis of the relationships between the components and the results of arithmetic operations that students have previously mastered.

2. Method

The aim of the present paper is to present an innovative teaching model for mastering the activity of finding an unknown component in equations by students at the primary stage of education.
The components of this innovative teaching model are presented in **Fig. 1.**

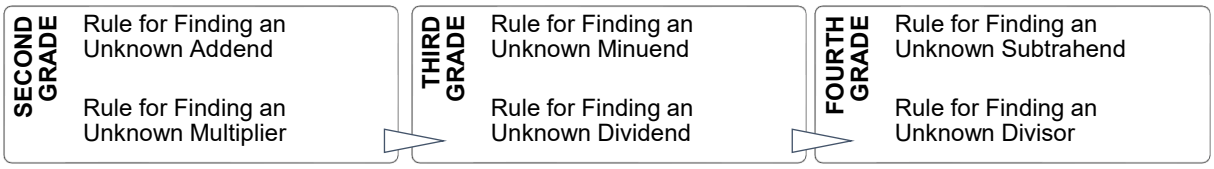

Fig. 1. Innovative teaching model for mastering the activity of finding an unknown component in equations.

2.1 Methodological Approach to Teaching the Rule for Finding an Unknown Addend

Finding an unknown addend by using the relationship between the components and the result in the operation of addition is a competence defined as an expected learning outcome in the mathematics curriculum for second grade [1]. The derivation of the rule is planned to take place within the general topic *Addition and Subtraction of Numbers up to 100 without Regrouping*.
It is appropriate for the methodological work to begin with the consideration of a problem on the basis of which the relationship between the components and the result in the operation of addition can be reached. To discover this relationship, the following problem is proposed:
Example 1. Compose a word problem based on the picture.

The picture is examined and analyzed. The teacher needs to emphasize the number of doughnuts that the boy and the girl place on the table and guide the students toward composing problems that are modeled by the expressions shown to the right of the picture.
Clarification: There are 23 blue doughnuts on the boy's tray and 10 pink doughnuts on the girl's tray.
Based on the illustration and the mathematical expressions, three-word problems can be composed: one that is solved by addition and two that are solved by subtraction. The problems are as follows:

a) *Georgi serves 23 blue doughnuts on the table, and Ani serves 10 pink doughnuts. How many doughnuts are there on the table altogether?*
b) *There are 33 doughnuts on the table. Of these, 10 are pink, and the rest are blue. How many blue doughnuts are there?*
c) *There are 33 doughnuts on the table. Of these, 23 are blue, and the rest are pink. How many pink doughnuts are there?*

The solutions to these word problems are as follows:

a) 23 + 10 = 33 (doughnuts altogether);
b) 33 – 10 = 23 (blue doughnuts);
c) 33 – 23 = 10 (pink doughnuts).

The three resulting interconnected equations are examined and analyzed. The discussion, aimed at identifying the position of the same numbers, leads to the following generalization: *If one addend is subtracted from the sum, the other addend is obtained.*
The derived relationship is applied when finding the unknown number in the problem from the following example.

Example 2. Find the unknown addend.

16 + □ = 48

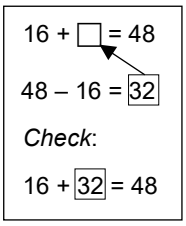

Fig. 2. Layout of the solution for problems involving the finding of an unknown addend.

By using the relationship between the components and the result in addition, the rule for finding an unknown addend is derived: *The unknown addend is found by subtracting the known addend from the sum.*

It is appropriate to reinforce this rule through problems in which an equation with an unknown addend is composed on the basis of a given mathematical text (Example 3) and through word problems that are modeled by an equation with an unknown addend (Example 4).

Example 3. Find the number that was thought of.

Neli thought of a number. She added 42 to it and obtained 68. What number did Neli think of?

Example 4. There were several boxes of chocolates on a shelf. After 3 more were placed there, they became 25. How many boxes of chocolates were there on the shelf initially?

Solving mathematical and practical problems by composing an equation with an unknown addend is an activity suitable for improving students' ability to use the derived rule in different situations.

For the application of students' mathematical knowledge, it is appropriate to solve problems with a more complex structure, such as the one proposed in the following example.

Example 5. Find the number.

To which number should 32 be added in order to obtain the difference between the numbers 96 and 54?

The organization of problems of this type should be carried out in two stages: first, establishing the correctness of the equations written by the students, and then checking the correct application of the rule for finding an unknown addend and the formatting according to the model in Example 2**.**

2.2 Methodological Approach to Teaching the Rule for Finding an Unknown Multiplier

Finding an unknown multiplier by using the relationship between the components and the result in the operation of multiplication is a competence defined as an expected learning outcome in the mathematics curriculum for second grade [1]. The teaching of the rule for finding it is planned to take place within the general topic *Multiplication and Division Tables*.

It is appropriate for the methodological work to begin with the consideration of a problem on the basis of which the relationship between the components and the result in multiplication can be defined. To discover this relationship, the following problem may be used:

Example 6. Compose word problems based on the picture.

Based on the illustration, three problems can be composed: one that is solved by multiplication and two that are solved by division. Here are sample formulations of the problems:

a) *There are 3 daffodils in each of 4 vases. How many daffodils are there in the vases altogether?*
b) *Twelve daffodils are placed in vases, with 3 daffodils in each vase. In how many vases are the daffodils placed?*
c) *Twelve daffodils are placed equally in 4 vases. How many daffodils are there in each vase?*

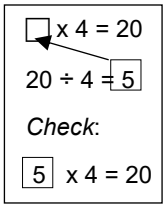
The solutions to these word problems are as follows:

a) 4 x 3 = 12 (daffodils altogether);
b) 12 ÷ 3 = 4 (vases);
c) 12 ÷ 4 = 3 (daffodils in one vase).

The three resulting interconnected equations are examined and analyzed. The discussion, aimed at identifying the position of the same numbers, leads to the following generalization: *If we divide the product by one of the multipliers, we obtain the other multiplier.*
The derived relationship is applied when finding the unknown number in the problem from the following example.

Example 7. Find the unknown multiplier.

□ x 4 = 20



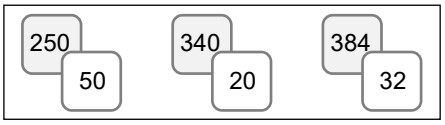


Fig. 3. Layout of the solution for problems involving the finding of an unknown multiplier.

By using the relationship between the components and the result in multiplication, the rule for finding an unknown multiplier is derived: *The unknown multiplier is found by dividing the product by the known multiplier.*
This is followed by solving a sufficient number of problems, such as those in Example 7, in order to help students make sense of the knowledge related to finding an unknown multiplier.
The problems for reinforcing and improving the skill of finding an unknown multiplier are analogous to those presented in section 2.1**.**

2.3 Methodological Approach to Teaching the Rule for Finding an Unknown Minuend

Finding an unknown minuend on the basis of the relationship between the components and the result in the operation of subtraction is a competence defined as an expected learning outcome in the mathematics curriculum for third grade [2]. The teaching of the rule for finding an unknown minuend is planned to take place within the general topic *Addition and Subtraction of Numbers up to 1000 without Regrouping*.
It is appropriate for the methodological work to begin with the consideration of a problem on the basis of which the relationship between the components and the result in the operation of subtraction can be clarified. To discover this relationship, the reasoning involved in solving the problem from the following example is proposed.
Example 8. Calculate the difference between the two numbers written on the cards and check it by addition.

As early as first grade, students know that the operation of addition can be used to check the operation of subtraction. According to the instructions for this problem, students should write three pairs of equations:

250 – 50 = 200, 340 – 20 = 320, 384 – 32 = 352,
200 + 50 = 250, 320 + 20 = 340, 352 + 32 = 384.

On this basis, after discussing the position of the same numbers in the equations, the following relationship is formulated: *If the difference is added to the subtrahend, the minuend is obtained.*
The derived relationship is applied when finding the unknown number in the problem from the following example.

Example 9. Find the unknown minuend.

□ – 30 = 100

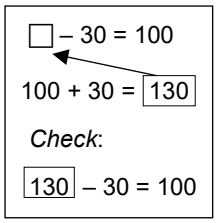

Fig. 4. Layout of the solution for problems involving the finding of an unknown minuend.

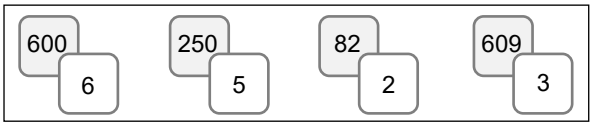
By using the relationship between the components and the result in subtraction, the rule for finding an unknown minuend is derived: *The unknown minuend is found by adding the difference and the subtrahend.*

This is followed by solving a sufficient number of problems, such as those in Example 9, in order to help students make sense of the knowledge related to finding an unknown minuend.



The problems for reinforcing and improving the skill of finding an unknown minuend are analogous to those presented in section 2.1**.**

2.4 Methodological Approach to Teaching the Rule for Finding an Unknown Dividend

Finding an unknown dividend on the basis of the relationship between the components and the result in the operation of division is a competence defined as an expected learning outcome in the mathematics curriculum for third grade [2]. The teaching of the rule for finding the unknown dividend is planned to take place within the general topic *Division of Two-Digit and Three-Digit Numbers by a One-Digit Number*.

It is appropriate for the methodological work to begin with the consideration of a problem on the basis of which the relationship between the components and the result in the operation of division can be clarified. To discover this relationship, the problem from the following example is suitable:

Example 10. Calculate the quotient of the two numbers written on the cards and check it by multiplication.

As early as second grade, students know that the operation of multiplication can be used to check the operation of division. According to the instructions for this problem, students should write four pairs of equations:

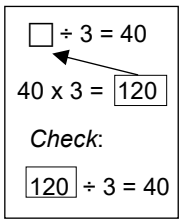
600 ÷ 6 = 100, 250 ÷ 5 = 50, 82 ÷ 2 = 41, 609 ÷ 3 = 203,
100 x 6 = 600, 50 x 5 = 250, 41 x 2 = 82, 203 x 3 = 609.

On this basis, after discussing the position of the same numbers in the equations, the following relationship is formulated: *If the quotient is multiplied by the divisor, the dividend is obtained.*

By using this relationship, the rule for finding an unknown dividend is derived in the following example.

Example 11. Find the unknown dividend.

□ ÷ 3 = 40



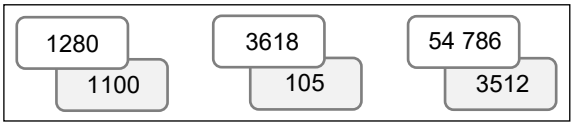


Fig. 5. Layout of the solution for problems involving the finding of an unknown dividend.

By using the relationship between the components and the result in division, the rule for finding an unknown dividend is derived: *The unknown dividend is found by multiplying the quotient by the divisor.*

This is followed by solving a sufficient number of problems, such as those in Example 11, in order to help third-grade students make sense of the knowledge related to finding an unknown dividend.
The problems for reinforcing and improving the skill of finding an unknown dividend are analogous to those presented in section 2.1.

2.5 Methodological Approach to Teaching the Rule for Finding an Unknown Subtrahend

Finding an unknown subtrahend by using the relationships between the components and the result in the operation of subtraction is a competence defined as an expected learning outcome in the mathematics curriculum for fourth grade [3]. The teaching of the rule for finding an unknown subtrahend is planned to take place within the general topic *Addition and Subtraction of Multi-Digit Numbers without Regrouping*.
The methodological work begins with the consideration of problems on the basis of which the relationships between the components and the result in the operations of addition and subtraction, studied in the previous grades and derived in the present paper in sections 2.1 and 2.3, respectively, can be updated. For this purpose, the problems from the following two examples are proposed.
Example 12. Calculate the difference between the two numbers written on the cards and check it by addition.

Example 13. Fill in the blanks by using the relationship between the operations of addition and subtraction.

6000 + 20 = 6020	15 204 + 3152 = 18 356
6020 – 20 = _____	18 356 – 3152 = _____
6020 – 6000 = _____	18 356 – 15 204 = _____

By using the relationships recalled in Example 12 and Example 13, two approaches to finding an unknown subtrahend are derived.

Example 14. Find the unknown subtrahend.

$3500 - \square = 1000$

It is appropriate to present the solution to this problem through the following two approaches:

First approach

$3500 - \square = 1000$

$1000 + \square = 3500$

$3500 - 1000 = \boxed{2500}$

Check:

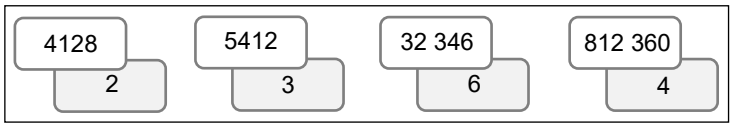
$3500 - \boxed{2500} = 1000$

Second approach

$3500 - \square = 1000$

$3500 - 1000 = \boxed{2500}$

Check:



$3500 - \boxed{2500} = 1000$

In the first approach, the problem of finding an unknown subtrahend is reduced to a problem of finding an unknown addend, while in the second approach the following rule is derived: *The unknown subtrahend is found by subtracting the difference from the minuend.*
This is followed by solving a sufficient number of problems, such as those in Example 14**,** in order to help students make sense of the knowledge related to finding an unknown subtrahend.
The problems for reinforcing and improving the skill of finding an unknown subtrahend are analogous to those presented in section 2.1.

2.6 Methodological Approach to Teaching the Rule for Finding an Unknown Divisor

Finding an unknown divisor by using the relationships between the components and the result in the operation of division is a competence defined as an expected learning outcome in the mathematics

curriculum for fourth grade [3]. The study of the rule for finding an unknown divisor is planned to take place within the general topic *Division of a Multi-Digit Number by a One-Digit Number*.
It is appropriate for the methodological work to begin with the consideration of problems on the basis of which the relationships between the components and the result in the operations of multiplication and division, studied in the previous grades and derived in the present paper in sections 2.2 and 2.4, respectively, can be updated. For this purpose, the problems from the following two examples are proposed.
Example 15. Calculate the quotient of the two numbers written on the cards and check it by multiplication.

Example 16. Fill in the blanks by using the relationship between the operations of multiplication and division.

328 x 5 = 1640	3050 x 3 = 9150	10 900 x 7 = 76 300	65 020 x 8 = 520 160
1640 ÷ 5 = _____	9150 ÷ 3 = _____	76 300 ÷ 7 = _____	520 160 ÷ 8 = _____

Example 17. Find the unknown divisor.

$$8600 \div \square = 2$$

It is appropriate to present the solution to this problem through the following two approaches:

First approach

$8600 \div \square = 2$

$2 \cdot \square = 8600$

$8600 \div 2 = \boxed{4300}$

Second approach

$8600 \div \square = 2$

$8600 \div 2 = \boxed{4300}$

In the first approach, the problem of finding an unknown divisor is reduced to a problem of finding an unknown multiplier, while in the second approach the following rule is derived: *The unknown divisor is found by dividing the dividend by the quotient*.
This is followed by solving a sufficient number of problems, such as those in Example 17, in order to help students make sense of the knowledge related to finding an unknown divisor.
The problems for reinforcing and improving the skill of finding an unknown divisor are analogous to those presented in section 2.1**.**

3. Organization of the Study

A longitudinal pedagogical experimental study was conducted in the period 2022–2025. It covered three consecutive school years, with the students participating in the study being in second grade during the first year and in fourth grade during the final year. A total of 250 students from three schools in Plovdiv, Bulgaria, took part in the experiment: 125 in the control group (CG) and 125 in the experimental group (EG). The author's innovative model for the effective mastery of skills for finding an unknown component in equations was applied in the instruction of the students from the experimental group.
The aim of the present study is to create, apply, experiment with, and establish the effectiveness of the developed innovative model of mathematics instruction in second, third, and fourth grade.
Hypothesis: If the author's innovative model of mathematics instruction is applied in grades 2–4, it would contribute to mastering and deepening students' knowledge and skills for finding an unknown component in equations, as well as to developing the mathematical and logical thinking of students at the primary level of education.
The object of the study is the process of mastering the knowledge and skills for finding an unknown component in equations by students from second to fourth grade.
The subject of the study is the identification of the relationships between the specific features of the activities for finding an unknown component in equations and the degree to which students master them, depending on the developed and applied author's innovative teaching model.
In the course of the experimental study, the students from both groups were subjected to a diagnostic assessment at the beginning of the study. This assessment was used to determine the level of their

mathematical competencies at the beginning of second grade, which made it possible to divide the students into a control group and an experimental group. One diagnostic assessment was also conducted at the end of second, third, and fourth grade, respectively, in order to determine the level of mastery of the skills for finding an unknown component in equations acquired in the respective grade.
The effectiveness of the innovative model created and applied in the instruction was assessed at the end of each school year according to the following criterion: *Mastery of competencies for finding an unknown component in equations.*
The evaluation of the obtained results was carried out according to the following indicators:
First indicator. Knowledge of the rules for finding an unknown component in equations.
Second indicator. Composing an equation with an unknown component based on a given mathematical text.
Third indicator. Solving a word problem that is modeled by an equation with an unknown component.
The present publication focuses on the final diagnostic assessment conducted in fourth grade, after the completion of the instruction of the fourth-grade students from the experimental group according to the innovative model. This assessment was used to diagnose the level of students' mathematical competencies according to the three indicators defined above, both in the control group and in the experimental group. The diagnostic assessment was carried out after the study of the general topic *Division of a Multi-Digit Number by a One-Digit Number*.

4. Results

The following section presents and analyzes the results of the conducted final diagnostic assessment according to the three indicators formulated above.
With regard to the first indicator, "Knowledge of the rules for finding an unknown component in equations," the analysis of the results shows that 93.6% of the students from the EG know the specified rules, whereas the percentage of students from the CG who have acquired this knowledge is 75.2%. Knowledge of the rules for finding an unknown component in equations is a prerequisite for the successful solving of various types of problems involving the specified learning content.
As regards the second indicator, "Composing an equation with an unknown component based on a given mathematical text," the analysis of the results from the independent work shows that 87.2% of the fourth-grade students from the EG who participated in the study have mastered the specified skills. By comparison, the percentage of students from the CG who are able to apply their skills in the specified context is 68.8%.
With regard to the most complex activity, "Solving a word problem that is modeled by an equation with an unknown component," which is also the third indicator used to assess students' mathematical competencies, the students from the EG demonstrated high results, with 75.2% of the students having mastered this activity. By comparison, the specified competence was mastered by 56.8% of the fourth-grade students from the CG, who were not taught according to the presented innovative model.

5. Conclusion

The pedagogical observations carried out during the experimental study, which lasted for three consecutive school years, as well as the presented results from the conducted final diagnostic assessment, confirm the previously formulated hypothesis: "If the author's innovative model of mathematics instruction is applied in grades 2–4, it would contribute to mastering and deepening students' knowledge and skills for finding an unknown component in equations, as well as to developing the mathematical and logical thinking of students at the primary stage of primary education." The analysis of the results clearly shows that instruction supported by the author's innovative model helped the students from the EG apply the acquired competencies more easily and effectively when composing an equation with an unknown component based on a given mathematical text and when solving word problems that are modeled by an equation with an unknown component.
The implemented longitudinal pedagogical experimental study shows that systematic work involving the solving of a sufficient number of tasks, diverse in type, for applying knowledge and skills related to finding an unknown component in equations leads to a higher level of mastery of the specific mathematical competencies. This will undoubtedly have a positive impact on students' confidence and self-esteem in mathematics lessons.

An Innovative Model for Teaching Mathematics and Social Studies through Game-Based Learning in Primary Education

Aleksandra Nikolova[1], Nikolay Danev[2]

[1,2]Plovdiv University 'Paisii Hilendarski', Bulgaria

Abstract

This article explores the possibilities for implementing game-based approaches in primary education (Year 3). It presents an innovative teaching model that integrates the development of mathematical, social science and digital competences. The main goal of the proposed model is to transform the learning process into an active, attractive, and developmental experience for students.
The publication presents an interdisciplinary game-based lesson entitled "Journey into the Past." It helps third-graders summarize their knowledge and skills in mathematics and social studies related to global topics: "Addition and Subtraction of Numbers up to 1000 without Regrouping," "Addition and Subtraction of Numbers up to 1000 with Regrouping," "Multiplication of Two-Digit and Three-Digit Numbers by One-Digit Number," "Division of Two-Digit and Three-Digit Numbers by a One-Digit Number" and "Bulgarian Society in the Middle Ages". The methodological development emphasizes the development of digital competencies through working with QR codes and 360-degree technologies, which transforms the lesson into a comprehensive educational experience.
The introduction of such interdisciplinary game-based lessons in primary education will help to increase student motivation and promote more lasting acquisition of knowledge and skills in various subjects.

Keywords: *Game-Based Learning, Mathematics, Social Studies, Innovative Model*

1. Introduction

The rapid development of new technologies presents modern education with a range of opportunities and challenges linked to the demands of a radically different economic and social environment. There is a growing consensus that modern schools must prepare students for jobs that do not yet exist, to use technologies that have not yet been invented, and to solve problems we do not yet know exist. To address the challenges facing education, a number of international organisations are developing strategic frameworks and concepts, focusing on the development of soft skills, critical thinking and adaptability, and aiming to transform the student from a passive recipient of information into an active participant in the learning process and a creator of their own future. An example of such a document is the Organisation for Economic Co-operation and Development's framework – 'The Future of Education and Skills 2030/2040' [1], which is one of the most influential contemporary documents rethinking the role of schools in the dynamic 21st century. At the heart of this project lies the concept of the 'OECD Learning Compass 2030' [2]. The document clearly states that, in the face of an unpredictable future, schools can no longer offer students a fixed route (map), but must equip them with tools for self-navigation. This is why a 'compass' is needed, comprising: knowledge, skills, attitudes and values, to help students begin to apply their knowledge in practice so that they can succeed in life after school. To achieve these goals, the use of integrative learning resources linked to real-world practice and combining knowledge and skills from different subjects is becoming increasingly important.
Modern primary education requires that learning content be presented in an accessible, motivating and practical way that encourages curiosity, independent thinking and experiential learning. In this context, the cross-curricular links between social studies and mathematics offer rich opportunities for making sense of knowledge through solving practical and creative tasks related to time, space, numbers and social relationships.
This article presents an innovative model of teaching mathematics and social studies through game-based learning for Year 3. Many researchers share the view that combining a game-based framework with a didactic task offers a number of advantages, including: the development of teamwork skills, the building of positive motivation for learning, the filling of gaps in knowledge, the correction of errors, etc. [3].
The lesson presented in this publication is designed to consolidate the knowledge, skills and attitudes acquired from the following global topics: *"Addition and Subtraction of Numbers up to 1000 without*

Regrouping," "Addition and Subtraction of Numbers up to 1000 with Regrouping," "Multiplication of Two-Digit and Three-Digit Numbers by a One-Digit Number," "Division of Two-Digit and Three-Digit Numbers by a One-Digit Number" [4] and *"Bulgarian Society in the Middle Ages"* [5]. The interdisciplinary lesson is structured as a themed adventure in which students must find a traveller lost in time. To achieve this goal, they sequentially solve tasks related to historical events, geographical locations, performing arithmetic operations, applying logical thinking and navigating various situations. The lesson includes both practical tasks, as well as links to interactive games and 360-degree images, which transform the traditional revision session into an engaging educational mission.

2. Method

The aim of this article is to present an innovative teaching model for mathematics and social studies through game-based learning in primary education. The model was implemented with 96 students from four Year 3 classes in two primary schools in Plovdiv, Bulgaria, during the 2025–2026 academic year. The innovative model comprises six lessons combining the third-year curriculum for mathematics and social studies. Five of the lessons cover global topics from both subjects that were being studied at the time the lessons were delivered, whilst the sixth serves to summarise part of the curriculum at the end of the school year. The focus of this publication will be precisely on this summary lesson.

2.1 Structure of the Interdisciplinary Game-Based Lesson 'Journey Into The Past'

The theme of this innovative lesson revolves around a lost time traveller. By successfully completing the set tasks and educational games, Year 3 students will be able to find him and, subsequently, learn about the historical period in which he has found himself.
Following a motivating introduction to the lesson topic, the lesson is delivered in the following three stages:
Stage One: Discovering the location in Medieval Bulgaria where the traveller has ended up
The class is divided into teams of four third-year students. Each team receives a worksheet (**Fig. 1.**), containing six questions – three on mathematics and three on social studies. At the end of the worksheet there is a URL address which the students in the team must complete by entering, in sequence, the letters preceding the correct answers to the six questions. In this way, if the students make a mistake on any of the questions, the link will not be active. It will only open if they answer all six questions correctly across both subjects. The correctly completed web address will take them to the place where the traveller has gone missing. The link is generated via the *bit.ly* platform, which allows for free link shortening and the creation of QR codes.
The images used in the first task on the worksheet are taken from the 'Man and Society' textbook for Year 3, authored by R. Penin and G. Yakimov [6].

1. Which of the images is related to Medieval Bulgaria?

a) b) c)

2. What are the missing words in the text?

The Proto-Bulgarians believed in the god _____. They were led by _____ and lived in _____.

In _____ the Bulgarians, led by Asparuh, defeated Byzantium and created _____ Bulgaria.

a) Perun, Prince, dugouts, 681, Volga

b) Lada, king, palaces, 678, Old Great

c) Tangra, khan, yurts, 681, Danube

3. Examine the plan of the city of Preslav and determine in which direction the palace church is located in relation to the Royal Palace.

a) East

b) West

c) North

d) South

4. A medieval craftsman has 1 kilogram of gold. From it he needs to make 276 gold coins, each weighing 3 grams. How many grams of gold will he have left after making the coins?

a) 182 grams b) 172 grams c) 272 grams

5. During the week, 45 groups of 8 students visited the archaeological museum to see the Preslav Treasure, and on Saturday and Sunday – 25 groups of 6 students. How many students in total saw the treasure?

a) 510 students b) 410 students c) 500 students

6. The gift shop at the Archaeological Museum received 144 round magnets and 128 rectangular magnets. The round magnets were packed in boxes of 6, and the rectangular ones in boxes of 8. How many boxes were the magnets packed into in total?

a) 30 boxes b) 40 boxes c) 50 boxes

Link: www.□□□□□□.bit.ly

Fig. 1. Worksheet with a space to fill in a URL address.

Stage Two: A Journey into the Middle Ages

When they open the URL, they have found, the students will be taken to a 360-degree image of medieval Tarnovo (the capital of the Second Bulgarian Kingdom) (**Fig. 2.**). The panoramic image is hosted on the Study360.eu platform, which allows the use of 360-degree images for educational purposes and the creation of special info points with additional information at various locations within the image.

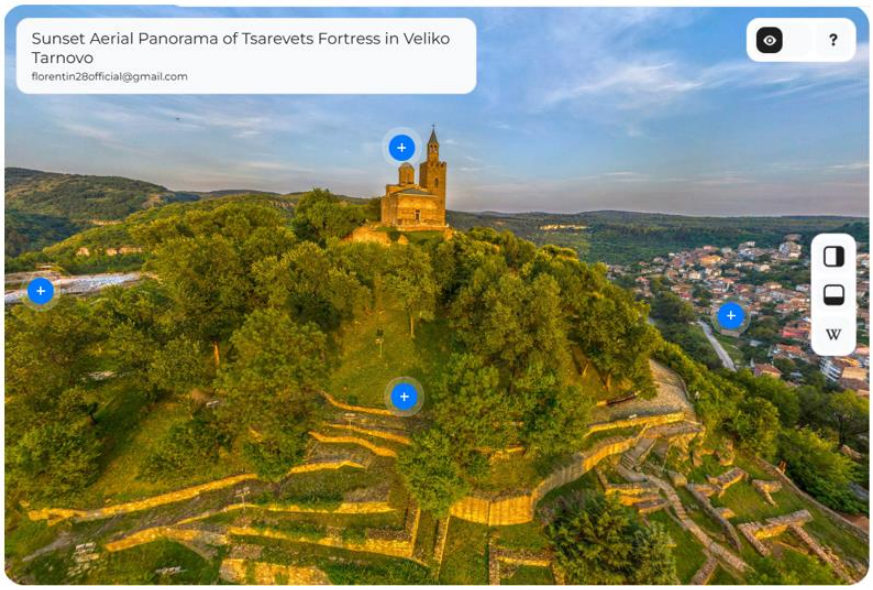

Fig. 2. 360-degree image of medieval Tarnovo.

The Middle Ages is the period in which the lost traveller finds himself. Six info points are located on the image of this old Bulgarian capital. Five of them contain information related to the overarching theme 'Bulgarian Society in the Middle Ages', which the Year 3 students need to recall, whilst the sixth info point contains a hidden link to the educational platform *LearningApps.org*.

Stage Three: In the footsteps of the lost traveller

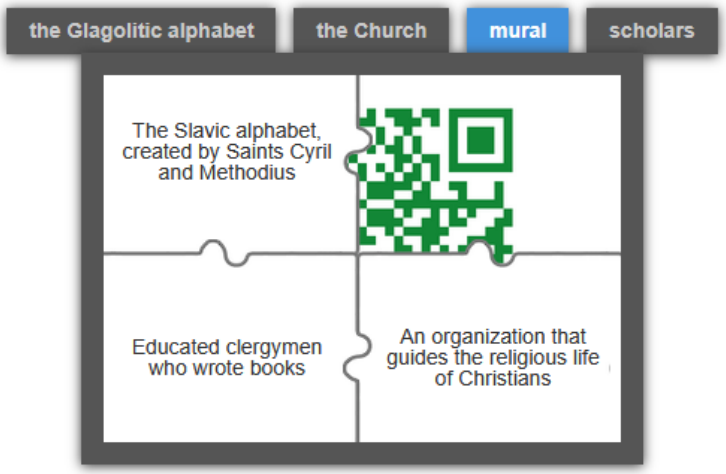

Fig. 3. Educational game on *LearningApps*.

The link that the Year 3 students discover in the 360-degree image takes them to an online educational game created using the 'Groups in a Puzzle' template on the *LearningApps.org* platform (**Fig. 3.**). In it, Year 3 students must match concepts and their definitions related to the information they recalled whilst exploring the 360-degree panoramic image. Correct completion of the game will reveal a QR code to the Year 3 students, which will take them to a talking avatar of the traveller (**Fig. 4.**). The image of the traveller itself was generated using *ChatGPT*, and the video in which he addresses the students was created using the free AI video generator *heygen.com*.

Fig. 4. Talking avatar.

Here are the words with which the traveller will greet the Year 3 students:
"Hurrah! You've found me! Thank you, brave time travellers! Whilst I was lost through the centuries, I found myself in the glorious days of the Bulgarian Middle Ages and learnt many important things!
I realised that Medieval Bulgaria was a powerful country, with an amazing culture, ruled by wise rulers. They protected the people, built impressive fortresses and monasteries, and made Bulgaria one of the leading countries in south-eastern Europe.
I also met various people from medieval society. I met boyars – the rich and important aides to the tsar; craftsmen – masters who made vessels, clothes and weapons; merchants – travelling to distant lands; and peasants – the largest part of the population, providing for the whole of society. All these groups played an important role.
I visited the beautiful capitals of Pliska, Preslav and Tarnovo, where I saw fortresses, palaces and churches. I also learnt that Saints Cyril and Methodius gave the Slavs an alphabet, and that their disciples found refuge in Bulgaria and continued the work of the Slavic apostles.

Remember: when a people are brave, hard-working, united and when they preserve their traditions, they remain strong, no matter the difficulties! And now it's time to head back… to your classroom!"

2.2 Development of Key Competences in the Interdisciplinary Game-Based Lesson "Journey Into The Past"

The varied system of educational activities in the "Journey into the Past" lesson supports the development of mathematical, civic and digital competences in Year 3 students.
According to the "Council Recommendation on key competences for lifelong learning", digital competence is defined as "the confident, critical and responsible use of and engagement with digital technologies for learning, at work and for participation in society" [7]. In the lesson presented, third-year students are given the opportunity to work with a variety of digital technologies – typing using a keyboard and opening a URL address, opening and navigating a 360-degree image, using information from info points within the image; navigating the *LearningApps.org* platform and participating in an online educational game, using a QR code scanning app to access a talking avatar generated using AI.
In the same document, mathematical competence is defined as 'the ability to develop and apply mathematical thinking and perspective in order to solve various problems in everyday situations' [7]. The maths tasks included in the worksheet used at the start of the lesson support the development of third-year students' mathematical competences by placing them in practical problem situations that can be solved using the tools and language of mathematics.
One of the aspects of civic competence emphasised in the Recommendation of the Council of the European Union is "awareness of current events and a critical understanding of the major events in national, European and world history" [7]. The concepts, facts and information on key events included in the various stages of the interdisciplinary lesson, studied under the topic *'Bulgarian Society in the Middle Ages'*, directly correspond to the values of European society, including a good knowledge of national history.

2.3 Challenges and Opportunities for Development in the Implementation of the Innovative Teaching Model

Possible challenges to the integration of the author's teaching model include the need for a stable internet connection, which is not always available in some schools, as well as the high level of skills required of the teacher to create such types of teaching materials.
The model also has potential for development in several directions. The technical aspect could be enhanced by integrating an AI-powered chatbot, with which students could converse in real time on various historical issues. The interdisciplinary nature could be deepened by integrating further subjects such as Bulgarian language and literature (through the analysis of various texts) or art (by redrawing parts of the 360-degree panoramic photographs; drawing objects from a particular era).

3. Survey

Following the conclusion of the implementation of the innovative model of game-based learning, a survey was conducted with the students from the four Year 3 classes included in the study. The aim was to ascertain the Year 3 students' views regarding their mastery of the curriculum content through game-based lessons.
Survey:
1. Select the statement that applies to you.
    - Game-based lessons made it easier for me to understand the maths material.
    - Game-based lessons made it harder for me to understand the maths material.
    - It was neither easier nor harder for me to understand the maths material.
2. Select the statement that applies to you.
    - The game-based lessons made it easier for me to understand the social studies material.
    - With the game-based lessons, I found it harder to understand the social studies material.
    - It was neither easier nor harder for me to understand the social studies material.
3. Select the statement that applies to you.
    - I found it easy to work with the photos and games on the phone/tablet.
    - I found it difficult to work with the photos and games on the phone/tablet.
    - It was neither easy nor difficult for me to work with the photos and games on the phone/tablet.
4. Select the statement that applies to you.

- I found the game-based lessons very interesting.
- I found the game-based lessons somewhat interesting.
- I didn't find the game-based lessons interesting.

5. Select the statement that applies to you.
   - I would like there to be more game-based lessons.
   - I would like there to be fewer game-based lessons.

With regard to the acquisition of maths learning material during game-based lessons, 90.63% of Year 3 students stated that it was easier for them, 1.04% of those surveyed (one student) stated that it was more difficult for them, whilst 8.33% saw no difference compared to traditional lessons.
As for the assimilation of social studies material, 92.71% of the third-year students surveyed noted that it was easier for them to understand the material, whilst 2.08% encountered more difficulties. Of all those surveyed, 5.21% reported no difference in the ease with which they absorbed the teaching material compared to traditional lessons.
The result is not surprising when students are asked about the ease of working with digital technologies. Of the third-year students surveyed, 97.92% stated that they had not encountered any difficulties when working with the various online platforms, whilst only 2.08% stated that they had experienced some difficulties.
One of the major shortcomings highlighted when discussing traditional methods of teaching and the organisation of the learning process is the lack of emotional engagement and variety to spark students' interest. When asked for their opinion on the author's interdisciplinary lessons, 96.87% of those surveyed stated that they found them interesting, whilst the remaining 3.13% said they found them somewhat interesting. It is positive that none of the third-year students surveyed reported that their interest had not been sparked during the game-based lessons.
The responses to the final question in the survey were decisive for the overall opinion of the Year 3 students regarding the integrative game-based lessons – 98.96% of those who took part in the survey would like to have more such lessons, whilst only 1.04% (one student) would prefer there to be fewer.

4. Conclusion

The presented author's innovative model for interdisciplinary learning through a game-based approach successfully integrates the curriculum content for mathematics and social studies for Year 3, by transforming the traditional lesson into an engaging 'journey through time'.
The results of the questionnaire survey conducted among the four experimental classes confirm the high effectiveness of this approach – over 90% of the third-year students report that the game-based format has facilitated their understanding of the teaching material in both mathematics and social studies. Almost all respondents (96.87%) expressed a strong interest in the lessons, and working with modern technologies (QR codes, 360-degree images and AI avatars) is readily embraced by the students, which contributes to the development of their digital competence in line with contemporary trends in education. The implementation of such integrative learning resources not only aids in the more lasting acquisition of the competences set out as expected outcomes in the curricula, but also develops soft skills such as critical thinking, teamwork and adaptability, which are necessary for tackling the challenges of the 21st century.

Study of Cases Involving Addition and Subtraction of Numbers Up To 100 without Crossing the 100-Mark Analysis of the Current State of Mathematics Textbooks for Secondary Schools Grade in Bulgaria

Petar Petrov

Plovdiv University "Paisii Hilendarski", Bulgaria

Abstract

The recent reforms in the educational system in the Republic of Bulgaria and the subsequent updates to the mathematics curricula for grades 1–4 (general education) have led to the development and approval of textbooks aimed at building sustainable mathematical competencies in students. In this regard, the Ministry of Education and Science (MES) has approved nine mathematics teaching kits for compulsory education in second grade, developed by various teams of authors.
The aim of this article is to analyze the theoretical frameworks that substantiate the methodology for teaching the global topic "Addition and Subtraction of Numbers Up to 100 Without Crossing the Hundred-Mark," and to examine their implementation in the current mathematics teaching materials for second grade in the primary education stage. Emphasis is placed on the sequence of introducing new knowledge, the approaches used to clarify the algorithms for adding and subtracting numbers up to 100 without crossing the 100-mark, and the means of illustrating them. With a view to optimizing the learning process and assisting teachers in planning and implementing instruction, the study aims to highlight best practices and methodological solutions presented by the author teams. It also seeks to identify similarities and differences in the presentation of the global theme of mathematics in second grade.

Keywords: *elementary mathematics education; addition and subtraction of numbers up to 100 without carrying*

1. Introduction

In the early stages of primary education, mathematics instruction plays a fundamental role in developing logical and analytical thinking in students. More specifically, this involves mastering basic arithmetic operations (addition and subtraction), as well as the knowledge and skills acquired through them. These are key factors in developing confidence, a systematic approach, and competencies for solving practical real-life problems.
The curricula developed following the educational reform aim to bring Bulgarian educational standards into alignment with European ones. They serve as a regulatory framework that defines the learning objectives, curriculum content, and expected outcomes for each subject in every grade. Their primary task is to ensure a higher-quality and more competitive education.
The topics in the second-grade mathematics curriculum include specific expected outcomes and key concepts from various areas of competence. The focus is on building upon the arithmetic operations of addition and subtraction learned in first grade and developing knowledge and skills for multiplication and division using tables. One of the key focuses is the application of algorithms and techniques for performing addition and subtraction with numbers up to 100 without crossing the tens place.

2. Method

According to V. Angelova, "Cases involving addition and subtraction of numbers up to 100 can be grouped into two main categories:
First group. Adding a two-digit number to a one-digit or two-digit number when the sum of their ones and tens is less than ten; Subtracting a one-digit or two-digit number from a two-digit number when the sum of the ones and tens of the minuend is greater than that of the subtrahend.
Second group. Adding a two-digit number to a one-digit or two-digit number when the sum of their one digits is greater than or equal to ten, or the sum of their tens digits is ten; subtracting a one-digit or two-digit number from a two-digit number when the number of ones in the minuend is less than the number

of ones in the subtrahend; subtraction from 100." [5]
This article/publication aims to present the theoretical foundations and contemporary methodological approaches to teaching the topic *"Addition and Subtraction of Numbers Up to 100 Without Carrying*," as well as to analyze how these concepts are applied in current second-grade mathematics textbooks.
The methodology for teaching the arithmetic operations of addition and subtraction without crossing the 100-mark encompasses both oral and written techniques for performing calculations with natural numbers up to 100.
Written addition (and *subtraction*) is performed according to the following algorithm: first, the ones digits of the numbers are added (or subtracted), and then their tens digits.
Oral addition (or *subtraction*) starts with the tens, and there is some variation in the calculations. Arithmetic algorithms are taught within a specific system, with each subsequent concept being explained based on the previous ones.
First group. Adding a two-digit number with a zero in the ones place to a one-digit number; subtracting the ones or tens from a two-digit number (20 + 3; 23 — 3; 23 — 20).
Second group. Adding a two-digit number to a one-digit number and subtracting a one-digit number from a two-digit number (21 + 5; 26 — 5).
Third group. Adding two-digit numbers, one of which has a zero in the ones place. Subtracting a two-digit number with a zero in the ones place from any two-digit number (27 + 10; 37 — 10).
Fourth group. Adding and subtracting arbitrary two-digit numbers (32 + 26; 58 — 26).
Let's consecutively examine how these four groups of cases are implemented in the current second-grade mathematics textbooks. These are the mathematics textbooks published by:

- "Prosveta Plus" by authors V. Angelova and S. Doichinova [1];
- "Prosveta" by authors Y. Garcheva and A. Manova [4];
- "Bulvest" by M. Bogdanova, M. Temnikova, and V. Ivanova [3];
- "Anubis" by T. Vitanov, G. Kirova, Z. Sharkova, I. Pushkarova, and D. Parusheva [9];
- "Pythagoras" by I. Mincheva, M. Dimitrova, and R. Gernat [6];
- "Scorpio" by R. Petrova, R. Stoyanova, and P. Daskova [8];
- "Riva" by L. Alexieva and M. Kirilova [2];
- "Bit and Technology" by T. Vulkova, M. Vanikova-Rukhova, D. Stoyanova, D. Dimitrova, I. Dimitrova, V. Damaskova, and T. Lazarova [10];
- "Archimedes" by Z. Paskaleva, M. Alashka, P. Paskalev, and R.Alashka [7].

The reasoning involved in studying the **first group** of cases is as follows:

- The number consisting of 2 tens and 3 ones is 23. Therefore, 20 + 3 = 23.
- In the case of 23 — 3, we use the fact that the number 23 consists of 2 tens and 3 ones. Therefore, if we subtract 3 (i.e., 3 ones) from 23, we get 2 tens, i.e., the number 20.
- In the case of 23 — 20, we also use the fact that the number 23 is the sum of 2 tens and 3 ones. When 2 tens are subtracted from 23, 3 ones remain.

These cases are presented as separate lessons in the textbooks of the following publishers: "Prosveta Plus" [1], "Pythagoras" [6], "Bulvest" [3] and "Scorpio" [8] which allows for a more targeted introduction and understanding of the new knowledge.
In the textbook published by "Anubis" [9] these cases are combined with others from different groups into a single lesson, resulting in a more compact presentation but requiring a higher degree of abstraction and potentially making it more difficult for students to initially comprehend material.
In the textbook published by "Prosveta" [4], the content is divided into two separate lessons—one presenting the addition operation and the other the subtraction operation—which creates a clear distinction between the two operations and supports the step-by-step development of algorithms.
In some of the textbooks published by "Bit i Technika" [10], "Riva" [2] and "Archimedes" [7] these topics are not treated as separate lessons, indicating a different, integrated approach to structuring the curriculum content rather than a differentiated one.
In the textbooks published by "Prosveta Plus" [1], "Bulvest" [3], and "Anubis" [9], new knowledge is formed through mathematical visualisation based on the place-value principle. The methodology relies on an analytical-synthetic approach, in which numbers are viewed as composed of tens and ones. The presentation through tables of decimal composition, as well as the visualization through colored columns and squares in the textbook by "Prosveta Plus" [1] and through the grouping of colored sticks and coins in the textbooks by "Anubis" and "Bulvest" [3] creates a clear, concrete-visual understanding of the structure of numbers and the process of performing the operation itself, facilitating the transition

from concrete to abstract thinking. This approach helps students realize that operations are performed within the context of the given sequence, which is key to understanding algorithms without carrying.

In contrast, the textbook published by "Pythagoras" [6] uses a more limited and less developed visual model (using coins). The emphasis is on the type of problems that help students understand the correlation addition and subtraction: *if we subtract one addend from the sum of two numbers, we get the other.*

In the textbook published by "Scorpio" [8], the introduction is primarily implemented through story-based and text-based problems, which points toward a situational and contextual approach. Although this increases motivation and connects knowledge to students' real-world experiences, the lack of sufficient concrete visual aids during the initial introduction may hinder the comprehension of algorithms, especially for students with less developed abstract thinking.

To clarify **the second group** of cases, it is advisable to use a concrete, schematic, and mathematical model in sequence. The numbers are then arranged in a table with rows, thus forming algorithms of the specified type.

The cases in the second group are presented differently in the various teaching kits, both in terms of lesson structure and methodological approaches.

In the textbook published by "Prosveta Plus" [1] these cases are presented in a separate lesson, which allows a clear focus on the new type of operations and their comparison, as they are covered in the same lesson.

In the textbooks from the following publishers: "Prosveta" [4], "Pythagoras" [6], "Archimedes" [7] and "Riva" [2] the content is divided into separate lessons in addition and subtraction, which supports the step-by-step development of algorithms. This allows students to focus on the algorithms for the individual operations. In the textbooks published by "Anubis" [9], "Bit and Technika" [10] and "Bulvest" [3] cases from the different groups are combined into a single lesson, which implies a higher degree of generalization and saves instructional time, but at the same time places higher demands on students' cognitive readiness.

In the textbook published by "Scorpio" [8] the content is more integrated; new knowledge is not introduced through a clearly defined stage but is incorporated into a system of problems. This would make it difficult for students to discover the algorithm on their own and could lead to incomplete and superficial learning. Ultimately, the presentation of new knowledge is again based on the analytical-synthetic approach, which is implemented by breaking numbers down into tens and ones. This approach is particularly evident in the textbooks published by "Prosveta Plus" [1], "Anubis" [9], and "Archimedes" [7]. Through it, students realize that a two-digit number has an internal structure (for example, 24 = 2 tens + 4 ones), which allows operations to be performed separately in the order of the ones or tens. Thus, algorithms are constructed not mechanically, but as a consequence of understanding the decimal positional system.

Mathematical operations are presented as actions on objects or movement along the number line. This approach is characteristic of textbooks published by "Prosveta" [4], "Prosveta Plus" [1], and "Bit i Tekhnika" [10]. Through this approach, addition is perceived as "adding" or "moving forward," and subtraction as "taking away" or "moving backward." This facilitates the initial understanding of the operations and creates a connection to students' real-world experiences.

All of the textbooks listed, with the exception of those published by "Scorpio" [8] and "Pythagoras" [6], use an algorithmic approach in which the operations are presented as a sequence of steps —writing the numbers in rows in a number chart, performing the operations in the ones place, writing down the result, then performing the operations in the tens place, and writing down the result again. This approach helps develop accurate computational skills and prepares students for more complex algorithms. At the same time, the textbooks published by "Pythagoras" [6] and "Scorpio" [8] do not present the algorithm using a row table; only a version involving mental calculation is provided. This may hinder the development of precise algorithmic concepts.

When studying the cases from **the third group**, an appropriate visual aid can be used, after which the numbers are arranged in the row table, and finally, the algorithms for written addition and subtraction of numbers of the type under consideration are formulated.

In the textbooks published by "Prosveta Plus" [1], "Pythagoras" [6], "Bulvest" [3], "Archimedes" [7], and "Bit i Technika" [10], the cases under consideration are separated into independent or clearly differentiated sections, which facilitates the targeted introduction of the algorithm. In contrast, in the textbooks published by "Anubis" [9], "Riva" [2], "Scorpio" [8] and "Prosveta" [4] these cases are not presented as separate lessons but are included in a broader context, which may make it difficult to highlight their specific features—namely, that the operations are performed only in the tens place, while the ones remain unchanged.

Particular attention should be paid to the textbooks published by “Bulvest” [3], “Bit i Technika” [10] and “Prosveta Plus” [1], where new knowledge is introduced through highly concrete, object-based visual aids. Models of tens and ones (colored cubes, grouping, and breaking down numbers) are used to clearly demonstrate that in operations such as (27 + 10; 37 — 10), changes occur only in the tens place. This approach helps students build a solid understanding of the structure of numbers and grasp the algorithm through observation and action, rather than through rote memorization.

Here again, the primary methodological approach used in most textbooks is the analytical-synthetic approach, implemented by breaking numbers down into tens and ones:

- when adding a round ten, the number of tens increases;
- when subtracting a round ten, the number of tens is reduced;
- the ones remain unchanged.

In the textbook published by “Archimedes” [7] the new concept is presented through visual aids and examples, but it is noted that there is no clearly formulated algorithm for the case (35 — 20). Students arrive at the result through models and examples, but without an explicitly generalized rule. This may make it difficult for some students to apply the knowledge independently, as there is no clear illustration of the algorithm.

The textbook published by “Bit and Technika” [10] employs an inductive approach, in which new knowledge is introduced through concrete problems and situations. Through observation and working with models, students arrive at the method of calculation, but the algorithm is not presented separately; rather, it is presented alongside examples of adding and subtracting a two-digit number from a one-digit number without carrying.

In the textbooks published by “Pythagoras” [6] “Prosveta Plus” [1] and “Bulvest” [3] the exercises for reinforcing knowledge and skills are particularly diverse and include both basic and advanced cases, which aids in a more thorough mastery of the material. Only the “Bulvest” [3] textbook lacks word problems.

The reasoning behind studying the problems in **the fourth group** is as follows: initially, the numbers are modeled using concrete models, then schematic models are used, and finally, the numbers are arranged in the rows of the table, with algorithms for written addition and subtraction of numbers of the type under consideration being formulated.

The introduction of new knowledge most often begins with a real-life word problem that creates a problem situation. For example, in textbooks published by “Anubis” [9] and “Archimedes” [7], students encounter real-life situations (money, objects) that require performing the arithmetic operations of addition or subtraction. This is followed by presenting the solution by breaking down the numbers into tens and ones and recording them in a table across the rows.

In the analyzed textbooks, visual aids vary in degree and type; in the textbooks published by “Prosveta Plus” [1] and “Bulvest” [3] a rich variety of concrete and visual aids is observed–colored blocks, tokens, coins, and other models are used to illustrate tens and ones. This is important for the transition from concrete to abstract thinking. The textbook from the “Bit i Technika” [10] publishing house also uses a variety of visual aids.

In the textbooks published by “Anubis” [9] and “Prosveta” [4] the visual aids are more structured and are primarily implemented through a number chart (tens and ones). This serves as a means of presenting the algorithms for the operations and clearly shows the order in which the operations are performed.

In the textbooks published by “Pythagoras” [6] and “Riva” [2] the visual presentation is more schematic–through the decomposition of numbers and the use of arrows and diagrams, which encourages the development of thinking strategies.

In the textbook published by “Scorpio” [8], visual aids are more limited and consist mainly of the use of an abacus and a table, which is not always sufficient for all students.

In terms of algorithmic approach, no significant differences are observed. In all textbooks, the algorithm is clearly formulated using number tables and the order of operations (“add the ones, add the tens,” “first subtract the ones, then the tens”), which aids in mastering the standard method of calculation. Only in the textbook published by “Bulvest” [3] is the algorithm formulated based on mental calculation methods, specifically breaking down the addends into sums of tens and ones and adding them sequentially in rows: 32 + 26 = (30 + 20) + (2 + 6) = 50 + 8 = 58.

Representing one addend as the sum of its tens and ones and adding them sequentially to the other: 32 + 26 = (32 + 20) + 6 = 52 + 6 = 58 or 32 + 26 = (32 + 6) + 20 = 38 + 20 = 58. This can lead to students learning the process mechanically without sufficient understanding. The algorithms for mental calculation are also covered by the other author teams, but not all of them include them in the lesson introducing the new concept.

The types of consolidation problems also show variety. All textbooks include arithmetic problems for

direct calculation. In addition, word problems are widely used to develop mathematical modeling skills. The textbooks from the publishers “Pythagoras” [6] “Riva” [2] and “Prosveta Plus” [1] also include more challenging problems–composing word problems, finding an unknown number, and verifying equalities and inequalities. The textbook published by “Prosveta” [4] includes problems with number lines and visual models that aid in understanding the relationship between addition and subtraction. In the textbook published by “Riva” [2], problems involving relations (comparisons and filling in tables) play a special role in developing logical thinking.
To reinforce new knowledge, a diverse system of problems is used:

- calculation problems for automation;
- table-filling problems;
- practical word problems;
- problems for identifying relationships;
- combined problems requiring deeper thinking.

3. Conclusion

An analysis of the nine second-grade mathematics curriculum sets approved by the Ministry of Education and Science (MES) shows that they offer a structured and multifaceted approach to learning, particularly regarding addition and subtraction of numbers up to 100 without carrying. The variety of methods, examples, and visual aids facilitates students’ understanding of the material and stimulates the development of their analytical and research skills. It can be concluded that the most effective way to clarify the algorithms for addition and subtraction without crossing the tens place is to combine several approaches:

- concrete visual aids → for initial understanding
- breaking down into tens and ones → to grasp the structure
- algorithmic steps → for skill development
- exercises and problems → for reinforcement.

To summarize, all textbooks cover addition and subtraction of two-digit numbers without carrying, but they differ in their method of introduction, the degree of visual representation, and the variety of problems. The most effective mastery of the cases covered is achieved by combining visual aids, an analytical-synthetic approach, and a clearly formulated algorithm. Of particular importance is the use of concrete models, which aid students’ understanding of the material and facilitate the transition from concreteness to abstraction. The differences, in turn, reflect various didactic approaches and can be effectively utilized in practice by combining their advantages. Since every student learns differently, the materials must meet diverse needs—ranging from strong object-based visual aids for some to more abstract schematic models for others.
Educational standards are changing to align with European requirements, so teaching materials must be constantly updated and strive for innovations that enrich the learning process and make it even more effective and accessible to all students.

Creating Digital Learning Resources Using Scratch for Learning 4th Grade Mathematics

Vilislav Radev

Plovdiv University “Paisii Hilendarski”, Bulgaria

Abstract

The article is dedicated to the creation and use of digital resources created on Scratch when teaching mathematics in the fourth grade. An animated Scratch module from the educational content of the mathematics textbook with authors Prof. Dr. Vladimira Angelova and Zhana Koleva, Prosveta Plus Publishing House, Sofia, 2019 is described in detail. Presented in this way, it offers an opportunity to integrate information technologies into mathematics classes in order to better master the educational material.

The purpose of the publication is to present the proposed methodological tools for the application of information technologies in mathematics teaching in the fourth grade, namely - animated Scratch modules, based on the educational content, would help to more effectively master knowledge, skills and attitudes related to mathematical literacy and modern key competencies of students. This would lead to a more effective implementation of the learning goals, to increasing students' interest in mathematics as an academic discipline and building a positive emotional attitude towards it. The expectations are also to create a better transition to the future professional and life realization of the students. The specifics of the developed learning content, the electronic environment, the animated scenarios and the teaching method are related to the 9 key competencies for the development of students set out in the curriculum and program, but the main emphasis is on "Mathematical Competence" and "Digital Competence".

Keywords: *Scratch, mathematics, information technology, digital resources, educational content*

1. Introduction

The dynamics of the last few years and the changes that have occurred in the life of the planet, dictated by global crises that have an impact in various areas - health, social, economic, political, etc., have imposed new requirements on education, namely that the environment be more flexible, open, social, healthy, interactive and digital. It is of key importance to implement various innovations in the educational process in a timely manner, to make modifications in the training trajectories that are adapted to the pace of learning and skills by learners. The UNESCO Global Education Monitoring Report for 2023, which focuses on technology and education, explicitly emphasizes that the opportunities and challenges posed by technology are the main construct for achieving quality education and sustainable development. In more and more areas of life, societies are moving towards digitalization, or in other words, this is the structuring of social life around digital communication and media infrastructure. Digital literacy should “respond to the current and future needs of learners and the community” and “provide students with the tools they need to address contemporary challenges” [7]. The increasing use and presence of digital solutions in people’s daily lives creates a need for systemic change based on digital transformation as a whole. It is important to note that *technologies and Media are effective tools when used as intended* . When we talk about digital learning, we mean any type of learning that is supported by technology or through pedagogical practices and techniques that make the use of a given technology effective.

The integration of digital educational tools into the learning process is inevitable, especially in subjects that usually have difficulty going hand in hand with imagination and fun. It is extremely difficult for students to connect reality with mathematical concepts. This problem is clearly highlighted in the results of the PISA tests - nearly 45% of Bulgarian children are able to cope with only the most elementary tasks [8] .

Primary school students perceive knowledge more effectively in an interactive environment. That is why the use of block-based programming, as an environment for creating visual models and interactive tasks, is emerging as a promising approach in mathematics education. It allows for the combination of logical thinking, creativity and practical application of mathematical knowledge. In this way, one of the most

favorite teaching methods of students is applied, namely - gamification ("use of game elements in a non-game context") [4] , which not only attracts attention for a longer time, but also increases the motivation and self-confidence of students.

2. Designing a Prototype of an Educational Animated Module in "Mathematics " for Fourth Grade

2.1 Pedagogical Characteristics of an Animated Module "Geometric Friends". Scenario and Technological Implementation

The created game "Geometric Friends" is from the educational content of the topic "Geometric Figures" on page 11 of the textbook "Mathematics" for 4th grade, authors V. Angelova, Zh. Atanasova of the publishing house Prosveta Plus [1] . The game is aimed at systematizing and summarizing the knowledge and skills of students about the studied geometric figures. With the help of the task, students will consolidate their competencies:

- Recognizes geometric shapes: square and triangle;
- Recognizes the types of triangles according to their sides;
- Defines a square as a type of rectangle;
- Defines a square as a rectangle;
- Solves geometric problems.

The proposed module includes a text problem that illustrates a square and an equilateral triangle. In the problem, we know the perimeter of the square and how much longer its side is than the side of an equilateral triangle. We are looking for the perimeter of the triangle in centimeters. Students consolidate their knowledge of geometric figures - a square and an isosceles triangle - by making the connection between the four sides of the square, and then use the condition and the data in it to be able to find the perimeter. When they find the side of the square, they can find the side of the triangle, and from there its perimeter.

The plot of the module is developed in three scenes, two of which are repetitive, but in each subsequent scene there is a different animation. The whole game proceeds sequentially step by step in accordance with the educational content. In order for the student to move forward in his solutions, he must successfully solve, record and calculate the problems, which consist of three numerical expressions.

The game is intended for all fourth grade students, and since they do not experience any difficulty in reading, the module is made like a comic book in which the students can read the characters' lines themselves. Although some of the students read more slowly and others faster, the time for reading the speech is sufficient and tailored to the needs of all fourth graders.

The characters in the game always give a positive assessment in support of the student, noting his knowledge, and for each correct answer he receives praise, this is key to achieving a pleasant atmosphere for the student, and at the same time maintaining his interest in the game. When the student makes a mistake, he is instructed to correct his mistake with an indefinite number of attempts. The game is dynamic and interactive for students.

In the first scene, students are introduced to a character named Annie, who is selected from the library available in “Scratch”, and she is in a “school corridor” decor, which was selected specifically for the game itself. This is an introductory scene before the game begins, so the character only welcomes the student and tells him that it is time to review the geometric shapes studied (square and triangle). Annie goes to the classroom to introduce the student to an old acquaintance from math class. (Fig. 1)

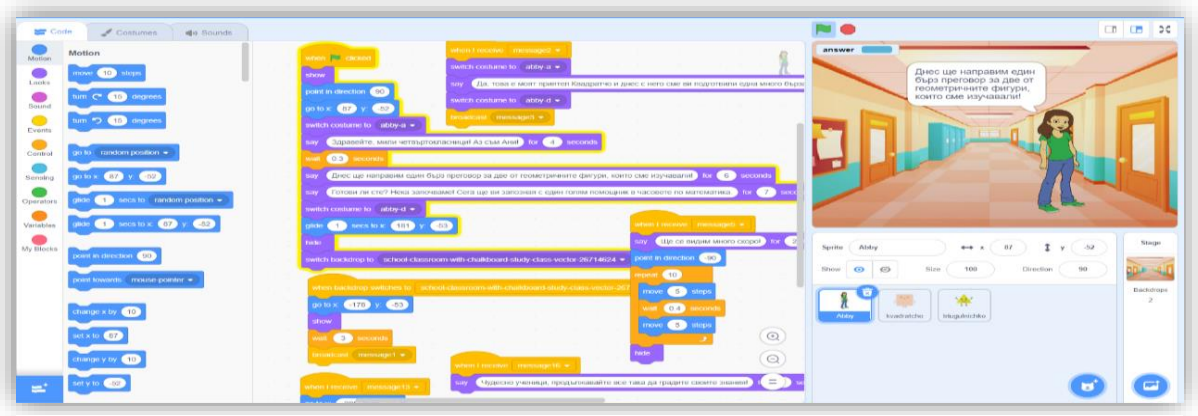

Fig. 1. Module "Geometric Friends", Scene 1.

The next scene is in a “math classroom” setting, which was again specially selected for the task. After Annie entered the room, she introduced the student to her old acquaintance from math classes, the square “Square”. Before introducing herself, the square wants to have a talk by asking the student what geometric figure she is. After the student answers the question, “Square” introduces the student to his assistant “Triangle”, when the triangle appears in the scene he does not forget to ask the student what geometric figure she is, after answering correctly, the heroine Annie leaves and the game begins. Both characters are not available in “Scratch”, but are specially selected for the content of the game. The goal in this part of the game is to consolidate the student’s knowledge of the geometric figures square and triangle. (Fig. 2)

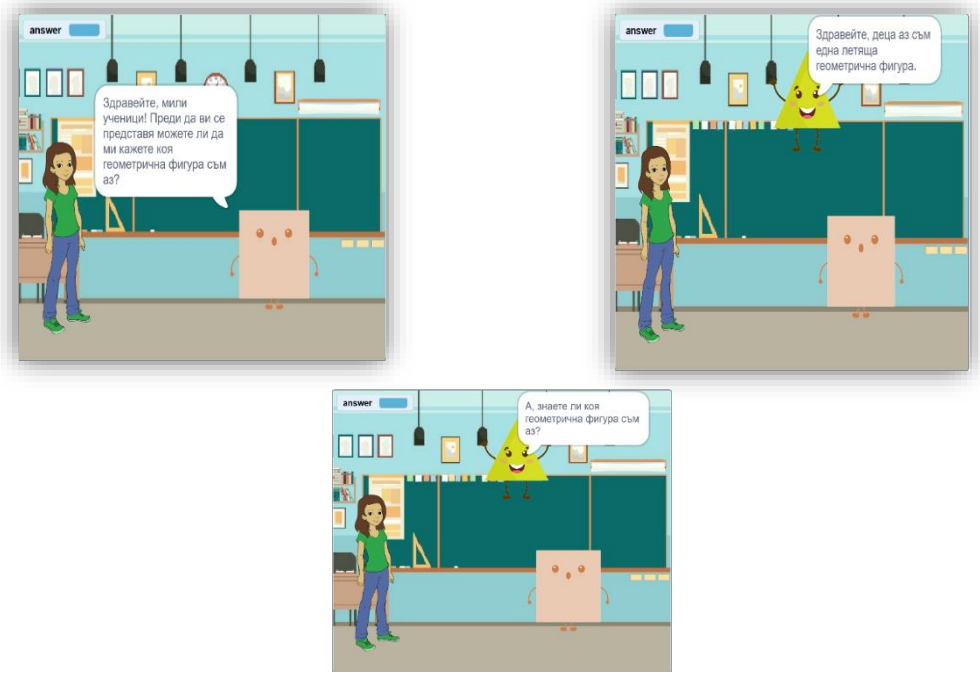

Fig. 2. Module "Geometric Friends", Scene 2.

When the game begins, the decor remains unchanged. The two characters state the condition of the task, they take turns, giving the student an instruction in advance to read carefully. To make the game more interesting for the student, the condition is a little more broken down, instead of “The perimeter of the square is …” the character says: “My perimeter is …” (Fig. 3). The goal of this part of the game is for the student to consolidate his ability to solve a geometric problem and to compose and calculate numerical expressions to solve the specific task. After they finish stating the condition of the task, the character “Square” checks whether the student has been paying attention, by asking him what is known from the condition and what is being sought. The student has time in which to answer these two questions orally. This is followed by a question in which the student must again verbally state what type of triangle is in the problem, thereby consolidating his knowledge and skills in recognizing the types of triangles according to their side (Fig. 4). When the student answers this question correctly, the problem is solved. Together with the help of the square and the triangle, the student must be able to write down and solve the three numerical expressions. With the help of the "Triangle", the fourth-grader must be able to find the side of the square by dividing the perimeter by the number of sides of the square. After finding the side of the square with the help of the "Square", he must be able to find the side of the triangle, using the information available about the side of the triangle from the condition. When he is completely ready with these solutions with the help of the "Triangle", the student will also be able to find the perimeter of the triangle.

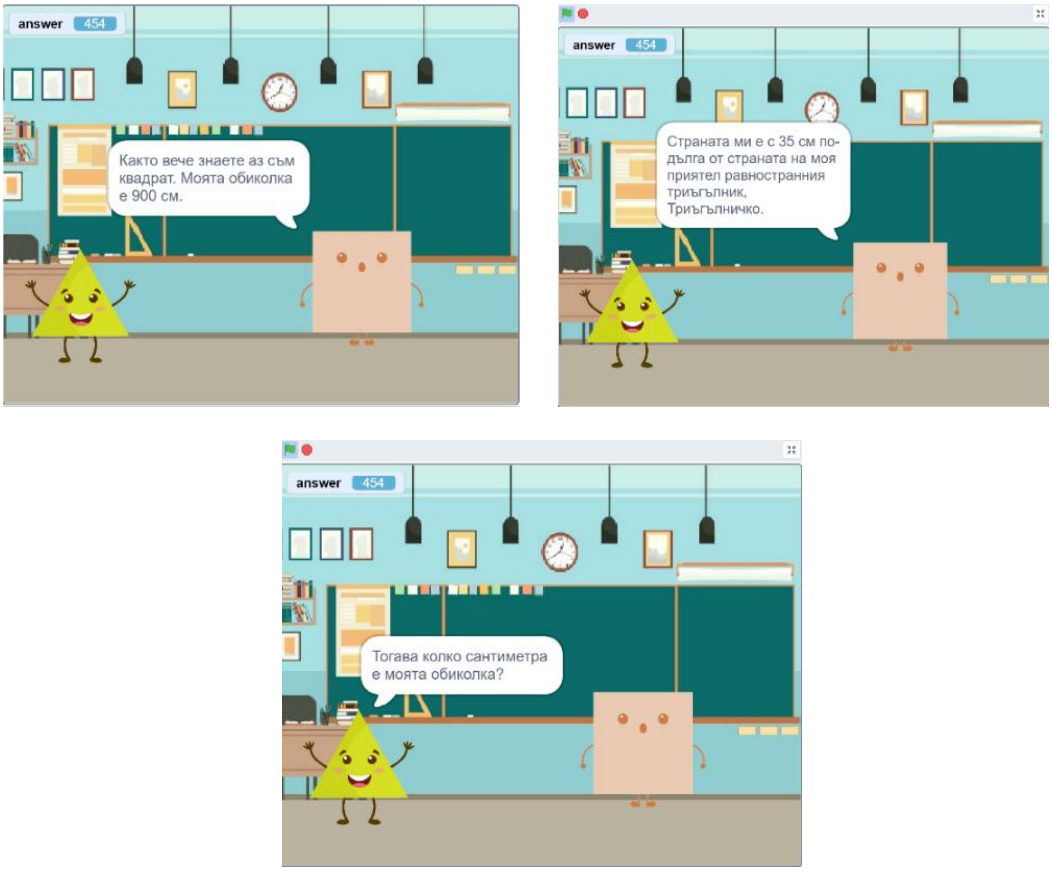

Fig. 3. Module "Geometric Friends", Scene 2.

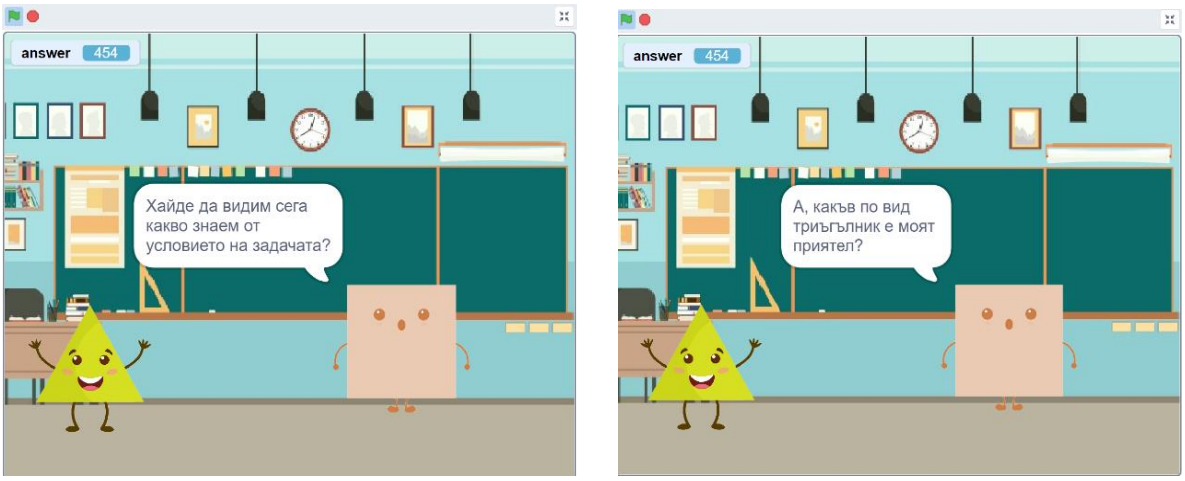

Fig. 4. Module "Geometric Friends", Scene 2.

Each numerical expression and its solution should be written in the field indicated for this with a blinking cursor, and the time for writing the solution is unlimited. After the student writes his answer, he should confirm the command by clicking on the blue tick with the mouse or pressing the “enter” button on the keyboard. When the student’s answer is correct, he receives praise from the geors “Great!”, and when the answer is wrong, he is given the opportunity to try again to solve the expression – “Try again!”, and this opportunity for correction is unlimited. (Fig. 5)

Only when the student has solved the entire geometric problem does the final scene follow, in which the

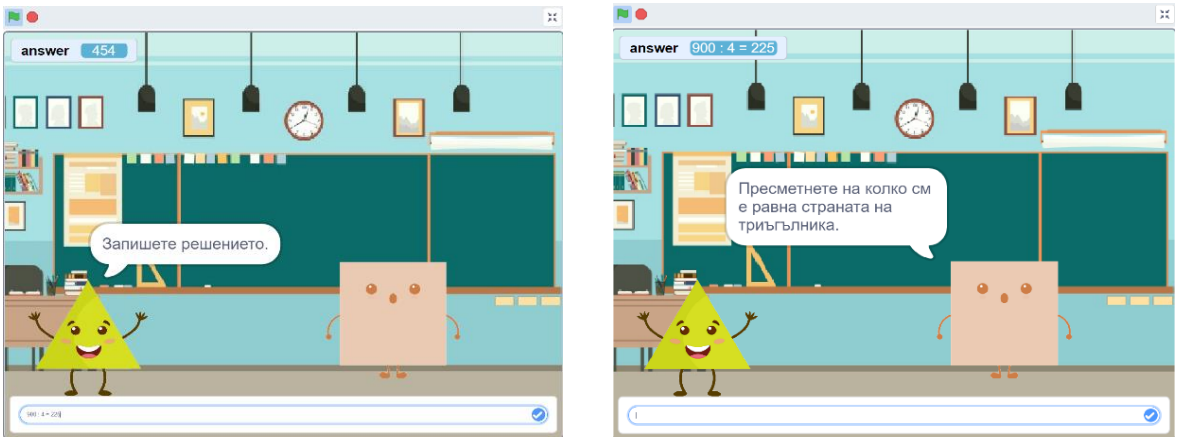

Fig. 5. Module "Geometric Friends", Scene 2.

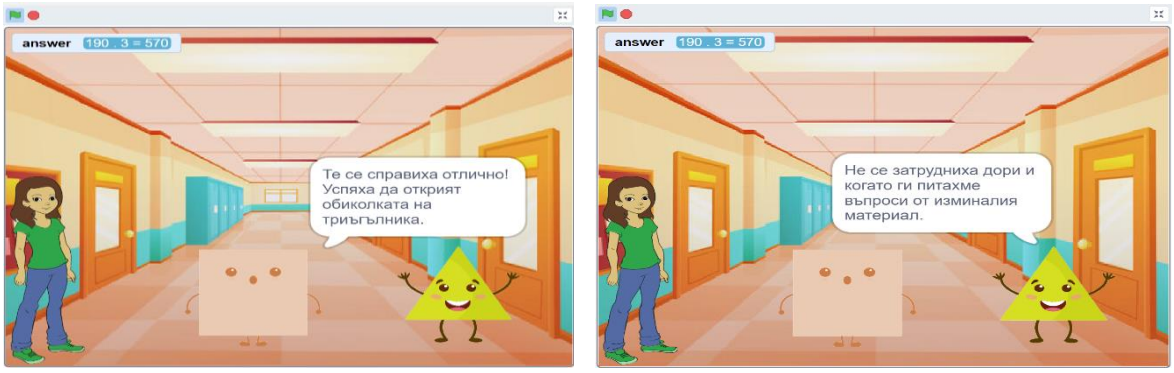

Fig. 6. Module "Geometric Friends", Scene 2.

decor changes again to a "school corridor", where Annie waits for the other two characters to give an assessment of how the student coped with solving the problem, of course the assessment is positive. (Fig. 6)

The game is suitable for both review and practice classes, as well as for individual preparation for each student.

3. Results

The pedagogical experiment was conducted in a class with 24 students. The class was divided into two groups of 12 students. The experimental group solved the task in Scratch within the framework of a lesson, while the control group worked with traditional exercises from the "Prosveta Plus" textbook. In the experimental group, the success rate in integrating Scratch was 89%, without violating the logic of the educational content in compared to 67% in the control group. These data show that creating and implementing digital electronic resources using Scratch facilitates the consolidation of learning content in mathematics classes. After completing this task, students in the experimental group were much more motivated and engaged with the remaining tasks during the lesson, while students in the control group did not change their motivation in any way, which confirms the role of visualization in increasing engagement. At the end of the class, a test was given to the class with the same task from the textbook, and students who had solved the task earlier with Scratch had 93% excellent results, while the group that solved the task in the textbook had an average result of 75% correct answers, which confirms the effect of visualization on the acquisition of skills.

4. Conclusion

The use of block-based programming in Scratch and the continuous enrichment of the methodological palette of 4th grade mathematics teachers is key to increasing student engagement and their motivation to learn. Digital educational tools will never stop developing, and to overcome the deficits in learning "Geometric Figures", the teacher must turn Scratch into his ally.

Study of the Operation of Dividing Natural Numbers by a One-Digit Number: Analysis of the Current State in Mathematics Textbook Sets for Grade 4

Antonia Diyanova Dobreva

Plovdiv University "Paisii Hilendarski", Bulgaria

Abstract

The most recent reform in primary mathematics education in Bulgaria, implemented in 2017, initiated substantial changes in the curricula and led to the approval of seven new textbook sets for the primary stage. The present paper is devoted to a comprehensive theoretical and practical analysis of the methodology for teaching division of multi-digit numbers by a one-digit number in Grade 4. This topic is of critical importance for the development of mathematical literacy and logical thinking among primary school pupils.

The study identifies and substantiates eight key methodological cases arranged in a strict logical sequence according to their cognitive complexity. The system begins with oral division of numbers expressed in place-value units and proceeds through algorithms without regrouping, cases with one or more regroupings in adjacent and non-adjacent place values, and specific difficulties related to zero in the quotient and cases in which the leading digit of the dividend is smaller than the divisor.

A central focus of the research is the comparative analysis of the current textbook sets published by "Arhimed," "Riva," "Prosveta Plus," "Bulvest 2000," "Anubis," "Prosveta," and "Bit i Tekhnika." The paper examines how each author team implements the proposed sequence and where methodological differences or unjustified jumps in difficulty are observed. The results show varying degrees of correspondence with the logical progression of the material, which directly affects the quality of students' acquisition of written algorithms. The paper offers valuable guidance for primary school teachers and methodologists, emphasizing the need for a systematic approach to teaching arithmetic operations in Grade 4.

Keywords: *mathematics education; division of natural numbers; Grade 4; textbook analysis; primary school*

Introduction

In recent years, educational reform in Bulgaria has been primarily directed toward the alignment of national educational standards with European Union standards. In this process, curricula have become a fundamental instrument for defining instructional aims, content, and expected learning outcomes for a given subject within a particular grade. The main objective of this process is to ensure that pupils receive high-quality education that is both appropriate and competitive in an international context.

Each topic in the curriculum is associated with specific expected outcomes and key concepts from different competence areas, with emphasis placed on the acquisition of arithmetic skills. These outcomes include knowledge aligned with the subject matter as well as with the age and cognitive capabilities of pupils. The methodological guidelines embedded in the mathematics curriculum for Grade 4 emphasise the use of technologies and strategies for mastering arithmetic operations such as multiplication and division of multi-digit numbers by one-digit numbers. This underscores the need to create an adaptive learning environment resposive to pupils' individual needs.

1. Method

The aim of this paper is to present the theoretical propositions that form the basis of the methodology for studying the topic "Division of a Multi-Digit Number by a One-Digit Number" and its implementation in the currently available mathematics textbook sets for Grade 4 of primary education.

Division of a multi-digit number by a one-digit number is taught through algorithms for written computation and through methods of oral computation.

A specific feature of division is that, in both oral and written procedures, calculations always begin from the highest place value of the dividend.

Written division is carried out in strict accordance with the following algorithm: activation of prior knowledge and skills concerning the meaning of division; the algorithm for dividing numbers up to 1000 by a one-digit number; the distributive property of division with respect to addition; and the ability to represent multi-digit numbers as sums of their place-value units in different ways.
The cases of division of numbers greater than 1000 by a one-digit number are grouped into two main categories:
Division without regrouping, in which each place value of the dividend is divided exactly by the divisor; and division with regrouping, in which at least one place value requires transformation.
The algorithms for computation should be studied in a specific sequence. The study of the algorithms for written and oral division of a multi-digit number by a one-digit number is organised in the following logical progression:

1. Division of numbers of the type 6000 : 2; 6,000,000 : 2 and 1500 : 3; 15,000 : 3; 15,000,000 : 3
2. Division of a multi-digit number by a one-digit number without regrouping, for example 4682 : 2
3. Division of a multi-digit number by a one-digit number with one regrouping, for example 3268 :
4. Division of a multi-digit number by a one-digit number with more than one regrouping in non-adjacent place values, for example 3674 : 2.
5. Division of a multi-digit number by a one-digit number with more than one regrouping in adjacent place values, for example 4386 : 3.
6. Division of a multi-digit number by a one-digit number when one of the digits in the quotient is zero, for example 6128 : 2.
7. Division of a multi-digit number by a one-digit number when more than one digit in the quotient is zero, for example 61,524 : 3.
8. Division of a multi-digit number by a one-digit number when the number of units in the highest place value of the dividend is less than the divisor, for example 1926 : 3.

This approach to arranging and studying the cases of division by a one-digit number is logically justified. It systematically derives all computational algorithms and organises them according to their complexity. The first of the listed cases is based on the decimal structure of the multi-digit number, with oral methods of division being applied. In deriving the algorithms for the subsequent cases, the distributive property of division with respect to addition is applied.
In order for pupils to recognize the practical necessity of mastering the algorithms for finding the quotients of multi-digit numbers by a one-digit number, it is appropriate to use a word problem as an introductory task, the solution of which requires the application and clarification of the new algorithm.

2. Analysis of Individual Cases

First Case: Division of Numbers of the Type 6000 : 2; 6,000,000 : 2; 1500 : 3; 15,000 : 3; 15,000,000 : 3

In deriving oral methods for division of numbers of the type 6000 : 2 and 6,000,000 : 2, the following conversions are used:
number ↔ number of thousands, for example 6000 = 6 thousand, 3 thousand = 3000;
number ↔ number of millions, for example 6,000,000 = 6 million, 3 million = 3,000,000.
The computation is reduced to basic multiplication facts.
For example:
6000 : 2 = 6 thousand : 2 = 3 thousand = 3000;
6,000,000 : 2 = 6 million : 2 = 3 million = 3,000,000.
The quotients of the type 1500 : 3; 15,000 : 3; 15,000,000 : 3 are clarified through analogous transformations, together with multiplication facts.

2.1 Second Case: Division of a Multi-digit Number by a One-digit Number without Regrouping (for Example 4682 : 2)

An analysis of the approved mathematics textbook sets for Grade 4 shows diverse approaches to teaching the division of a multi-digit number by a one-digit number without regrouping, for example 4682 : 2.
The methodology for introducing this case is as follows:
the dividend is represented as a sum of its place-value units, and the distributive property of division with respect to addition is applied:

4682 : 2 = (4 thousands + 6 hundreds + 8 tens + 2 units) : 2
= 2 thousands + 3 hundreds + 4 tens + 1 unit = 2341.
The written algorithm is explained with the help of a place-value table in which the dividend is recorded, emphasising its decimal structure. The division sign and the one-digit divisor are written to the right of the table. It is emphasized that division begins with the highest place value, in this case the thousands.

Thousands	Hundreds	Tens	Units
4	6	8	2
2	3	4	1

: 2

Written as:

4682 : 2 = 2341

The written algorithm for division of numbers of this type (4682 : 2) is as follows:

1. Divide the thousands of the dividend by 2. We obtain 4 thousands : 2 = 2 thousands. Write 2 thousands in the result.
2. Divide the hundreds of the dividend by 2. We obtain 6 hundreds : 2 = 3 hundreds. Write 3 hundreds in the result.
3. Divide the tens of the dividend by 2. We obtain 8 tens : 2 = 4 tens. Write 4 tens in the result.
4. Divide the units of the dividend by 2. We obtain 2 units : 2 = 1 unit. Write 1 unit in the result.

We obtain 2 thousands + 3 hundreds + 4 tens + 1 unit = 2341.
Finally, the procedure is presented without the table.
In my view, the methods for dividing a multi-digit number by a one-digit number without regrouping can be summarized as follows:

First method:

4682 : 2

= (4000 + 600 + 80 + 2) : 2

Second

4682 : 2 = 2341

In the first method, the dividend is represented as a sum of its place-value units, and the distributive property of division with respect to addition is applied.
In the second method, the written computation algorithm is applied.
Such cases are presented in all seven approved textbook sets for compulsory mathematics instruction in Grade 4: the set published by “Arhimed,” by R. Alashka and colleagues [1]; by “Riva,” by L. Aleksieva and M. Kirilova [2]; by “Prosveta Plus,” by V. Angelova and Zh. Koleva [4]; by “Bulvest 2000,” by M. Bogdanova, M. Temnikova, and V. Ivanova [5]; by “Anubis,” by T. Vitanov and colleagues [9]; by “Prosveta,” by Yu. Garcheva and A. Manova [6]; and by “Bit i Tekhnika,” by D. Kapitanova and colleagues [7].
In the textbook by V. Angelova and Zh. Koleva [3] the oral method of computation is first clarified, with the dividend represented as a sum of its place-value units and the distributive property applied; for the written method, a place-value table is used, and a clearly formulated algorithm for carrying out division is presented.
In the textbooks by L. Aleksieva and M. Kirilova and by D. Kapitanova and colleagues [7], a place-value table is used to explain the algorithm for performing division, but the algorithm is not explicitly formulated. The oral method of computation is insufficiently elaborated.
In the textbook by M. Bogdanova and colleagues [5], both an oral computation algorithm and a written computation algorithm are included. No tabular form is used.
The authors of the Grade 4 mathematics textbook, L. Vitanov and colleagues [9], first explain the oral method of computation; for the written method, they use a place-value table, but no clearly defined algorithm for written computation is provided.
In the Grade 4 mathematics textbook by Yu. Garcheva and A. Manova [6], no algorithm is formulated for the written division of a multi-digit number by a one-digit number; instead, pupils are directed to apply the corresponding algorithm for division with numbers up to 1000.

2.2 Third Case: Division of a Multi-digit Number by a One-digit Number with One Regrouping (for Example 3268 : 2)

In the third case, division in one of the place values is results in a remainder, which is carried to the next place value. The methodology for introducing this case is analogous to that described in section 2.2. It is important that pupils understand the role of the remainder and its relation to the decimal structure of the number, rather than perceiving regrouping as a purely formal operation.
In the textbook by "Arhimed," these tasks follow immediately after the cases without regrouping; an oral method is demonstrated through decomposition of the dividend and the carrying of the remainder, after which the standard written algorithm is shown. In the textbook by "Riva," cases with one regrouping are also included, but the emphasis is mainly on written division by example, with more limited oral explanations of the written algorithm.
In the textbook by "Prosveta Plus," the methodology is developed in greater detail: an oral method is first presented, and then the written algorithm is introduced with the corresponding steps and comments in a place-value table. In the textbook by "Bulvest 2000," both oral and written methods are presented, but greater emphasis is placed on the standard vertical layout. In the textbook by "Anubis," a place-value table is used, but a clearly formulated step-by-step algorithm is not provided, while in the textbook by "Prosveta," reliance is placed on transferring knowledge of division of numbers up to 1000 by a one-digit number. The textbook by "Bit i Tekhnika" includes a variety of tasks with one regrouping, but the algorithm is again presented mainly through solved examples.

2.3 Fourth Case: Division with More than One Regrouping in Non-adjacent Place Values (for Example 3674 : 2)

The fourth case involves divisions in which more than one remainder appears in different, non-adjacent place values, requiring pupils to follow a longer sequence of regroupings. The methodology for introducing this case is analogous to that described in section 2.2.
In the textbook by "Arhimed," such tasks appear after sufficient practice with simpler cases and are often marked as more difficult or included in sections intended for independent work.
In the textbook by "Prosveta Plus," these cases are introduced gradually, with visual support through a place-value table used purposefully to illustrate the carrying of remainders.
In the textbooks by "Riva," "Anubis," "Prosveta," and "Bit i Tekhnika," similar tasks are included, but they are not always clearly distinguished as a new type of difficulty; they are often distributed among general exercises without specific methodological commentary, which makes it more difficult for pupils to recognise the qualitatively new level of complexity.

2.4 Fifth Case: Division with More than One Regrouping in Adjacent Place Values (for Example 4386 : 3)

The fifth case is even more cognitively demanding, as remainders arise consecutively in adjacent place values and pupils must manage several successive regroupings without losing the logic of the algorithm. As in the previous cases, the methodology for introducing this case is analogous to that described in section 2.2.
The textbook by "Prosveta Plus" presents methodological guidance for such tasks through detailed solutions and intermediate questions that direct pupils' attention to each individual regrouping step.
In the textbook by "Bulvest 2000," tasks involving successive regroupings are also included, along with diagnostic exercises that allow for assessment of pupils' understanding.
In other textbook sets, such cases appear more rarely and are often not explicitly distinguished from cases with one regrouping, which may lead to a more mechanical application of the algorithm.

2.5 Sixth Case: Division of a Multi-digit Number by a One-digit Number When One Digit in the Quotient is Zero (for Example 6128 : 2)

The sixth case encompasses divisions in which one of the digits in the quotient is zero. It is methodologically important because pupils often omit the zero in the quotinent or fail to understand that it is a significant digit in the positional number system. The methodology for introducing this case is analogous to that described in section 2.2.
In the textbooks by "Riva" and "Bulvest 2000," specially selected tasks are included in which the quotient contains a zero, and the explanations emphasise the necessity of writing the zero in the correct place

in the quotient. In the textbook by “Prosveta Plus,” guiding questions are also used (“How many tens do we obtain? If there are no tens, what do we write in the quotient?”), which help pupils understand the role of zero.
In the textbooks by “Anubis,” “Prosveta,” and “Bit i Tekhnika,” tasks with a zero in the quotient are included in the general set of exercises, but without specific methodological separation or additional oral or written explanations, which increases the likelihood of errors.

2.6 Seventh Case: Division of a Multi-digit Number by a One-digit Number When More than One Digit in the Quotient is Zero (for Example 61,524 : 3)

The seventh case involves division situations in which more than one digit in the quotient is zero, which places increased demands on pupils’ attention and on their understanding of sequences of zeros in the quotient. Such tasks are encountered relatively rarely and more often found in sections for consolidation or supplementary practice. The methodology for this case is analogous to that described in section 2.2.
In most textbook sets, with the exception of isolated examples in “Prosveta Plus” and “Bulvest 2000,” there is no targeted work aimed at helping pupils understand a sequence of zeros in the quotient, which leaves this case partially embedded within the general flow of exercises.

2.7 Eighth Case: Division of a Multi-digit Number by a One-digit Number When the Number of Units in the Highest Place Value of the Dividend is Less than the Divisor (for Example 1926 : 3)

The eighth case is conceptually challenging, as it requires pupils to realise that they cannot divide the leading digit of the dividend alone, but must take the first two digits together, which changes the position of the first digit in the quotient. The methodology for introducing this case is analogous to that described in section 2.2.
In the textbooks by “Arhimed,” “Prosveta Plus,” and “Bulvest 2000,” such tasks are introduced after secure mastery of the other cases, accompanied by oral explanations and visual examples showing why the first digit cannot be divided separately and how this affects the place of the quotient.
In the textbooks by “Riva,” “Anubis,” “Prosveta,” and “Bit i Tekhnika,” similar tasks appear earlier in the sequence and without sufficient methodological emphasis, which increases the likelihood of errors and a more mechanical application of the procedure.
Conclusions and Methodological Recommendations
Summarising the analysis across the eight cases, the following conclusions can be drawn:
The proposed system of eight cases fully encompasses the range of division situations involving multi-digit numbers by a one-digit number within the primary curriculumand may serve as a criterion for evaluating the completeness and methodological soundness of textbook sets.
Although all textbooks formally comply with the curriculum, there are substantial differences in how consistently they follow the logical progression of the cases and in the way they emphasise difficult situations.
The most effective textbook sets are those that combine oral methods, visual support, and clearly formulated algorithms, and that provide a sufficient number of tasks involving more than one regrouping and zero/s in the quotient.
From a methodological perspective, the following recommendations are proposed:
The logical sequence of the eight cases should be strictly observed.
Oral and written methods should be systematically combined, with oral computation serving as a basis for understanding the written algorithm.
Special attention should be given to difficult cases such as multiple regrouping, zero/s in the quotient, and situations in which the leading digit of the dividend is less than the divisor.
Tasks with a practical orientation should be selected, in which division has real-life meaning, in accordance with the competence-based approach in education.
The role of the teacher is crucial: when deficiencies are identified in a particular textbook, the teacher should compensate through additional exercises, visual aids, and explanations, so as to ensure systematic and conscious mastery of division in Grade 4.

3. Conclusion

The study of division of multi-digit numbers by a one-digit number in Grade 4 plays a key role in developing stable arithmetic skills and in preparing pupils for more complex mathematical concepts in lower secondary education. Systematising the content through eight clearly distinguished

methodological cases ensures logical progression and enables more precise instructional planning at the primary level.
The analysis of the approved textbook sets shows that, although all of them meet the curricular requirements, there are substantial differences in the way algorithms are presented, in the degree of visual support, and in the emphasis placed on difficult cases related to regrouping and zeros in the quotient. This finding requires teachers to adopt a critical and reflective approach to the chosen textbook and, when necessary, to compensate for missing elements through additional tasks, oral methods, and visual models.
The proposed logical system of eight cases can serve not only as a tool for analysing existing textbook sets, but also as a guide for developing new teaching materials, supplementary aids, and methodological resources for primary mathematics education. In this sense, the results of the study are relevant both to classroom practice and to future research in the methodology of mathematics teaching.

Can Young Children Learn Bioethics and Geoethics? Evidence from a Mediated Non-Formal Science Experience

Marta Paz[1], Clara Vasconcelos[2]

[1,2]Science Teaching Unit, Faculty of Sciences (FCUP), University of Porto, Portugal & Interdisciplinary Centre of Marine and Environmental Research (CIIMAR), Portugal

Abstract

This study explores the educational potential of introducing bioethical and geoethical issues to young children through mediated non-formal science education experiences. The research focuses on primary students (ages 6–12; n = 24) as audiences and interlocutors rather than direct participants in structured instructional interventions. The context involved an intergenerational science theatre project, in which adolescents created and performed a play addressing ethical dilemmas related to life sciences and human–Earth interactions. Following the performance, younger children participated in a brief ludic activity using emoji-based response cards and engaged in semi-structured group interviews. Additional interviews with institutional educators provided complementary perspectives on engagement, comprehension and pedagogical feasibility. Data were analysed qualitatively and through descriptive quantitative analysis of responses to ten statements addressing bioethical, geoethical and combined ethical themes. Results from the ludic activity indicate a high proportion of correct responses in bioethical topics (95.8%), alongside consistent levels of correct responses in geoethical (80.2%) and mixed bioethical–geoethical categories (81.2%). These patterns suggest that children were able to recognise ethical dimensions, differentiate between types of socioscientific issues and articulate positions aligned with the narratives presented. Interview data further revealed emotional engagement, concern for living beings and the environment, and the ability to relate ethical questions to everyday experiences. Overall, the findings indicate that mediated, narrative-based and intergenerational approaches can lower conceptual barriers and support inclusive engagement with complex ethical dimensions of science in primary education. The study contributes to science education by highlighting non-formal, narrative-based approaches as effective entry points for early ethics learning, and by proposing mediated ethical understanding as a framework to explain how young learners engage with ethical dimensions of science.

Keywords: *Primary education; Bioethics; Geoethics; Socioscientific issues; Non-formal education*

1. Introduction

The increasing relevance of socioscientific issues (SSI), particularly those related to sustainability, technological development, and human-Earth system interactions, has reinforced the need to reorganise science education to integrate scientific understanding, ethical reflection, and responsible citizenship [1]. However, ethical dimensions remain underrepresented in formal science education [1,2], particularly in the early years, often due to assumptions about children's cognitive readiness to engage with abstract ethical concepts and the complexity of ethical deliberation required in socioscientific contexts [3,4].

Traditional approaches to science education tend to privilege conceptual knowledge over ethical deliberation, frequently relying on transmissive pedagogies that limit student engagement and the application of knowledge to real-world contexts [5]. In contrast, non-formal educational environments provide opportunities for more flexible, participatory and context-based learning experiences, where ethical dimensions can be explored through narrative, emotion and interaction.

The literature suggests that drama-based and embodied approaches can facilitate the understanding of complex scientific and ethical issues by lowering conceptual barriers and promoting empathy, perspective-taking and engagement [6,7,8]. Nevertheless, empirical evidence on younger children's ability to meaningfully engage with bioethical and geoethical issues remains limited.

This study addresses this gap by exploring whether primary school children, as audience members of a mediated non-formal educational intervention, can recognise, interpret and apply ethical dimensions related to science. The research question that guided this study was: To what extent can young children identify and engage with bioethical and geoethical issues through mediated, narrative-based non-formal science education experiences?

2. Theoretical Framework

2.1 Bioethics and Geoethics in Science Education

Bioethics and geoethics have emerged as key frameworks for addressing ethical challenges associated with scientific and technological development and human interactions with the Earth system. While bioethics focuses on life sciences, health and human dignity, geoethics extends ethical reflection to environmental responsibility, sustainability and intergenerational justice [9,10].
The integration of ethical dimensions into science education is increasingly recognised as essential for preparing students to engage with complex socioscientific issues (SSI) and to act as informed and responsible citizens [4,5,11]. SSI are characterised by uncertainty, conflicting values and the need to evaluate risks, making them particularly relevant for developing students' capacity to reason about real-world problems [12]. Research shows that SSI-based approaches promote critical thinking, argumentation and ethical reasoning, although their implementation remains uneven [13].
Evidence also indicates that SSI can be meaningfully integrated into primary education when connected to real-world contexts and supported by appropriate strategies [14]. In this context, bioethics and geoethics contribute to the development of moral reasoning and awareness of the ethical implications of scientific and environmental issues.
Despite these advances, their integration into early science education remains limited [15,16,17,18]. Although research suggests that children can engage with ethical reasoning and perspective-taking [19,20], these domains are often considered too abstract for younger learners. As a result, ethical discussions are frequently postponed, limiting opportunities for early development of ethical awareness.

2.2 Non-Formal and Mediated Learning Approaches

Non-formal education offers a complementary space to formal schooling, enabling participatory, contextualised and experiential learning. Such environments provide the flexibility to explore complex, interdisciplinary topics, including the ethical dimensions of science, in ways that are accessible and meaningful, particularly in contexts of social inclusion [21,22].
Mediated learning approaches are particularly relevant for addressing abstract concepts such as bioethical and geoethical issues. These approaches rely on narratives, interaction and guided interpretation, aligning with socio-constructivist perspectives that emphasise the role of dialogue and cultural tools in learning [23,24]. Intergenerational contexts further enhance relevance and engagement among younger learners.
Drama-based learning represents a powerful strategy within this framework. By combining storytelling, role-play, and emotional engagement, this approach allows learners to explore socioscientific issues in meaningful, situated contexts, supporting ethical reasoning and consideration of different perspectives [6,7]. Research shows that such approaches integrate cognitive, affective and social dimensions of learning and promote empathy and moral reflection [25,26].
Narrative and symbolic representations function as mediating tools that translate complex concepts into accessible experiences. The use of metaphors and analogies supports ethical reasoning and decision-making, particularly among younger learners [27,28,29]. These processes can be understood through sensemaking and mental models, which allow individuals to interpret complex situations without relying on fully articulated conceptual knowledge [30,31].
Taken together, non-formal, mediated and narrative-based approaches create conditions for the emergence of mediated ethical understanding, in which learners can recognise and respond to ethical dimensions of science without necessarily mastering formal concepts. The conceptual model guiding this study is presented in Figure 1.

Fig. 1. Conceptual model of mediated ethical understanding in non-formal science education.

3. Methodology

3.1 Research Design

This study adopts a mixed-methods approach within an exploratory case study design to examine how young children engage with bioethical and geoethical issues when exposed to a mediated, narrative-based non-formal educational intervention.
The study focuses on a convenience sample of 24 children (ages 6–12) attending the first and second cycles of basic education. They participated as audience members rather than as direct contributors to the intervention design. This distinction is relevant, as it allows for the examination of how ethical understanding may emerge through indirect, mediated experiences.
This design is consistent with established approaches in educational research that combine qualitative and quantitative data to provide a more comprehensive understanding of complex learning processes [32,33].

3.2 Educational Context and Intervention

The study was conducted in a non-formal educational context at a social support institution in an urban area characterised by socio-economic disadvantage. Such contexts are particularly relevant for exploring inclusive educational approaches, as they provide opportunities to engage learners who may have limited access to formal enrichment activities. Research highlights the importance of promoting social inclusion and supporting the development of moral reasoning from early stages, particularly by addressing children's epistemic beliefs and their capacity to engage with ethical issues [34,35].
The intervention was embedded in an intergenerational science education project, in which adolescents designed and performed a theatre play addressing bioethical and geoethical dilemmas. The play explored themes such as animal experimentation, environmental sustainability and human responsibility towards the Earth system.
Following the performance, younger children participated in two complementary activities: (i) a ludic evaluation task using emoji-based response cards to assess their responses to ethical statements, immediately after the theatre and (ii) semi-structured focus group interviews. Data collection from the interviews took place approximately 8 days after the performance, allowing for some reflection while maintaining proximity to the experience.

3.3 Data Collection and Analysis

Data were collected from multiple sources to enable triangulation. Quantitative data were obtained from participants' responses to an emoji-card activity comprising 10 items addressing bioethical, geoethical, and combined issues. Items were presented orally by a narrator and included both statements and questions. Participants responded individually using coloured cards: green (smiling emoji) to indicate agreement or an affirmative response, yellow (confused emoji) to indicate uncertainty, and red (angry emoji) to indicate disagreement or a negative response.
Examples of items included "A scientist should conduct experiments on animals without considering their well-being or level of suffering", "If a company discharges toxic waste into a river, causing harm to ecosystems and drinking water, is this an ethical practice?", and "Learning about the impacts of electronic waste on human health and the environment contributes to more ethical behaviour".
Participants' responses were recorded using an observation grid by two researchers positioned at different points in the room, allowing full visibility of all participants' responses. This procedure supported accurate data recording and reduced the risk of observational bias.
Qualitative data included transcriptions of two semi-structured focus group interviews with 18 participants. The groups were organised according to age and educational level: one group included 12 children attending the first cycle of basic education (ages 6–10), and the other included 6 children attending the second cycle (ages 10–12). Group formation accounted for age-related differences in cognitive and social development. The number of participants was determined by availability on the scheduled day of data collection. Additional interviews were conducted with institutional educators to provide complementary perspectives.
Quantitative data were analysed descriptively to identify patterns across bioethical, geoethical and combined categories. Qualitative data were examined through thematic content analysis, focusing on three dimensions: (i) recognition of ethical concepts, (ii) application of ethical reasoning in context, and (iii) emotional engagement and interpretation.

This combined approach enabled a comprehensive understanding of how participants engaged with ethical dimensions of science, integrating response patterns with interpretative insights.

4. Results and Discussion

The findings of this study indicate that young children can engage with bioethical and geoethical issues when presented through mediated, narrative-based approaches. Following the mixed-methods design, the baseline capacity for ethical identification is established quantitatively, followed by an in-depth qualitative analysis of the children's reasoning and retention.

4.1 Quantitative Findings: Immediate Identification of Ethical Dimensions

The results of the immediate emoji-card activity provide substantial evidence of the participants' capacity for ethical decision-making, as detailed in Table 1.

Table 1. Results of the emoji-card activity.

Category	Correct answer (%)	Uncertain (%)	Incorrect (%)
Bioethical topic	95.8	4.2	0.0
Geoethical topic	80.2	19.8	0.0
Combined topics	81.2	18.8	0.0

High levels of correct responses were observed across all categories, particularly in bioethical statements (95.8%), with slightly lower but consistent results in geoethical (80.2%) and combined categories (81.2%). The slightly lower results observed in geoethical and combined categories may reflect the greater level of abstraction and systems thinking required to interpret environmental and human–Earth interactions, compared to more immediate and relational bioethical issues. Notably, no incorrect responses were recorded, with remaining answers reflecting uncertainty rather than misunderstanding.

These results suggest that children in early stages of education are capable of recognising simple bioethical and geoethical principles when supported by appropriate pedagogical frameworks. This finding is consistent with previous research indicating the feasibility of ethics education in primary contexts [37,38], as well as recent reviews highlighting the development of argumentative and value-based reasoning from early school years [39]. In addition, studies show that younger learners construct meaning in scientific contexts through a combination of linguistic and non-linguistic resources, reinforcing the importance of multimodal and inclusive approaches [40], such as the emoji activity implemented here.

4.2 Qualitative Findings: Engagement, Applied Reasoning, and Educational Perspectives

To ascertain whether this high level of immediate identification translated into sustained reasoning and deeper ethical internalization, the focus groups conducted 8 days later were analyzed. Overall, participants demonstrated high levels of lingering engagement with the theatre-based intervention, expressing interest and valuing the opportunity to actively participate in the final decision-making process. Interactive elements, such as the voting component, were frequently highlighted as meaningful, suggesting that participation played a key role in sustaining attention and involvement over time. As one participant recalled, "[the voting component] brought more fun to the theatre" (Participant 6), while another argued that "... it was great" (Participant 14).

Despite the high identification success shown in the emoji activity, the qualitative data revealed that most participants had no prior familiarity with the concepts of *bioethics* and *geoethics*. None were able to provide formal definitions; however, when reflecting on the play a week later, many demonstrated an incipient applied understanding by using core values such as "care" (Participant 6), "protection" (Participant 5) or "responsibility" (Participant 12).

This distinction between formal conceptual knowledge and applied understanding is particularly significant. While conceptual mastery was absent, participants were nevertheless able to recognise ethical dimensions and interpret their meaning in context. This finding aligns with research on socioscientific decision-making, which conceptualises decision processes as multidimensional, involving the integration of knowledge, values, personal experiences and contextual factors [31]. From this perspective, ethical reasoning does not depend solely on formal conceptual understanding but can emerge through processes of interpretation and judgement. Similarly, studies on sensemaking and

mental models suggest that individuals rely on simplified representations to interpret complex situations and guide action [30].
Participants also demonstrated the ability to apply ethical reasoning to everyday situations, reflecting on issues such as animal welfare, environmental responsibility and social behaviour. However, difficulties were observed in generating explicit examples outside the scope of the play, indicating that while recognition and interpretation were present, the ability to independently articulate abstract ethical issues remained limited. This pattern suggests that early ethical understanding may be grounded in contextual and experience-based reasoning, rather than abstract conceptualisation.
Furthermore, the use of theatre appears to have facilitated access to complex issues by combining storytelling, emotion and interaction, allowing participants to engage with dilemmas in a situated and meaningful way. This is consistent with research indicating that narrative, metaphor and analogy can support ethical reasoning and decision-making by structuring how learners interpret and respond to complex situations [27,28,29]. In the context of socioscientific issues, science itself functions as a key epistemic resource for ethical reasoning [35]. In addition, participants demonstrated elements of perspective-taking, considering different viewpoints and reflecting on the consequences of actions. These findings are consistent with recent research showing that children can engage in perspective-taking and socioscientific decision-making when supported by contextualised learning environments [34], as well as earlier work highlighting the emergence of moral and environmental reasoning in primary education [36].
The intergenerational nature of the intervention appears to have further contributed to its effectiveness. Younger participants engaged with content produced by older peers, enhancing identification, motivation and relevance. This dynamic reflects socially mediated learning processes, in which meaning is co-constructed through interaction and shared experience.
Furthermore, the perspectives from institutional educators reinforce these findings. In individual interviews, all professionals (n=3) reported clear benefits of the intervention for younger participants, particularly in terms of long-term engagement, ethical awareness and the development of critical thinking. As one educator noted, “it is a much more engaging way for them to understand what is being discussed… these are not easy topics” (Educator 1). Another educator emphasised that the experience “left something that could awaken them to what they should or should not do”. The same participant added that it is important “to start introducing them to these topics from a very young age, as I think they are very relevant” (Educator 2).
On the other hand, educators expressed differing views on the most appropriate age to introduce bioethical and geoethical concepts. While one suggested that these topics can be introduced in the later years of primary education (1st cycle of basic education), provided they are approached gradually and in accessible ways (Educator 2), another mentioned the 2nd cycle of basic education (Educator 3), and another argued that greater cognitive maturity is required for deeper understanding, suggesting that these topics should only be addressed at secondary school level (Educator 1).
This reflects a tension also identified in the literature. On the one hand, research in early childhood education highlights that children are capable of engaging in ethical reasoning, perspective-taking and socio-emotional reflection [20,21]. On the other hand, the depth and complexity of ethical understanding are heavily influenced by cognitive development and maturity [3].

4.3 Synthesis and Conceptual Contribution

Taken together, the quantitative metrics and qualitative indicators suggest that young learners can develop early forms of ethical understanding when exposed to mediated, narrative-based and contextually meaningful learning environments. This supports the notion of *mediated ethical understanding*, in which learners can recognise and meaningfully respond to the ethical dimensions of science without necessarily mastering formal conceptual definitions. Additionally, our findings suggest that early exposure to ethically rich, narrative-based experiences may play a role in bridging the gap between scientific understanding and responsible action in young learners.
These results challenge traditional assumptions that ethical learning depends primarily on conceptual knowledge. Instead, they highlight the central role of engagement, interpretation and contextualisation in early science education.
Several limitations should be acknowledged. The study was conducted with a relatively small sample in a specific non-formal context, which may limit the generalisability of the findings. In addition, the short time frame between the intervention and data collection does not allow for the assessment of long-term learning effects.

5. Conclusions and Implications

This investigation examined how young children engage with bioethical and geoethical issues when exposed to a mediated, narrative-based non-formal educational intervention. Although participants did not demonstrate formal conceptual understanding, they showed a clear ability to identify ethical dimensions, apply contextual reasoning, and make value-based decisions.

These results support the notion that ethical learning in early stages does not depend primarily on conceptual mastery, but can emerge through engagement with meaningful, contextualised and emotionally resonant experiences. In this study, the use of theatre as a pedagogical tool, combined with interactive and intergenerational dynamics, appears to have played a central role in facilitating access to complex socioscientific issues.

From an educational perspective, the findings suggest that bioethical and geoethical dimensions can be meaningfully introduced in primary education, provided that age-appropriate and mediated approaches are used. Narrative-based strategies, such as drama, storytelling or visual representations, offer effective pathways to foster ethical engagement, particularly by promoting empathy, perspective-taking and reflective thinking.

At the same time, the results highlight the importance of recognising developmental differences. While younger learners can interpret and respond to ethical situations, the depth of understanding and the capacity for abstract conceptualisation remain limited. This suggests that ethical education should be introduced progressively, balancing accessibility with increasing conceptual complexity.

This study contributes to the field by providing empirical evidence for integrating ethical dimensions into early science education through non-formal and mediated approaches. It also introduces the concept of mediated ethical understanding as a useful framework to describe how learners engage with ethical issues in the absence of formal conceptual knowledge.

Future research should explore how these approaches can be adapted to formal educational settings and diverse learner populations, and examine their long-term impact on ethical reasoning, scientific literacy, and responsible citizenship. Further studies could also investigate how the progressive integration of conceptual knowledge may build upon early forms of mediated ethical understanding.

Child as Co-Author: Interdisciplinary Integration of Visual Arts and Media Literacy in Early Childhood Education

Lana Skender[1], Darija Kuharić[2]

[1]Academy of Arts and Culture, J. J. Strossmayer University of Osijek, Croatia
[2]Faculty of Education, J. J. Strossmayer University of Osijek, Croatia

Abstract

This paper examines the interdisciplinary integration of visual arts and media literacy in early childhood education, grounded in the concept of the child as a co-author in the process of meaning-making. Drawing on contemporary approaches to media literacy, visual culture, and constructivist pedagogy, the study positions the child as an active constructor of knowledge rather than a passive recipient of media content. The empirical part presents a qualitative case study of a six-year-old child who, after reading a story written by one of the authors, developed a narrative interpretation and translated it into a series of original illustrations. The analysis explores the relationship between verbal narrative and visual representation, focusing on how the child identifies and interprets elements of media messages—such as color, characters, emotional tone, and communicative intention—and reconfigures them through artistic expression. The findings suggest that integrating visual arts with media literacy supports the development of critical thinking, visual analysis, and creative interpretation. The child emerges as an active interpreter and co-author of meaning, highlighting the pedagogical value of artistic production in fostering early media competence and supporting interdisciplinary approaches in early education.

Keywords: *media literacy; visual arts; early childhood education; child as co-author; constructivism; case study*

1. Introduction

Children today grow up in a highly visual, media-saturated environment shaped by digital media, advertising, and public visual communication, all of which influence their perceptions and understanding of the world [4], [14]. Visual messages, particularly advertisements, function as complex systems of meaning that use symbolic and affective strategies to shape viewers' responses. Although often perceived as passive recipients, children actively interpret and negotiate media meanings within their social contexts, thereby calling for recognition of their capacity as meaning-makers [6].

Media literacy, defined as the ability to access, analyze, evaluate, and create media messages, is therefore essential from an early age [1], [10]. Research shows that even young children begin to understand persuasive intent, although their critical evaluation skills are still developing, so it is important to develop appropriate approaches in early education [15].

Visual arts offer a valuable pathway for fostering such competencies because artistic expression enables children to interpret and transform visual information. Grounded in constructivist perspectives, this study explores how integrating visual arts and media literacy supports children's interpretative abilities and examines how a child uses illustration to reconstruct a media message, positioning the child as a co-author of meaning within a multimodal framework [12], [13].

2. Theoretical Background

Contemporary pedagogical theories increasingly reject the notion of the child as a passive recipient of knowledge, instead positioning the child as an active participant in meaning-making. This perspective is grounded in the work of Piaget [19] and Vygotsky [25], who emphasize the child's active role in cognitive and symbolic development.

Piaget explains learning as a process of active construction through assimilation and accommodation, in which children interpret new experiences in relation to their existing cognitive structures [19]. In the context of media literacy and visual culture, children do not receive media messages as predetermined meanings but interpret them through their prior experiences and intellectual capacities. Visual expression, such as drawing, serves as a symbolic representation through which children externalize and reorganize their understanding [8].

Vygotsky extends this view by highlighting the social nature of learning, in which knowledge is mediated by interaction and cultural patterns [25]. Dialogue, reflection, and visual production support the development of more complex interpretative abilities, positioning artistic expression as a key medium of meaning-making [12].
A model for such an approach can be found in Reggio Emilia, which conceptualizes the child as competent, expressive, and capable of constructing meaning through multiple symbolic systems, as reflected in the concept of the "hundred languages of the child." [16], [20]. Learning is understood as a collaborative and interpretative process, with the adult acting as mentor rather than transmitter of knowledge.
Within this model, the concept of the child as a co-author emerges. Co-authorship aligns with participatory and democratic education, especially in foregrounding children's interpretations and shaping meaning rather than reproducing content [6].
In visual culture and media literacy contexts, this is particularly evident. Visual production enables children to construct and communicate their own perspectives, positioning them as active participants in visual culture [9]. Meaning is not inherent in images but emerges through interaction between the viewer and the visual text [23]. Through drawing and illustration, children select, emphasize, and transform elements, revealing both understanding and a critical attitude.
In interdisciplinary contexts that integrate visual arts and media literacy, children engage in multimodal meaning-making, in which their visual choices serve as indicators of agency and interpretation. Co-authorship provides a framework for understanding children's visual and narrative productions as the main arenas for meaning-making, positioning the child as an active participant within contemporary media environments.

2.1 From Perception to Interpretation: Media Literacy in Early Childhood

Media literacy is widely recognized as a fundamental competence in contemporary societies, encompassing the ability to access, analyze, evaluate, and create media messages [1], [10]. UNESCO further expands this concept by integrating media and information literacy, emphasizing an understanding of how media content is produced and situated within broader social and cultural contexts [24].
Contemporary approaches highlight the critical dimension of media literacy. As Buckingham argues, media literacy involves understanding representation, media language, audience, and production processes [4]. Developing media literacy requires recognizing how meaning is constructed and how spectators are positioned.
Important to this study is the shift from perception to interpretation. While perception refers to initial engagement with media, interpretation involves active cognitive and semiotic processing, questioning how meaning is constructed and why certain elements are emphasized. This approach is similar to constructivist and sociocultural perspectives on learning [3], [25].
Research shows that children begin to recognize persuasive intent between ages six and eight, although their critical evaluation remains limited [15]. It highlights the need for pedagogical approaches that move beyond awareness toward interpretative engagement.
Recent scholarship advocates moving from protectionist to empowerment-oriented models of media literacy, supporting children as active participants in media culture [5], [10]. Given children's frequent engagement with visual media, developing visual interpretative skills is essential. As Kress notes, meaning is increasingly constructed multimodally, requiring the ability to interpret visual and spatial elements [12].
Pedagogically, this implies integrating analysis with creative production. Activities such as discussing advertisements and reconstructing media messages through drawing enable children to externalize and reflect on their interpretations [11].
Within interdisciplinary contexts, particularly those that combine visual arts and media literacy, this progression becomes evident. By creating their own visuals, children can reshape media messages. It shows what they understand and turns them into active participants. Media literacy thus emerges as a multimodal, participatory practice that supports the development of critical awareness and the child's role as a co-author of meaning.

2.2 Drawing Meaning: Visual Arts as a Critical Literacy Practice

Given the central role of images in contemporary culture, media literacy necessarily includes the development of visual literacy, the ability to interpret, analyze, and construct meaning through visual elements such as color, composition, and symbolism [9], [23].
Visual culture theory emphasizes that meaning emerges through interaction between the image and the viewer within specific cultural contexts [23]. In educational settings, this involves encouraging children to question who created a message, for whom, and with what intent. Such inquiry supports the shift from perception to interpretation.
Duncum highlights the importance of engaging with media images in education, advocating a move from passive viewing to active interpretation [7]. When children reinterpret visual messages through artistic expression, critical reading becomes visible in their visual choices. In this study, illustration is therefore understood not as reproduction but as an interpretative act that transforms narrative meaning into visual form.
The sequential nature of illustrations further supports meaning-making by structuring temporal and causal relationships. It allows insight into how children organize and develop understanding over time. Illustrated sequences provide insight into how children organize and interpret meaning.
Visual arts can thus be seen as a critical literacy practice. Drawing supports symbolic thinking [19] and operates as a cultural tool for meaning-making [25], enabling children to reinterpret and transform visual information [12]. As Eisner argues, artistic activity fosters forms of thinking essential for interpretation and judgment [8].
Through visual production, children engage in processes of selection, evaluation, and transformation, which are considered core aspects of critical literacy [12], [21]. In interdisciplinary contexts, particularly those integrating visual arts and media literacy, drawing makes children's interpretations visible and positions them as active meaning-makers and co-authors within visual culture.

2.3 Illustration as an Interpretative Act

Picturebook illustration, particularly within a narrative sequence, represents a form of visual interpretation rather than a neutral reproduction of text. Illustrations construct and transform meaning by introducing visual, spatial, and affective dimensions. As such, illustration can be understood as a semiotic practice in which meaning is rearticulated through visual choices.
Visual production enables learners to develop personal perspectives and negotiate meaning within cultural contexts [9]. When children translate narrative into images, meaning is transformed rather than transferred [12]. Picturebook theory further emphasizes the dynamic relationship between text and image, where illustrations may complement, expand, or challenge the verbal narrative [17], [18].
Meaning, therefore, emerges through interaction between the image and the viewer [23]. Illustration thus functions as a visible trace of cognitive and interpretative processes. As Arizpe and Styles show, children actively engage with visual narratives, bringing personal and cultural understandings into their interpretations [2]. It becomes particularly evident in sequential illustration, where organizing events across images requires an understanding of temporal progression, causality, and narrative coherence [17].
Such processes position illustration as a multimodal practice through which children organize and negotiate meaning. By selecting, omitting, or reconfiguring elements, children reveal their interpretative strategies and critical engagement. In this sense, illustration becomes an analytically relevant site where media literacy, symbolic thinking, and agency are made visible.
Within this study, the creation of an illustrated narrative based on a misleading advertisement provides insight into how a child reconstructs media messages. The illustrations function as multimodal texts that reveal how perception is transformed into interpretation.
Illustration should therefore be understood not as a supplementary activity but as an interpretative act central to meaning-making. This perspective aligns with the concept of the child as a co-author, positioning visual production as a key site for constructing, negotiating, and transforming meaning.

3. Methodology

This qualitative case study aims to gain an in-depth understanding of how a child constructs and reinterprets media messages through visual expression. A qualitative approach was selected as it enables the exploration of meaning-making processes, symbolic structures, and interpretative practices,

in line with constructivist perspectives that conceptualize the child as an active agent in knowledge construction [3], [25].
The case study methodology allows for a detailed, context-sensitive analysis of a specific phenomenon within its natural setting [22], [26]. In this research, the phenomenon under investigation is the multimodal interpretation of media content through children's illustrations, understood as an interdisciplinary form of meaning-making that connects media literacy and visual arts.

3.1 Participant and Research Context

The participant in the study is a seven-year-old boy. The research was conducted in an educational context through a structured activity that supported both interpretation and creative expression. The activity consisted of three phases:

1. Reading the story *Adbad's Secret Plan*,
2. Producing a series of illustrations based on the narrative.
3. Engaging in a reflective conversation about the created illustrations.

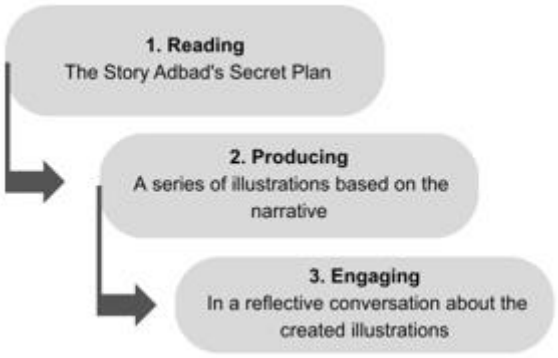

Fig. 1. Research activity sequence: reading the story, producing illustrations, and reflective conversation

This sequence enabled the collection of both visual and verbal data, allowing examination of relationships among narrative understanding, emotional engagement, and visual representation.

3.2 Analytical Framework: Multimodal Social Semiotic Approach

The analysis was conducted using a multimodal approach grounded in social semiotics [12], [13]. From this perspective, meaning is understood as emerging through the interaction of different semiotic modes, such as language and image, each offering specific affordances for meaning-making.
A mode is defined as a socially and culturally shaped resource for meaning-making [12]. In this study, particular attention is given to the interaction between the verbal mode (narrative) and the visual mode (illustration), through which the child reinterprets the media message.
Rather than treating illustration as a simple translation of the narrative, it is approached as a transformative multimodal act, in which meaning is reconfigured across modes. It aligns with a social semiotic understanding of communication as a process of design, where individuals actively shape meaning through the selection and organization of semiotic resources [12].
To systematically analyze the visual data, the study applies Kress and van Leeuwen's model of visual grammar, organized around three metafunctions: the representational, interpersonal, and compositional [13].

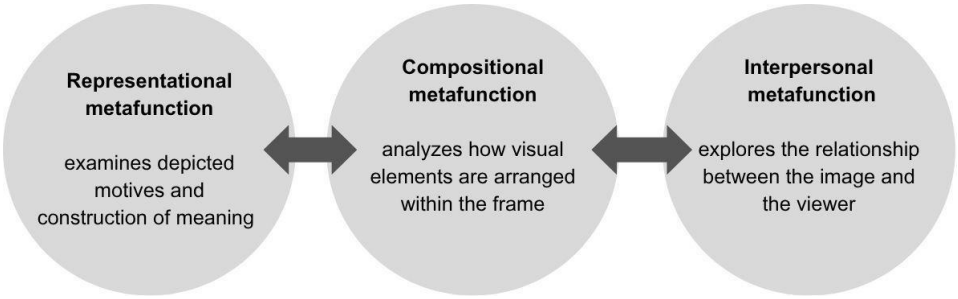

Fig. 2. Kress and van Leeuwen's (2006) model of visual grammar.

These dimensions do not operate independently but interact to produce meaning, enabling the analysis to capture how visual, narrative, and symbolic elements are orchestrated within the illustrations [11].
The analysis was conducted in an interpretative and iterative manner, integrating visual and verbal data. The illustrations were examined in relation to the narrative content and the child's reflections, with particular attention to:

- the selection and emphasis of visual elements,
- the transformation or reinterpretation of narrative content,
- the use of symbolic strategies (e.g., exaggeration, abstraction),
- and the organization of meaning across the sequence of images.

This approach allowed for the identification of indicators of media literacy, such as recognition of persuasive intent, awareness of emotional appeal, and the emergence of critical distance.
At the same time, the analysis focused on moments of interpretative agency, examining how the child actively reorganizes and transforms meaning across modes. In this sense, the illustrations were treated as multimodal texts that make visible the child's meaning-making processes and support the conceptualization of the child as a co-author of meaning.

4. Results: Multimodal Analysis of Children's Illustrations

The multimodal analysis of the two illustrations reveals a clear progression in the child's understanding and reinterpretation of the media message. Across the representational, interpersonal, and compositional dimensions, the findings indicate a shift from perceptual engagement toward critical interpretation.

4.1 Perceptual Engagement with the Media Message

Figure 3 depicts children standing in front of a large roadside poster featuring a football player. At the representational level, three key elements are present: the observing children, the poster, and the media figure. The football player is shown in motion, kicking a ball, enhancing the image's dynamic and appealing character. The act of looking, in which one of the children directs attention to the poster, establishes a simple narrative of engagement with the media content.
A notable feature is the poster's exaggerated scale relative to the surrounding environment. Its size surpasses that of nearby houses and figures, visually signaling its dominance. This disproportion suggests how media messages occupy and control visual space. At the same time, the contrast between the everyday setting and the idealized image on the poster introduces a distinction between lived reality and mediated representation.
From an interpersonal perspective, the illustration constructs an indirect relationship with the viewer. The football player does not engage with the gaze but is absorbed in the action, while one of the children focuses on the poster. This positioning situates the viewer as an observer rather than a participant. The emotional dimension is conveyed through the child's attentive stance and the accompanying narrative, both of which indicate fascination. It reflects sensitivity to the advertisement's emotional appeal, though without clear critical distance.
Compositional analysis reinforces the prominence of the media message. The poster occupies a central, visually dominant position, while the children appear smaller and lower in the frame. Strong color contrasts further highlight the poster as the focal point. The spatial separation between the everyday environment and the media image emphasizes the latter as the primary carrier of meaning.

Overall, the illustration suggests that the children recognize the advertisement's attractiveness and visual power but engages with it primarily at a perceptual level. It corresponds to an early stage of media literacy, characterized by awareness of appeal rather than critical evaluation.

4.2 Critical Reinterpretation and Deconstruction

Figure 4 demonstrates a significant transformation in the representation of the media message. The previously appealing football player is replaced by a simplified, dark figure with a skull-like face and an "X" over the mouth, marking a shift from realistic depiction to symbolic abstraction.
At the representational level, the focus moves from action to meaning. The figure functions as a visual metaphor for deception, danger, or concealed intent. Its stylized form and raised arms contribute to a sense of tension and exposure, suggesting that the child is engaging with the media message's underlying implications rather than its surface features.
The interpersonal dimension also changes. The simplified, abstract representation reduces emotional identification, creating distance and unease instead. Unlike the first illustration, which invites admiration, this image evokes reflection and discomfort. The accompanying text reinforces this shift by introducing themes of fear and secrecy, further supporting a critical stance toward the message.
Compositional features intensify this reinterpretation. The poster remains central, but the surrounding environment is significantly reduced or omitted, isolating the media message. The use of darker, monochromatic tones within the poster contrasts sharply with the background, emphasizing its seriousness and symbolic weight. This visual simplification directs attention exclusively to the message's meaning.
The advertisement is no longer represented as attractive but as deceptive and potentially harmful. Through abstraction, symbolism, and selective emphasis, the child demonstrates the ability to reinterpret and transform the original message.

Fig. 3. Child-produced illustration inspired by the story *Adbad's Secret Plan*: a boy and a girl observing the poster

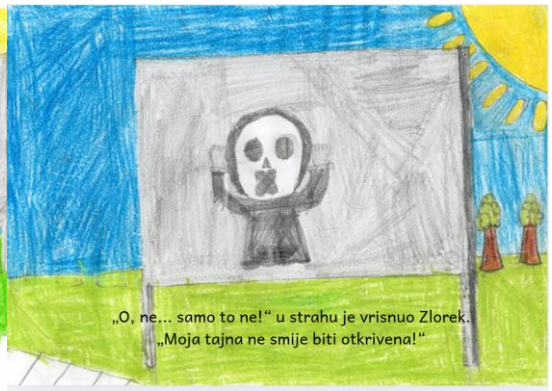

Fig. 4. Child-produced illustration inspired by the story *Adbad's Secret Plan*: Adbad as the central figure

5. Discussion

The findings of this study contribute to ongoing discussions on early media literacy, visual arts education, and the conceptualization of the child as an active meaning-maker. By analyzing children's illustrations as multimodal texts, this research demonstrates how visual production can function as a site of interpretation, transformation, and critical engagement with media content.
A key finding is the shift from perceptual engagement to interpretative and critical understanding. As the analysis shows, the illustration in Fig. 3 reflects the visual logic of advertising, emphasizing attractiveness, scale, and emotional appeal. In contrast, the second illustration reconfigures these same elements to expose manipulation and hidden intent.
This shift reflects a movement from representation to transformation. The child does not merely replicate the given narrative but actively reorganizes its meaning through visual means. The introduction of symbolic elements, the simplification of form, and the recontextualization of the poster all indicate interpretative agency.
This progression aligns with developmental perspectives on media literacy, which suggest that children initially engage with media at the surface level before gradually developing the capacity for critical

evaluation [15]. However, the present findings extend this understanding by demonstrating that such critical awareness can emerge earlier when children are supported through structured, multimodal learning experiences. The use of visual expression appears to facilitate this transition by enabling children to externalize and reflect upon their interpretations.

From a multimodal perspective, this process can be understood as a transformation of meaning across modes. The narrative is first encountered verbally, then interpreted cognitively and emotionally, and finally rearticulated visually. Each stage involves reinterpretation, rather than simple translation [12]. It supports the view that meaning-making is not linear but dynamic and recursive, involving continuous negotiation between different semiotic resources [11].

The findings also reinforce theoretical perspectives in visual culture studies, which emphasize that meaning is not inherent in the image but is constructed through the interaction between the viewer and the visual text [23]. In this study, the child's illustrations reveal how this interaction becomes productive: the child does not passively receive the media message but actively reshapes it, introducing new symbolic elements and altering its meaning.

Through visual production, the child participates in reconstructing the media message, demonstrating not only understanding but also critical positioning. The illustrations thus function as multimodal texts that make visible the child's interpretative processes and emerging media literacy.

Importantly, this supports pedagogical approaches that position children as competent and agentive participants in learning processes, as advocated in sociocultural and Reggio Emilia-inspired frameworks [16], [20], [25]. The child's ability to reinterpret and transform the media message suggests that even at an early age, children can engage in complex semiotic practices when provided with appropriate scaffolding and opportunities for expression.

The role of the visual arts in this process is particularly significant. Consistent with Eisner's argument that artistic activity fosters forms of thinking essential for interpretation and judgment, the act of illustration enabled the child to analyze, evaluate, and reconstruct the media message [8]. Rather than functioning as a supplementary activity, drawing served as a primary mode of inquiry and critical reflection.

Furthermore, the findings highlight the importance of interdisciplinary integration. By combining narrative, visual expression, and media analysis, the learning process becomes multimodal and dialogic. It supports arguments that media literacy education should move beyond analytical exercises toward creative and participatory practices [5], [10]. The integration of visual arts and media literacy provides a pedagogical framework in which interpretation and production are mutually reinforced.

At the same time, the study has limitations that should be acknowledged. As a single case study, the findings cannot be generalized to broader populations. The interpretation is also context-dependent and influenced by the specific task, narrative, and interaction with the researcher. Future research could explore similar approaches with larger sample sizes, across different age groups, or in varied media contexts to further examine the relationship between visual production and media literacy development.

Despite these limitations, the study offers important implications for educational practice. It suggests that early media literacy education should not be limited to recognizing media messages but should actively engage children in interpreting and reconstructing them. Visual arts, particularly illustration, provide a powerful means of making children's thinking visible and supporting the development of critical awareness.

This study demonstrates that the transition from perception to interpretation can be effectively supported through multimodal and interdisciplinary approaches. By engaging in visual reinterpretation, children move beyond passive reception and become co-authors of meaning, actively participating in the construction and transformation of media messages.

6. Conclusion

This study explored the potential of integrating visual arts and media literacy in early childhood education through a multimodal, case-based approach. By analyzing a child's illustrations as interpretative acts, the research demonstrated how visual expression can function as a powerful tool for meaning-making and critical engagement with media content.

The findings indicate that children can move from perceptual engagement with media messages to more complex forms of interpretation when supported by structured, interdisciplinary activities. The progression observed in the illustrations highlights the child's ability to reinterpret and transform the given narrative, revealing emerging critical awareness and interpretative agency.

By conceptualizing illustration as a multimodal practice, this study contributes to understanding how meaning is constructed across modes and how children participate in this process. The results support

the notion of the child as a co-author of meaning, actively engaged in reconstructing media messages rather than passively receiving them.
From a pedagogical perspective, the study underscores the importance of integrating visual arts into media literacy education. Such an approach not only enhances critical thinking but also makes children's interpretations visible and open to reflection.
Future research should explore multimodal and interdisciplinary approaches across contexts and age groups to better understand how early media literacy can be effectively supported in contemporary educational settings.

Special Needs

The Role of Teachers in Social-Emotional Learning to Support Children with Special Needs in Inclusive Schools

Sri Marmoah*[1], Diana Sinziana Duca[2]

[1]Universitas Sebelas Maret, Indonesia
[2]Stefan cel Mare University of Suceava, Romania

Abstract

Children with special needs still often receive discrimination even at inclusive schools. Teachers play a very important role in the learning of children with special needs. This study aims to examine the role of teachers in social-emotional learning (SEL) to support development in the primary school environment. This research uses a descriptive qualitative design. Data was collected through observation, semi-structured interviews, and document analysis. The validity of the data is ensured through triangulation of sources and techniques. Data analysis follows the Miles and Huberman model consists of data reduction, data presentation, and conclusion drawn. The results show that teachers have a role in teachers' social-emotional learning, including as Facilitators of Emotional Regulation, Models of Positive Social Behavior, Mediators of Social Interaction, and Supporters of Individual Emotional Needs. SEL can increase the involvement of students with special needs in classroom activities and help them manage their emotions and interact with peers. This research can provide an understanding of the role of teachers in the implementation of SEL in the context of inclusive education and become a reference for schools and educators in designing SEL strategies that are more adaptive and oriented to the individual needs of students with special needs.

1. Introduction

Teachers play a very important role in the learning of children with special needs (CSN). Teachers can facilitate learning that helps children with special needs reach their full potential [1], [2]. Teacher involvement can have an impact on the quality of learning [3]. Teachers in inclusive classrooms must be able to provide physical and non-physical access that ensures all students participate in educational activities without limitations [4]. Teachers often face challenges in dealing with children with special needs in regular classrooms [5].

The right to fair and quality education applies to all children [6], [7] including children with special needs [8]–[10]. This is in line with the Convention on the Rights of the Child, which emphasizes that every child has the right to learn in a safe and discrimination-free environment [11]. Inclusive education can be a key strategy to ensure every child gets a quality education in a supportive environment without discrimination. Inclusive education prioritizes diversity and equal educational opportunities for all learners regardless of their differences [12], [13]. Inclusive education attaches importance to children's right to participate without exception [14] and requiring schools to accept children without discrimination to ensure access to quality education [15]. Inclusive education supports the development of language, communication, social, academic skills [16], and fostering positive attitudes for children with special needs in the social environment [17], [18].

Currently, in Indonesia all schools are required to accept all students without exception, including Children with Special Needs. Article 31 of the 1945 Constitution and the National Education System Law affirm the right to education for all citizens without discrimination. The Government of Indonesia through the Regulation of the Minister of National Education Number 70 of 2009 has regulated and developed programs to promote inclusive education [19]. Regulation of the Minister of National Education of Indonesia No. 70 of 2009 states that each district/city must appoint at least one elementary and junior high school in each sub-district as an inclusive school, as well as a minimum of one high school per district/city [20], [21].

Social-Emotional Learning can be one of the educational approaches that focuses on developing students' social and emotional competencies. SEL is able to support the cognitive and emotional aspects of student learning [22]. SEL programs help children with special needs develop emotional competencies and social skills, which are essential for emotional development and social inclusion. Social-emotional learning can be one of the educational approaches that focuses on developing students' social and emotional competencies. SEL has 5 main components, including Self-Awareness, Self-Management, Relationship Skills, Social Awareness, Responsible Decision Making [23], [24]. An effective SEL program integrated into the school curriculum can provide appropriate learning for students [25], [26]. Research shows that SEL can contribute to academic improvement by improving students' emotional intelligence and interpersonal skills [27], [28].

However, the reality is that not all teachers understand and implement SEL in learning. This is supported by the opinion of Mithans et al. [29] that there are still many teachers who feel that they do not have adequate competence to effectively teach children with special needs. Effective SEL implementation requires specialized training and quality resources [30]. Supportive school leadership is also critical in creating an environment conducive to SEL [31]. Continuous professional development and training is important for teachers to feel confident and competent in implementing SEL [32].

In inclusive education, teachers should be able to accommodate CSN learning in learning. But in reality, learning is still equated with regular students. This is because teachers often lack the necessary training to effectively support students with special needs [33]–[35]. Public attitudes and stigma towards disability also hinder the effective implementation of inclusive education [36]–[38]. Collaboration between teachers, support staff, parents, and the community is needed to create a supportive and inclusive learning environment [39], [40].

This research is important because children with special needs need to receive appropriate social-emotional support in inclusive schools, in order to improve the quality of teaching and reduce educational gaps. In addition, the child's mental well-being is important for long-term development. The results of the research can provide data to help policymakers formulate more responsive and inclusive education policies. Research related to SEL studies has been extensively conducted, including research by Heyder [41] which examines teachers' attitudes towards inclusive education related to students' SEL in elementary school. Research by Wui [42] researched the effectiveness of SEL for children with special needs in Northern California Elementary Schools. Research on SEL strategies at the high school level [43], and the development of SEL to support children with special needs in regular schools and special schools [44]. However, there has not been much research related to the role of teachers in SEL to support children with special needs in inclusive schools. The novelty of this research lies in the exploration of the role of teachers in SEL to support children with special needs in inclusive schools. This study aims to examine the role of teachers in social-emotional learning (SEL) to support development in the elementary school environment. This research is in line with the Sustainable Development Goals goal 16, namely Peace, Justice, and Strong Institutions which emphasizes the importance of inclusive education, a safe, fair, and discrimination-free learning environment, as well as the role of teachers in building a school climate that supports the social and emotional well-being of students.

2. Method

2.1 Research Design

This study uses descriptive qualitative. Descriptive qualitative is used because in this study it is important to describe research findings related to the role of teachers in SEL to support children with special needs in inclusive schools. This is in accordance with the purpose of descriptive qualitative research, which is to explore the "how", "what", or "when" of phenomena and provide detailed insights into specific contexts and experiences [45].

2.2 Research Design

The research was conducted in one of the inclusion schools in the city of Surakarta. The research was conducted in 6 classes by observing the implementation of learning in the inclusion classroom and interviews were conducted with 6 classroom teachers and principals. The profiles of the students with special needs involved are presented in the following table:

Table 1. Types of children with special needs in inclusion schools

Types of Special Needs	Amount
Disturbances in activity and attention	1
Slow Learner	11
Mild mental retardation	9
Typical developmental disorders of speech and language	4
Autism	1
Intellectual Disability	1
Attention deficit disorder	2
Mixed behavioral and emotional disorders	2
Total	**31**

2.3 Data Collection

Data collection is carried out by means of observation, semi-structured interviews, and document analysis. Observations were carried out by observing the participation and involvement of students with special needs in classroom activities, interaction between peers and social inclusion, teachers' strategies in implementing SEL. Interviews were conducted in a structured manner to 6 classroom teachers and principals, as well as parents of CSN. The research questions focus on Perceptions of inclusive educational environments, perceptions of CSN, learning challenges of CSN, Strategies used by teachers to implement social- emotional learning (SEL), and support systems provided by schools and external stakeholders. Document analysis involves reviewing school policies, lesson plans, and other relevant materials to examine the frameworks and strategies used in implementing social-emotional learning.

2.4 Data Analysis

The data were analyzed using an interactive model created by Miles and Huberman. Data analysis techniques include data reduction, data visualization, and conclusion drawing [46]. The data validation technique uses source triangulation techniques and techniques.

3. Result

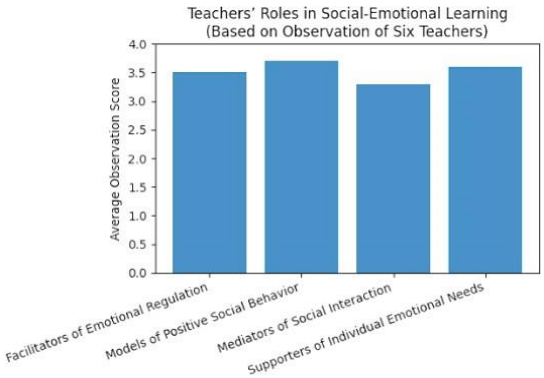

Fig. 1. Results of observation of the role of teachers in SEL

Based on the results of observations, the average score for the role of teachers in Social-Emotional Learning with details of the role of teachers as Facilitators of Emotional Regulation obtained an average score of 3.5 in the category of Excellent. The role of teachers as Models of Positive Social Behavior obtained an average score of 3.7 in the Excellent category. The role of teachers as Mediators of Social Interaction obtained an average score of 3.3 in the Good category. Meanwhile, the role of teachers as Supporters of Individual Emotional Needs obtained an average score of 3.6 in the Very Good category. The categorization of the observation score was determined using the Likert scale interval technique with a score range of 1–4 divided into four categories with an interval of 0.75, so that a score of 1.00–

1.75 was categorized as low, 1.76–2.50 was adequate, 2.51–3.25 was good, and 3.26–4.00 was very good [47].

The role of teachers as facilitators of emotion regulation is observed through the actions of teachers in helping students recognize their emotions, providing guidance to students when they are angry or anxious, teaching strategies to calm down, how teachers respond to students' emotional expressions with an empathetic and non-judgmental attitude, and providing opportunities for students to express their feelings appropriately both verbally and nonverbally. In an interview, one of the teachers stated:

> "I help students recognize and express emotions by first creating a safe and supportive environment first. Then I also teach emotional vocabulary to children so that children understand the emotions that exist and know how to express them. In addition, I also set an example through the expression of positive and healthy emotions what kind of" (R1-10 Jan 2025)

The role of teachers as a model of positive social behavior is observed through the teacher's consistency to be empathetic to all students, the use of polite and respectful language in class interactions, teachers' patience in dealing with learning difficulties and the behavior of students with special needs, teachers' attitudes in respecting differences and diversity in the classroom, and the example of positive social behavior that teachers consistently display in various learning situations. These results are in accordance with the teacher's statement as follows:

> "…. I always give an understanding and example of what is good and what is right to children. I always say that in this life it is very important to always be polite, honest, responsible, and respectful to others. I consistently apply it and can be internalized by children so that children are able to be empathetic and appreciate their friends" (R5-10 Jan 2025)

The role of teachers as mediators of social interaction is observed through teachers' efforts in organizing group learning activities that involve all students in an inclusive manner, encouraging interaction and cooperation between students, preventing exclusion of students with special needs, helping to resolve conflicts between students fairly and constructively, and guiding students in communicating and interacting positively in the classroom environment. The teacher stated:

> "To create continuous interaction, I set clear classroom rules at the beginning and made sure all students understood the importance of mutual respect. I also ensure that there is open communication between me and the students to create a sense of security in the classroom" (R2-10 Jan 2025)

> "I want to create strong bonds and increase student collaboration in participating in the classroom. I can do this by
> sometimes creating heterogeneous groups so that students are able to cooperate and collaborate with each other" (R6-10 Jan 2025)

The role of teachers as supporters of individual emotional needs is observed through giving attention and a personal approach to students with special needs, adjusting how to communicate according to the character and needs of students, providing motivation and emotional reinforcement consistently, teachers' efforts in creating a safe and emotionally comfortable classroom atmosphere, and teachers' concern for the emotional state of students during the learning process.

Furthermore, the role of teachers in implementing SEL can be seen in the image below:

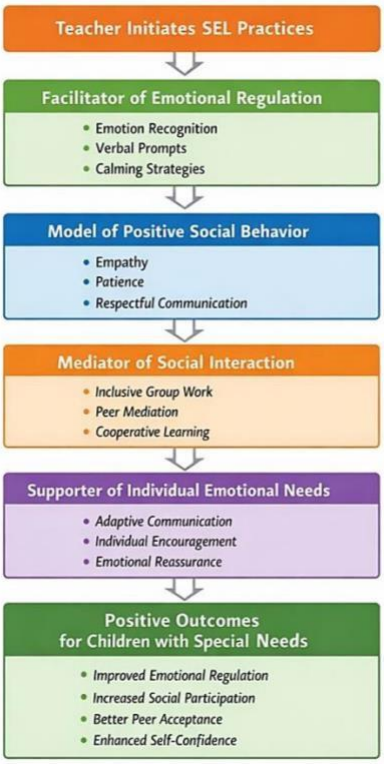

Fig. 2. Diagram of the role of teachers in SEL

Based on figure 2, it shows that the role of teachers in implementing Social-Emotional Learning in elementary schools starts from the teacher's initiative in implementing SEL practices. Furthermore, the role of teachers as facilitators of emotion regulation for students by helping to emotion recognition, verbal prompts, and calming strategies. The next flow shows that teachers function as positive social behavior models that are internalized by students with a sense of empathy, patience, and respectful communication. The next stage shows the role of teachers as mediators of social interaction that ensures the involvement and social acceptance of students with special needs by holding inclusive group work, peer mediation, and cooperative learning. This process is strengthened through individual emotional support that is responsive to the unique needs of each student through adaptive communication, individual encouragement, and emotional reassurance. This will ultimately have a positive effect on improving the social-emotional abilities and well-being of students with special needs as shown by improved emotional regulation, increased social participation, better peer acceptance, and enhanced self-confidence.

4. Discussion

Based on the results of the research, teachers clearly show good understanding and ability in implementing SEL. Teachers realize an understanding related to SEL to support children with special needs in inclusion classes with real roles. SEL is essential for the inclusion and acceptance of children with special needs [48], [49]. Teachers' understanding and implementation of SEL can significantly improve the social and academic outcomes of students with special needs [50], [51]. In the research, the role of teachers in SEL includes Facilitators of Emotional Regulation, Models of Positive Social Behavior, Mediators of Social Interaction, and Supporters of Individual Emotional Needs.

Teachers who act as facilitators of emotion regulation are characterized by teacher actions that can help students recognize the emotions they feel. Teachers who show empathy will be able to understand students' personal and social situations and respond with care and attention [52], [53]. Teachers who empathize with students can inspire and motivate students, thereby increasing achievement and satisfaction [54]. Teachers as facilitators will be able to provide guidance to students when they are angry or anxious, teach them strategies to calm down, and respond to students' emotional expressions with an empathetic and non-judgmental attitude. Teachers play an important role in recognizing the signs of anxiety by providing appropriate support [55], [56]. Teachers need to teach and instill stress

management techniques to help reduce stress and anxiety so as to restore students' focus [57], [58]. In addition, the role of teachers as facilitators is also seen in providing opportunities for students to express their feelings appropriately both verbally and nonverbally. The teacher's ability to manage one's own emotions will foster a positive emotional climate in the classroom [59]–[61]. The conscious and planned application of SEL practices makes teachers able to support the emotional regulation of students with special needs well in learning. Teachers must improve SEL teaching abilities to support students' basic psychological needs [62].

Teachers who are models of positive social behavior are characterized by the teacher's consistency to be empathetic to all students, the use of polite and respectful language in class interactions, and the patience of teachers in dealing with learning difficulties and the behavior of students with special needs. Teachers who show empathy and emotional support can affect students' social and emotional well-being [63]. Inclusive practices and supportive behavior of teachers are essential for the social and academic competence of students with special needs [64]. Positive teacher-student interaction and efforts to support students who are discriminated against can increase students' sense of community and motivation [65]. Teachers are also able to show an attitude of respect for differences and diversity in the classroom and provide examples of positive social behavior consistently. Teachers who are open and empathetic are more likely to be able to foster an inclusive environment [66]. Teachers who teach social values verbally and practically by providing real examples that students follow, thus proving the practice of SEL through the example of teachers are able to create a sustainable ecosystem and build an inclusive classroom. Teachers as role models for students must be able to show respect, empathy, and positive social interaction so that they can influence students to adopt similar behaviors [67], [68].

Teachers who act as mediators of social interaction are shown through teachers' efforts to organize group learning activities that involve all students in an inclusive manner, encourage interaction and cooperation between students, and prevent exclusion of students with special needs. Teachers can use different instruction to customize assignments and leverage peer support to ensure that all students can participate meaningfully [69]. Other studies reveal that teachers can guide students to find meaning and build shared knowledge through classroom discourse [70]. By becoming a mediator between students, teachers are able to carry out differentiated learning on social-emotional aspects. Responsive SELs can help create an equitable learning environment by considering individual differences and prioritizing empathy and social responsibility [71], [72]. Effective communication as well as student-tailored feedback are essential to creating a classroom environment that supports inclusivity [73]. In addition, teachers who are able to help resolve conflicts between students in a fair and constructive manner, as well as guide students in communicating and interacting positively in the classroom environment, will present the inclusive learning practices needed by students. Teachers who mediate conflicts fairly and constructively can easily create a positive classroom environment [74]. Teachers can foster an inclusive learning environment by embedding SEL practices into daily routines and learning [75], [76].

Teachers as supporters of individual emotional needs can be seen through teachers' concern in providing personal attention and approaches to students with special needs, adjusting how to communicate according to the character and needs of students, providing motivation and emotional reinforcement consistently, and being able to create a safe and emotionally comfortable classroom atmosphere. Teachers who provide consistent motivation and reinforcement will be able to create a classroom climate that supports and meets the emotional needs of students with special needs [77], [78]. A positive classroom climate is fostered by the support of teacher autonomy and a positive teacher-student relationship [79]. The role played by teachers can give an idea that it is important for teachers to meet the emotional needs of each student as a unique individual. By providing the emotional support needed by every student, adaptive and responsive SEL practice is able to accommodate both regular and special needs students. Effective SEL implementation requires acceptance from teachers, creative scheduling, ongoing evaluation, and ongoing leadership support [80]–[82].

The role of teachers in implementing Social-Emotional Learning in elementary schools starts from the teacher's initiative in implementing SEL practices. Teachers are responsible for the integration of SEL into students' daily experiences by building important life skills such as empathy, self-regulation, and responsible decision-making [83], [84]. Furthermore, the role of teachers as facilitators of emotion regulation for students by helping to emotion recognition, verbal prompts, and calming strategies.Teachers play an important role in the regulation of emotions to create a conducive learning environment [85]. The next flow shows that teachers function as positive social behavior models that

are internalized by students with a sense of empathy, patience, and respectful communication. Teachers' self-regulation and emotional intelligence are essential in fostering positive student-teacher relationships [86]. The next stage shows the role of teachers as mediators of social interaction that ensures the involvement and social acceptance of students with special needs by holding inclusive group work, peer mediation, and cooperative learning. For example, pairing students with special needs with proficient peers can create cooperation and support [69]. This process is strengthened through individual emotional support that is responsive to the unique needs of each student through adaptive communication, individual encouragement, and emotional reassurance. Providing emotional support is essential for the well-being of students with special needs [87], [88]. This will ultimately have a positive effect on improving the social-emotional abilities and welfare of students with special needs as shown by improved emotional regulation, increased social participation, better peer acceptance, and enhanced self-confidence. SEL encourages social inclusion and participation by improving social skills and empathy [48].

In this study, teachers are able to show different approaches according to the needs of students. SEL practice can be seen from teachers who are able to provide personal attention, adjust the way they communicate with students, provide both physical and emotional reinforcement, and are able to create a safe, comfortable, and inclusive classroom environment. So that this affects the condition of students. SEL can contribute to building CSN's confidence by creating an inclusive learning environment. Social-Emotional Learning (SEL) is recognized as an essential component of education that supports students' social, emotional, and academic development. Studies show that effective SEL programs not only improve social competencies such as cooperation, self-control, emotion regulation, and problem-solving [89], [90], but also strengthens interpersonal relationships and student decision-making [91]. So this study proves that learning for children with special needs is appropriate to be equated with regular students but can be adjusted to the needs of children through a SEL approach that is responsive to the needs of children.

5. Conclusion

This study shows that in social-emotional learning, teachers have an important role as Facilitators of Emotional Regulation, Models of Positive Social Behavior, Mediators of Social Interaction, and Supporters of Individual Emotional Needs. The results of observations and interviews show that the implementation of SEL strategies by teachers is able to increase the involvement of students with special needs in classroom activities and help them manage their emotions and interact with peers. The findings of the study also revealed that although SEL has been implemented, its implementation is still partial and highly dependent on teachers' initiatives, with the support of the school system and parental involvement not yet optimal. Theoretically, this study strengthens the understanding of the role of teachers in the implementation of SEL in the context of inclusive education, while practically the results of the research can be a reference for schools and educators in designing SEL strategies that are more adaptive and oriented to the individual needs of students with special needs. More broadly, the results of this study contribute to the achievement of SDGs 16 by affirming the strategic role of teachers in creating peaceful, fair, and inclusive elementary schools. This research is limited to one inclusive school in Surakarta City with a descriptive qualitative approach, so the findings cannot be generalized widely and require further research with a more diverse scope and methods.

Using Pragmatic Language Profiles to Support Differential Diagnosis in Children with Developmental Language Disorder and Autistic Children

Vasiliki Lymperopoulou[1], Georgia Andreou[2], Vasiliki Aslanoglou[3]

[1,2,3]University of Thessaly, Greece

Abstract

Developmental Language Disorder (DLD) and Autism share some common features in language development, often making the diagnostic distinction between the two disorders particularly challenging (Hage et al., 2022). These overlaps may lead to diagnostic ambiguity, affecting diagnostic accuracy (Andreou et al., 2022). Although pragmatic difficulties have been documented in both populations, significant differences between the two populations have been observed (Hage et al., 2022). The aim of the present study is to investigate whether the assessment of pragmatic skills could contribute to the differential diagnosis of Greek speaking autistic children and children with DLD. 25 children with DLD (Mean age=84.09 months) and 25 autistic children (Mean age=84.19 months), matched for chronological age and gender participated in the study. Pragmatic skills were examined using the Greek version of Children's Communication Checklist-2 (CCC-2, Bishop, 2003; Georgiou & Spanoudis, 2021). Specifically, the following scales of CCC-2 were used: Coherence, inappropriate initiation, stereotyped language, use of context, non-verbal communication, social relations and interests. Results showed significant differences across most measures with autistic children generally scoring lower than DLD children. The findings are examined in the context of diagnostic differentiation between the two populations. Pragmatic language, and in particular the pragmatic abilities in which differences are observed between the two groups, could potentially function as discriminative markers between the disorders. Consequently, the assessment of pragmatic skills, in combination with other diagnostic measures, may contribute to achieving more complete and accurate diagnoses.

Keywords: *Autism, DLD, pragmatic language*

1. Introduction

1.1 Autism Spectrum Disorder

Autism Spectrum Disorder (ASD) is characterized by persistent difficulties in social communication and social interaction across multiple contexts as well as restricted and repetitive (stereotypical) patterns of behaviour, interests and activities (APA, 2013). There is a high degree of heterogeneity in the language development of children with ASD. A percentage of children with ASD do not experience language difficulties, while other children are characterized as nonverbal, as they do not develop expressive or functional speech (Luyster & Lord, 2009; Norrelgen et al., 2014). Many children also experience delays in language development (Herlihy et al., 2015). Children with ASD and language difficulties mainly present difficulties in receptive speech and language comprehension (Volden et al., 2011; Zhou et al., 2018). In terms of pragmatic development, pragmatic abilities of children with ASD are significantly lower than those of their typically developing peers. In particular, weaknesses are already apparent in infancy, but as the child grows older, these weaknesses seem to become more intense (Papoudi & Kossyvaki, 2018). Furthermore, pragmatic difficulties are also observed in children with ASD without language difficulties (Baixauli-Fortea et al., 2019; Tager-Flusberg, 2006). More specifically, children with ASD present difficulties in conversational abilities, inference abilities and social reciprocity (Georgiou & Spanoudis, 2021; Lam, 2014).

1.2 Developmental Language Disorder

Developmental Language Disorder (DLD) is characterized by persistent deficits in language acquisition, as well as in understanding, production, and use of language (spoken or signed) (World Health Organization, 2019), causing significant limitations in the individual's ability to communicate. Language

difficulties are the main characteristic of children with DLD as language development is slower compared to that of their typically developing peers and these deficits are evident not only in childhood but also in adulthood (Davies et al., 2016).
Language difficulties are observed at all levels of language development and mainly in the production and comprehension of spoken language. In addition, difficulties are identified in reading skills and written language production (Andreou & Aslanoglou, 2022; Aslanoglou, 2023). Regarding pragmatic language, children with DLD also exhibit difficulties, which are probably more related to difficulties in structural language rather than to deficits in social knowledge (Andreou et al., 2025c; Davies et al., 2016). Pragmatic difficulties of children with DLD are mainly found in inference (Andrés-Roqueta & Katsos, 2020; Jones & Westermann, 2021), in conversational abilities (Andreou, Lymperopoulou & Aslanoglou, 2025a) and in understanding and using idiomatic language and figurative expressions (Vulchanova et al., 2019).

1.3 Commonalities and Differences between ASD and DLD in Pragmatic Language

DLD and ASD share some common features in language development, which often makes the differentiation between the two disorders particularly challenging (Hage et al., 2022). These overlaps may lead to diagnostic ambiguity or even confusion, affecting the accuracy and validity of the diagnosis (Andreou et al., 2022; Hage et al., 2022; Norbury et al., 2004). Although difficulties in pragmatic abilities have been documented in both individuals with ASD and DLD, pragmatic language is a linguistic level where significant differences between the two populations are evident (Hage et al., 2022; Schaeffer, 2018). The differences in pragmatic difficulties between the two populations mainly concern the nature of their deficits. Specifically, children with ASD have difficulties in pragmatic abilities related to both structural language (linguistic pragmatics) and Theory of Mind, such as social reciprocity (social pragmatics) (Andreou et al., 2025c; Andrés-Roqueta et al., 2017). In contrast, children with DLD have difficulties in pragmatic skills related to language (linguistic pragmatics), while pragmatic abilities related to Theory of Mind (social pragmatics) appear comparable to those of typically developing children, with any observed differences being minimal (Andreou et al., 2025c; Ferrara et al., 2020). Given these differences, the investigation of pragmatic skills could contribute substantially to the differential diagnosis of the two disorders by acting as a discriminative diagnostic marker (Andreou et al., 2022).
According to the above, the aim of the present study is to investigate whether the assessment of pragmatic skills could contribute to the differential diagnosis of Greek-speaking autistic children and children with DLD. Therefore, the following research hypotheses have been set:
1) It is expected that children with ASD will exhibit greater difficulties in pragmatic language abilities compared to children with DLD.
2) It is expected that children with ASD will exhibit greater difficulties in social reciprocity compared to children with DLD.

2. Method

2.1 Participants

The sample of the study consisted of 50 Greek-speaking students. More specifically, 25 children with ASD (mean age = 84.19; mean non-verbal intelligence= 89.80) and 25 children with DLD (mean age = 84.09; mean non-verbal intelligence = 88.20). Both groups comprised seventeen boys and eight girls and were matched on gender and chronological age. All participants attended either general or special schools in Greece and received individualized intervention programs, including speech and language therapy, occupational therapy, and special education support.
For the initial group allocation, the participants' official diagnoses issued by public state services, such as the Centers for Multidisciplinary Assessment, Counseling, and Support (KEDASY), were taken into consideration. Subsequently, all participants were administered the Greek version of the Raven's Coloured Progressive Matrices (Sideridis et al., 2015), and the Mean Length of Utterance -word (MLUw) was calculated (Rice et al., 2010).
The inclusion criteria for participation required that children be aged between 6 and 8 years old, have Greek as their first language and be monolingual, and have a non-verbal intelligence score of 85 or above as measured by the Greek version of the Raven's Coloured Progressive Matrices (Sideridis et al., 2015). In addition, participants were required to have an MLUw score of 4.0 or higher and no comorbid psychiatric or developmental disorders or sensory impairments, based on their official diagnoses. Participants in the ASD group had received an official diagnosis for Autism Spectrum

Disorder, High-Functioning Autism, or Atypical Autism, whereas participants in the DLD group had received an official diagnosis for language problems/deficits that compose the profile of DLD (Table 1).

Table 1. Means and Standard Deviations of Age, Non-verbal Intelligence and MLUw of the participants

	DLD[a]		ASD[b]	
	M	**SD**	**M**	**SD**
Age (months)	84.09	6.72	84.19	6.55
Non-verbal intelligence	88.20	4.54	89.80	4.20
MLUw[c]	4.37	0.09	5.79	0.82

[a] DLD=Developmental Language Disorder
[b] ASD= Autism Spectrum Disorder
[c] MLUw= Mean Length of Utterance (word)

2.2 Procedure

The study employed a non-probability sampling method, and specifically convenience sampling, due to the limited availability of the target populations (Etikan et al., 2016). Also, there was a predetermined time frame for the research, which precluded the use of random sampling techniques. Assessments were conducted individually by the researcher in a quiet setting at the school or educational center, typically across two or three sessions, with each child completing the full procedure in approximately 90 minutes. Non-verbal intelligence was evaluated using the Greek version of the Raven's Coloured Progressive Matrices (Sideridis et al., 2015), and language production was assessed by calculating the MLUw through spontaneous conversation.

2.3 Measures

The Greek version of Children's Communication Checklist-2 (Bishop, 2003; Georgiou & Spanoudis, 2021) was used in the research in order to evaluate pragmatic language abilities of the participants. It is the Greek adaptation of the Children's Communication Checklist-2 (CCC-2; Bishop, 2003) and includes 70 questions for children aged 4–16 years, completed by parents or teachers who have known the child for at least six months. The questions are divided into ten subscales that assess structural and pragmatic aspects of communication, specifically speech, syntax, semantics, coherence, inappropriate initiation, stereotypical language, use of context, nonverbal communication, social relationships, and interests.
In the current study, the subscales related to pragmatic skills were used. Specifically, the scales of Coherence, Inappropriate Initiation, Stereotypical Language, Use of Context, Nonverbal Communication, Social Relationships, and Interests were examined. The subscales Coherence, Inappropriate Initiation, Stereotypical Language, Use of Context, Nonverbal Communication constitute pragmatic language abilities. In addition, the last two subscales are combined to form the composite index of Social Reciprocity. Raters are asked to assess the frequency of specific linguistic, pragmatic, and social behaviors using a four-point scale ranging from "never or rarely" to "very often/always."

2.4 Data Analysis

Data analysis was conducted using IBM SPSS Statistics. Initially, descriptive statistics were calculated for all study variables. Group differences between children with ASD and children with DLD were examined using independent sample t-tests.

3. Results

Independent T-test analysis was performed to compare the two groups. Table 2 presents the descriptive data on the performance of the children in both groups on pragmatic language abilities, as well as the statistical significance between the groups on this measurement.
The analysis conducted to compare pragmatic abilities of children with ASD and those with DLD showed that there was a statistically significant difference (p<.001) in pragmatic language abilities between DLD

(*M*=28.44, *SD*=2.47) and ASD (*M*=24.08, *SD*=4.97) (Table 2). Table 3 presents the mean scores and between-group differences for each pragmatic language subscale of the CCC-2 (Bishop, 2003; Georgiou & Spanoudis, 2021).
The analysis comparing social reciprocity of children with ASD and children with DLD revealed that there was a statistically significant difference (*p*<.001) regarding social reciprocity between the groups (ASD *M*=-7.08, *SD*=9.35; DLD *M*=7.16, *SD*= 7.16) (Table 2). Table 3 presents the mean scores and between-group differences for each social reciprocity subscale of the CCC-2 (Bishop, 2003; Georgiou & Spanoudis, 2021).

Table 2. Performance of DLD and ASD groups in pragmatic language and in social reciprocity.

* p< .05

4. Discussion

According to the first hypothesis, it is expected that children with ASD will exhibit greater difficulties in pragmatic language abilities compared to children with DLD. The results of the study indicated lower performance for children with ASD as compared to children with DLD in pragmatic language abilities and are consistent with previous research that compared the two populations on pragmatic language skills. More specifically, Hage et al. (2022) reported greater pragmatic difficulties in children with ASD in comparison to children with DLD, based on a questionnaire completed by teachers and parents. In addition, Ferrara et al. (2020) found lower performance in pragmatic language abilities for children with ASD in comparison to children with DLD using CCC-2 (Bishop, 2003). Finally, Andreou et al. (2025c) examined pragmatic language in Greek-speaking children with ASD and DLD and concluded that, although both groups demonstrated pragmatic impairments, pragmatic difficulties were more pronounced in children with ASD than in children with DLD. The first hypothesis was confirmed, reinforcing previous findings regarding pragmatic language in DLD and ASD.
The second hypothesis states that it is expected that children with ASD will exhibit greater difficulties in

social reciprocity (social relations and interests) compared to children with DLD. The findings of the present study showed that children with ASD scored significantly lower on the Social Reciprocity scale compared to children with DLD. This result was expected, as this particular scale of the CCC-2 (Bishop, 2003) has been documented as particularly sensitive in distinguishing between children with structural language difficulties and children whose pragmatic deficits exceed the level of their structural language skills, a characteristic often observed in the ASD population (Bishop & Baird, 2001; Norbury et al., 2004). The results are consistent with previous research findings, which indicate that children with ASD have greater difficulties in social reciprocity than children with DLD. In particular, de la Torre Carril et al. (2021) examining pragmatic language profiles of children with ASD and DLD using CCC-2 (Bishop, 2003) found that children with DLD did not present difficulties in social reciprocity, while the performance of children with ASD was significantly lower than that of children with DLD in this task. In addition, Ferrara et al. (2020) using also CCC-2 in these two populations reached similar results. Finally, Georgiou and Spanoudis (2021) in a study regarding Greek-speaking children with DLD and ASD found also lower performance for children with ASD as compared to children with DLD in social reciprocity. Thus, the results of the present study confirm the second research hypothesis and add further empirical data supporting the claim that children with ASD present more difficulties in social reciprocity as compared to children with DLD.

5. Conclusion

This study examined and compared the pragmatic profiles of children with ASD and children with DLD. The findings are consistent with previous research on the pragmatic abilities of the two populations. The differences identified in their pragmatic profile highlight pragmatic language as a possible factor in distinguishing the two disorders, underscoring the importance of its systematic assessment in the diagnostic process.

In particular, the differences observed in specific dimensions of pragmatic language support the view that, despite superficial similarities between ASD and DLD, the underlying linguistic and pragmatic deficits are not identical. In children with ASD, difficulties seem to be more related to social reciprocity and the use of language in a social context, while in children with DLD, limitations are mainly found in structural aspects of language (Andreou et al., 2025b).

Consequently, the integration of pragmatic skills assessment in combination with measures of structural language assessment may contribute significantly to diagnostic accuracy and clearer differentiation between the two disorders. At the same time, these findings have practical implications for the design of targeted interventions tailored to the specific communication profile of each group. More specifically, identifying distinct pragmatic language profiles in children with ASD and DLD may assist teachers, speech and language therapists, and special education professionals in identifying the specific communication needs of each population. Children with ASD may benefit from interventions that focus on social reciprocity, conversational skills, and the use of language in social context, while interventions for children with DLD may place emphasis on the development of structural language skills. Furthermore, the assessment of pragmatic abilities could support instructional planning and facilitate the selection of appropriate teaching strategies that address the specific communication needs of each group.

Finally, this study has certain limitations that should be taken into account when interpreting the findings. First, the relatively small sample size limits the ability to generalize the results to the broader population of children with ASD and DLD, as it may not fully reflect the heterogeneity that characterizes the two groups. Furthermore, the limited age range of the participants does not allow for the investigation of possible developmental differences in pragmatic abilities. Future research with larger and more age-diverse samples could offer more reliable and generalizable conclusions.

Abstract

The use of Artificial Intelligence (AI) can facilitate personalised activities tailored to students' specific needs, promoting greater engagement and meaningful learning. This paper presents a case study reporting on the application of generative AI in the planning of inclusive and personalised teaching practices for a 14-year-old boy diagnosed with an Intellectual Disability (ID), within the context of Specialised Educational Support (AEE), enrolled in year 8 of primary school at a state school in the interior of Rio Grande do Sul, Brazil. These actions were developed as part of the Pilot Project: Development of the EduEsp Pocket Guide prototype to assist in teaching practices with students with ID and/or Autism Spectrum Disorder (ASD), developed under the Institutional Programme for Introduction to Teaching (PIBID) at the Federal University of Santa Maria (UFSM-Brazil), in partnership with the Federal University of Paraná (UFPR-Brazil) and the Polytechnic Institute of Bragança (IPB-Portugal). Whilst preserving the anonymity of the student and the school, specific student information was used as a reference to develop targeted prompts that simulate learning situations and guide the creation of individualised activities and teaching strategies tailored to the student, thereby contributing to the development and implementation of Individualised Education Plans (IEPs). The results indicated significant potential to integrate AI and pedagogical planning to enhance teaching practices, reduce barriers to learning, and promote greater educational equity, thereby contributing to teacher training for work in technology-mediated, inclusive contexts. In addition, the study included a critical analysis of different available technologies, as well as the selection of consistent theoretical frameworks to guide the ethical and safe use of AI in education. This aspect has recently been corroborated by the Brazilian Artificial Intelligence Plan (BAIP), which helps define guidelines for the safe use of AI in education and encourages research to demonstrate its effectiveness.

Keywords: *Artificial intelligence, AI in Education, GenAI, EduEsp Pocket Guide, Intellectual Disability, Autism.*

1. Introduction

This article presents a case study within the framework of the "Pilot Project: Development of the EduEsp Pocket Guide Prototype", designed to support teaching practices with students with intellectual disabilities (ID) and/or autism spectrum disorder (ASD). The project was developed under the Institutional Program for Teaching Initiation Scholarships (PIBID), at the Federal University of Santa Maria (UFSM - Brazil), in partnership with the Federal University of Paraná (UFPR - Brazil) and the Polytechnic Institute of Bragança (IPB - Portugal). The EduEsp Pocket Guide prototype is based on AI and aims to assist teachers in personalising instruction for students with ID and/or ASD, ensuring inclusive and accessible teaching practices, which are increasingly in demand in a digital society characterised by inclusion and diversity.

The activities are carried out by students enrolled in the Special Education program at UFSM who are currently working in Specialised Educational Services (AEE) at a K-12 school in the municipality of Santa Maria, Rio Grande do Sul, Brazil. In short, they are near-future professionals.

The Institutional Program for Teaching Initiation Scholarships (PIBID) [1] is an initiative within the National Teacher Training Policy of Brazil's Ministry of Education (MEC). Administered by the Coordination for the Improvement of Higher Education Personnel (CAPES), which awards grants to Higher Education Institutions (HEIs) that select scholarship recipients for their approved subprojects, with the aim of fostering the initiation into teaching, contributing to the strengthening of teacher training at the higher education level and to the improvement of the quality of Brazilian public basic education. The program facilitates the integration of undergraduate students or academics into the daily life of

public schools, promoting collaboration between universities and basic education through supervised practical experiences [2].
Currently, the PIBID/UFSM Inclusive Special Education subproject operates through two centres, each with 24 teaching initiation scholarship recipients (students from Special Education programs), three supervising teachers (teachers from partner schools), and one coordinating teacher (a university professor). It carries out activities with specific objectives, in which students' involvement facilitates direct contact with the potential and challenges of planning inclusive and personalised pedagogical practices in the school context, as adapting activities to meet students' specific needs within a regular classroom setting has been a challenge for teachers. Thus, the report presented here addresses an initiative developed by Core 1 of the Inclusive Special Education subproject.
In the school context, the objective of developing the EduEsp Pocket Guide prototype is to create and implement an Artificial Intelligence (AI)-based prototype to assist teachers in decision-making and in personalising instruction for students with intellectual disabilities (ID) and/or autism spectrum disorder (ASD), ensuring inclusive, accessible, and efficient pedagogical practices. The proposal is justified by the need to serve an increasingly large population of students with learning difficulties, as confirmed by diagnoses, enrolled in elementary and secondary schools.
Brazilian law guarantees the right to education in an inclusive educational system for students with disabilities, autism spectrum disorder, and high abilities/giftedness, based on equal opportunities and without discrimination [3], [4]. According to the Statute of Persons with Disabilities, a person with a disability is defined as someone who has a long-term physical, mental, intellectual, or sensory impairment that, in interaction with one or more barriers, may hinder their full and effective participation in society on an equal footing with others [5].
In this context, special education is offered across all levels, stages, and modalities, with the aim of ensuring educational resources and services that support, complement, and supplement the schooling process.
Specialised Educational Services (AEE) should serve as a support to ensure conditions for access, participation, retention, and learning for students in the special education population within regular education. The objective of AEE is not to replace the traditional curriculum, but to complement the schooling of people with disabilities and/or supplement the schooling of highly skilled/gifted individuals, with a view to eliminating barriers to inclusion.
Professionals working in Special Education must have the necessary training to teach and undergo continuing education in inclusive education. To identify the students to be served, the law requires conducting case studies to inform the Specialised Educational Service Plan (PAEE) and the Individualised Educational Plan (PEI). The PAEE and PEI are mandatory individualized pedagogical documents designed to guide the work to be carried out in the general classroom; the work carried out within the scope of Specialized Educational Support (AEE); collaborative activities at the educational institution; and intersectoral coordination efforts [4], always taking into account, when necessary, the Brazilian Artificial Intelligence Plan (BAIP) [6] and the National Common Core Curriculum [7].
However, one of the challenges faced by teachers is developing accessible activities that do not distance students from the curricular proposals developed by the class. In this scenario, Generative Artificial Intelligence can serve as a tool to support instructional planning, assisting in the adaptation of texts, the simplification of language, the creation of visual materials, and the diversification of teaching strategies, avoiding the infantilization of content and materials that may occur when using these technologies [8] and adhering to Universal Design for Learning (UDL) [9].
Generative Artificial Intelligence (GenAI) is the branch of AI focused on creating new content—texts, images, audio, videos, and code-based on patterns learned from large training datasets [13], [15]. Unlike traditional systems, GenAI tools rely on Large Language Models (LLMs), which operate probabilistically, predicting sequences of words or pixels based on statistical correlations [1]. This architecture underpins tools such as ChatGPT, Gemini, Copilot, Claude, DALL-E, Suno, and Pictory, among others, which are gradually being incorporated into everyday educational practice.
In the field of education, GenAI has established itself as a resource to support the personalization of teaching, curriculum adaptation, and the development of accessible instructional materials [1], [13], [16], with significant potential for Inclusive Special Education by generating activities aligned with the Individualized Education Plan (IEP) and tailored to students' cognitive characteristics, interests, and age groups. However, generative models operate through statistical inference and can produce plausible yet inaccurate or biased responses, which is why ethical, critical, and teacher-mediated use is an indispensable condition [1], [16].
The BAIP, launched in 2025, aims to guide the development, use, and regulation of AI in Brazil with a focus on addressing major national, social, economic, environmental, and cultural challenges, in order

to ensure security and individual and collective rights, social inclusion, the defense of democracy, information integrity, the protection of labour and workers, national sovereignty, and the nation's sustainable economic development [6].
Regarding the positive impacts and challenges of AI in inclusive education, studies published between 2021 and 2024 highlight that AI improves accessibility by providing adapted materials and helps alleviate educators' administrative burden, allowing them to prioritise pedagogical guidance. As for the challenges, there remain shortages of AI training, inadequate infrastructure, and ethical concerns related to privacy and equitable access to technology [12].
The effectiveness of GenAI tools depends on the quality of the prompts used in interacting with the model. Prompt Engineering is defined as the systematic process of designing, refining, and evaluating natural language instructions to obtain more accurate, relevant, and pedagogically aligned responses from LLMs [14], [17]. According to the literature, a well-structured prompt includes four central elements – instruction, context, examples, and constraints [17] – and can employ techniques such as zero-shot, few-shot, role prompting, and chain-of-thought prompting [14].
In the educational context, it is through Prompt Engineering that the teacher exercises their pedagogical authorship over the product generated by AI [13], [14]. In Inclusive Special Education, describing the student's skills, potential, interests, and learning barriers in the prompt guides the AI to produce materials aligned with the Individualised Education Plan (IEP), respecting the age group and avoiding infantilization. It is, therefore, a new teaching competency, linked to the critical evaluation of the generated outputs and adherence to ethical principles regarding privacy, equitable access, and respect for diversity [14], [15].

2. Methodology

The scientific methodology is a rigorous and systematic approach that serves as the basis for producing reliable, verifiable knowledge, grounded in precise and demonstrable findings. Consequently, we present the participants, the location, the instruments and the procedures adopted in a case study.
Participants: The study involved students from the Special Education course at UFSM, together with their supervising lecturers and project partners. For the case study, based on the observations, a student was selected (here referred to as Rafael) to preserve his anonymity. He is a 14-year-old adolescent diagnosed with an Intellectual Disability (ID), enrolled in the 8th year of primary school. Rafael demonstrates a high degree of independence in his home life, but experiences difficulties with reading, writing, comprehension and social interaction. Specifically:

- Communication: speaks softly, is shy, uses gestures;
- Reading/writing: recognises letters and numbers up to 20;
- Socialisation: keeps to himself at break time, interacts in small groups in the Multifunctional Resource Room (MRR);
- Independence: takes care of his own meals, personal hygiene and clothing.

Location: The activities were carried out at a primary and secondary school located in a socially vulnerable area of the municipality of Santa Maria, Rio Grande do Sul, Brazil. Within the school, the activities took place in two main areas: the Multifunctional Resource Room (SRM), where Specialised Educational Support (AEE) is provided, and the mainstream classroom during lessons in specific subjects.
Instruments: For the functional assessment of the student, the SIS-A (Support Intensity Scale – Adult Version, currently in the final stages of validation in the Brazilian context) was used. To develop the pedagogical activities, a comparative analysis was conducted of various available Artificial Intelligence tools, namely ChatGPT, Gemini, Copilot, NotebookLM, Para Casa Inclusivo, and Suno, to identify which one(s) were most suitable for the student's educational context. Interaction with these tools occurred through the creation of targeted prompts that simulated learning situations and guided the development of individualised activities and teaching strategies tailored to the student.
The following are used for assessment and monitoring: quarterly descriptive reports; a portfolio with photographs and written records; interdisciplinary teaching meetings; participatory class councils; and, where possible, reassessment using SIS-A.
Procedure: The activities began in October 2024. The students attended the school for two sessions per week and, during one of those sessions, participated in study and planning meetings at the university. Each week, the activities carried out at the school were discussed in meetings with the supervising teachers and project partners. Initially, observations of students were carried out in the AEE and SRM, and monitoring took place in the mainstream classroom during lessons in specific subjects.

During the observations, the students' skills, potential, difficulties and needs were considered. Following the initial assessment period, a case study was selected from which Rafael's profile was created. Concurrently with the observation phase and the collection of information about the student, studies were carried out at the University, involving the selection of reliable theoretical sources to provide a foundation, the comparison of available technologies, and the choice of the most appropriate Artificial Intelligence tool to support the personalisation of teaching and the making of more assertive pedagogical decisions for the case. Based on Rafael's profile, the following objectives were established: to ensure active and meaningful participation in learning activities covering the content of the Brazilian National Common Core Curriculum (BNCC), delivered in mainstream classrooms [7]; to promote communicative and socio-emotional skills; to foster autonomy and self-esteem; and to implement the principles of the Individualised Educational Plan (IEP) and, where possible, to develop Universal Design for Learning (UDL). The most frequently used methodological strategies were structured, pre-planned routines; the use of concrete materials (bottle caps, images, games); small-group activities, always mediated; and oral, practical, and descriptive assessments. Whilst preserving the anonymity of the student and the school, specific information about the student was used as a reference for developing targeted prompts that simulate learning situations and guide the creation of individualised activities and pedagogical strategies tailored to Rafael. The design of these activities was discussed at length by the team and then implemented at the school with the student.

3. Results

In the results section, we will present the prompts and outputs generated by GenAI. Next, two detailed examples are presented: Portuguese Language (Table 2) and Science (Table 3), which show the planned subjects, proposed or to-be-proposed topics, pedagogical objectives, requested adaptations, and the GenAI used.

Table 1. Description of the plan for using GenAI in the teaching activities devised by the team.

Subject	Theme/Proposal	Objective	Adaptation	AI tool
Portuguese	Text comprehension	Oral and visual comprehension	Text with pictograms + read-aloud	Chat GPT, Gemini
Mathematics	Decimal numbers	Understanding quantities up to 100	Bottle caps + visual aids	DALL-E, ChatGPT
Science	The water cycle	Understanding and distinguishing the physical and chemical states of water	Real objects and music	DALL-E, Canva, Voicemod
History	The culture of Brazil's indigenous peoples	Respect for cultural diversity	Illustrated comic strips	Pictory, Lumen5
Physical Education	Motor skills	Body and spatial awareness	Visual and verbal activities	Soundrw, Synthesia

To illustrate the activities, the planned practices for the Portuguese and science courses will be presented. As an example of an activity for the Portuguese Language course (Table 2), the objective was defined as oral and visual comprehension, with a focus on text interpretation. For Activity 1, the following sequence of prompts was devised, which generated the following outputs.

Table 2. Sequence of prompts and outputs for creating an adapted activity for Portuguese.

Prompt 1
"Write an educational text in Portuguese for Year 8 pupils, using simple, short and straightforward sentences. The topic is 'Separating Organic and Recyclable Waste'. The text should explain: what organic waste is, what recyclable waste is, examples of each, and how separating them helps the city and the environment. The text should be no more than 150 words and use language that is accessible to students with intellectual disabilities."
Answer 1
"Title: Managing Waste: Organic and Recyclable

Every day, we produce waste at home and at school. This waste can be divided into two main types: organic and recyclable. Organic waste comes from food scraps, such as fruit and vegetable peelings and bread crusts. This waste can be turned into compost for plants. Recyclable waste consists of materials such as plastic bottles, paper, tins and glass. When recycled, they can be turned into new objects and help reduce pollution. Sorting waste is an act of caring for the environment. When we put waste in the right place, we help keep the city cleaner and contribute to the health of nature and people."

Prompt 2

"Rewrite the text using emojis as pictograms to represent key words. The text should be simple, with short sentences, and accessible to a 14-year-old student with an intellectual disability.
Topic: Waste sorting.
Use pictograms for: rubbish, organic waste (🍌 🥕 📦), recyclable (♻️ 📰 🍾), city (🏙️), nature (🌳), people (👨‍👩‍👧‍👦)."

Answer 2

"Title: 🌍 ♻️ Managing Waste
📦 We produce waste every day.
👉 This waste can be of two types:
1️⃣ Organic waste 🍌 🥕 📦
➡️ Food scraps (peels, fruit, bread).
➡️ Can be turned into 🌱 compost for plants.
2️⃣ Recyclable Waste 📰 🍾 ♻️
➡️ Paper, plastic bottles, tins, glass.
➡️ Can be turned into new objects.
✨ Sorting your rubbish helps:
✔️ Keep the city clean 🏙️
✔️ Look after nature 🌳
✔️ Improve people's lives 👨‍👩‍👧‍👦"

Prompt 3

"Create a series of nine images in a children's educational style, using bright colours and simple lines, in Portuguese, on the theme of 'Waste Management'. Each panel should feature a short, clear sentence and an illustrative pictogram.
Panel 1: 'We produce waste every day' (a boy throwing rubbish into a bin).
Panel 2: 'Organic Waste' (banana peel, carrot, bread).
Panel 3: 'It can become compost' (plant growing).
Panel 4: 'Recyclable Waste' (bottle, paper, tin).
Panel 5: 'Sorting rubbish helps' (city and trees) and "Keeping the city clean" (clean city) (green tree).
Panel 6: 'Keeping the city clean' and 'Caring for nature' (three smiling children)."

Answer 3 (English version and original Portuguese version)

Images created and translated in ChatGPT

For the science module (Table 3), the aim was to understand and distinguish the physical and chemical states of water; in this activity, the goal was to use real images for matching exercises and music with a rhythm of the student's choice.

Table 3. Sequence of prompts and outputs for designing an adapted Science activity.

<table>
<tr><th colspan="4">Prompt 1 for image pairing (Gemini)</th></tr>
<tr><td colspan="4">"Create six high-quality, photorealistic images, maintaining a consistent visual style. Each image must depict one of the three states of water (solid, liquid, gaseous), with two examples for each state: one from everyday life and one from nature. The word corresponding to the state of water ('SOLID', 'LIQUID', 'GAS') must be displayed in all images using the same font style.
For the Solid state: An ice cube and a frozen winter mountain landscape
For the Liquid state: A river in the rain with visible raindrops in the water and in the air, and a clear glass filled with water with condensation droplets on the outside, without ice
For the Gaseous state: A kettle on the hob, emitting a large amount of dense steam, and a mountainous valley covered in thick fog or low-lying clouds.</td></tr>
<tr><th colspan="4">Answer 1</th></tr>
<tr><td colspan="4"> 
</td></tr>
<tr><td>SOLID</td><td>GASEOUS</td><td>LIQUID</td><td>LIQUID</td><td>GASEOUS</td></tr>
<tr><th colspan="4">Prompt 2 for children's pop music (Suno)</th></tr>
<tr><td colspan="4">Children's pop song (1–1.5 mins) about the water cycle and the states of water. The lyrics explain that water is everywhere and changes form! Liquid, solid, gas. Links: evaporation, condensation, precipitation. Chorus: continuous transformation. Young, clear, enthusiastic voice; children's choir. Aim: to memorise and understand the water cycle. In Brazilian Portuguese.</td></tr>
<tr><th colspan="4">Answer 2 - Song lyrics: The Water Cycle</th></tr>
<tr><td>[Verso 1]
Água no copo
Água no rio
Cai do céu
Faz um desafio
Chove na terra
Escorre no chão
O ciclo começa
Presta atenção

[Pré-refrão]
Evapora no calor do sol
Sobe ao céu
Vira um lençol

[Refrão]
Transformação contínua
Sem parar
Água é mágica
Sempre a mudar
De líquido a vapor
Vai condensar
Volta em chuva
Pra recomeçar</td><td>[Verse 1]
Water in a glass
Water in a river
Falls from the sky
It's a challenge
It rains on the earth
Runs down the ground
The cycle begins
Pay attention

[Pre-chorus]
Evaporates in sun's heat
Rises to the sky
Turns into a blanket

[Chorus]
Constant transformation
Non-stop
Water is magic
Always changing
From liquid to vapour
It condenses
Returns as rain
To start all over again</td><td>[Verso 2]
Lá nas montanhas
O gelo a brilhar
Neve que cai
Sólido a formar
Vapor da chaleira
Nuvem no ar
Neblina na manhã
Vem nos abraçar

[Pré-refrão]
Condensa lá no alto
Vira gota a cair
Precipita de novo
Pra vida surgir

[Refrão]
Transformação contínua
Sem parar
Água é mágica
Sempre a mudar
De líquido a vapor
Vai condensar
Volta em chuva
Pra recomeçar</td><td>[Verse 2]
Up in the mountains
The ice glistens
Snow falls
Solid forms
Steam from the kettle
Clouds in the air
Morning mist
Come and embrace us

[Pre-chorus]
It condenses up above
Becomes a falling drop
Falls once more
For life to emerge

[Chorus]
Constant transformation
Non-stop
Water is magic
Always changing
From liquid to vapour
It condenses
Returns as rain
To begin anew</td></tr>
</table>

4. Discussion

The use of prompts based on systematic observations of the student enables the creation of activities that are more accessible and tailored to the adolescent's specific needs, thereby encouraging the adolescent's participation and learning. This process aligns with the view that working with students with intellectual disabilities requires individualised, collaborative planning that is grounded in the student's reality and built around clear goals. The detailed description of skills, potential, and learning barriers in the prompts transformed pedagogical observation into direct input for the personalisation of teaching, a function that, according to Arruda (2024), constitutes one of the most promising contributions of Generative AI to teaching practice [1].

In this regard, it was possible to observe that AI tools complement one another, as exemplified by the creation of comic strips, where prompts needed to be adjusted several times to ensure they were age-appropriate for the student to avoid infantilising the proposed activities. The iterative process of refining commands to avoid infantilising the activities corresponds to what Röhe and Santaella (2023) characterise as an inherent condition of GenAI use, particularly in image generation tasks, which require progressive refinement and multiple attempts at adjustment [13]. Such vigilance is pedagogically fundamental: Camargo (2022) warns that treating adolescents with intellectual disabilities as children, by proposing activities outside their age-appropriate context, leads to demotivation and compromises the full development of their potential [8].

Activities such as comics, word searches, crosswords, and quizzes, recommended by AI tools as teaching strategies, have proven particularly engaging and effective for students with reading difficulties, aiding their comprehension of the content. The effectiveness observed with the use of comic strips, word searches, crosswords and quizzes is consistent with the studies by Lima, Sena and Serra (2024); Magnago and Nunes (2024), which demonstrate that playful resources and gamification elements contribute to the cognitive, social and linguistic development of students with intellectual disabilities, enhancing intrinsic motivation and promoting personalised learning [10], [11].

The diversification of teaching strategies promotes student engagement and their participation in the proposed activities. The activities planned based on the content that mainstream classroom teachers are working on – and thus tailored to the class's real-world context, where all students can participate – align with the most current principles of inclusive education. The diversification of teaching strategies aligns, for example, with the principles of Universal Design for Learning (UDL) – a curricular approach that advocates multiple forms of presentation, expression and engagement [9]. From this perspective, the use of GenAI to generate variations of the same content (pictograms, audio, images, video and simplified text) serves as an operational resource for implementing UDL in teaching practice.

Final Remarks

Artificial Intelligence tools can be used as allies in inclusive education, enabling teachers to analyse pedagogical data, identify learning patterns, suggest curricular adaptations, recommend personalised strategies for each student, and draw up Individualised Education Plans, thereby enhancing active participation and meaningful learning. The creation of personas with AI supports undergraduate students in their initial training when discussing inclusive strategies to cater to students with intellectual disabilities (ID) and/or autism spectrum disorder (ASD), as well as classes with diverse profiles.

Furthermore, the use of AI in pedagogical planning has demonstrated potential to optimise time spent developing materials and activities, allowing teachers to prioritise more meaningful and contextualised practices for students, particularly those in special education. The activities produced with the support of digital tools proved to be more accessible, visually appealing and aligned with students' interests, fostering greater engagement, participation and autonomy.

Thus, integrating Artificial Intelligence and pedagogical planning can improve the quality of education for students with ID and ASD, reducing educational inequality through personalised learning, with teachers better equipped to work with technology and inclusion. However, it should be emphasised that it is necessary to respect the ethical principles governing the use of AI in the creation of accessible teaching materials, considering students' real needs and avoiding the production of childish materials, especially for adolescents and young people in special education.

It should be acknowledged that this study has certain limitations inherent to its single-case design, which constrain the generalisability of its findings to other students and contexts. Moreover, whilst the activities were observed to increase engagement and participation, no systematic outcome data or standardised indicators of student responses were collected, which limits the extent to which improvements in learning can be directly attributed to the use of GenAI-supported materials. The iterative refinement of prompts,

particularly for image generation, also warrants further documentation, as the number of adjustments required, the nature of the changes made, and the criteria guiding each refinement step were not systematically recorded. Future studies should therefore incorporate clearer protocols for tracking prompt iterations and for measuring student outcomes over time. Finally, although ethical considerations regarding privacy, data protection, and the avoidance of infantilising content were addressed throughout the project, a more in-depth critical discussion of the risks associated with GenAI use in inclusive education – such as algorithmic bias, over-reliance on AI-generated content, and the potential erosion of teacher judgement – remains an important avenue for future work.

Whilst this pilot case study focused mainly on representation and engagement, future developments of the EduEsp Pocket Guide could also explore GenAI's role in supporting Action and Expression – for instance, enabling Rafael to demonstrate learning through audio recordings, AI-transcribed dictation, or simple multimedia productions. Future iterations should also gather qualitative feedback from PIBID undergraduates on how this process shaped their own pedagogical reasoning and professional development.

Learning is For Everyone (LiFE): Paving the Pathway for Inclusive Education for Children with Disabilities

Ursula Hinostroza Castillo[1], Stefania Vindrola Paseta[2], Ghalia Ghawi[3], Helene Guillou[4]

[1,2,3,4]UNICEF Office of Strategy and Evidence–Innocenti, Italy

Abstract

Children with disabilities remain among the most excluded learners globally. Despite growing policy commitments to inclusive education, persistent barriers related to stigma, inaccessible environments, rigid curricula, limited teacher preparation, and insufficient data systems continue to prevent their meaningful participation and learning. The Learning is For Everyone (LiFE) research initiative, led by UNICEF Innocenti in partnership with UNICEF country offices, offered a comprehensive mixed-methods, system-level analysis of inclusive education for children with disabilities, aiming to identify the challenges countries face in making their education systems more inclusive. The research was conducted in seven countries: Cambodia, Djibouti, Kyrgyzstan, Mozambique, Nepal, Niger, and Paraguay. Drawing on quantitative and qualitative primary data from teachers, head teachers, district officials, parents, and children with and without disabilities; alongside secondary analysis of Programme for International Student Assessment – Development (PISA-D) 2018 and Multiple Indicator Cluster Survey (MICS) 6 data, and a targeted global literature review, this paper synthesizes the key findings and evidence-based policy recommendations organized around three interconnected action areas: Recognize, Reform, and Resource. Findings reveal that exclusion is not inevitable but often reflective of systemic gaps that can be addressed. The paper concludes with a call for sustained political will and financial investment, coordinated intersectoral action, and the recognition of diversity as a strength that benefits all learners.

Keywords: *inclusive education, children with disabilities, Universal Design for Learning, low-and middle-income countries*

1. Introduction

Children with disabilities were half as likely to attend school as their peers without disabilities, despite education being a fundamental right for every child [1] [2]. Even when enrolled, they face persistent barriers to learning. Data from 2021 showed that children with disabilities are 42 per cent less likely to develop foundational literacy and numeracy skills. These figures underscore that access alone is insufficient. Education systems must enable meaningful participation and learning for every child, including children with disabilities who represent 10 per cent of children aged 0-17 globally [3].

Providing meaningful learning opportunities for all children requires a systemic shift towards inclusive education. Inclusive education, as defined in General Comment No. 4 of the Convention on the Rights of Persons with Disabilities (CRPD), involves comprehensive reforms to content, pedagogy, structures, and strategies, aiming to ensure responsive, participatory, and supportive learning environments for all [4]. This vision aligns with Sustainable Development Goal 4, which affirms the global commitment to inclusive and equitable quality education [5].

Evidence consistently shows that inclusive settings benefit all learners. They boost the self-efficacy, social skills, and academic performance of students with disabilities, while also supporting neurodivergent learners and those with invisible or uncertified needs through more responsive instruction [6]. Students without disabilities benefit as well, gaining problem-solving, interpersonal, and socioemotional skills from learning alongside diverse peers [7], yet these gains are often limited by inadequate financing, system capacity, teacher preparation, and persistent stigma.

The Learning is For Everyone (LiFE) research initiative, led by UNICEF Office of Strategy and Evidence–Innocenti in partnership with UNICEF country offices and ministries of education in seven countries (Cambodia, Djibouti, Kyrgyzstan, Mozambique, Nepal, Niger, and Paraguay), was designed to generate system-level evidence to address these challenges. Guided by the Education Sector Analysis (ESA) volume 3 guidelines, the research examined how policies, school structures, pedagogy, data systems, and accountability mechanisms interact to enable or constrain the implementation of inclusive education

[7]. This approach allowed an emphasis on the principle that inclusive education should be a core component of an education system, requiring systemic reform rather than being treated as an add-on.
This paper presents a synthesis of the findings and policy recommendations, structured around three action areas derived from the research: Recognize, Reform, and Resource. It argues that governments must **recognize** children with disabilities as rights-holders and ensure their inclusion is visible and valued through improved understanding and documentation of disability. It calls for **reform** across education systems so that policies, structures, and professional practices respond to learner diversity rather than relying on adhoc efforts. Finally, it emphasizes the need to **resource** inclusive education through sustained investments in accessible environments, materials, and human capacity to translate commitments into meaningful change

2. Methodology

The main goal of the LiFE research was to generate evidence on the status of inclusive education for children with disabilities across pre-primary, primary, and secondary levels, and to provide evidence-based policy recommendations relevant at both country and global levels. The study followed a mixed-methods design, combining primary and secondary data analysis, to answer three core research questions about the barriers children with disabilitiesn face, the system-level constraints shaping provision, and the opportunities that can be scaled to strengthen inclusive education.
The research was anchored in the inclusive education framework in the ESA Volume 3, which examines disability-inclusive education systems across four dimensions: supply (teachers, infrastructure, learning materials), quality (curriculum, assessment, learning support), demand (attitudes, costs, perceived benefits), and the enabling environment (laws, policies, data, finance). This framework informed all stages of the research, from design to interpretation of data.

2.1 Instruments and Data Analysis

The paper used a comprehensive mixed-methods design drawing on three data sources**: (i) a targeted global literature review** of recent academic and policy work on disability-inclusive education; **(ii) country-level primary research** involving digital surveys with teachers, head teachers, and district officials in six countries, along with interviews and focus groups with children aged 10–16 (with and without disabilities), their parents, and teachers; **(iii) and secondary analysis** of international datasets, including PISA for Development (2018), PISA 2022 teacher data from low- and middle-income countries, and existing analyses of the Child Functioning Module from MICS Round 6.
Ethical approval was received for the country-level research from an Institutional Review Board, and ethical standards were applied throughout the study, using age-appropriate assent to ensure children's informed participation. Accessibility was prioritized through accommodations such as sign language interpretation and simplified materials to support children's comfort and well-being.

2.2 Limitations

Certain questionnaire items were adapted to local contexts, reducing the potential for direct cross-country comparison. Response rates varied across countries and participant groups, affecting representativeness. Although accommodations were provided for children with disabilities, additional adjustments to protocols were required at times, and translation from local languages may have led to a loss of nuance. For the secondary data analysis, access to datasets varied, and definitions of disability differed across sources, requiring careful interpretation.

3. Findings

3.1 Recognize: Making Disability Understood and Valued

Advancing inclusive education requires recognizing children with disabilities as rights-holders, learners, and active contributors. This begins with shifting how disability is understood, measured, and addressed.

Attitudes and perceptions of disability
LiFE evidence shows that the understanding of disability varies widely across countries and stakeholders, shaping attitudes and influencing the direction of inclusive education reforms. Policy frameworks range from medical-model approaches, as seen in Cambodia and Kyrgyzstan, to more

social-model orientations in Djibouti, Mozambique, Paraguay, and Nepal—differences that affect whether systems prioritize segregation or inclusive practices. Across all countries, participants' perceptions were often medicalized, with disability viewed as a deficit, especially for invisible disabilities. Attitudes among parents, teachers, and children were mixed: many expressed support for inclusion, yet misconceptions, stigma, and uncertainty persisted. These perceptions have concrete implications, reinforcing expectations of separate provision and limiting pedagogical adaptation in mainstream schools. Some countries, such as Djibouti and Nepal, have begun fostering more positive attitudes through structured interactions between children with and without disabilities, helping challenge stereotypes and build more inclusive school cultures.

"Boys with disabilities are people just like us; they are not different from us—they are beautiful human beings." (Child without disability, Primary school, Paraguay)

Identification systems

Consistent with global trends, LiFE research highlighted a lack of systematic protocols for identifying barriers to learning and participation. Screening tools exist in most countries, but tools designed to identify functional barriers within classrooms are largely absent. Many children remain unidentified, particularly those with invisible disabilities. Particularly, screening tools remain widely used but face persistent limitations, especially in Low- and Middle-Income Countries (LMICs), where many children are still not identified. Coverage is uneven because tools are often not culturally or contextually adapted, and "culture-free" instruments may miss context-specific developmental issues [8]. Evidence from systematic reviews shows that screening tools tend to be less effective outside their original linguistic or cultural settings, and culturally sensitive tools for LMICs remain scarce [9].

LiFE data indicated that over 70% of trained teachers in Djibouti, Kyrgyzstan, Mozambique, Nepal, and Paraguay reported that their training helped them identify indicators of potential disability (Figure 1). Nonetheless, clear referral pathways linking identification to support within and beyond school are still needed to ensure timely provision of services.

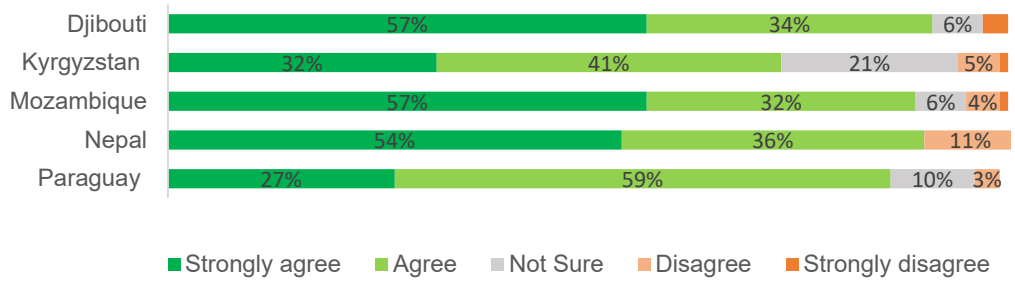

Fig. 1. Teacher's agreement on how training courses have helped them to identify indicators of a potential disability or learning difficulty

Source: Author's elaboration, based on LiFE teacher surveys.

Disability data systems

LiFE evidence revealed that while most countries collect some disability information, their systems still rely heavily on medical classifications, and only a few capture functional difficulties—limiting their ability to plan inclusive support. Although six of the seven countries use Washington Group (WG) questions in national censuses, integration into Education Management Information Systems (EMIS) was less common, with only Mozambique and Nepal adopting functional approaches in school-level data. These findings mirror global patterns: many regions lack unified disability definitions and rely on medical models, though promising initiatives—such as MICS-6 comparable data, the adoption of WG tools in East and Southern Africa, and recent efforts to make large-scale assessments more accessible [10]—show a broader shift toward functional, rights-based data systems that can strengthen national reforms.

3.2 Reform: Transforming Education Systems

Inclusive education requires system-wide change; LiFE evidence shows persistent gaps but also highlighted positive dispersed practices showing signs that progress is achievable.

Access and school placement

LiFE findings showed that children with disabilities faced persistent barriers to accessing and thriving in mainstream education, including reliance on special schools driven by concerns about capacity, safety,

and resources in regular schools, as well as mixed attitudes from teachers and parents shaped by system constraints. These patterns mirror global evidence from PISA-D and MICS, which consistently document lower attendance among children with disabilities, higher rates of exclusion, weaker learning outcomes, and gender-specific barriers such as inadequate WASH facilities for girls with disabilities. LiFE qualitative data also revealed that some families perceived special schools as safer due to less incidents of bullying, while examples from Mozambique highlight how strong school leadership and community partnerships can foster more inclusive environments. International evidence, such as resource centre models in Ethiopia and Paraguay, highlights how mainstream systems can benefit from the expertise of special schools, the knowledge of specialised professionals, and the use of accessible teaching and learning materials, to build their capacity on how to support children with disabilities.

Inclusive teaching practices & teacher training

Despite limited formal training, many teachers across LiFE countries reported intuitively applying inclusive practices, drawing on principles of frameworks such as Universal Design for Learning (UDL), collaborative learning, and differentiated instruction, by repeating key information, offering individual support, using real-life examples, and adapting classroom seating arrangements. In Nepal, 93% of teachers reported seating students based on individual needs. However, in most LiFE countries fewer than 20% of teachers received formal training in disability-inclusive education (Figure 2). Existing training was frequently short, irregular, and theoretical. Large class sizes, rigid curricula, and limited resources were cited as barriers to implementing inclusive approaches effectively. The OECD TALIS 2024 survey confirms this is a global challenge: 1 in 4 teachers across OECD countries reported needing additional training in teaching students with special education needs [11].

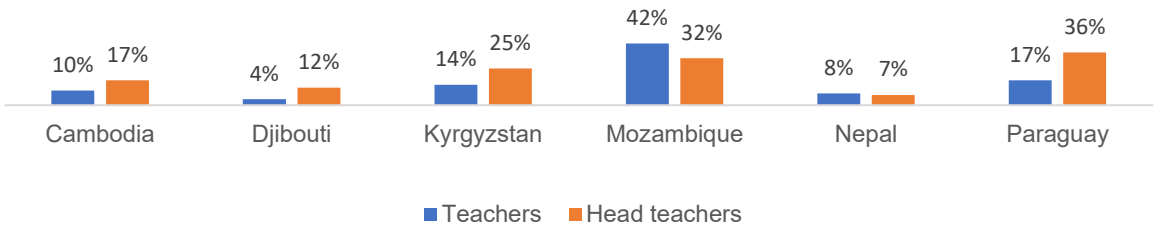

Fig. 2. Percentage of teachers and head teachers that reported receiving training in disability-inclusive education, by country

Source: Author's elaboration, based on LiFE head teacher and teacher surveys.

Assessment for all

LiFE evidence showed that although many countries have adopted inclusive education policies, inclusive assessment strategies were lagging, with most countries missing clear frameworks or applying them inconsistently. This often meant children with disabilities were assessed in ways that did not meet their needs. Teachers and students across LiFE countries reported that accommodations were rare and often limited to extra time, which was not always effective. Nonetheless, more meaningful adaptations were also observed, including sign language interpretation, Braille versions of tests, scribes, and quieter testing environments, indicating that good practices exist but require systematisation and scaling. These findings align with global research, which shows that inclusive assessment is conceptually underdeveloped, overly focused on categorisation, and rarely designed to support diverse learners [12].

3.3 Resource: Investing in Inclusion

Achieving inclusive education requires sustained investment in both material and human resources. Without adequate resourcing, policy commitments cannot be translated into practice.

Physical accessibility

School infrastructure and transportation were major barriers to school access across all LiFE countries. Families of children with disabilities reported lacking accessible and affordable transport, with some parents, predominantly mothers, having to leave their employment to accompany their children to school or stay with them during the day to support them with mobility or hygiene activities. Within schools, the absence of ramps, narrow doorways, overcrowded classrooms, and inaccessible WASH facilities restricted mobility and participation. Head teacher surveys confirmed limited availability of essential accessibility features, especially tactile floor signals and accessible toilets (Figure 3).

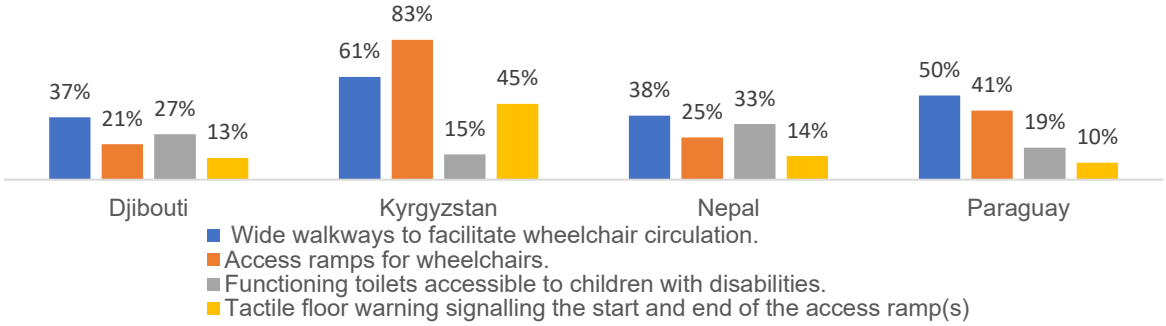

Fig. 3. Percentage of head teachers who reported the following accessibility features were available as part of their school infrastructure, by country
Source: Author's elaboration, based on the LiFE head teacher survey.

Teaching and learning materials and assistive technologies
Across all countries, teachers, parents, and children reported shortages of general educational resources and disability-specific materials, such as large-print books, audiobooks and tactile or hands-on manipulatives. Teachers frequently created low-cost materials using locally available resources; such as pebbles and seeds for mathematics in Nepal, or recycled materials for Braille instruction in Mozambique; demonstrating strong innovation in the face of resource constraints. However, these efforts were often individual and isolated, rather than systematic. Paraguay's Accessible Digital Textbooks (ADTs) initiative – developed using UDL principles - was highlighted as a promising effort, enabling students with disabilities to access the same content as their peers without disabilities in accessible formats [13].

Specialist support and teachers with disabilities
Specialist support was scarce across most LiFE countries. Psychologists and physiotherapists were the most commonly available specialists; yet sign language interpreters were scarce, with only 9 per cent of head teachers in Nepal and 5 per cent in Paraguay reporting their availability. Teachers with disabilities remained underrepresented across all LiFE countries and faced acute challenges in their work environments. Interview data revealed that stigma and discrimination from school staff and families, as well as inaccessible school infrastructure and materials, can hinder their ability to carry out their roles effectively. Yet LiFE findings showed teachers with disabilities brought unique strengths to schools and classrooms: greater empathy, a culture of acceptance and equity among staff, adaptive instructional strategies, and the ability to serve as role models for students with disabilities.
"It's wonderful that people with disabilities can also be part of the teaching profession. I am very happy. I completed my Bachelor's using Braille (...) and became a relief primary teacher. My focus is on supporting the education of children with disabilities... Two of my students from this school have successfully passed the Teacher Service Commission exams and are now working as teachers. (Teacher with disability Inclusive school, Nepal)

4. Policy Recommendations

4.1 Recognize: Prioritized actions to recognize children with disabilities include:

- **Foster positive attitudes toward disability aligned with the social and human rights models**. This entails implementing multi-level sensitization campaigns, developed with OPDs, to challenge stigma and stereotypes. Within the education sector, integrate disability-related content into curricula and teacher training that reflects lived experiences [14]. Ensure authenticity and impact by meaningfully involving persons with disabilities—including children—in the design, delivery, and evaluation of all awareness and sensitization efforts [15].

- **Communicate and demonstrate the benefits of disability-inclusive education for all learners** by mobilizing strong political commitment and sustained sensitization efforts that highlight how inclusion strengthens cognitive, social, and emotional outcomes for every student [16]. School leaders and teachers should be engaged as advocates and evidence champions, helping shape positive attitudes, mobilize resources, and create safe, supportive environments for teaching learners with disabilities.
- **Establish educational identification tools to effectively identify barriers to participation and learning, and ensure that appropriate support is provided to children**. This requires designing school-ready tools focused on functional needs and participation, paired with strong teacher training so they can use them effectively and provide timely accommodations. Clear referral pathways must link school-level identification to specialized services through coordinated action across education, health, and social protection [17]. To sustain this system, monitoring mechanisms should be integrated into EMIS to track identification practices, teacher preparedness, available supports, and student outcomes [18].
- **Strengthen collection, analysis, and use of to properly identify barriers to participation and learning, in line with inclusive principles**. This requires reviewing and adapting national and local data systems so they can capture disaggregated information on participation, learning barriers, and support needs. To ensure data quality, officials involved in data collection must be trained to collect, enter, and analyze information accurately, supported by quality-assurance and feedback mechanisms that promote coherence across the system while allowing schools flexibility to respond to local needs [19].

4.2 Reform: Priority actions to reform education systems to become more inclusive include:

- **Strengthen the capacity of mainstream schools to enrol students with disabilities.** This includes fostering collaboration between mainstream and special schools so teachers can benefit from disability-specific expertise; progressively transforming special schools into inclusion support centres that provide ongoing guidance, resources, and specialist services; and expanding community-based outreach to ensure families understand children's right to attend mainstream schools and feel supported in enrolling them [20].
- **Institutionalize the use of inclusive strategies in teaching and learning**. This requires implementing flexible curricula grounded in frameworks such as UDL, cooperative learning, and differentiated instruction [21]; creating opportunities for teachers to share effective inclusive practices and ensuring that teacher training embeds these approaches as core content both in pre-service and ongoing professional development.
- **Transform teacher training to systematically integrate inclusive education**. This means revising pre- and in-service training so disability-inclusive education becomes mandatory and embedded in accreditation [22]; ensuring programmes address the full range of inclusive strategies such as UDL, differentiated instruction, accessible materials, and formative assessment; guaranteeing long-term policy and financing support; and equipping head teachers to foster collaboration, allocate resources, and create school cultures that enable teachers to implement inclusive practices effectively.
- **Identify and institutionalize teaching practices that promote inclusion by embedding them within teacher professional development**. This requires identifying teachers who excel at inclusive practices, creating structured opportunities for peer learning, and formally recognizing the leadership role these teachers play. Governments should use existing monitoring processes to spot these teachers; ministries of education should embed teacher-led learning into national professional development frameworks; and both national and local authorities should provide recognition, training, and incentives that reinforce inclusive practice as a core professional competency [23].
- **Formalize disability-responsive assessment accommodation guidelines**. Ministries of education should map and document current practices to build a comprehensive, adaptable set of options for all learners; teacher training institutes must equip teachers to implement these accommodations; and assessment outcomes should be used to identify learning needs, adjust instruction, and refine curriculum and teacher preparation [24].

4.3 Resource: Prioritized actions to sustaining and enhancing resourcing of inclusive education are:

- **Improve physical accessibility by addressing both transportation and school infrastructure to ensure all children can reach schools and learn within them safely**. This includes developing and enforcing national guidelines for accessible transport, adopting a phased approach to retrofitting vehicles and buildings, embedding Universal Design principles in new school construction standards, and conducting regular accessibility audits [25]. Where resources are limited, immediate low-cost accommodations should be prioritized, such as assigning ground-floor classrooms to groups that include students with physical disabilities, or modifying classroom lighting and acoustics.
- **Strengthen resource provision and scale teacher-created low-cost materials**, by mapping existing resources and gaps, and combining system-wide investments with targeted funding for accessible materials, assistive devices, and specialist support across central, regional, and local levels. Governments should explore expanding access to multidisciplinary specialists through itinerant models and cross-sector coordination [26]. Teacher-created low-cost materials should be systematically documented and scaled through open-access repositories integrated into national planning, while AI-supported tools are promoted to speed up the creation of accessible resources under clear policies, ethical standards, and UDL-aligned training [27].
- **Recruit and support teachers with disabilities through inclusive recruitment practices.** Teacher training programmes at all levels must provide accessible infrastructure, assistive technologies, and UDL-aligned content, guaranteeing appropriate support from enrolment to certification. Schools should also enforce accessibility standards in buildings, materials, and assistive devices, enabling teachers with disabilities to perform their roles without barriers [28]. Head teacher preparation should also incorporate disability awareness to eliminate hiring bias.

5. Conclusions

The LiFE research demonstrated that the exclusion of children with disabilities is not inevitable but stems from addressable gaps in infrastructure, teacher preparation, data, and resources [29]. The evidence showed that inclusion is achievable and already supported by promising practices. Doing so requires political will, sustained investment, coordinated action, and a shift toward viewing diversity as a strength; recognizing children with disabilities as rights-holders, reforming systems to meet their needs, and resourcing schools with accessible environments and specialist support can drive meaningful transformation for all learners. Protective Factors Across School Trajectories: Socioeconomic and Racial Disparities

Ane Mayra Melo Silva[1], Julio Cezar Albuquerque da Costa[2], Luan Filipy Freire Torres[1], Ana Luísa Gomes de Barros Freitas[1], Heitor Marinho da Silva Araújo[3], Cleverson Natan da Silva[1], Leogildo Alves Freires[1]

Abstract

School dropout constitutes a multifaceted, relational process of disengagement from school, resulting from the interweaving of socioeconomic, cultural, and institutional determinants and the insufficiency of educational structures and support networks [1], which makes it essential to identify vulnerabilities early and strengthen protective factors throughout school trajectories [2]. This study aimed to analyze the influence of race/color and the Socioeconomic Level Index (INSE) on relational protective factors of school trajectories. Accordingly, a sample of 10,000 synthetic data was used, based on 3,678 valid responses/answers from students of four Brazilian states who completed the Relational Factors for the Risk of School Dropout Scale – Alternative version (IAFREE-A). The synthetic data was calculated using the Gaussian Copula technique, which considers the association between the observed variables in the dataset to estimate new responses, generating a new and bigger dataset. This approach was considered due to the General Law of Data Protection (LGPD), ensuring ethical compliance through the use of anonymized data, nationwide data collection using real data is currently being conducted in Brazil. Analyses were conducted in JASP using Kruskal–Wallis tests with Dunn post hoc comparisons (Holm correction) due to non-normality (Shapiro–Wilk), and effect sizes were estimated using eta-squared (η^2), variables were the scores of the 14 attention factors. Results showed that, for race/color, significant differences were found in E-FAM2 ($p<.001$), E-EST2 ($p<.001$), and E-EST3 ($p=.002$). Brown students reported poorer family support and educational expectations than White, while Black and Brown showed more negative perceptions of school belonging. For INSE, lower levels were associated with greater vulnerability across E-FAM1, E-FAM2, E-COM2, E-EST1, and E-EST3 (all $p<.001$), particularly family support. Protecting school trajectories requires intersectional policies strengthening school inclusivity for racial minorities and economically vulnerable students.

1. Introduction

School dropout is a persistent problem in contemporary educational systems, with consequences that extend beyond students' individual trajectories and directly affect countries' social and economic development [3]. In Brazil, this phenomenon does not affect all students equally, as it follows patterns that expose and reproduce, within the educational system itself, the structural inequalities of society [4]. The racial dimension makes this inequality even more evident, as Black and Brown youth account for the majority of those who do not complete basic education in the country [5], revealing that school retention is conditioned by racial and socioeconomic factors, causing school dropout to transcend the purely pedagogical dimension and come to reflect broader social inequalities existing in the Brazilian context [4].

The literature has advanced our understanding of this phenomenon and reached an important conclusion: school dropout is not an isolated event, but rather the result of a relational and multifactorial process involving socioeconomic conditions, cultural aspects, institutional factors, and weaknesses in student support networks [6]. As demonstrated in studies, it is evident that school disengagement rarely occurs suddenly, but is preceded by a gradual weakening of the bonds established between the student and the various settings that make up their school experience [3],[7]. It is within this set of relationships that both the main risks and the protective factors for educational trajectories are concentrated, understood as relational elements that, when reinforced, promote student retention and continuity in the

educational system, even in the face of the adversities they face [2]. In this context, the early identification of vulnerabilities, combined with the reinforcement of these protective factors, has been identified as one of the most important strategies for combating school dropout [2].
Among the factors that shape this process, race/color and socioeconomic status stand out as particularly significant structural determinants. Early warning systems for school dropout have shown that students in economically vulnerable situations and belonging to racial minority groups face greater difficulties in staying in school, related both to limited material resources and to the weakening of the support networks that sustain school continuity [8]. Although the importance of these variables is increasingly recognized, studies investigating their effects in an integrated and intersectional manner within the Brazilian context remain limited, particularly when the focus is on relational protective factors, rather than solely on risk indicators or academic performance.
Moving in this direction is essential, since understanding the factors that promote school retention is a prerequisite for developing more effective interventions aimed at promoting equity, as advocated by international agendas focused on safeguarding educational trajectories [2]. Thus, the present study aimed to analyze the influence of race/ethnicity and the Socioeconomic Status Index (*Índice do Nível Socio-Econômico* - INSE) on relational protective factors for the educational trajectories of Brazilian students, assessed using the Relational Factors for the Risk of School Dropout Scale – Alternative version (IAFREE-A) [9]. It is worth highlighting that INSE is a composite indicator developed by INEP that classifies students into eight hierarchical groups, from Group I (lowest) to Group VIII (highest), based on the parents' level of education and the household's possession of goods and services, making it a widely used measure to capture socioeconomic stratification in the Brazilian education system [10].

2. Method

2.1 Participants

The sample consisted of 10,000 synthetic data points generated from 3,678 valid responses from students, with a predominance of females (50.82%), students of brown race (54.88%), and those in Group V of the Socioeconomic Status Index (INSE) (21.66%). In addition, a higher concentration of participants was observed in the Midwest region (44.35%), followed by the Southeast (25.72%). All sociodemographic characteristics are presented in Table 1.

Table 1. Sociodemographic profile of the sample.

Gender	n	%	Race/Ethnicity	n	%
Male	4898	48.98	White	2168	21.68
Female	5082	50.82	Black	2062	20.62
I prefer not to declare	20	0.20	Brown	5488	54.88
			Other	282	2.82
Region of Residence	n	%	Socioeconomic Status Index	n	%
Midwest	4435	44.35	I	196	1.96
Northeast	1368	13.68	II	1101	11.01
North	1625	16.25	III	1525	15.25
Southeast	2572	25.72	IV	2042	20.42
			V	2166	21.66
			VI	1592	15.92
			VII	1222	12.22
			VIII	156	1.56

2.2 Instruments

The final version of the Scale of Relational Factors for the Risk of School Dropout – Alternative Version (IAFREE-A) [9], an adaptation of the IAFREE originally developed by Vasconcelos et al. [7], aligned with and guided by the concept of School Trajectory Protection. In this sense, the instrument is completed exclusively by students and consists of 46 items, organized into 5 relational dimensions and 14 attention factors. The 5 dimensions are designated as protective dimensions, namely: Student-School (SSc), Student-School Professionals (SP), Student-Family (SF), Student-Community (SC), and Student-Student (SSt), totaling 14 factors of attention: Infrastructure (SSc1); School as a Safe Space (SSc2); Discrimination (SSc3); School Management and Organization (SP1); Pedagogical Quality (SP2); Teacher expectations (SP3); Parenting (SF1); Family support structure (SF2); Family interaction (SF3); Network interaction (SC1); Community relations (SC2); Interpersonal relationships and social skills (SSt1); Expectations regarding education/educational development (SSt2); Belonging/Identification (SSt3). Responses are recorded on a 1-to-4 Likert scale in two formats: frequency (1 = "Never," 2 = "Sometimes," 3 = "Frequently," and 4 = "Always") and agreement (1 = "Strongly disagree," 2 = "Disagree," 3 = "Agree," and 4 = "Strongly agree"), both accompanied by a pictorial scale. In general, the scores are reversed, with the exception of items Q5 and Q36, whose statements are already negative, such that higher scores indicate greater attention to the educational trajectory, while lower scores reflect lower vulnerability. Additionally, a 33-item sociodemographic questionnaire was administered to characterize the participants' profiles, covering variables such as gender, race/ethnicity, Socioeconomic Status Index, and others.

2.3 Procedures

The study was conducted in accordance with ethical guidelines for research involving human subjects, as per National Health Council Resolutions No. 466/2012 and No. 510/2016, and was approved by the Human Research Ethics Committee (CEP/UFAL) under approval No. 5.407.594. Thus, data collection was carried out with students in schools from four state school systems, located in the Central-West, Northeast, North, and Southeast regions of Brazil. For this data collection, a specific digital platform was developed for the administration of the IAFREE-A, where students gained access to the platform only after their parents or guardians signed the Informed Consent Form (ICF), and the Informed Assent Form (IAF) was made available on the platform itself for the students.

2.4 Data Analysis

The analysis procedures were performed in R [11], where synthetic data were generated using the Gaussian Copula technique, based on multivariate normal distributions and the integral probability transformation applied to the original data [12]. The adoption of this approach is justified both from a methodological standpoint, as it preserves the dependency structure among variables, an essential aspect in psychometric data where latent factors emerge from correlations between items [13], [14], and from an ethical standpoint, as it ensures the anonymization of information in compliance with the General Data Protection Law (LGPD) [15]. Thus, the correspondence between the synthetic and original data was assessed using the Hellinger distance, which ranges from 0 to 1, with values close to zero indicating greater similarity between distributions and higher values indicating greater discrepancy [16]. In this study, a value of 0.20 was adopted as the criterion for adequacy.

Based on the generation of synthetic data, statistical analyses were performed using the JASP software [17]. A priori, data normality was assessed using the Shapiro–Wilk test ($p < .05$) [18], and since the assumptions were not met, indicating asymmetry [19], nonparametric tests were chosen, specifically the Kruskal–Wallis test for three or more groups, with application of Dunn's post hoc test [20] when necessary. Effect sizes were reported using eta-squared and Biserial rank correlation (Dunn post hoc), following the interpretation of thresholds by Serdar et al. [21] for small (0.20), moderate (0.50), and large (0.80) effects. The scores of the 14 attention factors of the IAFREE-A were used as dependent variables for the comparative tests. As independent variables, race/ethnicity and INSE were used, classified on a scale from I to VIII, where I represents the lowest conditions and VIII the highest, based on a composite score comprising variables such as income, education, and assets.

3. Results

The correspondence between the synthetic data and the original data was assessed using the Hellinger distance (Hd), a metric ranging from 0 to 1, in which values closer to zero indicate greater similarity between the compared distributions. As shown in Table 2, all values found remained below the adopted adequacy criterion (Hd < 0.20), indicating a high degree of similarity between the distributions of the synthetic data and the original data.
Thus, regarding the instrument's dimensions, Hd values ranged from 0.015 (E-EST) to 0.034 (E-COM). Among the factors, however, there was a slightly greater variation, with values ranging from 0.032 (E-ESC2 and E-FAM3) to 0.065 (E-EST2), remaining within the limit considered adequate, reinforcing the quality of the approximation obtained. Meanwhile, race/ethnicity showed Hd = 0.067, while INSE recorded Hd = 0.027, both below the established cutoff point. It is noted that the relatively higher value observed for race/color is possibly related to the greater heterogeneity of this variable in the original sample, which tends to make its synthetic reproduction more complex when compared to more homogeneous distributions.

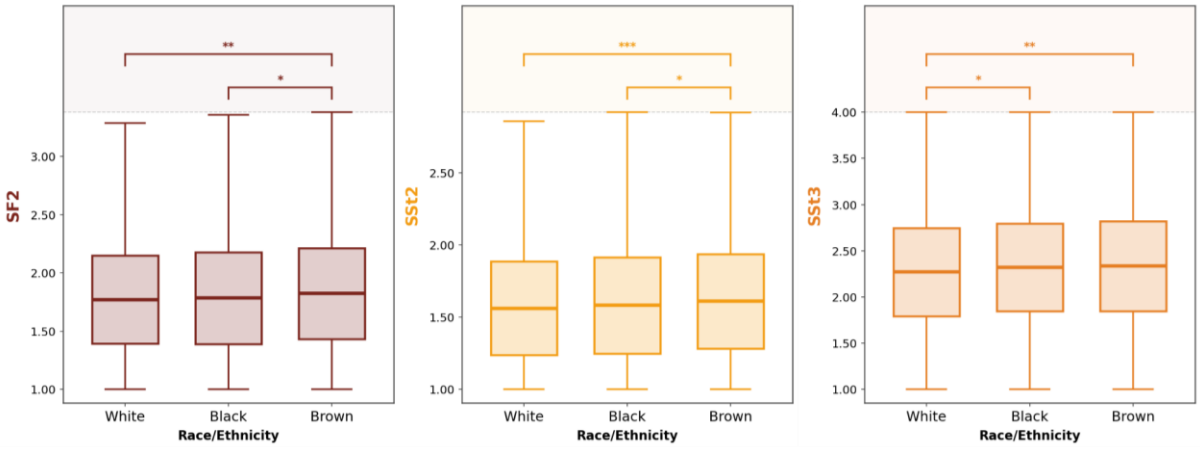

Table 2. Hellinger distance by dimension, factor, and sociodemographic variables.

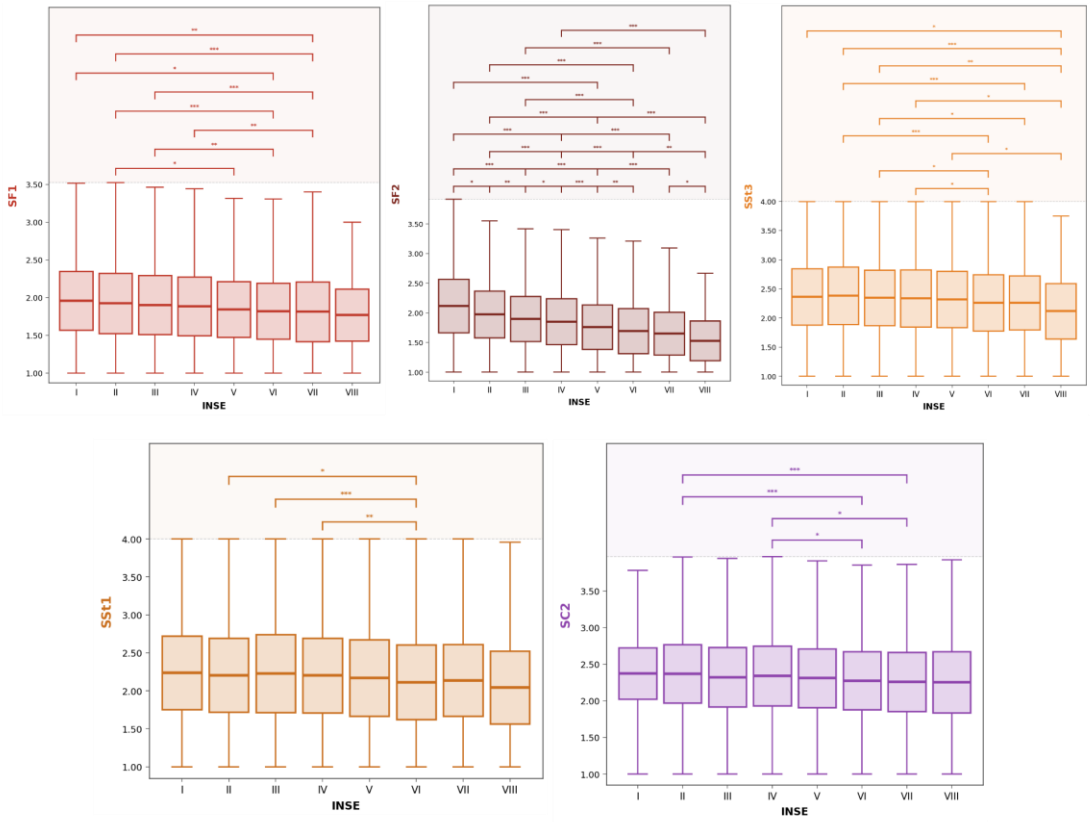
Dimension	Hd	Factor 1	Hd	Factor 2	Hd	Factor 3	Hd
SSc	0.017	*SSc1*	0.035	*SSc2*	0.033	*SSc3*	0.044
SF	0.026	*SF1*	0.039	*SF2*	0.038	*SF3*	0.032
SP	0.021	*SP1*	0.036	*SP2*	0.035	*SP3*	0.032
SC	0.034	*SC1*	0.037	*SC2*	0.033	—	—
SSt	0.015	*SSt1*	0.038	*SSt2*	0.065	*SSt3*	0.043
Variables		*Race*/Ethnicity	0.067	*INSE*	0.027	—	—

Note. Hd: Hellinger distance. INSE: Socioeconomic Status Index.

With regard to the comparative analyses, for the Race/Ethnicity variable, the Kruskal-Wallis test indicated statistically significant differences in SF2 ($H(2) = 15.34$; $p<0.001$; $\eta^2 = 0.001$), SSt2 ($H(2) = 19.13$; $p<0.001$; $\eta^2 = 0.002$), and SSt3 ($H(2) = 12.60$; $p=.002$; $\eta^2 = 0.001$). Next, Dunn's post hoc test (with Holm correction) was applied to examine paired comparisons between the groups. In this context, regarding the SF2 factor, brown students reported a negative perception of the support structure at home, compared to white students ($z = -3.444$; $p=.002$) and Black students ($z = -2.750$; $p=.012$).

Similar results were found for the SSt2 factor, in which brown students also reported negative perceptions regarding expectations regarding education, when compared to white students ($z = -4.062$; $p<.001$) and Black students ($z = -2.687$; $p=.014$). In contrast, regarding the SSt3 factor, related to feelings of belonging and identification, Black and brown students had higher scores, that is, less positive impressions, than white students ($z = -2.424$; $p=.031$ and $z = -3.524$; $p=.001$, respectively).As illustrated in Figure 1, higher scores reflect greater perceived vulnerability, with Brown students consistently presenting the highest scores across SF2, SSt2, and SSt3, followed by Black students, indicating that racial minority groups experience greater relational vulnerability within the school context.



Note. *: p<.05; **: p<.01; ***: p<.001.

Fig. 1. Boxplots of factors showing statistically significant differences across Race/Ethnicity categories.

When considering the Socioeconomic Status Index (INSE) variable, there were statistically significant differences in the factors SF1 ($H(7) = 48.35$; $p < .001$; $\eta^2 = 0.004$), SF2 ($H(7) = 399.1$; $p<.001$; $\eta^2 = 0.039$), SC2 ($H(7) = 33.94$; $p<.001$; $\eta^2 = 0.003$), SSt1 ($H(7) = 32.62$; $p<.001$; $\eta^2 = 0.003$), and SSt3 ($H(7) = 43.41$; $p<.001$; $\eta^2 = 0.004$). When Dunn's post-hoc test was applied, considering the Parenting factor (SF1), Group I had higher scores compared to Groups VI ($z=3.272$; $p=.023$) and VII ($z=3.602$; $p=.008$), suggesting a greater perception of a family environment that does not fully value education and personal development among students from lower socioeconomic backgrounds. Group II, in turn, differed from groups V ($z=3.264$; $p=.023$), VI ($z=4.147$; $p<.001$), and VII ($z=4.622$; $p <.001$), while Group III had higher scores than Groups VI ($z=3.722$; $p=.005$) and VII ($z=4.242$; $p<.001$), and Group IV also differed from Group VII ($z=3.556$; $p=.009$).

As for the Family support structure (SF2), Group I scored higher than all other groups, with Group II ($z=2.508$; $p=.049$), Group III ($z=4.219$; $p<.001$), Group IV ($z=5.391$; $p<.001$), V ($z=7.565$; $p<.001$), VI ($z=9.088$; $p<.001$), VII ($z=9.831$; $p<.001$), and VIII ($z=9.009$; $p<.001$). Group II obtained higher scores than groups III ($z=3.180$; $p=.007$), IV ($z=5.583$; $p<.001$), V ($z=9.993$; $p<.001$), VI ($z=12.59$; $p<.001$), VII ($z=13.53$; $p<.001$), and VIII ($z=9.026$; $p<.001$). Meanwhile, group III scored higher than groups IV ($z=2.452$; $p=.049$), V ($z=7.303$; $p<.001$), VI ($z=10.26$; $p<.001$), VII ($z=11.36$; $p<.001$), and VIII ($z=7.690$; $p<.001$), and group IV differed from groups V ($z=5.224$; $p<.001$), VI ($z=8.517$; $p<.001$), VII ($z=9.769$; $p<.001$), and VIII ($z=6.783$; $p<.001$). Group V also differed from groups VI ($z=3.745$; $p=.001$), VII ($z=5.372$; $p<.001$), and VIII ($z=4.853$; $p<.001$), while groups VI ($z=3.322$; $p=.005$) and VII ($z=2.472$; $p=.049$) obtained higher scores than group VIII. All these high scores indicate that the lower the students' socioeconomic status, the greater their perception of a lack of resources and support within the family context. As shown in Figure 2, scores tend to decrease progressively from Group I to Group VIII, suggesting that students from lower socioeconomic backgrounds report greater vulnerability across the relational factors of their school experience, reinforcing the role of economic disadvantage as a structural determinant within the educational context.

Note. *: p<.05; **: p<.01; ***: p<.001.

Fig. 2. Boxplots of factors showing statistically significant differences across INSE categories.

With regard to Community relations (SC2), significant comparisons were limited to groups II and IV. Group II had higher scores than groups VI (z=4.152; p<.001) and VII (z=4.253; p<.001), a pattern also observed in group IV compared to groups VI (z=3.356; p=.020) and VII (z=3.488; p=.013), indicating a greater perception of distance between the school and the community among students from lower socioeconomic backgrounds. Regarding Interpersonal relationships and social skills (SSt1), it was observed that group II had higher scores than group VI (z=3.256; p=.029), a result also observed in group III (z=4.331; p<.001) and in group IV (z=3.585; p=.009), suggesting that students from lower socioeconomic backgrounds perceive more conflictual interpersonal relationships, with less empathy and greater communication difficulties.

On the Belonging/Identification factor (SSt3), Group I scored higher than Group VIII (z=3.071; p=.041), while Group II scored higher than Groups VI (z=4.490; p<.001), VII (z=4.229; p<.001), and VIII (z=4.257; p<.001), and Group III scored higher than Groups VI (z=3.329; p=.020), VII (z=3.101; p=.041) and VIII (z=3.658; p=.006). In turn, Group IV obtained higher scores than Groups VI (z=3.101; p=.041) and VIII (z=3.513; p=.011), while Group V stood out with higher scores compared to Group VIII (z=3.245; p=.026), suggesting that the lower the students' socioeconomic status, the lower their sense of belonging and identification with the school environment.

4. Discussion

The close correspondence between the synthetic data and the original data indicates that the synthetic generation process successfully preserved the sample's distributional structure without introducing distortions that could compromise the analyses performed. Recent evidence demonstrates the effectiveness of using synthetic data both in medical contexts and in reproducing complex behavioral patterns [21], [22], with similarities between those studies and the present one. Furthermore, beyond being a satisfactory methodological result, this finding has significant ethical relevance, as the use of these data enables robust statistical analyses while simultaneously strengthening the protection of participants' privacy. In this context, the slightly higher value observed for race/ethnicity, for example,

should not be interpreted as a limitation of the method, but rather as a reflection of the greater heterogeneity of this variable in the original sample, a characteristic that makes its reproduction more complex, as well as reinforcing its centrality to the study's objectives, since the indices remained within the established adequacy limits.

Based on this premise, and ensuring the consistency of the data, the analyses show that the school experience, particularly among mixed-race students, is marked by relational vulnerabilities that manifest themselves both in the family environment and in the expectations formed regarding the future. Within the family context, these students perceive fewer resources and less support at home to sustain their educational trajectory, a pattern that can be interpreted as a reflection of historical conditions of exclusion that limit not only access to material goods but also the presence of educated role models within the family unit, which, in turn, compromises the concrete and symbolic support that the family can offer the student [24]. Furthermore, this context fosters a more uncertain perception of the concrete benefits of schooling, contributing to a cycle in which social vulnerability also translates into less subjective investment in one's own educational trajectory [8].

Furthermore, low expectations are directly linked to a weakened sense of belonging in school. Students from racial minorities reported a greater sense of not belonging compared to white students, a condition that influences fundamental aspects of their educational trajectory, such as motivation, attendance, and retention. Recent evidence suggests that this process tends to intensify across educational levels [25] and stems not only from abstract identity conflicts but also from concrete experiences of exclusion and devaluation encountered in daily school life [8]. The fact that race/color-related effects were concentrated primarily in subjective and affective dimensions, such as support, expectations, and belonging, rather than in more objective aspects of the school structure suggests that racial inequalities are expressed above all in students' daily experiences. Precisely for this reason, these processes tend to elude more traditional educational indicators, even though they have a decisive impact on the continuity of the educational journey.

Similarly, socioeconomic inequalities also revealed a broad pattern of relational vulnerability. It was observed that the lower the students' socioeconomic status, the more negative their perceptions of family support, community ties, and school integration were. The perception of insufficient resources in the home environment appears to affect not only the material conditions for studying but also the possibilities for emotional support and involvement in school life, a situation that should not be interpreted as a lack of interest on the part of families, but rather as a consequence of contexts in which the demands of survival limit the concrete conditions for participating in their children's educational journey [26].

At the same time, the greater perceived distance between schools and communities in lower-income groups suggests weaknesses in the connection between educational institutions and the social environment in which these young people live, fostering disengagement when schools fail to engage with students' experiences, cultural references, and everyday realities [6]. Consequently, the combination of these material, relational, and emotional factors helps us understand that school dropout rarely occurs abruptly. In many cases, it is preceded by a gradual and silent process of subjective withdrawal, marked by low participation, difficulties in integration, and strained relationships with peers and teachers, aspects that often go unnoticed by conventional educational indicators [27].

That safeguarding students' educational trajectories requires recognizing that school retention is, above all, a relational issue, and that effective interventions must address the conditions that make the school environment a welcoming, inclusive, and meaningful space for all students, regardless of their racial background or economic status. Future research with longitudinal designs and more regionally diverse samples could deepen our understanding of the mechanisms through which these inequalities are consolidated or mitigated over time, contributing to the development of educational policies that are more equitable and sensitive to the heterogeneity of the Brazilian context.

Abstract

The present study aimed to investigate the impacts of external variables of school trajectories on the students' subjective perceptions of interpersonal relationships and sense of belonging in school, in addition to the expectations regarding education. To this end, we used the IAFREE-A questionnaire, which is based on the perspective of five related dimensions of school dropout risk [1]: students' relationship with the school (SSc), family (SF), school professionals (SP), community (SC), and students' relationship with themselves (SSt). Thus, a Structural Equation Modeling was used to investigate the influence of SSC, SF, SP, and SC on SSt variables, using a synthetic dataset generated through the Gaussian Copula technique, using a real dataset of 3,678 students from four states in Brazil. This data generation method estimates new responses based on the association between variables in the real dataset, reproducing its factorial structure, and was used in this study due to the General Law of Data Protection (LGPD), ensuring ethical compliance through the use of anonymized data. Nationwide data collection using real-world data is currently being conducted in Brazil. The explanatory model showed excellent results [$\chi^2(898) = 11459.827$; CFI = 0.983; TLI = 0.980; SRMR = 0.038; RMSEA = 0.034 (0.034–0.035)], with regression coefficients indicating a substantial contribution of the perception of school as a safe place to students' levels of interpersonal relationships (B=0.82, p<.001) and expectations regarding education (B=0.59, p<.001), indicating that the higher the perception of school as a safe place, the higher the levels of expectations regarding education and interpersonal relationships. Moreover, School management/organization was the strongest predictor of sense of belonging (B =0.91, p<.001), indicating that an increase in School management and organization leads to an increase in the perception of belonging.

Keywords: *School trajectories, Educational psychology, Risk of school dropout.*

1. Introduction

School dropout and abandonment constitute a multifaceted phenomenon that transcends the mere interruption of formal educational trajectories, resulting from the intertwining of socioeconomic, cultural, and institutional variables that extend beyond purely individual and family circumstances. In most cases, dropout and abandonment represent the outcome of situations in which existing educational structures and support systems prove inadequate to meet the specific needs of students [2].
Defined by the non-renewal of enrollment in the subsequent educational stage, this phenomenon surpasses the strictly pedagogical domain, also constituting a serious public health issue with substantial economic impact [3],[4],[5],[6],[7]. The lack of formal qualifications, frequently resulting from dropout, predisposes individuals to unemployment, intensifying social inequalities and perpetuating cycles of vulnerability. Consequently, this scenario may contribute to rising rates of functional illiteracy and, in extreme cases, correlate with increased crime rates, as well as mental health problems such as elevated stress levels [5],[6],[7],[8],[9].

In response to this multidimensional challenge, it is worth highlighting the existence of the Relational Factors for the Risk of School Dropout Scale (*Instrumento de Avaliação dos Fatores Relacionais do risco de Evasão Escolar* — IAFREE), developed by Vasconcelos et al. [1] and adapted for the context of protecting school trajectories by Freires et al. [10]. The IAFREE is grounded in the theory of relational factors of school dropout risk, which together function as predictors of school dropout. Among these relational factors, the instrument encompasses the relationships between students and the school, school staff, family, community, and among students themselves or their peers.

The Student–Student (SSt) relational dimension reveals that aspects related to students' educational expectations, their interpersonal relationships, and their sense of belonging to the school environment are equally important for protecting school trajectories. In this context, studies such as that of Martinelli, Muelle-Zuniga, and Alves [11] investigated students' perceptions of the learning environment, focusing on harmony, cooperation, participation, engagement, and teacher support. The findings indicate that students with higher academic performance held more positive perceptions of these aspects, suggesting a correlation with motivation and interest in learning.

In this regard, the factor "Interpersonal relationships and social skills" (SSt1) underscores that the interpersonal relationships established within the school environment are fundamental to the construction of positive educational experiences, fostering a climate of trust, self-acceptance, and cooperation that enhances motivation and interest in learning [12]. Conversely, the absence or fragility of these interpersonal bonds may significantly compromise students' attachment to the institution, negatively affecting motivation, socioemotional development, and educational continuity [13].

Furthermore, it is important to note that educational trajectories are shaped by how students perceive the expectations associated with their academic journey. The factor "Educational expectations and educational development" (SSt2) emphasizes that students form expectations regarding the outcomes of their own performance and the value they attribute to academic success. Accordingly, for schooling to be integrated as a meaningful part of students' life projects, it is essential that they believe in their own competencies to achieve positive outcomes [14]. Likewise, the way in which students perceive their academic future directly influences the formation of their expectations regarding their educational trajectory [15]. Thus, the greater the degree of confidence students place in their personal capacities, the greater the tendency to maintain high and consistent educational expectations, which in turn increases the likelihood of completing secondary education and pursuing higher education [16]. This indicates that each student's perception of their own expectations directly shapes the academic choices they make and the level of engagement they sustain with their studies.

Similarly, the factor "Belonging and identification" (SSt3) points to the notion that feeling integrated, recognized, and valued as part of a group constitutes an essential element in the construction of educational trajectories [13]. When students identify with, and are accepted and respected by, their peer group, affective and social bonds are strengthened, thereby fostering continuous engagement in school activities and contributing to the development of subjective well-being throughout the school career. This sense of belonging extends beyond its immediate effects on academic performance, playing a structuring role in the psychosocial dynamics that underpin the entire academic journey [17].

2. Methods

2.1 Participants

The sample was composed of 10,000 synthetic data, generated through a real sample of 3,678 students from four out of five regions of Brazil (except for the South region). The synthetic data was generated based on the resemblance to the real one, so the prevalence of groups listed in Table 1 reflects the real group concentration of the original data. Based on this, the majority of the sample was composed of women (50.82%), self-identified as brown (54.88%), from the center-west region of Brazil (44.35%), and from the middle point of the socioeconomic index (21.66%), that is, neither poor nor rich.

Table 1. Profile of the sample.

Sex	n	%	Race/Color	n	%
Male	4898	48.98	White	2168	21.68
Female	5082	50.82	Black	2062	20.62
Not informed	20	0.20	Brown	5488	54.88
			Other	282	2.82
Regions of Brazil	n	%	Socioeconomic index	n	%
Center-West	4435	44.35	I	196	1.96
Northeast	1368	13.68	II	1101	11.01
North	1625	16.25	III	1525	15.25
Southeast	2572	25.72	IV	2042	20.42
			V	2166	21.66
			VI	1592	15.92
			VII	1222	12.22
			VIII	156	1.56

2.2 Procedures

Data collection was aligned with the ethical statements for research with human beings, based on the Resolutions No. 466/2012 and No. 510/2026 of the National Health Council of Brazil, and the project was approved by the Research Ethics Committee with Human Beings from the Federal University of Alagoas in the process number 5,407,594. The scope of data collection reached four out of five regions of Brazil, being: North, Northeast, Center-West, and Southeast (except for the South region). During questionnaire administration, the Informed Consent Form (ICF) was available on the platform of data collection, and the Informed Assent Form (IAF) was shared with parents days before administration. Moreover, it is important to highlight that the data derived from the administration was used to generate the synthetic dataset of 10,000 samples used in this study.

2.3 Instruments

The final version of the Relational Factors for the Risk of School Dropout Scale - Alternative version (IAFREE-A) was used [10]. The IAFREE-A is an adaptation of the original scale, developed by Vasconcelos et al. [1], that was based on the evaluation of the risk of school dropout using students' relational factors, being: Student-School (SSc), Student-School professionals (SP), Student-Family (SF), Student-Community (SC), and Student-Student (SSt). The alternative version is aligned and oriented towards the concept of School Trajectory Protection. The original version of the instrument was based on two respondents: the students and the professors of the school, but in the revised version of the instrument, the target audience has changed to students only [18]. In addition, the alternative version maintains this characteristic, being administered with students only. Another important change relies on the scale length. While the original and revised versions had only 36 items, the alternative version is composed of 46 items.

Moreover, the IAFREE-A is based on a hierarchical factor structure, with five relational dimensions and two or three factors each, being: Infrastructure (SSc1); School as a safe space (SSc2); Discrimination (SSc3); School management and organization (SP1); Pedagogical quality (SP2); Teacher expectations (SP3); Parenting (SF1); Home support structure (SF2); Family interaction (SF3); Network interaction (SC1); Community relations (SC2); Interpersonal relationships and social skills (SSt1); Expectations regarding education/educational development (SSt2); Belonging/Identification (SSt3). Response categories vary from 1 to 4 in two settings: frequency (1 = "Never", 2 = "Sometimes", 3 = "Frequently" and 4 = "Always") and agreement (1 = "Strongly disagree", 2 = "Disagree", 3 = "Agree" and 4 = "Strongly agree"), and both are administered with pictorial scales, in addition to the number and label. The items of IAFREE-A have positive descriptions, and by that, they are reverse-scored after the data collection, with the exception of items Q5 and Q36, which already have negative descriptions. Due to the reversion, higher scores reflect higher vulnerability of the student in the relational factors or dimensions.

2.4 Data Analysis

Initially, the synthetic data generation technique was used through the Gaussian Copula Machine Learning technique [19]. This is a synthetic data generation technique that represents real data by transforming each original variable into a uniform scale (through ranks or empirical distribution functions), then projecting these uniform variables into a latent space with a multivariate normal distribution. From the Gaussian correlation matrix, new normal latent vectors are simulated, which are transformed to the aforementioned uniform scale, and finally, are converted back to the marginal distributions of each variable, as originally. Moreover, the resemblance of the synthetic data was investigated through the analysis of the Hellinger distance, which ranges from 0 to 1 and indicates how close the two distributions are, with values closer to 0 indicating similarity, while values closer to 1 indicate substantial differences between the real and synthetic data [20]. For the study, values up to 0.20 were used as the cutoff point for the Hellinger distance.
In addition, further investigation was conducted to evaluate the resemblance of the synthetic and real data, considering psychometric analyses, due to the nature of the data. Based on this, Confirmatory Factor Analysis (CFA) models were used for the IAFREE factors, in order to evaluate the factorial invariance of the two samples. The Weighted Least Squares Mean and Variance Adjusted (WLSMV) estimator was used, due to the ordinal nature of the items [21]. Thus, to assess the fit of the CFA model, the following fit indicators were used: a) $\chi 2$: with significant results indicating perfect fit of the model; c) Comparative Fit Index (CFI) and Tucker Lewis Index (TLI): with results ≥ 0.90 indicating satisfactory model fit, and ≥ 0.95 indicating excellent model fit; Root Mean Square Error of Approximation (RMSEA): which presents adequate results when ≤ 0.08, with the upper limit of the indicator not exceeding values of 0.10 [22]. Factor loadings were considered adequate when ≥ |0.40|.
In addition, Multigroup Confirmatory Factor Analysis (MCFA) was also used to investigate the invariance of the instruments between real and synthetic data, that is, whether the factorial structure of the instruments in the real data is also reproduced with the synthetic data. The hypothesis tested is that, since the synthetic data generation technique used in this study is based on the correlation between variables (as are clustering techniques such as factor analysis), the factor structure of the instrument is expected not to change between the real and synthetic data. To analyze this hypothesis, the following models were used: a) configural invariance: which investigates whether the factor structure remains the same for the real and synthetic data (number of latent factors, items explained by each latent factor, etc.); b) metric invariance: which aims to investigate the equivalence of factor loadings between groups, that is, it assesses whether the magnitude of the relationships between the items and their respective latent factors is statistically similar in the real and synthetic data; c) scalar invariance: which investigates whether the scores are related to the level of latent trait in the real and synthetic data [23],[24]. For the assessment of factorial invariance in these models, the criteria used were $\Delta CFI < 0.01$ and $\Delta RMSEA < 0.015$ [25]. Finally, a Structural Equation Model was tested to estimate the impact of the factors of Student-School (SSc), Student-School professionals (SP), Student-Family (SF), and Student-Community (SC) on the Student-Student (SSt) factors. For this purpose, the same estimator and fit indices were used.

3. Results

Initially, the differences between real and synthetic data, generated using the Gaussian Copula technique, were investigated using Hellinger distance indicators. The results showed that the data presented adequate similarity, with a mean Hellinger distance of 0.060 (SD = 0.008), indicating that the synthetic data adequately represent the real data. Furthermore, MCFA was used to investigate the factorial invariance of the measure, considering both real and synthetic data. The results of the multi-group factorial models indicated that there was no factorial invariance when comparing the real and synthetic datasets, indicating that the factorial structure of the instrument did not vary according to the generation of the synthetic data (Table 2).

Table 2. Fit indices for factorial invariance and predictive model.

	x2(df)	CFI	ΔCFI	TLI	RMSEA	ΔRMSEA	SRMR
Configural	42972.685 (1930)	.962		.960	.056		.060
Metric	43574.949 (1971)	.962	.000	.960	.056	.000	.060
Scalar	43409.864 (2017)	.962	.000	.961	.055	-.001	.060
Predictive	3968.681 (898)	.985		.983	.031		.036

Furthermore, the analysis of the predictors of the student-to-student dimension factors indicated that, for the interpersonal relationships factor, the impact of the variables of discrimination, perception of the school as a safe space (β = .82, p < .001) and discrimination (β = .14, p < .001), stemming from the student's relational dimension with the school, was observed, in addition to the impact of support at home (β = .24, p = .035), stemming from the student's relational dimension with the family. Furthermore, the impact of teachers' expectations (β = -.26, p < .001) and school organization (β = .57, p = .012) on students' interpersonal relationships was also observed, both derived from the student's relational dimension with school professionals. The results indicate that the greater the perception of the school as a safe space, school organization, and support at home, the better the student's interpersonal relationships will be. Furthermore, it can also be observed that the increase in experiences of discrimination can subtly increase interpersonal relationships, while teachers' expectations tend to negatively impact interpersonal relationships. The strongest predictor of the interpersonal relationships variable was the perception of the school as a safe space, and the model explained 81.5% of the variance of this variable.

As for the belonging factor, the impact of infrastructure (β = -.17, p = .033), family involvement (β = -.34, p = .012), associations with the school system (β = .57, p = .003), pedagogical quality (β = -.40, p = .037), and school organization and management (β = .91, p = .004) was observed. It was observed that increased engagement with the network and school organization and management impact the increase in students' sense of belonging, while increased family involvement, pedagogical quality, and a better perception of infrastructure were associated with a decrease in the sense of belonging, with the latter relationship being the weakest. The most important predictor of the sense of belonging was school management and organization, and the model explained 49.0% of the variance in the belonging variable.

Finally, for the factor of expectations regarding education, it was observed that the impact of the perception of the school as a safe space (β = .59, p < .001), school infrastructure (β = -.25, p < .001), family involvement (β = .26, p < .001), teachers' expectations (β = -.20, p < .001), and school management and organization (β = .64, p = .005) was significant. Therefore, it is possible to infer that the increased perception of the school as a safe space, family involvement, and school organization impact the increase in expectations regarding education. On the other hand, it was also observed that the higher the teacher expectations and school infrastructure, the lower the expectations regarding education. The most important predictor of expectations regarding education was school management and organization, and the model explained 72.2% of the variance in the expectations regarding education variable.

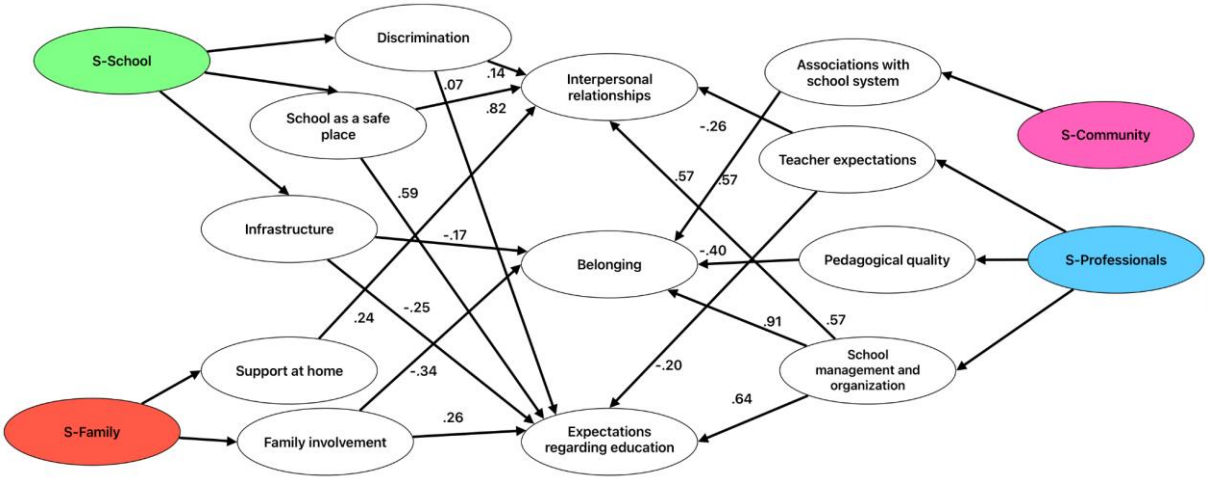

Fig. 1. Structural model for the predictors of Student-Student dimension.

4. Discussion

The aim of this study was to investigate the predictors of the subjective factor among the relational factors of school dropout risk, from the perspective of protecting school trajectories, considering as potential predictors the relational factors between the student and the school, school staff, family, and community. To this end, a synthetic database was employed, generated from a sample of 3,678 students across four regions of Brazil. Initial results indicated that there was no factorial structure invariance when comparing the real and synthetic datasets. In addition, Hellinger distance indicators yielded low values, suggesting that the synthetic data faithfully represented the real data, a result consistent with findings from recent studies supporting the utility of synthetic data in health-related settings as well as in capturing intricate behavioral dynamics [26],[27].

Regarding the predictive analyses, the structural model explained 81.5% of the variance in the interpersonal relationships variable, with the perception of school as a safe space being the strongest predictor. A modest positive impact of discrimination on interpersonal relationships was also observed. The hypothesized mechanism underlying the predictive impact of discrimination was the formation of groups through homophily, in which individuals tend to interact more frequently with others from the same group, as suggested by Kogachi and Graham [28], who found that adolescents from racial minority groups showed stronger friendships with members of the same group. Accordingly, this hypothesis may be extended to the findings of the present study through the interpretation that groups of students who experience discrimination at school tend to develop stronger relational bonds among themselves, which would explain the small yet positive impact observed in the structural model analysis.

With respect to the sense of school belonging factor, the model explained 49% of the outcome variance, and the strongest predictor was school management and organization. Conversely, higher levels of family involvement were associated with lower sense of school belonging, which may be accounted for by the helicopter parenting hypothesis, in which parents display intrusive, controlling behaviors toward their children [29], thereby reducing peer attachment [29] and increasing negative affect [30].

Furthermore, for the educational expectations variable, the structural model explained 72.2% of the outcome variance, with school management and organization again emerging as the strongest predictor. The study by Johnson, Pas and Bradshaw [31] found a positive association between emotional and service support, rules and consequences, and adolescents' future orientations in a sample of 27,698 students across 12 countries. This finding supports the view that clear communication of rules and administrative support are directly associated with students' expectations regarding their own educational trajectories.

Based on these findings, it was possible to observe that the relational factors of school dropout risk are not only potentially associated, as the underlying theory proposes [1], but may also act as predictors of one another. The results revealed substantial predictive impacts, particularly for interpersonal relationships (81.5%) and educational expectations (72.2%), indicating an important relationship among the variables examined in this manuscript. Among the study's limitations, the absence of longitudinal analyses or analyses distinguishing different stages of school development is noteworthy, as these would allow for the investigation of relationships among variables over time and across students'

educational trajectories. Furthermore, it should be noted that the sample used as the basis for generating the synthetic data was not representative of the Brazilian population, which limits the generalizability of the findings. Finally, it is considered that the findings of this study may contribute to the interpretation of how various school contextual variables can impact students' subjective experiences, as well as their peer relationships within the school environment.

Abstract

School dropout and educational disengagement are increasingly conceptualized as cumulative and relational processes shaped by the interplay of institutional, familial, relational, and structural factors, requiring multidimensional approaches that account for both the configurations of risk and their social patterning. This study aimed to identify latent profiles of school trajectory risk among Brazilian public school students and to examine how these profiles are sociodemographically patterned across gender, race/ethnicity, socioeconomic status, and student labor participation. Accordingly, a sample of 10,000 synthetic data was used, based on valid responses/answers from students of four Brazilian states (Rondônia, Minas Gerais, Mato Grosso, and Maranhão) who completed the Relational Factors for the Risk of School Dropout Scale – Alternative version (IAFREE-A).The synthetic data was calculated using the Gaussian Copula technique, which considers the association between the observed variables in the dataset to estimate new responses, generating a new and bigger dataset. This approach was considered due to the General Law of Data Protection (LGPD) and the need to ensure the protection of participating children and adolescents. Latent Profile Analysis (LPA) was conducted using the five aggregated dimensions of the IAFREE-A — student–student, student–school, student–school-professionals, student–family, and student–community. Model [1] selection followed an analytic hierarchy process based on multiple fit indices (Akogul & Erisoglu, 2017). The best-fitting solution was a three-class model (BIC = 59,332; entropy = 0.79; minimum classification probability = 0.88), with profiles interpreted as low (27.2%), medium (53.9%), and high risk (18.9%), showing monotonic separation across all five dimensions, with high-risk students presenting elevated scores in the student–school (M = 2.98) and student–community (M = 2.91) domains. Subsequently, chi-square analyses examined associations between profile membership and sociodemographic variables. A statistically significant association emerged for gender ($\chi^2 = 118.47$; $p < .001$; $V = 0.077$): female students were over-represented in the high-risk profile (adjusted residual = +8.91), whereas male students concentrated in the low-risk profile (+8.02). Associations with socioeconomic level (V = 0.033), student employment (V = 0.022), and race/ethnicity (V = 0.007) were weak and non-significant. Findings indicate clear, well-separated multidimensional profiles of school trajectory risk and a robust gendered patterning of vulnerability, supporting a process-oriented understanding of school trajectory risk under LGPD-compliant research conditions.

Keywords: *latent profile analysis; school trajectories; educational inequality; Gaussian copula*

Introduction

School dropout is currently understood as a processual and multifactorial phenomenon, although debates persist regarding which factors influence this process and the extent of their effects [1,2]. The literature also presents conceptual divergences concerning the meaning of the term “school dropout.” In the present study, the definition adopted follows the criteria established by the National Institute for Educational Studies and Research (INEP), which distinguishes between dropout (*evasão escolar*) and school abandonment (*abandono escolar*). According to INEP, dropout refers to a transition rate indicating the absence of enrollment in any school in the year following the school census, whereas school abandonment refers to a school-flow indicator that captures the interruption of attendance after the census reference date [3]. These phenomena should not be interpreted as definitive conditions by nature, since they may represent temporary interruptions within educational trajectories and may therefore be reversible.

Although this distinction introduces analytic nuances, dropout and abandonment still correspond to specific moments within broader educational trajectories. In this context, several Latin American countries have increasingly incorporated the notion of school trajectories into public educational policies, conceptualizing dropout and abandonment as possible events within these trajectories rather than as their totality [4]. This perspective is associated with the concept of trajectory protection, which shifts the focus from the prevention of isolated events toward the promotion of conditions that sustain students' educational continuity through institutional, personal, and contextual support mechanisms during the schooling process [5].

Studies indicate that weak school belonging, negative peer interactions, low perceived support from teachers, family disengagement, and community vulnerability are associated with indicators of school disengagement, absenteeism, low academic investment, and dropout intention [6-10]. These findings support the proposition that school trajectory risk emerges through the articulation of multiple relational dimensions rather than through isolated predictors [11, 1].

Based on this framework, the Instrument for the Assessment of Relational Factors for the Risk of School Dropout – Alternative Version (IAFREE-A) was developed according to the Relational Model [12]. The instrument integrates protective dimensions and indicators of vulnerability associated with school abandonment and dropout into a single multidimensional assessment, enabling the measurement and prediction of the complex relational system underlying these phenomena and providing a comprehensive understanding of students' educational experiences within the school context [13,14]. The IAFREE-A comprises 14 relational factors distributed across five essential dimensions: Student–School, Student–School Professionals, Student–Family, Student–Community, and Student–Student [12].

In the Brazilian public education context, school trajectories are shaped by structural inequalities associated with territorial disparities, socioeconomic precariousness, institutional instability, and unequal access to educational resources [15, 16]. Although dropout rates have declined in recent decades, indicators of school disengagement and interrupted trajectories remain concentrated among students exposed to conditions of social vulnerability [17, 18]. Research in this field has also examined the role of sociodemographic variables, such as gender, race/ethnicity, socioeconomic level, and adolescent labor participation, in the distribution of educational risk [19, 20]. However, findings remain inconsistent, particularly when relational and contextual dimensions are incorporated into the analytic models [21].

Most studies investigating school dropout employ variable-centered approaches, such as regression models and correlational analyses, which estimate the independent contribution of predictors to educational outcomes [22, 8]. Although these approaches provide evidence regarding associations between variables, they are limited in identifying heterogeneous subgroups characterized by distinct configurations of risk [23, 24]. Person-centered approaches, such as Latent Profile Analysis (LPA), enable the identification of latent subpopulations based on response patterns across multiple indicators [25, 26]. In the context of school trajectory research, LPA allows the estimation of qualitatively distinct profiles of relational vulnerability, contributing to the understanding of how different dimensions co-occur within individuals [27, 6].

Therefore, the aim of this study is to identify latent profiles of school trajectory risk among Brazilian public school students and to examine how these profiles are sociodemographically patterned across gender, race/ethnicity, socioeconomic status, and student labor participation.

Method

Design

This is a quantitative, cross-sectional, non-experimental study conducted on a synthetic dataset. The research combined a person-centered approach, through Latent Profile Analysis (LPA), with a group-comparison approach, through chi-square association tests, with the aim of identifying latent profiles of risk in school trajectories and examining how these profiles are distributed across students' sociodemographic characteristics.

Ethical Considerations and Generation of the Synthetic Dataset

Given the sensitive nature of educational data involving children and adolescents, and in compliance with the Brazilian General Data Protection Law (LGPD — Law no. 13,709/2018), the analyses were conducted on a synthetic dataset, constructed from the original responses of students to the IAFREE-A

instrument. Data analyses were conducted using the R statistical environment [28]. Synthetic data were generated using the Gaussian Copula technique, which is based on multivariate normal distributions combined with probability integral transformations of the original data [29]. One of the main advantages of this approach is that it preserves the dependency structure among variables [30], which is particularly important for psychometric data because latent constructs are derived from the correlation structure among observed items [31]. Furthermore, previous studies have demonstrated that the Gaussian Copula approach effectively reproduces the statistical properties of real datasets in diverse fields, including medical research (30, 32] and behavioral sciences [33].
The similarity between the original and synthetic datasets was assessed using the Hellinger distance, an index ranging from 0 to 1 that quantifies the similarity between two probability distributions. Values closer to 0 indicate greater similarity, whereas values closer to 1 indicate greater dissimilarity between the original and synthetic datasets [34]. Following previous recommendations, Hellinger distance values of up to 0.20 were considered indicative of adequate similarity between the original and synthetic datasets.

Sociodemographic Variables

The synthetic dataset comprised 10,000 records simulating public school students from four Brazilian states from the 9th grade of Elementary School to the 3rd year of Upper Secondary Education, generated from a real sample of 3536 students. Regarding gender, the sample was balanced between male (n = 4,898; 49.0%) and female students (n = 5,082; 50.8%), with a small proportion identifying as other (n = 20; 0.2%). In terms of race/ethnicity, 56.2% identified as Indigenous or other (n = 5,620), 23.0% as Black or Brown (n = 2,299), and 20.8% as White (n = 2,081). Most students reported not engaging in paid work (n = 7,933; 79.3%), while 20.7% indicated current labor participation (n = 2,067). The distribution across socioeconomic strata (INSE), ranging from I (lowest) to VIII (highest), concentrated in the middle levels (strata III to VI accounted for 73.3% of the sample), with smaller proportions in the extreme strata (3.5% combined in I and VIII).

Instrument

The study used the Instrument for the Assessment of Relational Factors for the Risk of School Dropout - Alternative version (IAFREE-A), a multidimensional scale developed to assess protective and risk factors in school trajectories across five relational dimensions: (a) Student–Student (SSt), which captures interpersonal relationships, social skills, educational expectations, and sense of belonging among peers; (b) Student–School (SSc), which encompasses the perception of school as a safe place and institutional responses; (c) Student–School Professionals (SSP), referring to the relationship with teachers and pedagogical staff; (d) Student–Family (SF), which assesses family support and engagement with the student's school trajectory; and (e) Student–Community (SC), referring to the student's relationship with the surrounding community. Each item is answered on a four-point Likert scale, with higher scores indicating that a higher level of attention is required for this school trajectory.

Analytical Procedures

Analyses were conducted in R software, version 4.4 [28], using the tidyLPA package [35] for latent profile estimation. Latent Profile Analysis (LPA) was conducted using the mean scores of the five aggregated dimensions of the IAFREE-A (SSt, SSc, SSP, SF, SC) as indicators. Solutions ranging from two to five classes were compared, all estimated under the specification of equal variances between classes and zero covariances (Model 1 of tidyLPA). The selection of the optimal number of classes followed an analytic hierarchy process based on multiple fit indices [7], including AIC, AWE, BIC, CAIC, CLC, KIC, and SABIC, complemented by the examination of entropy, minimum and maximum classification probabilities, and the conceptual interpretability of the solutions. The random seed was fixed (set.seed = 2024) to ensure analytic reproducibility.
After selecting the final solution, each participant was assigned to the latent class with the highest posterior probability, and the profiles were labeled as low, medium, and high risk based on the aggregated means of the five dimensions
Subsequently, Pearson's chi-square association tests were conducted to examine the relationship between latent risk profile and each sociodemographic variable. Effect size was estimated using Cramér's V, and post hoc analysis was performed through adjusted standardized residuals, with cells presenting $|z| > 1.96$ ($\alpha = 0.05$) considered statistically significant. Across all contingency tables, more

than 80% of cells presented expected frequencies above 5, meeting the classical Cochran criterion for the validity of the chi-square asymptotic approximation. The only exception was the cell corresponding to the intersection between the high-risk profile and the "other" gender category (expected frequency = 3.78), which represents 0.2% of the sample and does not substantively affect the inferences of the test.

Results

Selection of the Number of Latent Classes

Table 1 presents the fit indices for solutions ranging from two to five classes. The three-class solution was selected as the most adequate, based on the combination of statistical fit and conceptual interpretability. Although the BIC continued to decrease in solutions with more classes, entropy peaked at three classes (0.785), and the minimum classification probability remained high (0.880), indicating good separation between profiles. The substantive interpretation was also clearer with three classes, with profiles monotonically ordered along increasing levels of risk.

Table 1. Fit indices for solutions from two to five classes (Model 1: equal variances, zero covariances)

Classes	LogLik	AIC	BIC	SABIC	Entropy	Min. Prob.
2	−31,849	63,730	63,845	63,795	0.775	0.923
3	−29,565	59,173	59,332	59,262	0.785	0.880
4	−28,751	57,558	57,760	57,671	0.768	0.826
5	−28,425	56,918	57,163	57,055	0.749	0.774

Characterization of the Latent Profiles

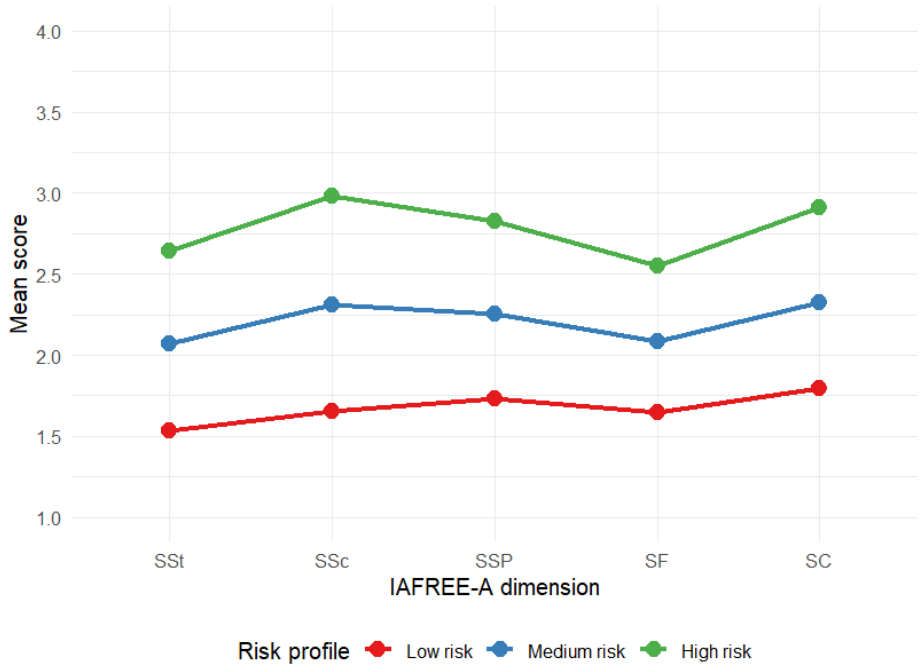
The three-class solution yielded clearly differentiated and monotonically ordered profiles across the five dimensions of the IAFREE-A. The low-risk profile comprised 27.2% of the sample (n = 2,715), with means below 1.80 across all dimensions. The medium-risk profile was the most populous, comprising 53.9% of the sample (n = 5,393), with means between 2.07 and 2.32. The high-risk profile, comprising 18.9% of the sample (n = 1,892), presented the highest means, particularly in the Student–School (M = 2.98) and Student–Community (M = 2.91) dimensions. Table 2 presents the profile means in each dimension.

Table 2. Means of the IAFREE-A dimensional scores by latent profile

Profile	n (%)	SSc	SSP	SF	SC	SSt	Overall mean
Low risk	2,715 (27.2%)	1.66	1.73	1.65	1.79	1.54	1.67
Medium risk	5,393 (53.9%)	2.31	2.25	2.09	2.32	2.07	2.21
High risk	1,892 (18.9%)	2.98	2.82	2.55	2.91	2.64	2.78

The pattern shown in Figure 1 reveals monotonic separation between the three profiles across all dimensions, with progressively greater distances between scores as the level of risk increases. The Student–Family dimension presented the lowest mean scores across all profiles, while Student–School and Student–Community presented the highest mean scores, suggesting that institutional and community dimensions contribute proportionally more to the configuration of risk across all levels.

Figure 1. Latent profile means across the five IAFREE-A dimensions



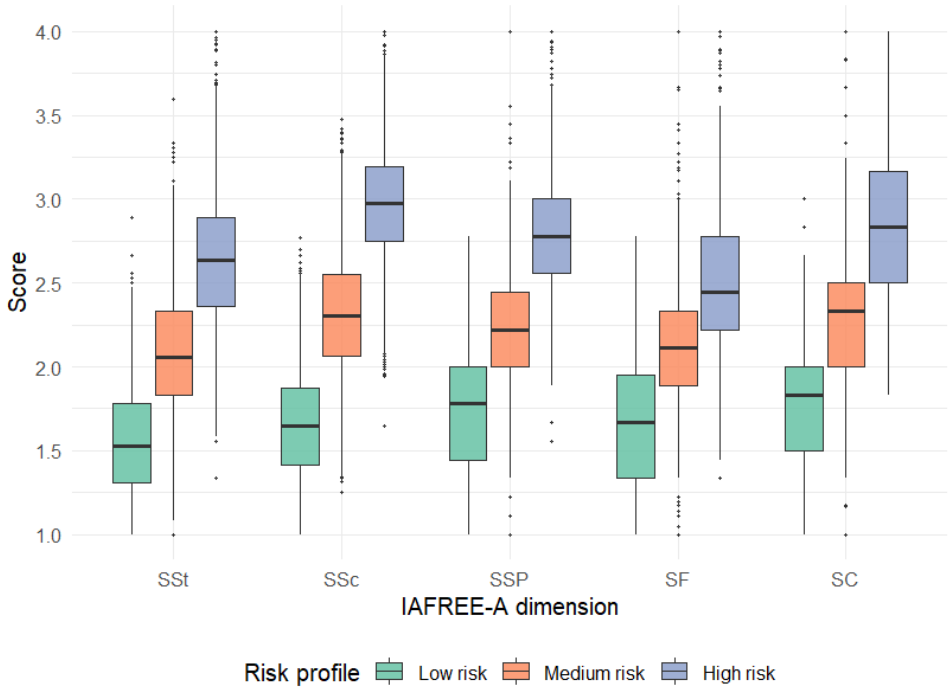


Figure 2. Distribution of IAFREE-A dimensions by latent risk profile

Associations between Latent Profiles and Sociodemographic Variables

Pearson's chi-square tests revealed only one statistically significant association between the risk profile and the sociodemographic variables examined. Table 3 summarizes the results.

Table 3. Chi-square tests between latent profile and sociodemographic variables

Variable	χ^2	df	p	Cramér's V	N
Gender	118.47	4	< 0.001	0.077	10,000
Labor participation	4.90	2	0.087	0.022	10,000
Race/ethnicity	0.98	4	0.913	0.007	10,000
Socioeconomic level (INSE)	21.25	14	0.095	0.033	10,000

Gender

The analysis revealed a significant association between gender and risk profile ($\chi^2(4) = 118.47$; $p < 0.001$; $V = 0.077$). Although Cramér's V indicates a small effect size (which is expected given the large sample size), the adjusted standardized residuals revealed a clear pattern of differential distribution. Male students were significantly over-represented in the low-risk profile ($z = +8.02$) and under-represented in the high-risk profile ($z = -9.13$). Conversely, female students were over-represented in the high-risk profile ($z = +8.91$) and under-represented in the low-risk profile ($z = -7.91$). Table 4 details the frequencies and percentages by category.

Table 4. Percentage distribution of gender by risk profile

Profile	Male	Female	Other
Low risk	55.5%	44.4%	0.1%
Medium risk	49.0%	50.8%	0.2%
High risk	39.5%	60.0%	0.4%

Labor Participation, Race/Ethnicity, and Socioeconomic Level

The associations between risk profile and labor participation ($\chi^2(2) = 4.90$; $p = 0.087$; $V = 0.022$), race/ethnicity ($\chi^2(4) = 0.98$; $p = 0.913$; $V = 0.007$), and socioeconomic level ($\chi^2(14) = 21.25$; $p = 0.095$; $V = 0.033$) did not reach statistical significance. Cramér's V values were all below 0.05, indicating associations of negligible magnitude. Inspection of the contingency tables confirms the near-equivalence of distributions across profiles: for example, the proportion of students who work varies minimally across profiles (19.8% in the low-risk profile, 20.5% in the medium-risk profile, and 22.4% in the high-risk profile), as does the distribution by race/ethnicity (≈21% White, ≈23% Black/Brown, and ≈56% Indigenous/Other across all profiles) and by socioeconomic stratum.

The absence of substantive associations between these sociodemographic variables and the latent profiles, in contrast with the robust finding for gender, suggests that, in the synthetic dataset analyzed, the relational risk structures captured by the five dimensions of the IAFREE-A are distributed relatively homogeneously across socioeconomic, racial, and labor strata, but display a clear pattern of differentiation by gender.

Discussion

The Latent Profile Analysis identified three profiles that were subsequently categorized according to risk level. The low-risk profile presented more homogeneous scores across the IAFREE-A dimensions, whereas higher-risk profiles maintained a similar dimensional configuration but with greater score dispersion. This pattern suggests a cumulative and processual organization of school trajectory vulnerability, indicating that school trajectory risk should not be conceptualized as a dichotomous

phenomenon, but rather as a continuum in which the relative contribution and intensity of relational dimensions vary according to the latent profile configuration [23, 1]. The monotonic separation observed across the profiles also supports the interpretation that different relational domains co-occur in the constitution of educational vulnerability rather than operating as isolated predictors.

Within this configuration, the prominence of the Student–School and Student–Community dimensions in the high-risk profile is notable, indicating greater fragility in students' relationships with the school institution and with the communities in which they are embedded. From an intervention perspective, these findings suggest the relevance of investigating institutional and territorial conditions associated with school trajectories. Based on the literature and on the relational indicators assessed by the instrument, these vulnerabilities may involve perceptions of insecurity within school and community contexts, institutional exclusion, precarious infrastructure, and limited articulation between educational systems and health and social assistance services [11, 8, 1]. In contrast, the Student–Family dimension presented the lowest scores across profiles, suggesting that family relationships remained comparatively more preserved even among high-risk students. This result indicates that family support may function as a protective factor contributing to school permanence up to the moment of data collection.

The chi-square and post hoc analyses also identified a small but systematic overrepresentation of male students in the low-risk profile and female students in the high-risk profile. In conjunction with the relational profile structure, these findings suggest that gendered experiences may differentially shape school trajectories and perceptions of institutional and contextual vulnerability. The observed gender pattern differs from studies reporting higher prevalence of school dropout among male students, particularly in contexts involving labor participation and school interruption. However, the present study operationalized school trajectory risk through relational indicators rather than completed dropout events. In this sense, female students may report higher levels of relational strain, institutional dissatisfaction, emotional burden, or perceived social vulnerability without necessarily presenting higher rates of school abandonment. The findings therefore reinforce the distinction between dropout occurrence and latent configurations of educational vulnerability.

Some limitations should be considered. The cross-sectional design restricts causal inference regarding the development of school trajectory risk over time. The use of synthetic data, although justified by ethical and legal requirements, may attenuate specific distributional characteristics present in the original sample. In addition, the analyses were restricted to students from four Brazilian states, limiting the generalizability of the findings to other educational contexts. Future studies may investigate longitudinal transitions between latent profiles, examine measurement invariance across sociodemographic groups, and incorporate additional indicators such as academic performance, mental health, and school attendance.

Conclusion

The present study identified three latent profiles of school trajectory risk among Brazilian public school students based on the relational dimensions assessed by the IAFREE-A. The profiles demonstrated monotonic separation across the five domains, indicating differentiated configurations of relational vulnerability. The findings support the conceptualization of school trajectory risk as a multidimensional construct involving institutional, interpersonal, familial, and community dimensions.

The results also indicated that gender was the only sociodemographic variable associated with latent profile membership. Female students were disproportionately represented in the high-risk profile, whereas male students concentrated in the low-risk profile. In contrast, race/ethnicity, socioeconomic level, and labor participation did not present significant associations with relational risk configurations in the analyzed dataset.

From a psychometric and methodological standpoint, the study demonstrates the applicability of Latent Profile Analysis for identifying heterogeneous patterns of educational vulnerability and supports the use of multidimensional relational indicators in the assessment of school trajectory risk. The use of synthetic data generated through Gaussian Copula procedures also contributes to the discussion regarding ethical data management in educational research involving minors under LGPD regulations.

The findings reinforce the relevance of multidimensional approaches to school trajectory analysis and indicate that prevention strategies should incorporate relational and contextual dimensions associated with school permanence. Interventions centered exclusively on academic performance indicators may not capture latent configurations of vulnerability associated with educational disengagement. Research is already being conducted on a wider sample encompassing students from all Brazilian states and can

help to investigate how the tendencies observed in the present study vary on a more diverse and representative sample.

Abstract

Peer relationships and school belonging are central relational dimensions shaping students' school trajectories, particularly in contexts of structural vulnerability. This study aimed to identify latent profiles of relational risk among Brazilian public school students and to examine whether these profiles represent empirically distinct groups, combining person-centered and group-comparison approaches. Given the sensitive nature of educational data involving minors and the requirements of the Brazilian General Data Protection Law (LGPD), analyses were conducted on a synthetic dataset (N = 10,000) generated via a Gaussian Copula procedure, simulating responses from public school students from the 9th grade to the 3rd year of upper secondary education in four Brazilian states. Latent Profile Analysis (LPA) was conducted using the three factors of the Student–Student (SSt) dimension: interpersonal relations and social skills, educational expectations, and belonging/identification. Model selection followed an analytic hierarchy process based on multiple fit indices. The best-fitting solution was a three-class model (BIC = 52,390; entropy = 0.65), with profiles interpreted as low (30.7%), medium (49.7%), and high relational risk (19.6%). Kruskal–Wallis analyses showed significant differences between all classes for the SSt total score (χ^2 = 7,702.60; $p < .001$; $\varepsilon^2 = 0.770$), interpersonal relations ($\varepsilon^2 = 0.687$), and belonging ($\varepsilon^2 = 0.654$), indicating very large effects. Educational expectations differed less ($\varepsilon^2 = 0.081$). Profiles also differed in the student–school dimension ($\varepsilon^2 = 0.359$), particularly perception of school as a safe place ($\varepsilon^2 = 0.318$), and across student–school-professionals ($\varepsilon^2 = 0.189$), student–community ($\varepsilon^2 = 0.171$), and student–family relations ($\varepsilon^2 = 0.150$). Post hoc Dunn comparisons confirmed differences between all groups. Findings indicate well-separated latent profiles of relational risk, supporting a process-oriented understanding of school trajectory risk under LGPD-compliant research conditions.

1. Introduction

School dropout and school leaving constitute multifaceted phenomena that transcend the mere interruption of the formal educational trajectory, resulting from the interweaving of socioeconomic, cultural, and institutional variables that go beyond purely individual and familial circumstances [25]. Beyond the pedagogical domain, these processes constitute a public health issue with substantial economic impact [3, 14, 28], since the lack of formal qualifications frequently predisposes individuals to unemployment and intensifies social inequalities [9, 27]. Accordingly, the present study aims to identify latent profiles of relational risk among Brazilian public school students based on the factors of the Student–Student dimension of the IAFREE-A, and to examine whether these profiles differentiate significantly across the remaining dimensions of the instrument.

The circumstances surrounding this phenomenon are intricate and interconnected, ranging from socioeconomic factors — such as the early entry into the labor market to supplement family income — to pedagogical issues, including unmotivating teaching methods or the absence of adequate support for struggling students [4, 16, 21, 23]. Problems in the school environment, such as discrimination, violence, or the perception that the institution offers no promising future, also contribute significantly [12]. In Brazil, dropout and school leaving are differentiated by the School Census criteria: school leaving refers to withdrawal during the school year, while dropout is identified when the student fails to enroll for the subsequent year [7] — a distinction that is essential for the formulation of more effective public policies [5].

Dropout and school leaving should therefore be understood not as isolated events, but as processes of disconnection from school, characterized by relational and multifactorial dynamics that reveal structural inequalities historically present in Brazilian society [10]. From this perspective, the notion of school trajectory protection gains relevance, proposing a broader interpretation of schooling that considers transitions, articulations, and linkages across systemic, institutional, and individual dimensions [11, 24]. Students' pathways cannot be understood solely from their individual characteristics, as they reflect broader inequalities related to familial, institutional, and educational contexts [22].
Given this complexity, there is a need for psychometrically adequate measures to assess the factors that may protect school trajectories. In this regard, the Instrument for the Assessment of Relational Factors for the Risk of School Dropout (IAFREE) [26] was developed under a relational and multidimensional approach, organized across five dimensions: Student–School, Student–School Professionals, Student–Family, Student–Community, and Student–Student. Subsequent revised and alternative versions were later developed, including the IAFREE-R [8] and the IAFREE-A-46, the latter shifting the emphasis from identifying risk factors toward the perspective of protection and continuity of school trajectories.

2. Method

2.1 Design

This is a quantitative, cross-sectional, non-experimental study conducted on a synthetic dataset. The research combined a person-centered approach, through Latent Profile Analysis (LPA), with a group-comparison approach, through non-parametric Kruskal–Wallis tests, with the aim of identifying latent profiles of relational risk in school trajectories and examining whether these profiles represent empirically distinct groups across the dimensions of the IAFREE-A.

2.2 Ethical Considerations and Generation of the Synthetic Dataset

Given the sensitive nature of educational data involving children and adolescents, and in compliance with the Brazilian General Data Protection Law (LGPD — Law no. 13,709/2018), the analyses were conducted on a synthetic dataset, constructed from 3536 original responses of students to the IAFREE-A instrument. The Gaussian Copula technique was used for the generation of synthetic data. It is a synthetic data generation technique based on multivariate normal distributions, applied through a probability integral transformation of the real data [13]. One of the advantages of this technique is that it accounts for the dependence (or association) between the variables [2] of a dataset, a feature that is necessary for the use of synthetic data with psychometric variables, since the latent factors derived from such measures are grouped through the correlations between items [6]. Furthermore, the Gaussian Copula methodology has shown satisfactory results in reproducing real data, both in the medical field [2, 20] and in reproducing behavioral patterns [19].
To assess the reproducibility of the synthetic data in relation to the real data, the Hellinger distance indicator was used, which ranges from 0 to 1 and indicates how close or different two probability distributions are. For the interpretation of similarity between the real and synthetic data, values closer to 0 indicate greater similarity, while values closer to 1 indicate greater differences between the original and generated data [15]. In this study, values up to 0.20 were considered adequate.

2.3 Instrument

The study used the Instrument for the Assessment of Relational Factors for the Risk of School Dropout — Alternative version (IAFREE-A), a multidimensional scale designed to assess protective and risk-related factors in school trajectories across five relational domains: (a) Student–Student (SSt), (b) Student–School (SSc), (c) Student–School Professionals (SSP), (d) Student–Family (SF), and (e) Student–Community (SC). Each item is answered on a four-point Likert scale, with higher scores indicating higher levels of relational risk. The Student–Student dimension, which constitutes the central focus of the present study, comprises three factors: interpersonal relations and social skills (SSt1), educational expectations (SSt2), and belonging/identification (SSt3).

2.4 Analytical Procedures

Analyses were conducted in R software, version 4.4 [17], using the tidyLPA package [18] for latent profile estimation. LPA was conducted using the three factors of the Student–Student dimension (SSt1, SSt2, SSt3) as indicators. Solutions ranging from two to five classes were compared, all estimated under the specification of equal variances between classes and zero covariances (Model 1 of tidyLPA). The selection of the optimal number of classes followed an analytic hierarchy process based on multiple fit indices [1], including AIC, AWE, BIC, CAIC, CLC, KIC, and SABIC, complemented by the examination of entropy, classification probabilities, and the conceptual interpretability of the solutions. The random seed was fixed (set.seed = 2024) to ensure analytic reproducibility.
After selecting the final solution, each participant was assigned to the latent class with the highest posterior probability, and the profiles were labeled as low, medium, and high relational risk, based on the means of the three SSt factors — an ordering justified by the fact that higher IAFREE-A scores indicate greater relational risk. Subsequently, non-parametric Kruskal–Wallis tests were conducted to examine differences between latent classes in the SSt total score and its three factors, as well as in the remaining dimensions of the IAFREE-A (SSc, SSP, SF, SC) and their respective sub-factors. The non-parametric approach was adopted given the ordinal nature of the response scale and the non-normal distribution of the dimensional scores. Effect size was estimated using epsilon-squared (ε^2), with values of .01, .08, and .26 interpreted as small, moderate, and large effects, respectively. Post hoc analyses were performed using Dunn's test with Bonferroni correction for multiple comparisons.

3. Results

3.1 Sample Characterization

The synthetic dataset comprised 10,000 records simulating public school students from four Brazilian states. Regarding gender, the sample was balanced between male (n = 4,898; 49.0%) and female students (n = 5,082; 50.8%), with a small proportion identifying as other (n = 20; 0.2%). Regarding race/ethnicity, the composition reflected the typical profile of Brazilian public schools: 54.9% identified as Brown (*Parda*), 21.7% as White, and 20.6% as Black, with the remaining 2.8% comprising Asian, Indigenous, and undeclared students). Most students reported not engaging in paid work (n = 7,933; 79.3%), while 20.7% indicated current labor participation (n = 2,067). The distribution across socioeconomic strata (INSE) concentrated in the middle levels (strata III to VI accounted for 73.3% of the sample), with smaller proportions in the extreme strata (3.5% combined in I and VIII).

3.2 Selection of the Number of Latent Classes

Table 1 presents the fit indices for solutions ranging from two to five classes. Although models with four and five classes presented progressively lower BIC values, indicating better statistical fit, the three-class solution was selected as the most adequate based on the combination of parsimony, conceptual interpretability, and coherence with the theoretical framework of relational risk, which is traditionally operationalized along three levels (low, medium, and high). The three-class model presented adequate classification quality (entropy = 0.652; minimum classification probability = 0.796), with profiles monotonically ordered along increasing levels of relational risk.

Table 1. Fit indices for solutions from two to five classes (Model 1: equal variances, zero covariances)

Classes	LogLik	AIC	BIC	SABIC	Entropy	Min. Prob.	Max. Prob.
2	−26,692	53,403	53,476	53,444	0.669	0.885	0.913
3	−26,131	52,289	52,390	52,346	0.652	0.796	0.845
4	−25,955	51,946	52,076	52,019	0.758	0.776	0.881
5	−25,734	51,512	51,671	51,601	0.716	0.531	0.894

3.3 Characterization of the Latent Profiles

The three-class solution yielded clearly differentiated profiles, monotonically ordered across the three factors of the SSt dimension. The low-risk profile comprised 30.7% of the sample (n = 3,066), the medium-risk profile 49.7% (n = 4,969), and the high-risk profile 19.6% (n = 1,965). Table 2 presents the means of the SSt total score and its three factors by latent profile.

Table 2. Means of the Student–Student (SSt) dimension and its factors by latent profile

Profile	n (%)	SSt1	SSt2	SSt3	SSt total
Low risk	3,066 (30.7%)	1.42	1.43	1.57	1.47
Medium risk	4,969 (49.7%)	2.25	1.60	2.43	2.09
High risk	1,965 (19.6%)	3.17	1.83	3.19	2.77

The patterns illustrated in Figure 1 reveal monotonic separation between the three profiles, with progressively greater distances between profiles in SSt1 (interpersonal relations) and SSt3 (belonging/identification), while SSt2 (educational expectations) presented a more compressed distribution across profiles.

Figure 1. Latent profile means across the three SSt factors

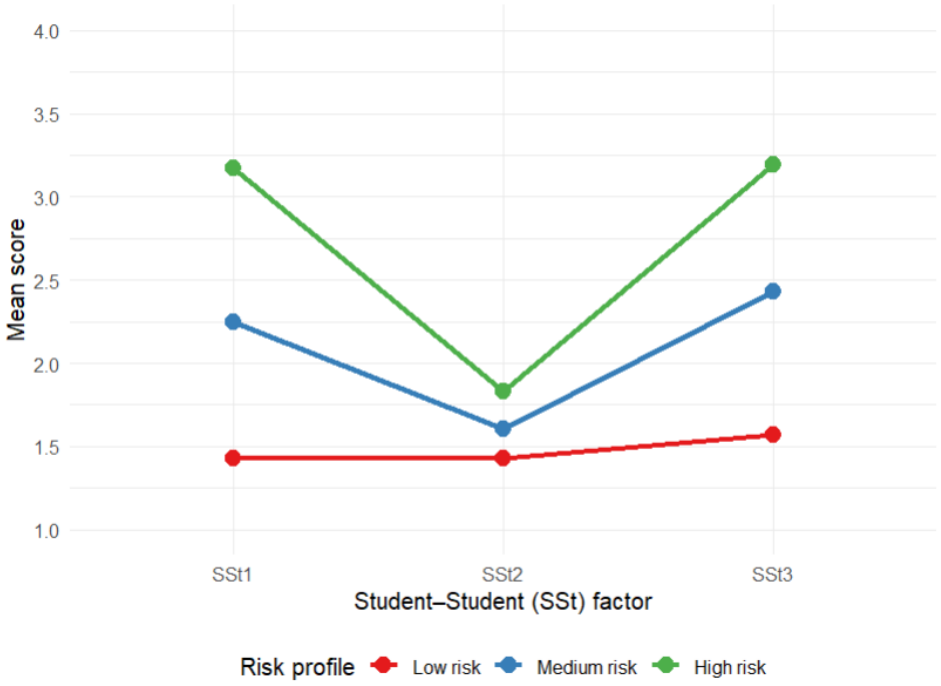

Fig. 1. Line plot of profile means across SSt factors

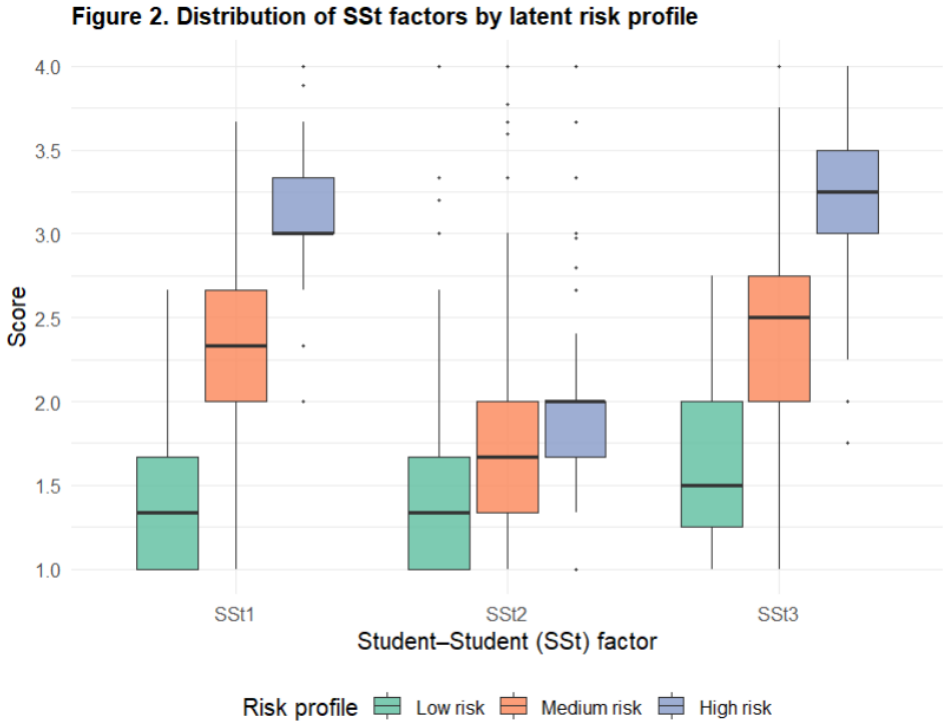

Fig. 2. Boxplot of distributions by profile

3.4 Differences Between Profiles

Kruskal–Wallis tests revealed statistically significant differences between the three latent classes for the SSt total score ($\chi^2(2) = 7{,}702.60$; $p < .001$; $\varepsilon^2 = 0.770$), indicating a very large effect. Differences were also significant and of very large magnitude for SSt1 — interpersonal relations and social skills ($\chi^2(2) = 6{,}870.60$; $p < .001$; $\varepsilon^2 = 0.687$) — and SSt3 — belonging/identification ($\chi^2(2) = 6{,}537.25$; $p < .001$; $\varepsilon^2 = 0.654$). In contrast, SSt2 (educational expectations) presented a significant but smaller effect ($\chi^2(2) = 811.30$; $p < .001$; $\varepsilon^2 = 0.081$). Post hoc Dunn comparisons confirmed significant pairwise differences between all three classes (low vs. medium, medium vs. high, low vs. high; all $p < .001$). The latent profiles also differed significantly across all other dimensions of the IAFREE-A. Table 3 summarizes the results.

Table 3. Kruskal–Wallis tests comparing latent profiles across IAFREE-A dimensions and sub-factors

Dimension / Factor	χ^2	df	p	ε^2
Student–Student total (SSt)	7,702.60	2	< .001	0.770
SSt1 — Interpersonal relations	6,870.60	2	< .001	0.687
SSt2 — Educational expectations	811.30	2	< .001	0.081
SSt3 — Belonging/identification	6,537.25	2	< .001	0.654
Student–School total (SSc)	3,587.85	2	< .001	0.359
SSc2 — Perception of safe school	3,176.01	2	< .001	0.318
Student–School Professionals (SSP)	1,886.85	2	< .001	0.189
Student–Family total (SF)	1,498.63	2	< .001	0.150
Student–Community total (SC)	1,710.22	2	< .001	0.171

The largest effect outside the SSt dimension occurred in Student–School (SSc) ($\varepsilon^2 = 0.359$), particularly in the Perception of the School as a Safe Place factor (SSc2; $\varepsilon^2 = 0.318$). Moderate effects were observed for SSP, SC, and SF. All post hoc Dunn comparisons confirmed significant differences between low, medium, and high risk groups across all dimensions (all $p < .001$).

4. Discussion

The present study identified three monotonically ordered profiles of relational risk (low, medium, and high) and demonstrated that these profiles extend their differentiation to all other relational dimensions of the IAFREE-A, with particularly strong effects in the institutional domain. The identification of three latent profiles with adequate classification quality supports the conceptual premise that relational risk among peers is not uniformly distributed in the student population, but organizes into qualitatively distinct configurations, aligning with process-oriented perspectives that conceptualize school disengagement as a relational and multifactorial phenomenon [10, 22].

The pattern of effect sizes across the three SSt factors revealed an important nuance. Interpersonal relations and social skills ($\varepsilon^2 = 0.687$) and belonging/identification ($\varepsilon^2 = 0.654$) presented very large effects, while educational expectations ($\varepsilon^2 = 0.081$) showed a small effect, suggesting that students' aspirations remain relatively stable across risk profiles. This pattern reinforces the interpretation that relational risk emerges primarily in the affective and interpersonal fabric of school experience rather than in the cognitive domain of aspirations, supporting the conceptual framework of the IAFREE-A [26].

Notably, the latent profiles identified through peer relations extended their differentiation to all other IAFREE-A dimensions, with the largest effect outside the SSt dimension occurring in Student–School ($\varepsilon^2 = 0.359$), particularly in the perception of school as a safe place ($\varepsilon^2 = 0.318$). This convergence indicates that peer-relational risk does not operate in isolation but reverberates into how students experience the school as an institution. Such finding aligns with the broader argument that school trajectories must be understood across multiple interconnected dimensions (systemic, institutional, and individual [11, 24]) and supports the relational model underlying the IAFREE-A [26].

This study has limitations that must be acknowledged. The analyses were conducted on synthetic data generated via the Gaussian Copula technique to comply with the LGPD and to safeguard the identity of participating minors. While this approach preserves the multivariate structure of the original data, it introduces methodological constraints regarding the generalizability of magnitude estimates. Additionally, the cross-sectional design limits causal inferences.

5. Conclusion

The findings indicate that relational risk in school trajectories is organized into three qualitatively distinct profiles, characterized primarily by peer relations and school belonging, while educational expectations remain relatively preserved across risk levels. The extension of these profiles to the institutional domain, particularly to the perception of school as a safe place, supports a process-oriented understanding of school disengagement as a phenomenon that operates simultaneously in interpersonal and institutional dimensions.

Methodologically, the integration of person-centered modeling (LPA) with group-comparison testing on privacy-preserving synthetic data demonstrates the viability of conducting psychometrically rigorous research with minors under LGPD-compliant conditions, offering a pathway for ethically responsible educational research and informing protective interventions focused on the relational fabric of school experience.

Furthermore, large-scale data collection is currently underway for the nationwide application of the IAFREE-A across Brazilian public schools. This ongoing effort will allow future studies to test the replicability of the latent profile structure identified here in empirical, non-synthetic data, expanding the evidence base for the use of relational instruments in early identification of at-risk school trajectories at a national level.

Abstract

This study describes the digitalisation of the Supports Intensity Scale – Children's Version (SIS-C), which measures the support needs of children and teenagers aged 5 to 16 with Intellectual and Developmental Disabilities [5] [6]. As part of a broader research project, it aims to adapt the original paper-and-pencil version into a digital alternative while preserving the psychometric integrity established in prior studies. This exploratory study developed a digital model based on data from 801 participants. The process involved key stages: reorganisation and repositioning of variables and response categories; validation by expert judges; interface adaptation; and methodological adjustments to support implementation. Variables were reorganised and repositioned to ensure usability, traceability, and effective data management, including the addition of identification fields tailored to the Brazilian context. Following these modifications, the instrument underwent validation by expert judges in Special Education and Educational Technology. Their feedback informed structural revisions and interface refinements, leading to distinct forms for interviewers, respondents, and participants. Once these revisions were implemented, the instrument was developed into a digital version integrated into a database. Google Workspace tools (Forms and Sheets) were selected for their accessibility, usability, and data management capabilities, providing a cost-free interface. The data from 801 participants were processed in the R statistical environment, ensuring computational accuracy and enabling automated score calculation, reducing manual errors and enhancing reliability. The system also enabled analytical visualisation and longitudinal monitoring, features that were not previously available. The digital version improved application efficiency, analysis speed, and large-scale data management, while preserving conceptual equivalence with the original instrument. The study demonstrates that successful digital adaptation requires validation and contextual redesign, rather than simple format migration. The SIS-C Digital contributes to advancing support needs assessment in Special Education by providing a more efficient tool for data collection, analysis, and interpretation.

1. Introduction

In Brazil, according to data from the Brazilian Institute of Geography and Statistics (IBGE), 18.6 million Brazilians aged two or older are considered People with Disabilities (PwD) [1]. In addition, according to the 2023 School Census released by the National Institute for Educational Studies and Research Anísio Teixeira (INEP), there were 952,904 Special Education enrolments in Basic Education of students diagnosed with Intellectual and Developmental Disabilities (IDD) [2].

Although students with IDD represent a significant share of diagnoses in Basic Education, the assessment of IDD has not been an easy task since the 1950s, when it was carried out based on Intelligence Quotient (IQ) tests. Over the years, intelligence tests began to be rethought, and adaptive behaviour assessment instruments started to be developed to support the diagnostic process [3].

In this regard, the *American Association on Intellectual and Developmental Disabilities* (AAIDD) published the first version of the Supports Intensity Scale (SIS) in 2004, intended to assess the intensity

[15]This study was financed in part by the Coordenação de Aperfeiçoamento de Pessoal de Nível Superior - Brasil (CAPES) - Finance code 001. Acknowledgments: *American Association on Intellectual and Developmental Disabilities* and Federação Nacional das APAEs (FENAPAE).

of supports needed by youths and adults aged 16 and older [4]. At this point, the supports paradigm became central, and the instrument's purpose shifted away from diagnosis toward guiding professional practice and improving the quality of life of individuals with disabilities.
In 2014, AAIDD developed the Supports Intensity Scale – Children's Version (SIS-C), which aims to measure the relative intensity of the support needs of children and adolescents with intellectual and developmental disabilities and developmental delays, between five and 16 years old [5]. The children's version became necessary because "[...] the settings and activities of childhood differ from the settings and activities of adult life" [6].
The SIS-C was validated and adapted to the Brazilian context through the study "Adaptation and Validation of the Supports Intensity Scale for Children and Adolescents (SIS-C) with Intellectual Disability in Brazil" [7]. For this study, the SIS-C was administered in all regions of the country, with a total of 801 administrations [8] completed manually using the printed, paper-and-pencil version of the instrument. The SIS-C was translated and validated for the Brazilian context and, during the establishment of its psychometric parameters, yielded an overall Cronbach's Alpha coefficient of 0.968, indicating excellent internal consistency and item reliability during the establishment of its psychometric parameters, yielded an overall Cronbach's Alpha coefficient of 0.968, indicating excellent internal consistency and item reliability.
The paper-and-pencil version is widely known and is the most common way to complete instruments; however, it can be prone to errors, especially during result generation [9]. This is a problem shared by several instruments that rely on manual entry followed by calculation for analysis, as human error can occur during the calculation process [10].
One strategy to minimise the errors of paper-and-pencil completion is the digitalisation of instruments. Instruments are considered digital when their organisation and administration are carried out by a computer or via the Internet [11]. Although the digitalisation of instruments is not new, the use of technology to automate manual processes continues to grow, especially in the United States and in Europe [9] [12]. In Brazil, where studies began later, growth has been gradual since 2004 [9].
In a literature review conducted on the CAPES Journal Portal (Coordenação de Aperfeiçoamento de Pessoal de Nível Superior) using the Boolean operators "Escala de Intensidade de Apoio" OR "Escala de Intensidade de Suporte" OR "Escala de Intensidade de Apoio - Versão Criança" OR "Escala de Intensidade de Apoio - Versão Adulto" OR "Supports Intensity Scale - Children's Version" OR "Supports Intensity Scale - Adult's Version" AND "Informatização de Instrumentos" OR "Avaliação Informatizada" OR "Computerized instruments" OR "Computerized Assessment" OR "Teste Informatizado" OR "Computerized Test", no studies were found that demonstrated this transition from the paper-and-pencil version to an automated version. Thus, the need to conduct this study to digitalise the SIS-C scale in Brazil was identified.
The digitalisation of psychometric instruments is not a neutral technical process. Research in this area consistently demonstrates that format transitions can affect construct validity, measurement invariance, and response equivalence if not systematically managed [Bugbee, 1996; Mead & Drasgow, 1993]. Mode effects – differences in scores attributable to the medium of administration rather than to the underlying construct – have been documented across cognitive, behavioural, and adaptive scales, particularly when respondent populations include individuals with low digital literacy or atypical cognitive profiles [Cella et al., 2007]. Accordingly, the digitalisation of the SIS-C must be framed not merely as a technological upgrade but as a validity-sensitive psychometric endeavour that requires explicit attention to measurement equivalence, interface accessibility, and procedural fidelity.
Therefore, this study, which is part of a larger study [13], aims to describe the digitalisation process of the Supports Intensity Scale – Children's Version (SIS-C) for children and adolescents aged five to 16 with Intellectual and Developmental Disabilities (IDD).

2. Methods

This study is characterised as quantitative, with a non-experimental, cross-sectional, and exploratory design [14] [15], aimed at developing a digital version of the SIS-C in Brazil.

2.1 Data Source

This study was based on data from the Brazilian adaptation and validation study of the instrument. The SIS-C sample consisted of 801 children and adolescents (five to 16 years old) with IDD, distributed across five Brazilian regions, 20 states, and 120 cities, ensuring broad geographic representativeness of the national territory [8].

2.2 Instrument

The SIS-C is organized as follows: Section 1) Exceptional Medical and Behavioural Support Needs, composed of subscale 1A – Medical and 1B – Behavioural; Section 2) Support Needs Scale, composed of seven subscales: Part 2A Home Living Activities; Part 2B Community Living Activities; Part 2C School Participation Activities; Part 2D School Learning Activities; Part 2E Health and Safety Activities; Part 2F Social Activities; Part 2G Self-Advocacy Activities; and Section 3) Scoring and Profile Form [5]. As already emphasised, this instrument is a standardised assessment tool designed to measure the support needs of a child or adolescent aged five to 16 with IDD to succeed in age-appropriate community settings [8]. Accordingly, the visual presentation of the SIS-C Digital result charts sought to display the scores obtained in Section 1. Exceptional Medical and Behavioural Support Needs, which represent the summary of scores, and the scores obtained in Section 2. Support Needs Scale, which represents the child or adolescent's support needs profile.

2.3 Framework for the Digitalisation of SIS-C:

After the ethical procedures, the digitalisation involved four key stages: Phase 1 – reorganisation and repositioning of variables and response categories; Phase 2 – validation by expert judges; Phase 3 – interface adaptation; and Phase 4 – methodological adjustments to support implementation, as presented in Figure 1.

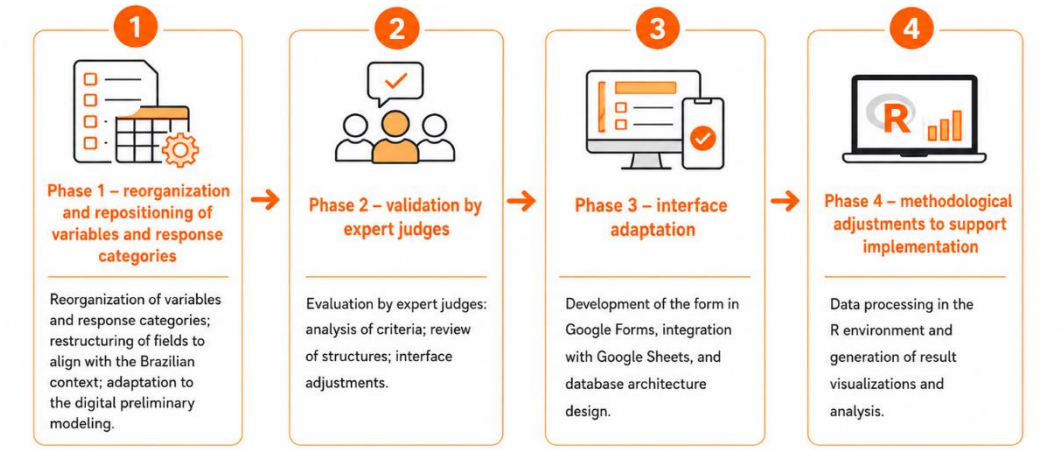

Figure 1. Framework for the digitalisation development of the SIS-C. Developed using ChatGPT.

The selection of expert judges followed purposive sampling criteria based on three conditions: (a) a minimum of five years of active research or professional practice in Special Education or Educational Technology; (b) authorship of at least two peer-reviewed publications relevant to psychometric instrument design, adaptive behaviour assessment, or digital learning systems; and (c) institutional affiliation in Brazil or Portugal, ensuring contextual familiarity with both the source instrument and the target implementation environment. Units receiving 75% or higher agreement were considered priorities for revision. Below this threshold, decisions were made based on technical and conceptual relevance, as assessed by the research team in consultation with the original instrument manual.

2.4 Data Analysis Procedures

To test data entry on the platform, 95% of the source data was used in the digital version. Sequential stages of the data analysis procedure adopted for the SIS-C Digital, illustrating the parallel workflow between platform data entry, automated score processing in R/RStudio, and computational equivalence verification against the original paper-and-pencil dataset.

Data analysis procedures were conducted in parallel with the digitalisation framework (Section 2.3) and with progressive data entry into the platform (Figure 2). A total of 95% of the source dataset (n = 763) was used to test computational fidelity, with raw scores processed in the R statistical environment using RStudio, enabling automated score calculation and normative comparisons based on the age-referenced parameters from Appendices B and C of the SIS-C manual. To verify equivalence, digitally processed scores were compared with the original, manually calculated values using Pearson's

correlation coefficient and mean absolute error, ensuring that no systematic bias was introduced during the format transition.

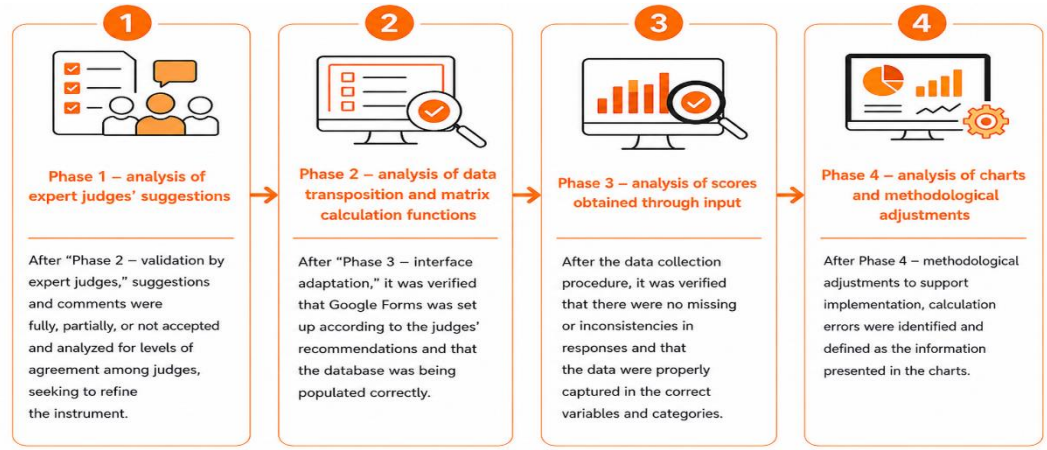

Figure 2. Stages of the Data Analysis Procedure of the SIS-C Digital. Developed using ChatGPT.

3. Results and Discussion

For the development of the digital version of the scale, the variables (general items and adaptive behaviours) and categories (respondents' answers) of the paper-and-pencil SIS-C were tabulated as presented, thus yielding the first digital version, named "SIS-C Digital Scale - Pilot 2021". The same procedure was applied when importing the database of the Brazilian SIS-C adaptation and validation project, which resulted in the second digital version, named "Database - Pilot 2024".

When comparing the two versions, differences were identified, specifically in the variables and categories of the cover sheet related to types of associated diagnosis, kinship, types of residence, and educational stages. This was because the "Database - Pilot 2024" version had incorporated variables and categories derived from the instrument's open-ended items, collected during the validation study administrations. Therefore, the variables and categories of the two versions were merged to be complementary, resulting in the third version, named "SIS-C Digital Scale + Database".

After grouping the variables and categories, the list of the 27 Brazilian states was included to map the geographic distribution of respondents. In addition, new variables were included in the "Associated Diagnosis" field, which was renamed "Primary Diagnosis" and complemented by the "Secondary Diagnosis" variable, while new categories were added to the "Person who provides support" variable.

To facilitate the inclusion or exclusion of variables in future versions, each variable and category, whether open-ended or closed, was coded; that is, a numerical value was assigned to each, as recommended in the literature [15]. As a result of this process, a fourth version was created, named "SIS-C Digital Scale Pre-Equivalence Test".

Once all the information was organised, the platform was selected, and the variables and categories were transposed to *Google Forms*, the platform chosen for the development of the interface and the digital version. It is worth noting that, although *Google Forms* is not a platform designed for psychometric assessments, this interface was chosen because it is free, does not require purchasing a domain, has a simple, intuitive, and well-organised interface, and can generate a storage base in *Google Sheets*.

Once *Google Forms* was created, a visual identity was designed using the colours of the paper-and-pencil version, and the pilot model of the scale was developed and organised into three forms: one for interviewer registration, another for respondent registration, and a third form containing the fields for the "Participant Profile" and Sections 1 and 2 of the Scale.

The pilot model of the SIS-C Digital was then submitted for equivalence review by two judges, one from the field of Special Education (SE) and the other from Educational Technology (ET), from Brazil and Portugal, selected based on their publications in the areas of SE and ET. The judges' comments included suggestions for incorporating certain variables and categories, for the presentation format of variables and categories, and for the organisation of the form. The remarks were discussed, and the suggestions were incorporated, resulting in a fifth version of the scale, named "Expert Judges Version".

The development of a pilot model is an important stage in the instrument development process, as testing the pilot allows comments and revisions to be made and refined based on respondents' contributions [14]. For this reason, it is recommended that the pilot model of an instrument be administered to a sample composed of specialists in the field, such as expert judges. This administration

is intended to evaluate the instrument items and verify whether the categories and variables, as well as their response formats, are understandable and aligned with the proposed objectives, enabling adequate administration to the remaining participants [11].

With the fifth version of the scale, a new form was created in *Google Forms*, structured as a single form, organized into: Section 1 – Interviewer Data; Section 2 – Respondent Data; and Section 3 – Interview and Profile Form – Child or Adolescent Data; subsection 1 – Exceptional Medical Support Needs and Exceptional Behavioural Support Needs; subsection 2 – Support Needs Scale, with its seven subscales. As a result, the "Expert Judges Version" was submitted for validation by eight expert judges, three from the field of SE and five from the field of ET, selected based on their experience and length of work in these areas, whether in SE or ET, in addition to being researchers from Brazil and Portugal.

A total of 52 comments and suggestions were received from the expert judges. Of these, 21 were disregarded as repetitive or as commendations of the proposal. The remaining 31 comments and suggestions were tabulated and grouped into 14 units of analysis according to the type and nature of the comments and suggestions, which were then grouped by semantic proximity into four categories: a) Scale Structure; b) Interviewers; c) Respondents; d) Participant Profile.

Next, the percentage of judges (n = 8) who indicated, in their comments, the need for adjustments in each of these units of analysis was calculated, and they were then classified, regarding the decision to incorporate the suggestions, in three ways: 1) Fully accepted (AI): suggestions and comments that contributed to the clarity, functionality, or appropriateness of the digitalisation; 2) Partially accepted (AP): suggestions and comments that contributed to improving the scale but, to some extent, conflicted with the structure of the original scale, or in which the comments conflicted with each other; 3) Not accepted (NA): suggestions and comments that would alter the structure of the scale and the data, that contradicted what is proposed in the instrument's manual, that fell outside the proposed objective of the validation, or that referred to cultural differences between Brazil and Portugal.

It is worth noting that the decision to incorporate suggestions and comments was not based solely on the percentage (%) of agreement across thematic convergence among the expert judges, but also on their technical relevance and importance for improving the scale, as shown in Table 1.

Table 1. SIS-C Digital validation data by expert judges [13]

Unit of analysis	Category	Type of comments	Agreement %	Classification
1. Layout, legibility and/or formatting adjustments	Scale Structure	Font, text formatting, visual organization, watermark, display	100%	AI
2. Review of administration instructions	Scale Structure	Clarity of instructions, explicitness of procedures	25%	AI
3. Inclusion/adjustment of confidentiality and/or ethics statement	Scale Structure	Consent and confidentiality	25%	NA
4. Numbering and organization of questions	Scale Structure	Numbering of items and blocks	25%	AP
5. Required fields and/or completion validation	Scale Structure	Required fields	50%	AP
6. Review of the scoring key and score presentation	Scale Structure	Calculations and automation of results	37.5%	AI
7. Adjustments to the navigation logic/usability of the digital scale	Scale Structure	Separation of the Form	12.5%	NA
8. Inclusion of an "Other" option	Scale Structure/Profile	Inclusion of the "Other" category in closed fields	87.5%	AI
9. Comments on changing, extending, or shortening the instrument	Scale Structure	Scale length and completion time	25%	NA
10. Adjustments to the professional profile field	Interviewer	Role, position, professional council, interviewer qualifications	50%	AP
11. Adjustments to the respondent/family member profile	Respondent	Kinship, cohabitation, respondent data	25%	AP

12. Review of form terminologies/acronyms	Respondent	Ambiguous acronyms and terminology	25%	NA
13. Adjustments to participants' sociodemographic variables	Profile	Sex/gender, race/ethnicity, states, etc.	25%	AP
14. Criteria for IQ measurement and/or adaptive behavior and eligibility	Profile	Definition and recording of these data	12.5%	NA
15. Inclusion or refinement of information on supports/providers	Profile	Support person, contacts, support	12.5%	AI

It was observed that the contributions of the SE expert judges were more focused on the conceptual fidelity of the scale, the relevance of the variables and categories, and the eligibility and assessed constructs, whereas the contributions of the ET expert judges were more focused on the analysis of platform usability, navigation flow, and system functionalities. After evaluating all units of analysis, the suggestions and comments that were fully or partially accepted were incorporated, culminating in the development of a sixth digital version, named "SIS-C Digital".

The suggestions and comments from the expert judges raise important reflections, since digitalising an instrument requires more than simply migrating from one format to another. The way it is administered must be rethought, as must the format of the variables and categories, requiring a contextual redesign and computational strategies that enhance efficiency, accuracy, and data management. This reinforces the need for instruments to be analysed, discussed, and validated by samples of specialists in the field [16] [11]. The results show that the digitalisation of the SIS-C required not only digital transposition but also the structural reorganisation of the variables, the redefinition of navigation flows, and methodological adaptation to preserve the conceptual equivalence of the scale.

Following the changes, the interface was updated by creating a form in *Google Forms*, and the Database (Matrix) in *Google Sheets* was initiated for data storage. The Matrix was organised according to the layout of the variables and categories of the SIS-C Digital, and the data from the 801 participants were individually transposed to the variables and categories of the final version of the SIS-C Digital. The data were then reviewed to ensure there were no errors or omissions.

Verifying transposed data is important in the digitalisation process because, as a manual procedure, errors can occur. However, such potential errors need to be corrected through individual review of the data and through the appropriate modifications [15].

After analysing the transposed data, methodological adjustments to support implementation were initiated by developing the calculation functions. To this end, a spreadsheet was created to receive data from the Matrix and perform calculations on the raw data, organised by the values of the items in each section of the scale. These data were automatically transferred to a new spreadsheet, and the raw values were submitted to automated operations for summing the scale parts and calculating the mean. Subsequently, the values were directed to specific spreadsheets, organised by age groups (for example, "5-6_y" and "7-8_y"), incorporating the reference values provided in Appendix B and Appendix C of the scale's manual, which, in the paper-and-pencil version, serve to establish the parameters and define the participants' support intensity levels.

This calculation stage, in the paper-and-pencil version, is performed manually in Section 3 "Scoring and Profile Form". However, with digitalisation, this step becomes automated. As a result, this format offers several advantages, such as time savings in data entry and correction, score generation, and result verification, especially in reducing calculation and measurement errors [9] [10].

Upon completing the development of the Matrix's calculation functions, a test was conducted using 95% of the data (n = 763) with the SIS-C Digital to ensure that the data entered remained unchanged. The comparison between manually transposed data and data processed by the SIS-C Digital showed equivalence of results in the analysed database, indicating the stability of the automated calculation functions and the consistency of the computational processing of the data.

One of the main advances observed with the SIS-C Digital concerns the automation of calculations, which is now performed quickly and with a significant reduction in the risk of human error, as reported in the literature. Unlike the paper-and-pencil version, in which calculations must be performed manually, the digital version enables greater accuracy in score generation and optimises the time devoted to correcting and analysing results. These findings corroborate theoretical discussions that highlight one of the main advantages of computerised tests: the computer's ability to score responses without error, quickly and accurately [17]. Likewise, studies indicate that programs and computational resources could contribute to the presentation of statistical results [12].

Once the calculations were completed, programming was carried out in the R system using RStudio, and the development of visual presentations of the result charts to visualise support intensity levels was initiated. The presentation of the SIS-C Digital results was designed to be intuitive, clearly showing the support intensity levels of the child and adolescent, as well as those of other participants in the same age group. These data needed to be understood both by the interviewer and by Education or Health professionals who design educational plans or interventions for the child or adolescent and who could therefore come into contact with the results of the SIS-C Digital, since the information is analysed and produces results that allow understanding the support needs that a child or adolescent requires to live in society with autonomy and independence [18].
For the presentation of scores, following the digitalisation of the scale in the SIS-C Digital, after data *input* and processing in the R system, it became possible to perform calculations automatically and generate chart data in a simpler, more efficient way for analysis.
In the SIS-C Digital, the data is received from Section 1. Exceptional Medical and Behavioural Support Needs are sent to the interviewer's registered e-mail. In the document, the Section 1 scores indicate the behavioural and medical needs items separately, and, for each of them, the items in which the child or adolescent most needs support are presented at the top, following the model of other studies of the scale in which Section 1 scores are organised starting from the highest scores [19].
The data received from the Section 2 Support Needs Scale, as well as those from Section 1, are stored in the Matrix and, once the scale has been completed, are sent to the interviewer's registered e-mail and presented to the interviewer in two ways:
1) Support Needs Profile: the first chart is the support needs profile chart, composed of the *Standard* Score, the Composite *Standard* Score (Support Needs Index), and the Percentile, according to Appendices B and C. In this chart, the age-group means for each part of the scale are represented by columns on the x-axis; alongside, a line indicates each participant's score.
2) Item Scores for each of the Parts: each of the seven subscales is given a chart in which the items for which the children or adolescents most need support are presented at the top, in descending order.
The visualisation of the support needs chart, organised in this way, provides a concise, simple way to view a summary of scores across the seven parts and to indicate which items require greater attention for the child or adolescent [19].
Thus, we can affirm that the results obtained so far [13] show that the digitalisation of the SIS-C preserved the conceptual structure of the original instrument while also improving processing efficiency, reducing operational errors, and enabling new resources for data analysis and visualisation. In addition, the process showed that the digital adaptation of instruments requires methodological validation, structural reorganisation, and computational integration, and is not limited to a simple format migration. The SIS-C Digital now provides a system for monitoring the development of children and adolescents with IDD, as well as longitudinal analysis and continuous assessment, more faithfully reflecting the reality of the Brazilian territory.

4. Conclusions

Finally, this study achieved its proposed objective: to describe the digitalisation process of the Supports Intensity Scale – Children's Version (SIS-C) for children and adolescents aged five to 16 with Intellectual and Developmental Disabilities (IDD). It can be stated that the digitalisation of the SIS-C in Brazil contributed to greater speed in analysis and result generation, as well as to the reduction of human errors, since automated calculations are not subject to typing or mathematical errors and results are now generated.
The results also show that the SIS-C digitalisation process was not limited to migrating the paper-and-pencil version to digital, but also required structural reorganisation, validation by expert judges, and the development of computational strategies and programs, with the aim of preserving the scale's psychometric properties.
In addition, the structure developed for the SIS-C Digital enabled the creation of a data matrix capable of storing historical and longitudinal data on participants' information, enabling different possibilities of analysis regarding the support needs of children and adolescents with intellectual disability throughout the Brazilian territory (allowing different types of analyses).
Another aspect that needs to be highlighted concerns the generation of scores and the presentation of result charts, which facilitate data interpretation by Education and Health professionals and enable the historical and longitudinal monitoring of data by participants in Brazil.
As a limitation of this study, although functional tests and verification of the automated calculations were carried out, the results presented correspond to an initial stage of a broader study. Another limitation is

the limited potential to replicate this study in other countries, because each country needs to work with its own standardised data, that is, statistical values that reflect the reality of that country. Based on these points, future studies may investigate the validity, usability, and reliability of the SIS-C Digital across different application contexts, as well as analyse the potential of the tool for longitudinal monitoring, indicator generation, and decision-making support in educational and clinical contexts.

From Research Center to Science Museum: Comparative Experiential Engagement Pathways in Informal STEM Learning Environments

Dimitra Giantsiou[1], Vangelis Karkaletsis[2]

[1]National Technical University of Athens, Greece
[2]National Centre for Scientific Research "Demokritos", Greece

Abstract

This study is part of an ongoing doctoral research project exploring how students experience science when they encounter it outside formal school settings. More specifically, it compares how two informal STEM settings shape students' engagement, emotional response, and sense-making during science-related activities.
To address this research question, a comparative mixed-methods design was developed focusing on two informal STEM settings in Athens, Greece: The National Centre for Scientific Research "Demokritos" and the science and technology exhibition environment Aitherion.
The study combines quantitative data from structured questionnaires with qualitative observations, in order to examine the experience from more than one angle. The research instrument investigated constructs including active participation, experiential learning, emotional engagement, metacognitive awareness, autonomy, science skills, contextual interaction, and future STEM orientation.
A total of 150 secondary education students participated in the comparative phase of the study, including 75 students from Demokritos and 75 students from Aitherion.
Construct reliability analysis demonstrated satisfactory internal consistency for the main analytical constructs used in the comparative analysis, with Cronbach's alpha values ranging from .757 to .910.
Findings suggest that both environments supported highly positive STEM learning experiences, although through different experiential engagement pathways. Demokritos appeared to strengthen perceptions of scientific authenticity and direct engagement with scientific practice, whereas Aitherion appeared to enhance emotional engagement, accessibility, interactivity, and experiential immersion.
Descriptive and comparative analyses showed consistently positive evaluations across the main constructs. Emotional engagement emerged as a particularly important dimension, demonstrating a strong positive relationship with students' overall learning experience ($r = .783$, $p < .001$).
Independent-samples t-tests revealed statistically significant differences between the two environments regarding active participation, experiential learning, and emotional engagement, with higher scores reported in the Aitherion environment.
The findings suggest that informal STEM learning should be understood not only as exposure to scientific content, but as a broader experience involving participation, emotion, context, and students' developing relationship with science. The structure of the data may also allow future work to explore educational analytics approaches in a more systematic way.

Keywords: *Informal STEM learning, Experiential learning, Emotional engagement, Science museums, Research centers, Educational analytics, Science identity*

1. Introduction

In recent decades, informal STEM learning environments have received increasing attention within educational research due to their capacity to enrich students' relationships with science beyond traditional classroom settings. Museums, science exhibitions, research centers, and interactive STEM environments provide opportunities for students to engage with scientific concepts through participation, exploration, and experimentation.
Contemporary science education research increasingly recognizes that meaningful learning extends beyond cognitive achievement alone. Students do not only understand science cognitively, they also respond to it emotionally, socially, and personally.
Within this context, informal STEM learning environments appear particularly suitable for experiential engagement with science. Such environments allow students to interact with scientific ideas in authentic,

participatory, and socially mediated ways that differ substantially from conventional classroom instruction.
The present study explores how different informal STEM ecosystems shape students' engagement with science, emotional involvement, experiential immersion, and future STEM orientation.
The comparative framework focuses on two distinct informal STEM environments in Athens, Greece:

- the National Centre for Scientific Research "Demokritos," representing an authentic research-centered scientific environment,
- and Aitherion, a science and technology exhibition environment emphasizing interactivity and immersive public engagement with science.

The purpose of the comparative design is not to evaluate which environment is "better," but rather to investigate how different informal STEM ecosystems activate different experiential pathways of engagement with science.
More broadly, the study contributes to current discussions on experiential learning, science identity, contextual engagement, and emotional involvement in STEM education. Rather than approaching informal STEM learning as a simple extension of formal instruction, the present research approaches these environments as spaces where students engage with science through experience, interaction, and participation.
The research is situated within a broader doctoral framework investigating how students experience science through informal and experiential educational settings and how these experiences may influence long-term engagement with STEM learning and their later interest in science and STEM-related studies or careers.

2. Theoretical Framework

2.1 Experiential Learning and Informal STEM Education

The study is theoretically grounded in experiential learning approaches, particularly Kolb's Experiential Learning Theory. According to Kolb (1984), learning develops through the transformation of experience via concrete experience, reflective observation, conceptualization, and active experimentation.
Informal STEM environments fit well with this view of learning because they allow students to participate actively, interact directly with scientific phenomena, and connect scientific ideas with personal experiences and meaning-making processes.
Within this perspective, learning is viewed as an active process shaped by experience, participation, and social interaction rather than passive reception of information.
Experiential learning approaches are particularly relevant within science education because scientific understanding is often strengthened when learners interact directly with scientific practices, experimentation, inquiry, and authentic scientific contexts. Informal STEM environments therefore provide important opportunities for students to experience science not only as something explained to them, but as something they can observe, question, and experience directly.

2.2 Contextual Learning and Informal Environments

The research is additionally informed by the Contextual Model of Learning proposed by Falk and Dierking (2016). According to this model, learning in museums and informal environments emerges through the interaction of personal contexts, sociocultural interactions, and the physical environment.
This framework is highly relevant to the present study because Demokritos and Aitherion represent substantially different contextual and experiential learning environments.
Demokritos offers students direct exposure to authentic scientific practice and research culture, whereas Aitherion emphasizes immersive participation, interpretative interaction, accessibility, and visitor-centered experiential engagement.
The contextual dimension of learning is particularly important within informal STEM education because students' experiences are shaped not only by scientific content but also by the broader experiential atmosphere, social interactions, interpretative structures, and emotional dynamics of the learning environment itself.

2.3 Emotional Engagement and Science Identity

Recent STEM education research increasingly emphasizes the importance of emotional engagement and science identity formation. Students' relationships with science appear strongly influenced not only

by conceptual understanding but also by emotional involvement, participation, personal relevance, and feelings of belonging within scientific experiences.
In this study, emotion is treated as part of the learning process itself, not as something external to it. Science identity approaches additionally suggest that students' long-term engagement with science is influenced by whether they perceive themselves as capable participants within scientific practices and scientific culture. Informal STEM environments may therefore contribute to science identity formation by providing opportunities for authentic participation, experiential immersion, and socially meaningful interaction with science.
In the present study, informal STEM learning is approached as a multidimensional experiential process in which participation, emotional involvement, experiential immersion, contextual interaction, and science-related identity development function as interacting dimensions shaping students' relationships with science.
Within this framework, experiential engagement ecosystem refers to the interaction between cognitive, emotional, contextual, participatory, and identity-related dimensions that shape informal STEM experiences.
For this reason, the study does not treat the different dimensions of learning as separate outcomes, but as elements that influence one another during the experience.

3. Methodology

3.1 Research Design

The study adopts a comparative mixed-methods design combining quantitative and qualitative approaches.
The comparative framework focused on two informal STEM learning environments:

- the National Centre for Scientific Research "Demokritos",
- and the science and technology exhibition environment Aitherion.

A mixed-methods approach was used because the study needed both numerical comparison and observational interpretation.
The study combines descriptive statistical analysis, comparative analysis, and interpretative qualitative observations in order to examine how different informal STEM environments shape experiential engagement with science. Observations focused on students' visible participation, interaction with the activities, questions, hesitation, enthusiasm, and use of the physical space.

3.2 Participants

A total of 150 secondary education students participated in the comparative phase of the study.
The comparative sample included:

- 75 students participating in educational activities at Demokritos,
- and 75 students participating in activities at Aitherion.

Participants ranged primarily between 14 and 17 years of age and participated in organized educational visits to the two informal STEM environments.
The sample included students from both Gymnasium and Lyceum educational levels, with representation across both educational levels and genders.
Students completed structured questionnaires immediately following their participation in the activities.
The same questionnaire structure was used across both environments in order to support the comparative framework of the study.
The balanced comparative design was selected in order to support more consistent comparison between the two experiential contexts while maintaining methodological coherence across the analytical sample.

3.3 Research Instrument

The quantitative instrument consisted of parallel structured questionnaires investigating multiple dimensions of informal STEM learning.
The questionnaire explored constructs including:

- active participation,
- experiential learning,
- metacognitive awareness,

- emotional engagement,
- informal learning and autonomy,
- school–museum relationship,
- scientific skills,
- social and cultural context,
- and future STEM orientation.

Example questionnaire items included:

- "I felt enthusiastic during the activity" (emotional engagement),
- "The activity helped me understand how science works in real life" (scientific authenticity) and
- "I would like to participate in similar STEM activities in the future" (future STEM orientation).

Responses were collected using Likert-type scales ranging from 0 to 10.
Construct reliability analysis demonstrated satisfactory internal consistency for the main analytical constructs used in the comparative analysis. Cronbach's alpha values ranged from .757 to .910 for the primary multi-item scales, including active participation (α = .850), experiential learning (α = .835), emotional engagement (α = .910), and future STEM orientation (α = .757).
Qualitative observations were additionally used to support the interpretation of students' experiential responses within the two environments.

3.4 Data Analysis

The analysis included:

- descriptive statistics,
- construct reliability analysis,
- independent-samples t-tests,
- effect size analysis using Cohen's d,
- correlation analysis among the main experiential constructs.

Welch independent-samples t-tests were used due to variance differences observed between groups across some constructs.
Statistical analyses and reliability analyses were conducted using RStudio (R version 4.2.2).
The analysis also considers how different experiential dimensions relate to one another, which may inform future educational analytics work.
Although the present paper focuses primarily on descriptive and comparative analysis, the structure of the dataset may support future work on learner engagement profiles.

4. Findings

4.1 Overall Positive STEM Learning Experience

Findings indicated that both environments supported highly positive informal STEM learning experiences. Students in both Demokritos and Aitherion reported strong levels of participation, engagement, and experiential involvement.
Descriptive analysis showed consistently positive evaluations across the main constructs of the questionnaire. Emotional engagement and overall experience emerged among the strongest dimensions of the learning experience.
Overall, the results indicate that informal STEM environments may operate as meaningful complementary spaces for science learning beyond the classroom. The learning context itself therefore appears to matter.

4.2 Different Experiential Pathways

Although both environments produced positive learning experiences, important experiential differences emerged.
The Demokritos environment appeared to strengthen perceptions of scientific authenticity, direct exposure to scientific research, and students' understanding of science as a real research process.
In contrast, Aitherion appeared to emphasize emotional engagement, accessibility, interactivity, and experiential immersion.
Table 1 presents comparative descriptive statistics for the main experiential constructs across the two environments.

Table 1. Comparative descriptive statistics across the two informal STEM environments

Construct	Demokritos (M ± SD)	Aitherion (M ± SD)	t(df)	p	Cohen's d
Active Participation	6.773333 ± 2.64	7.70 ± 1.83	-2.4911 (131.63)	.01398	0.4121
Experiential Learning	7.644444 ± 2.30	8.30 ± 1.55	-2.0499 (129.86)	.04238	0.3348
Emotional Engagement	7.448889 ± 2.58	8.34 ± 1.65	-2.5237 (126.06)	.01286	0.4121
Future STEM Orientation	7.302222 ± 2.25	7.56 ± 2.17	-0.7263 (147.82)	.46880	0.1200
Overall Experience	7.893333 ± 2.21	8.47 ± 1.77	-1.7528 (141.38)	.08181	0.2900

The analysis revealed statistically significant differences regarding active participation, experiential learning, and emotional engagement, with students in the Aitherion environment reporting higher scores across these dimensions.
The effect sizes observed across these dimensions were small to moderate, suggesting meaningful experiential differences between the two environments without implying absolute superiority of one context over the other.
However, differences regarding future STEM orientation and overall experience did not reach statistical significance.

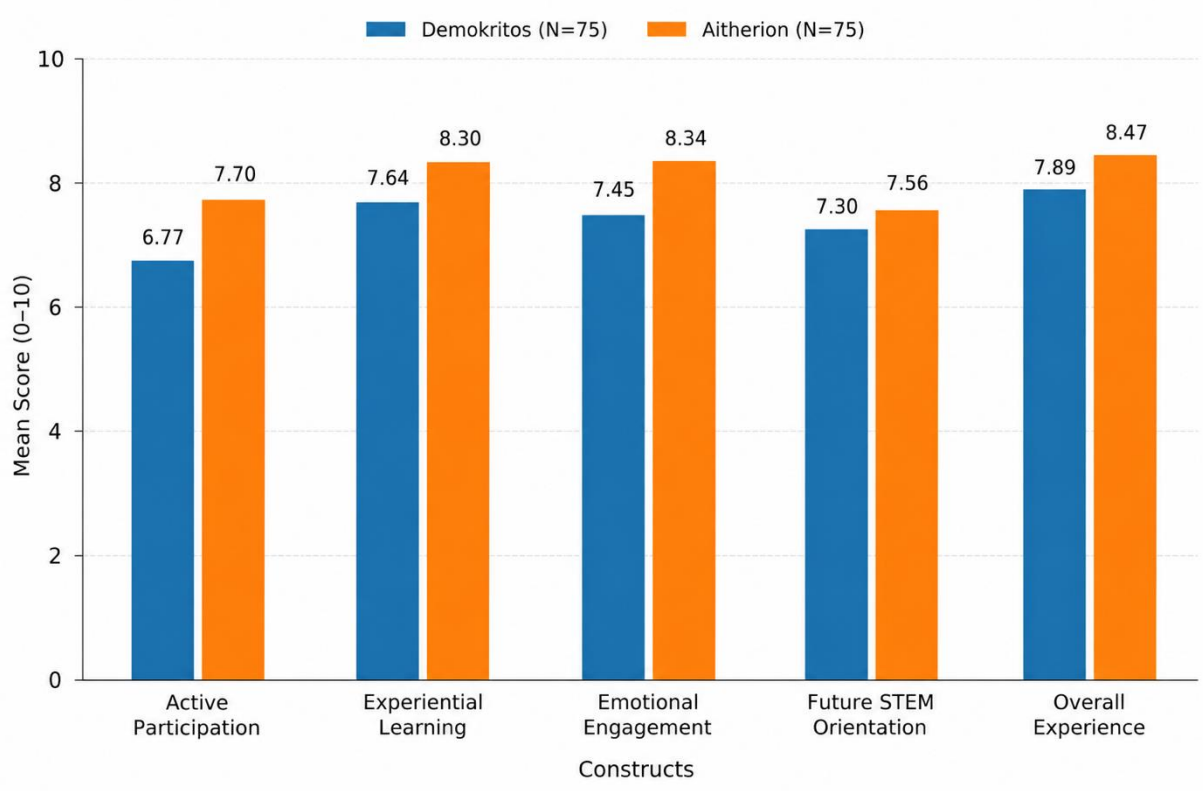

Fig. 1. Comparative experiential profiles of Demokritos and Aitherion across the main constructs of informal STEM learning.

The comparative findings suggest that the two environments supported engagement in different ways. These findings suggest that informal STEM environments may operate through different experiential mechanisms, with some environments emphasizing scientific authenticity and research culture, while others emphasize immersion, accessibility, and emotional participation.

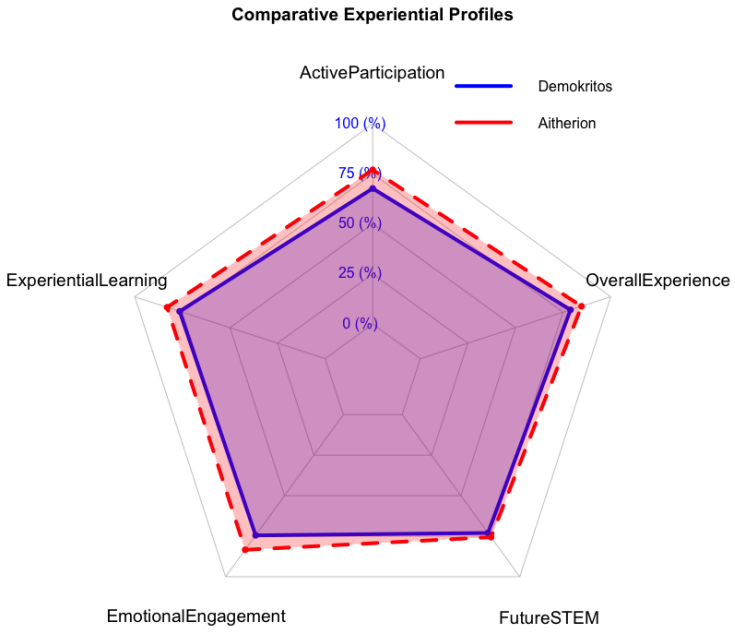

Fig. 2. Comparative experiential engagement profiles across the two informal STEM learning environments.

4.3 Emotional Engagement as a Central Experiential Mechanism

One of the most important findings of the study concerns the role of emotional engagement.
Students reporting higher levels of enthusiasm, personal involvement, and emotional connection with the activities also tended to report more positive overall learning experiences.
Correlation analysis demonstrated a strong positive relationship between emotional engagement and overall learning experience ($r = .783$, $p < .001$), suggesting that emotional involvement functions as one of the main ways through which students came to value the experience.
Taken together, the results highlight the importance of participation and emotional involvement within informal STEM learning experiences, rather than viewing learning simply as knowledge transmission.
The strength of the observed relationship additionally suggests that students' emotional experiences within informal STEM environments may play a particularly important role in shaping how students evaluate, remember, and relate to science experiences more broadly.
The comparative results show that informal STEM learning cannot be reduced to a single model of student engagement.

5. Discussion

The findings contribute to current discussions concerning experiential learning and student engagement within informal STEM education.
A central observation from the comparative analysis is that the two environments supported engagement through different mechanisms. In this sense, different environments appear to activate different experiential pathways of engagement with science.
Demokritos emphasizes scientific authenticity and direct interaction with research culture, whereas Aitherion strengthens emotional engagement, immersive participation, and interpretative interaction with scientific ideas.
Importantly, however, both environments appear capable of supporting meaningful science engagement.
These observations align closely with experiential learning approaches and the Contextual Model of Learning proposed by Falk and Dierking. Learning appears to emerge not only through cognitive

processing but also through emotional involvement, participation, contextual interaction, and experiential immersion.
Perhaps the most notable finding concerns the role of emotional engagement. Students' relationships with science appear strongly influenced by whether they experience science as emotionally meaningful, participatory, and personally relevant.
Emotional engagement also appeared to connect participation, contextual immersion, and students' future orientation toward STEM learning.
The findings suggest that students' informal STEM experiences are shaped by multiple interacting dimensions. These include understanding, participation, emotional involvement, the structure of the setting, and students' sense of belonging within science-related activities.
In practice, this means that informal STEM environments may influence students not only cognitively, but also emotionally and socially through participation, immersion, and identity-related experiences.

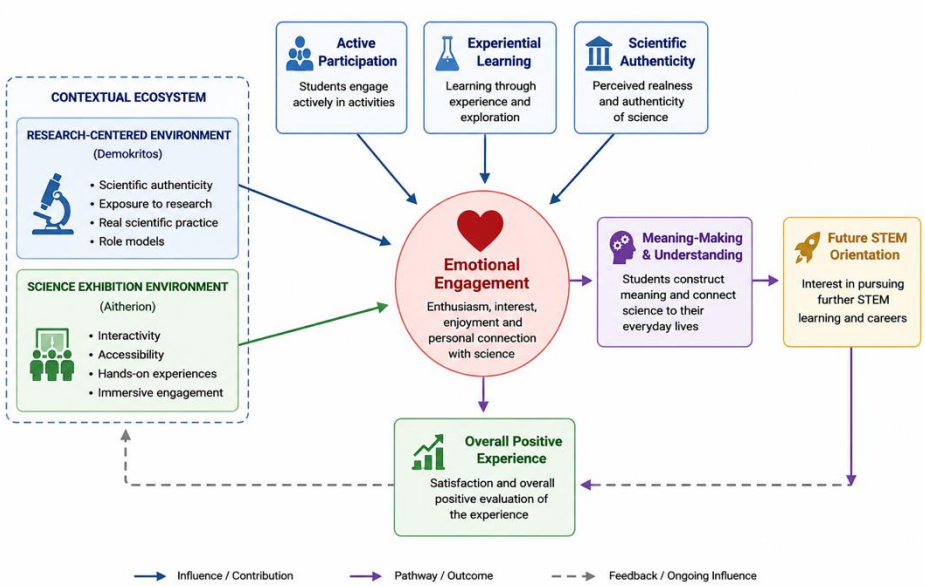

Fig. 3. Conceptual model of experiential engagement pathways in informal STEM learning environments.

At the same time, several methodological limitations should be acknowledged. First, the study relies primarily on self-report questionnaires completed immediately following participation in the activities, which may increase the influence of recency effects and social desirability bias. Second, the study did not include pre-visit measurements, limiting the possibility of examining changes in students' attitudes before and after participation. In addition, the research focuses primarily on short-term experiential responses and does not investigate the long-term sustainability of STEM engagement over time.
Finally, the comparative framework is based on two informal STEM environments located in Athens, Greece, limiting broader generalizability.
Future studies may additionally explore explainable predictive approaches, such as learner engagement profiling and decision-tree modeling, in order to investigate how experiential dimensions predict future STEM orientation across different informal learning environments.
The multidimensional structure of the present findings may additionally support future applications of educational analytics and explainable predictive modeling within informal STEM education research.
The findings may additionally support educators, museum designers, and informal STEM learning practitioners in designing experiential science activities that strengthen emotional engagement, participation, contextual immersion, and students' long-term relationships with science.
Despite these limitations, the study provides an important exploratory framework for understanding experiential engagement within informal STEM education.

6. Conclusions

The present study investigated how students experience science across two different informal STEM learning environments: a research-centered scientific environment and a science exhibition environment.

The findings suggest that both environments support meaningful STEM learning experiences, although through different experiential mechanisms.
Demokritos appears to strengthen perceptions of scientific authenticity and direct interaction with research culture, whereas Aitherion enhances emotional engagement, immersive participation, and experiential accessibility.
The study additionally highlights the central role of emotional engagement within informal STEM learning. Students seem to value these experiences more strongly when they feel involved, not only informed.
Overall, the findings highlight the multidimensional nature of informal STEM learning, where cognitive, emotional, contextual, and participatory dimensions continuously interact during the learning experience.
The study therefore offers a comparative framework for understanding how different informal STEM settings can support students' relationship with science in distinct but complementary ways.

Teacher Professional Development

Three Models to Address the Global Teacher Shortage: What School Leaders Must Do to Create Sustainable Pathways that Grow Well-Prepared and Diverse Teachers

Suzanne Galella[1], Mark Murphy[2], Sandra Pesavento[3]

[1,2,3]Marywood University, United States

Abstract

A global teacher shortage has presented schools and school leaders with an unexpected barrier to success in their efforts to recover learning loss and generate meaningful academic gains after the COVID-19 pandemic. The high number of teacher vacancies requires an innovative and coordinated response from school leaders and teacher preparation programs to ensure a qualified and diverse teacher workforce now and in the future. This paper explores three models initiated by Marywood University in collaboration with its school partners to expand the teacher pipeline, recruit and retain highly qualified teachers, and address a growing need for diversity in the teaching profession. Those models include a grow-your-own (GYO) program for high school students, alternative routes to certification for aspiring paraprofessional educators, and an accelerated pathway for adult learners seeking initial or secondary teaching certifications. Together, the University and its partners have responded to the needs of the workforce and created sustainable practices to diversify and stabilize the local labor market. In combination with emerging literature on teacher preparation, these models provide a foundation for best practices that can be used to produce similar results in a variety of settings, including international contexts.

Beyond recounting successes and comparative analysis, this paper calls on school leaders to embrace their role in developing innovative, sustainable, and ethical teacher preparation programs that are capable of filling teacher vacancies in the modern era.

Keywords: *Teacher Shortage, Grow-Your-Own (GYO), Alternative Route, Accelerated Pathways, School Leadership, Teacher Preparation*

1. Introduction

Teacher quality matters. More than any other tool or resource that can affect student success, the single most important factor that influences student learning is the quality of the teacher who designs, delivers, and assesses their progress (Darling-Hammond, L., & Young, P., 2002). Ministries of education, state departments, and school leaders have focused on this vital element in the classroom for years in an effort to improve student outcomes and increase accountability (Danielson, C. 2016; The New Teacher Project, 2009), but before the quality of teaching can be assessed in a classroom, there must first be a highly qualified teacher assigned to it.

Teacher shortages have garnered attention in the five years that elapsed since the global pandemic (Miller et al., 2019; Rice et al., 2024; Pitt, 2025; Sparks, 2025). But a diminished supply of qualified teachers affected schools long before COVID-19 (McKibben, 2025; Partelow, L., 2019; Schmitt, J., & deCourcy, K., 2022). This is especially true in specific content areas such as math, science, and special education (Day, J., & Nagro, S., 2025; Rice et al., 2024). Poor working conditions and overall compensation are generally recognized barriers to a sustainable teacher pipeline (Sparks, 2025), with some further noting particular difficulty filling vacant positions in rural areas, urban schools, (Carl, B. & Seelig, J., 2025; McClure, C., & Reeves, 2004; Miller et al., 2019) and in communities with compounding socioeconomic challenges (Bianco, M. & Marin-Paris, D., 2019; Goings et al., 2018; Research for Action, 2025).

Recognizing the importance of establishing and maintaining a sustainable teacher pipeline, state agencies have supported Alternate Route Teacher Certification (ARTC), designed to increase the number of qualified and certificated teacher applicants by reducing barriers to entry into the teaching profession. Such efforts have focused on providing financial support for alternative route programs, incentivizing continuous service for teachers certified through them, and addressing general working conditions for all teachers through leadership training and professional development (Miller et al., 2019; National Education Association, 2020; Pitt, 2024). While much is documented about the effort to recruit

candidates to alternate route programs, there is considerably less attention given to best practices and the sustainability of ARTC programs in the literature. The aim of this paper is to describe themes that emerged from a comprehensive literature review on alternative route teaching certification programs in order to compare them with programs under development at Marywood University in the United States of America, and inform others who are similarly tasked with designing alternate route programs in response to a diminished supply of qualified teachers.

2. Methodology

A narrative review was used to explore and explain phenomena expressed to the authors by local school leaders from twenty public and private schools. Sources were first identified by themes expressed over a two-year period of on-site visits and professional events with K-12 school leaders. Thematic and content analyses were applied to the initial search terms. Chronologic order provided a final search strategy that was initially delimited to a five-year post-pandemic window. Older sources were then identified through spiralization.
No formal risk of bias assessment was employed, though the author's independent research served as a mitigating factor for inherent bias.

3. Research Questions

The research questions that guided this paper were:

1. How do alternative route teaching preparation programs structure themselves to serve the needs of teacher candidates, particularly those in high-need areas, to increase supply to the local teacher labor markets?
2. What can educational leaders do to ensure their alternate route programs align with established best practices and position ARTC teachers for sustained success in teaching?

4. Literature Review

Alternate pathway programs vary from state to state in the US but are generally described as programs that recruit cohorts of students to obtain a state teaching license through an accelerated pathway that reduces barriers that might dissuade future teacher candidates from teaching (Blazar et al., 2026; Day, J., & Nagro, S. 2025). The two primary models found in the literature include pre- and post-baccalaureate alternate route teacher certification programs and community-rooted "Grow Your Own" models. Pre- and post- baccalaureate programs recruit prospective teachers from adjacent fields into teaching, while Grow Your Own programs are designed for high school students and/or community members already employed or engaged in the schools without teaching credentials.
Alternate Route Teacher Certification (ARTC) programs have become a vital resource for school leaders in responding to global and localized teacher shortages (Day, J., & Nagro, S., 2025; Garcia, 2024; Miller et al., 2019; National Education Association, 2020; Research for Action, 2025; Pitt, 2024). By relieving teacher candidates of common barriers to entry into the profession and placing greater emphasis on real-world classroom training over a traditional approach to teacher preparation (Garcia, 2024; Hamman et al., 2023; National Academy of Education, 2024; National Education Association, 2020), ARTC programs reduce the delta between pre-service training and full-time employment as a teacher**.** In doing so, they not only increase the supply of qualified teachers they also demonstrate the potential to increase diversity and reduce teacher attrition (Hamman, D. 2023; McKibben, S. 2025) that can exacerbate teacher supply problems.
There is great evidence to suggest that alternate route programs have led to an increase in teacher certifications, particularly for areas with the greatest need (Hamman et al., 2023; PA Dept. of Ed, 2025; Research for Action, 2025). Examining their own alternate route program outcomes, Miller et al. (2024) recounted early success not only in recruiting candidates to the teaching profession through their ARTC program but also in job placement. "Over the course of the past five years, 154 participants have started our [alternate route] program, and 113 have been hired and placed as teachers of record, which is an average of 22 new teachers each year. [...] Statewide, alternative IHE-based teacher preparation program completers made up 26%-30% of the teacher education completers from 2012 to 2016 (p. 5)."
Citing data from the 2021 US Bureau of Labor Statistics, Day and Nagro (2025) similarly reported that nearly 20% of all newly certified teachers entering the workforce in the United States came from alternate route programs (p. 739).

In Pennsylvania alone, over 100 students were reported “on track” to become certified special education teachers through an Accelerated Special Education Teacher Certification program offered by 14 colleges and universities throughout the Commonwealth (Pennsylvania Department of Education, 2025). That represented nearly 15% of all new special education instructional I certificates from 2023-2024 (Pennsylvania Department of Education, n.d.).
Together, these reports indicate that higher education leaders need to design ARTC programs for an average of one out of every five certified teachers, a number that may increase due to early retirements and natural attrition.
With this in mind, the authors investigated how alternative route teacher certification programs were evolving to meet the needs of teacher candidates, particularly those in high-need areas. The research objective was to learn best practices that can be used to increase teacher supply and ensure ARTC teachers are positioned for sustained success. The themes chosen by the authors relate to the design of ARTC programs, the recruitment of teacher candidates, the delivery of instruction, and the overall sustainability of those programs.

4.1 Provide Multiple Pathways

The first theme found in the literature was the wide variety of ARTC programs themselves. “While most states permit them, AR preparation programs are difficult to define due to their vast models of requirements, implementation, and participants (Day & Nagro, 2025, p. 738).” No singular ARTC model for either pre- or post-baccalaureate programming presented a clear advantage in terms of teacher recruitment or outcomes, but all demonstrated promise in fulfilling their goals. Therefore, ARTC Programs that offer multiple pathways, including alternative route programs for adults, paraeducators, and high school students, will invariably serve a broader range of future teachers than those that limit themselves to one specific model. A multi-tiered approach to alternative certification was also shown to increase diversity among alternate route certified teachers. “Much of the research examining the different pipelines used to recruit teachers of color ultimately finds that ‘Grow Your Own’ *and [emphasis added]* residency programs are most successful in recruiting teachers of color (Carter, 2021, p. 2).”
The potential for diversifying teacher candidates through multiple ARTC pathways was supported by McClure and Reeves as early as 2004. Attracting “those who have the interest and potential but lack education credentials and certification [including] secondary school students, community college students, education paraprofessionals, substitute teachers, and professionals in other fields - will require states to develop career pathways that accommodate the particular needs of nontraditional students, including financial aid (p. 16).”

4.2 Meet Future Teachers Where They Are

Preparing pre-service teachers with real-world classroom experience through ARTC programs was a core component of both adult teacher training programs and Grow Your Own models. In many ARTC models, classroom experience was used to supplement, or even replace, traditional lecture-based classes. Such job-embedded training serves as a tool for affirmation, validation, and re-recruitment of ARTC teachers, while providing valuable experience, but it required changes to traditional preparation to be successful. A number of programs moved away from in-person instruction entirely, opting for online modalities, rather than in-person classes for ARTC students.
Online instruction was also shown to remove the barrier of proximity to campuses. The need to “meet the students where they are at” or, in this case, meet the *future teachers* where they are at, was expressed to the authors and emphasized in the literature. This phrase has become commonplace in K-12 classrooms in the post-pandemic era, emphasizing the importance of understanding student readiness and designed instruction scaffolds learners toward instructional goals. Similarly, ARTC candidates must be met where and when they are able. The online modality was frequently cited as the preferred method for flexible ARTC instructional delivery. “One way to address teacher shortages in rural areas is to offer quality alternate route degree programs through an online delivery system, which can overcome the barrier of proximity to a campus or program (Miller et al., 2025, p. 2).”
Shifting to online instruction can be a significant challenge. It is presented throughout the literature as a necessary first step, however, to reducing barriers for alternative route teachers and one that has the greatest potential for sustainability.

4.3 Cultivate Partnerships

Practitioners with whom we worked frequently shared how rapidly the field of teaching had evolved in the years that followed the COVID-19 pandemic leading to teacher burnout and increased attrition. In response, most suggested the need for collaborative efforts and partnerships between schools, colleges and universities, community leaders, and policy makers. “The data is clear: If Pennsylvania hopes to be an educational and economic leader in the future, then recruiting and retaining a skilled and diverse teacher workforce must be a top priority of policymakers (Boyce & Morton, 2023, p.7).”
Local organizations such as PA Needs Teachers have initiated public relations campaigns to address what they say is a teacher shortage crisis that threatens student achievement and the prosperity of the Commonwealth of Pennsylvania. “If we want our kids to be equipped to achieve their dreams and our economy to thrive, it’s simple: PA needs teachers (PA Needs Teachers, n.d.). Similar calls for cooperation among state and local agencies were presented in Blazar et al. (2026), Hamman & Nguyen (2023), and Miller and others (2019).
The recent focus on teacher shortages is not limited to a specific region of the United States, however. It is a national problem that can be addressed through strategic partnerships between school districts, universities, and community organizations. A variety of state-wide reports suggest that coordinated responses have begun; however, more work remains. With this in mind, we frame the discussion of the literature around a case study of ARTC programs at Marywood University in Scranton, Pennsylvania, United States of America.

5. Case Study Discussion

5.1 Multiple Pathways to ARTC

One of the strongest correlations between the literature and the implementation of programs at Marywood University was the importance of offering multiple pathways into the teaching profession. Rather than focusing on a single certification model, the School of Education introduced and developed several ARTC programs. The pathways include a Grow Your Own (GYO) partnership with a local school district, an Early Childhood Education pathway through a Career and Technical Center, and a Paraeducator program with a local education agency. Modifications to the University’s existing Master of Arts in Teaching (MAT) program were also made to reflect the ARTC pathway programs and reduce barriers to entry into the profession for post-baccalaureate students. Each pathway opened the door for students who may not have considered teacher certification through a traditional process.
Conversations with prospective students revealed that beginning or returning to a traditional teacher certification program felt too rigid and often did not align with the realities of ARTC students’ lives, which included full-time employment, caregiving responsibilities, financial commitments, and personal obligations. These pathways were created to provide opportunities for certification to students who previously believed none existed. Flexible online coursework, part-time enrollment programs, reduced tuition costs, and evening and weekend sessions made certification possible for them.
In addition to increasing enrollment, these pathways attracted a more diverse applicant pool, including candidates from a broader range of racial, cultural, socioeconomic, and professional backgrounds. Many students were already connected to their local school through roles such as paraprofessionals, substitute teachers, and classroom aides, which reinforced the benefit of culturally relevant teaching.

5.2 Recruiting ARTC Candidates

Another finding was the importance of relationship-based recruitment efforts and individualized student support through personalized advisement. “Recruiting for the program was not a one-time event [...]. We constantly evaluated our various recruiting strategies [and] recommend that programs designate personnel to be responsible for monitoring recruitment efforts to ascertain that programs are effectively expending their efforts and resources (Miller et al., 2019, p. 13).” Faculty and staff at Marywood made a commitment to meet potential candidates in the field rather than to rely on traditional recruitment through general marketing. That allowed the University to better understand the needs of local schools and create pathways that were more likely to benefit teacher candidates. Faculty advisors then worked closely with students to customize a schedule that took their personal responsibilities, financial resources, work commitments, and long-term professional goals into consideration. Our experience was consistent with Miller and others (2019) in a post-pandemic setting.

5.3 Meeting Them Where They Are

Meeting students "where they are" required changes in modality, course offerings, and master scheduling for the University. The evolution of the program was not always comfortable for faculty and part-time instructors, but the focus quickly shifted to making the online learning space as engaging and supportive as possible so students did not feel as though they were teaching themselves. This required a blend of synchronous and asynchronous classes, redesigning course assignments and assessments to match the modality, and an ongoing commitment to making the coursework relevant, meaningful, and engaging. The program also added course sections and offered coursework outside of normal sequences to ensure that courses were available when students needed to take them. This flexibility helped students stay motivated and served as an important re-recruitment and retention tool by preventing semesters of inactivity.

5.4 Importance of Online Modality and Field Experience

There is no doubt that many faculty still prefer in-person learning experiences for preparing future educators. However, the program recognized that traditional on-campus instruction posed a significant barrier to the ARTC pathways, as described in the literature. This was equally true for high school students who are required to attend school, paraeducators employed by schools and bound by defined operational hours, and post-baccalaureate students with full-time jobs and/or family responsibilities. As a result, the ARTC programs at Marywood adopted a blended approach to online learning and retooled course activities and assessments to better align with an online modality. The flexibility created opportunities for students to pursue certification without sacrificing employment or other responsibilities. More importantly, a shift to online learning preserved and emphasized real-world classroom experiences and job-embedded learning. Students in the Grow Your Own (GYO) program spend up to a full class period each day working with younger students and master teachers to observe and apply basic elements of lesson planning and instructional support. The paraeducator pathway recognizes that paraeducators have daily access to classrooms, students, and experienced teachers and strengthens their experience by providing additional layers of support from faculty, field supervisors, and a structured scope and sequence of applied learning opportunities that deepen understanding of curriculum and pedagogy in their school setting.

5.5 The Role of Partnerships

The redevelopment and continued growth of the SOE's ARTC programs would not have been possible without the cooperation and genuine collaborative efforts of local school districts, school leaders, and community partners. The School of Education made a concerted effort to work directly with educators in their school communities off-campus. In turn, school leaders and community partners opened their doors and worked collaboratively with the University to identify certification pathways that could address staffing shortages without significantly disrupting the school schedule and staffing. Each partner school and school leader played an essential role in creating, redefining, and sustaining the ARTC pathways. These partnerships provided valuable insight into constantly changing workforce needs, local challenges, and the types of support necessary for future teachers to be successful.

School leaders were essential personnel who identified ARTC candidates already working within their schools as substitute teachers, paraprofessionals, or support staff, and encouraged them to pursue certification through an alternative pathway aligned to their needs. As a result, the ARTC programs expanded access to the teaching profession while supporting local schools in addressing staffing shortages in the areas of greatest need, particularly rural and urban schools and more generally, special education classrooms. Efforts are now underway to recruit additional candidates for math and science certifications which remain difficult to fill.

Through the ARTC pathways, enrollment in the School of Education at Marywood increased 45% in three years. These results suggest that partnerships between universities, school districts, and community organizations are, in fact, essential for developing sustainable and responsive teacher preparation pathways capable of addressing the ongoing challenges caused by teacher shortages.

6. Limitations

There were several limitations to this literature review and case study. First, the research was limited to themes expressed to the authors of this paper in K-12 settings in the United States. It relied heavily on

available literature published in the past five years (2021-2026) and used spiralization to identify earlier work that might inform best practices. A comprehensive review of the literature dating back to the origin of alternative teacher certification programs may yield different results. The same can be said for the inclusion of literature focused on international schools.
The discussion of the case study is similarly limited to one small private university in Northeastern Pennsylvania, United States, and may not be reflective of a broader sample of colleges and universities that offer ARTC programs, both domestically and abroad.

7. Implications and Conclusion

This paper presented the changing needs of ARTC programs. Those needs are most relevant to anyone working in a higher education leadership position with teacher training programs. The paper stressed the importance higher education leaders working closely with their K-12 counterparts to respond to current teacher shortages. In doing so, we must also recognize the changing needs of K-12 school leadership.
Principals, supervisors, and superintendents will need to commit to the recruitment and retention of a fully qualified and diverse staff in a way that may not have been addressed in their leadership training programs. Graduate leadership programs should be willing to offer support and training designed for new challenges in K-12 leadership.
Our conversations with K-12 school leaders led to the realization that modifications to our own graduate-level leadership training program were necessary. Closer attention to applied leadership styles that reduce teacher attrition, improve working conditions and school climate, and support a greater understanding of labor relations were prioritized over management theory.
In making those adjustments, students' confidence in their ability to resolve complex problems of practice that lead to teacher shortages increased. Interest grew in the program resulting in higher enrollments and greater diversity of leadership candidates over the past two years. The redesign also led to the creation of a new degree at the University - a Doctor of Education in Educational Leadership – that is focused on leading "in the new normal." The Ed.D. in Educational Leadership has now expanded to an international market for teacher-leaders and school administrators around the world leading to greater learning experiences and preparation of leadership candidates.
In summary, the themes presented in the Alternate Route Teacher Certification research were able to be directly applied to school leadership: in order to prepare the next generation of highly qualified educators *and educational leaders,* we must provide multiple pathways that reduce barriers to entry, meet aspiring educators and educational leaders where they are at, and maintain collaborative relationships between K-12 schools and certification programs, in order to resolve shortages now and in the future.

The Landscape of Becoming a Science Teacher: A Case Study on Professional Identity, Inquiry and Emotions in Preservice Teachers' Education

Cristina García-Ruiz[1], Teresa Lupión-Cobos[2], Ángel Blanco-López[3]

[1,2,3]Science Education, Universidad de Málaga, Spain

Abstract

In recent years, teaching identity has emerged as a growing research area in science education, considering its impact on students' performance. This study explores the interrelationships between teacher identity construction, inquiry orientation, and emotional experiences of Physics and Chemistry preservice teachers during their initial teacher education. We performed a multidimensional analysis using a case-study approach and validated instruments, such as the pre-service teachers' IBSE perception (PTIT) questionnaire for inquiry perception and the Professional Practice and Inquiry (PPI) questionnaire for identity perception. Results revealed that pre-service teachers generally recognised the value of inquiry-based approaches for students, experienced predominantly positive emotions during training, and had difficulty in establishing past-present connections, likely due to limited teaching experience. The study found that high teaching identity scores on the PPI questionnaire did not necessarily correlate with inquiry orientation. At the same time, positive emotions were observed across different profiles, suggesting that becoming a science teacher follows individualized pathways. Consequently, this research highlights the importance of integrating identity, inquiry, and emotions into teacher education programs and of designing personalised approaches to support diverse developmental trajectories while maintaining high professional standards.

Keywords: *Pre-service teachers, teacher identity, inquiry-based science education, emotions*

1. Theoretical Framework

Research on the construction and development of teaching identity has recently sparked a growing interest in science education due to its influence on the development of teaching strategies and its direct impact on student learning. [1]. Determined by contextual and personal factors and with a dynamic and multidimensional nature, which evolves hand in hand with professional development [2], it refers to the self-concept or central image constructed from experiences, beliefs, and values, personal and practical practices that shape teaching actions.

In Secondary Education, pre-service teachers (PSTs) also face a duality between their identity as students and their identity as science teachers, giving rise to difficulties during teacher education programs. These difficulties are mostly related to the change in professional identity, the teaching model they aspire to, and their previous professional experience [3].

On the one hand, the construction of the teaching identity closely relates to PSTs' research capacity, not only to the skills to teach students through a research approach but also to the ability to address philosophies and ways of interacting within an educational community that values and practices science and technology through inquiry, being able to deliberate reflection aimed to focus on problem posing [4]. By inquiring and examining their understanding of teaching, PSTs question, think, discuss, and further increase awareness of their understandings, values, and dispositions to teach to solidify their role as teachers [5].

On the other hand, recent research has also highlighted the relevant role of emotions in configuring teacher identity [6]. The emotional profile that teachers experience about their identity is complex and not unidirectional, meaning that PSTs can face teaching challenges associated with "negative" emotions and yet have the ability to reverse these emotions, hence contributing significantly to the development of their teaching identity [7].

2. Aims and Research Questions

This research aims to explore the complex interplay between teacher identity construction, inquiry orientation, and emotional experiences in Physics and Chemistry PSTs during their initial teacher education. Specifically, we examine how these three factors interact and influence each other during the development of the professional teaching identity, addressing the following research question:
[**RQ1**] What are the PSTs' perceptions about inquiry, emotions and identity?
[**RQ2**] What patterns emerge from integrating identity perception, inquiry orientation, and emotional experiences in PSTs?

3. Methodology

This research presents a case study developed with eight Physics and Chemistry PSTs of the Secondary Teaching Master Degree (MEd) at the University of Málaga during the academic year 2020/2021. They all held a bachelor's or master's degree in either Science or Engineering, a prerequisite to enrolling in the MEd, which is compulsory to become a Secondary Education Teacher. All participants had different teaching and research experience levels, although not in a professional way.
Data were collected in agreement with the Ethics Committee of the University of Málaga (CEUMA) (ref. no. 139-2023-H) during the completion of the MEd, where PSTs received specific instruction about inquiry-based science education, teacher identity and emotions through a training program outlined to promote the professional development associated with these aspects [8],[9].
We employed an integrated multidimensional analysis approach to examine the relationships between teacher identity, emotional experiences, and inquiry orientation. This approach allows for systematically comparing and integrating data from three distinct quantitative instruments, identifying patterns and relationships across these factors of teacher development (Figure 1).

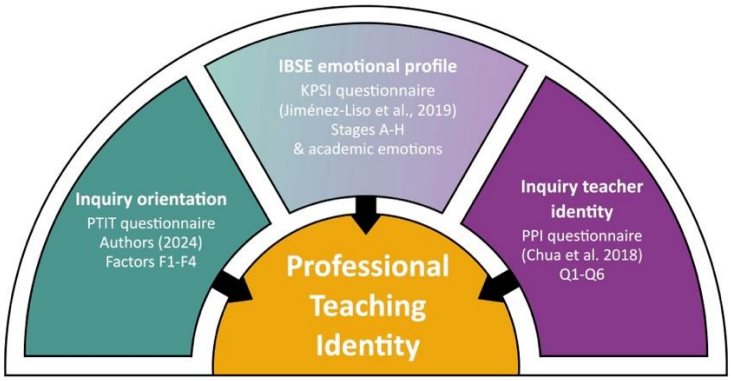

Fig. 1. Integrated multidimensional analysis framework

To deepen the perception of inquiry, we applied the validated PSTs IBSE perception (PTIT) Likert-type questionnaire (1: totally disagree to 4: totally agree) [10], which provides an idea of the PSTs' disposition towards inquiry-based science education (IBSE). To do so, we calculated the participants' scores for each of the four factors composing the questionnaire (**F1**, IBSE teaching practice; **F2**, IBSE students' applicability; **F3**, IBSE difficulties related to personal aspects; and **F4**, IBSE difficulties related to external aspects). Regarding the emotional profile that emerged in the teaching role, we adapted the instrument described by Jiménez-Liso et al. [11], including the stages of the design of inquiry activities (**A**, focussing; **B**, context; **C**: development; **D**: curriculum; **E**: management; **F**: assessment; **G**: communication, and **H**: transfer), combining the multiple selection of achievement (**TRU**, trust; **SAT**, satisfaction; **SHA**, shame, and **DIS**, dissatisfaction) and epistemic emotions (**INT**, interest; **CON**, concentration; **BOR**, boredom; **REJ**, rejection and **INS**, insecurity).
Finally, to explore identity perception we applied an adaptation of the validated Professional Practice and Inquiry (PPI) questionnaire created by Chua et al. [12], selecting six Likert-type questions (1: strongly disagree, 5: strongly agree) aimed to detangle what it means to be an inquiring teacher professional (**Q1-Q6**), showing the PSTs capability of being effective inquirers regarding their teaching practices and identity development.

4. Findings

Figure 2 shows the comparison of the inquiry, emotions and identity profile by participant, revealing some interesting variations and commonalities. When analysing the participants' orientation toward inquiry [**RQ1**], some patterns across the group arose.

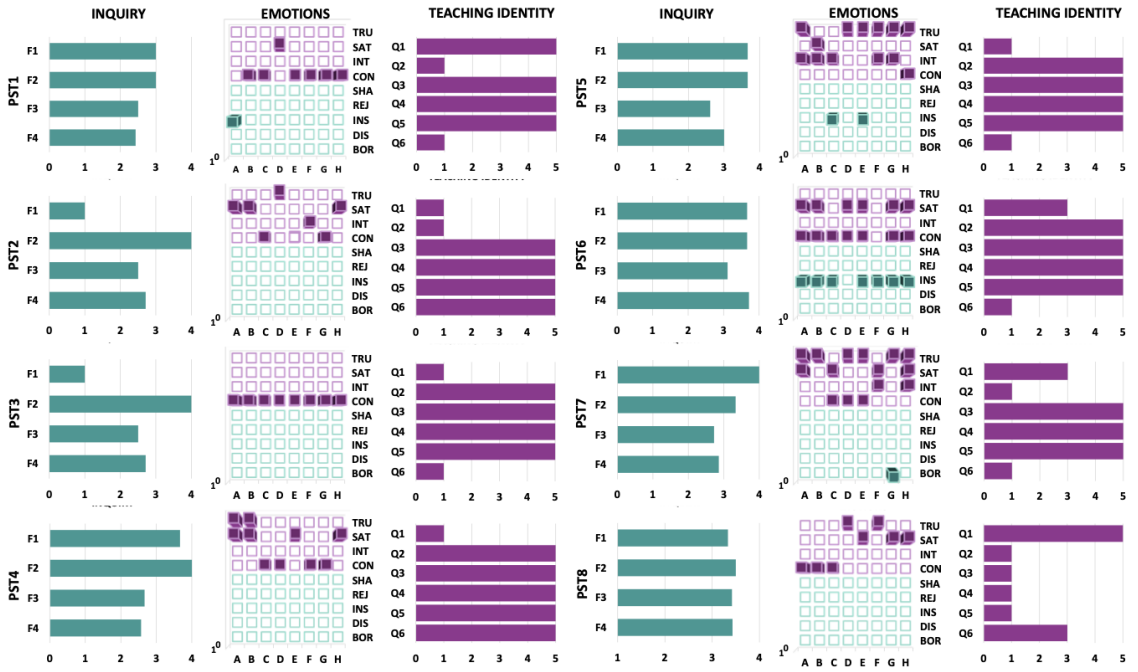

Fig. 2. Comparison of the identity, inquiry and emotional profile by participant

Factor **F2** emerged as a decisive dimension across participants, suggesting they recognise the motivational value of inquiry-based approaches for students and indicating a predominantly student-centred perspective. The contrast between internal difficulties (**F3**) and external difficulties (**F4**) provides mixed insight into perceived barriers, with scores being relatively similar in both dimensions. The data also revealed that PST6 and PST8 demonstrated exceptionally balanced scores across all inquiry factors, indicating a solid overall orientation toward inquiry-based teaching practices. In contrast, PST2 showed a disparity between factors, with particularly low scores in **F1**, but high in **F2**, suggesting strong recognition of IBSE value for students despite challenges in implementation.

The participants' emotional experiences during IBSE activities [**RQ1**] revealed a predominance of positive emotions, with concentration emerging as the most frequently experienced emotion. Trust and satisfaction also appeared consistently, though with varying patterns among different participants. PST5 and PST7 demonstrated particularly strong positive emotional profiles. While negative emotions (insecurity, dissatisfaction, boredom) were less frequent, some participants, such as PST6, exhibited a more diverse emotional range, stressing the complex nature of emotional development during teacher preparation.

Considering teaching identity [**RQ1**], most participants (except PST8) demonstrated stronger connections to aspects linked to questions **Q3**, **Q4**, and **Q5** related to ways to improve teaching practice. However, participants showed lower scores in establishing past-present connections (**Q6)** likely reflecting their limited teaching experience. The variation in **Q1** ("having a question in mind") and **Q2** ("thinking about classroom experiences to support my stance") also suggests different levels of engagement with evidence-based reflective practice. Particularly interesting were the cases of PST4 and PST8, who exhibited distinctly different identity profiles from their peers. PST4 demonstrated remarkably consistent high scores across all identity dimensions, suggesting a well-developed and balanced teaching identity. In contrast, PST8's profile revealed more moderate scores, indicating a different trajectory in identity development.

One of the most compelling findings emerged from examining relationships between the three dimensions (identity, inquiry and emotions) [**RQ2**]. Some participants with high teaching identity scores (particularly in Q3-Q5) showed varying inquiry orientation scores, suggesting these aspects of teacher development might not be as directly related as previously assumed. The emotional dimension adds another layer of complexity, with positive emotions (*trust, satisfaction, confidence*) appearing across different profiles regardless of identity or inquiry scores.
A particularly interesting case was PST8, whose profile showed a distinctive pattern. Despite lower scores in identity dimensions (especially Q3-Q5), this participant demonstrated consistently moderate-to-high inquiry scores across all factors, while maintaining positive emotions (concentration, satisfaction), challenging simple correlations and suggesting that balanced inquiry perceptions can coexist with different identity profiles.
These findings lead us to suggest three main development patterns (table 1): i) confidence-led development, exemplified by PST4-PST6, showing particularly high reflection scores (**Q3-Q5**), strong F1 and F2 scores, and predominantly positive emotions across phases, though notably PST6 also expressed insecurity; ii) a growth-oriented pattern, exhibited by PST2, PST3 and PST7, with strong improvement-focused reflection (**Q3, Q5**) but more variations in **Q1, Q6** and **F1** scores, accompanied by generally positive emotional responses; and iii) a challenge-aware development, represented by PST1 and PST8.

Table 1. Suggested patterns correlating identity, inquiry and emotions for each participant

Pattern type	PST	Identity*						Inquiry**				Most frequent emotions
		Q1	Q2	Q3	Q4	Q5	Q6	F1	F2	F3	F4	
Confidence-led	4	1	5	5	5	5	5	3.7	4.0	2.7	2.6	CON, SAT
	5	1	5	5	5	5	1	3.7	3.7	2.6	2.1	INT, TRU
	6	3	5	5	5	5	1	3.7	3.7	3.1	3.7	CON, SAT, INS
Growth-oriented	2	1	1	5	5	5	5	1.0	4.0	2.5	2.7	CON, SAT
	3	1	5	5	5	5	1	3.5	4.0	2.7	2.6	CON
	7	3	1	5	5	5	1	3.5	3.3	2.7	2.9	SAT, TRU
Challenge-aware	1	5	1	5	5	5	1	3.0	3.0	2.5	2.4	CON
	8	5	1	1	1	1	3	3.3	3.5	3.4	3.4	CON, SAT

* Scores ** Factor mean value

5. Conclusions and Educational Implications

This research shows how PSTs perceived the development of their teacher identity, their readiness to inquiry and their emotional profile experienced during the MEd. Performed as a case study, the varied profiles observed in this study highlight the importance of personalized approaches to teacher education that can accommodate and support different developmental trajectories while maintaining high standards for professional growth.
With the caution due to the reduced number of participants, the emergence of three distinct developmental patterns (confidence-led, growth-oriented, and challenge-aware) suggests that becoming a science teacher is not a uniform process but rather a highly individualized journey where multiple pathways can lead to successful professional development.
Despite the limitations of our small sample size, these insights provide valuable direction for future research and practice in science teacher education, particularly in understanding how to better support PSTs in developing their teaching identity through inquiry-based approaches while attending to their emotional well-being. Integrating these three dimensions - identity, inquiry, and emotions - is fundamental in shaping effective science teachers, suggesting that teacher education programs should explicitly address and support all three aspects of their curriculum and practice.

Innovating Entrepreneurship Education through Lived Practice: A Self-Study of Professional Practice Using the 4Ps of Innovation

Karen McGivern

St Mary's University College, Northern Ireland

Abstract

*Entrepreneurship education in higher education increasingly emphasises innovation, authenticity and experiential learning, yet limited research has examined how educators' own entrepreneurial practice informs innovation pedagogy. This paper presents an innovation-focused self-study of professional practice that explores how the author's dual role as a micro-entrepreneur and business educator enriched student learning and supported ongoing business development through the application of the **4Ps of Innovation framework** [3]. Drawing on reflective self-inquiry, professional teaching artefacts and curriculum design decisions, the study examines how product, process, position and paradigm innovation were modelled through lived micro-enterprise practice and embedded within entrepreneurship teaching. The findings suggest that using the 4Ps as a reflexive bridge between theory and practice enabled students to engage with innovation as an accessible, iterative and sustainable activity, while simultaneously informing continuous improvement within the micro-business. While context-specific, the study offers analytically transferable insights and a practice-informed framework that other entrepreneurship educators and practitioner-researchers can adapt.*

Keywords: *self-study of professional practice; innovation education; 4Ps of innovation; micro-enterprise; entrepreneurship education*

1. Introduction

Innovation is positioned as a core pillar of entrepreneurship education within UK higher education, aligned with sector priorities around employability, enterprise capability and real-world relevance [1],[5]. Yet innovation is frequently presented in ways that privilege technological disruption, scalability and high-growth start-up cultures. Such representations risk narrowing students' conceptual understanding and obscuring the incremental and multidimensional nature of innovation that characterises the majority of UK enterprises, particularly micro-businesses [4].

The 4Ps of Innovation framework conceptualises innovation across four domains:

- **Product innovation** – changes in goods or services
- **Process innovation** – changes in creation and delivery methods
- **Position innovation** – changes in market context or framing
- **Paradigm innovation** – changes in underlying mental models or business logic [3]

This framework provides a broader lens through which innovation can be understood beyond technological novelty. However, while widely cited in innovation management literature, its pedagogical operationalisation within entrepreneurship education remains underexplored. Many entrepreneurship educators simultaneously engage in entrepreneurial activity. The potential of this dual professional identity to model multidimensional innovation for students has received limited scholarly attention. This paper addresses that gap by examining how the author's micro-enterprise practice was analysed and enacted through the 4Ps framework and embedded within entrepreneurship teaching through a self-study of professional practice.

2. Micro-enterprise, and the Multidimensionality of Innovation

Micro-enterprises, defined as businesses employing fewer than ten individuals, constitute the dominant form of enterprise within the UK economy [4]. Operating under constrained resources, such businesses rarely engage in radical innovation. Instead, innovation emerges incrementally and pragmatically across multiple dimensions.

Within micro-enterprise contexts:

- **Product innovation** may involve adaptation, bundling, or refinement rather than invention.
- **Process innovation** often centres on efficiency, customer interaction models or digital integration.
- **Position innovation** may involve reframing services to reach new markets or alter perceived value.
- **Paradigm innovation** may require rethinking the fundamental assumptions underpinning value creation.

Entrepreneurship education has historically privileged product-focused narratives of innovation. This emphasis risks reinforcing a narrow understanding of entrepreneurial success. The 4Ps framework challenges this by foregrounding innovation as systemic and interconnected, aligning more closely with micro-enterprise realities and offering a more inclusive and attainable conception of innovation for students [3]. Bessant and Tidd [3] argue that innovation should be understood as a multidimensional process extending beyond product development to include changes in processes, positioning and organisational paradigms. This broader conceptualisation is particularly relevant within entrepreneurship education, where students may otherwise develop narrow understandings of innovation associated primarily with technological invention or high-growth business models. While alternative innovation frameworks such as Design Thinking [8] and Lean Startup approaches [9] emphasise iterative problem-solving, customer feedback and rapid experimentation, these models often focus primarily on product development and venture creation processes. In contrast, the 4Ps of Innovation framework offers a broader conceptualisation of innovation by recognising that innovation can occur simultaneously across products, processes, positioning and organisational paradigms. This multidimensional perspective is particularly valuable within entrepreneurship education because it enables students to identify innovation opportunities beyond technological invention or high-growth start-up cultures. The framework therefore aligns closely with experiential and reflective pedagogies by helping students analyse innovation within authentic, resource-constrained and practice-based contexts.

3. Methodological Framework: Self-Study of Professional Practice

This study adopts a self-study of professional practice methodology, positioning the educator's entrepreneurial and pedagogical activities as the primary site of inquiry. Self-study approaches are well established in teacher education and the scholarship of teaching and learning, where they facilitate systematic interrogation of professional knowledge-in-practice [6], [7]. Entrepreneurial decision-making was not treated as an anecdotal illustration but as analytically interrogated data. Innovation decisions within the micro-enterprise were retrospectively and contemporaneously mapped against the 4Ps framework. These reflections were then traced into curriculum design, assessment construction and classroom dialogue. The purpose was not statistical generalisability but analytical transferability, generating conceptual insights that may inform similar educator-practitioners operating within entrepreneurship education contexts.

4. Conceptual Framework: the 4Ps of Innovation as Pedagogical and Reflexive Framework

The conceptual framework integrates dual professional identity with the 4Ps of Innovation as both:

1. **Analytical Lens** – to examine innovation within the micro-enterprise
2. **Pedagogical Scaffold** – to structure innovation teaching
3. **Reflexive Tool** – to interrogate underlying entrepreneurial assumptions

Within the micro-enterprise, innovation was mapped systematically:

Product Innovation
Refinement of service offerings, bundling strategies and experience design were analysed not as routine adjustments but as deliberate innovation activity.
Process Innovation
Operational systems, client onboarding, digital tools and workflow redesign were examined as forms of value-creating innovation rather than administrative necessity.
Position Innovation

Market reframing and shifts in target audience communication illustrated how repositioning altered perceived value without altering core offerings.

Paradigm Innovation

Most significantly, underlying assumptions concerning value, growth, and entrepreneurial success were critically interrogated. This level of innovation challenged taken-for-granted entrepreneurial narratives and reshaped both business strategy and teaching philosophy.

Embedding these dimensions into curriculum design allowed innovation to be presented as layered and systemic rather than singular or product driven.

5. Methodology: Innovation-focused Self-study Process

The research process mirrored innovation itself: iterative, reflective and recursive.

Professional artefacts analysed included:

- Module learning outcomes
- Assessment briefs
- Teaching slides and case materials
- Student innovation analyses

These artefacts were examined to trace how the 4Ps framework increasingly structured:

- Classroom questioning
- Assessment rubrics
- Student business analysis tasks
- Feedback language

Thematic analysis identified recurring shifts:

- Movement from product-centric examples toward multidimensional innovation mapping
- Increasing emphasis on paradigm questioning
- Greater student ability to identify interconnections across innovation types

Literature on experiential learning and innovation management provided a critical interpretive frame [3],[10]. Reflexivity formed an important component of the research process, particularly given the author's dual role as educator and micro-entrepreneur. Ongoing reflective journaling and iterative revisiting of teaching artefacts enabled assumptions, biases and professional positioning to be critically interrogated throughout the study. Rather than attempting to eliminate subjectivity, the study acknowledged practitioner perspective as a valuable source of insight, consistent with established principles of self-study research [6].

6. Findings: The Pedagogical Power of the 4Ps

The findings reveal that the 4Ps of Innovation framework functioned as more than a conceptual model for analysing business activity. Within this study, the framework became a pedagogical scaffold that enabled students to engage with innovation as a multidimensional, iterative and accessible process grounded in authentic entrepreneurial practice. Three interrelated pedagogical insights emerged from the analysis.

6.1 Making Innovation Accessible through Micro-enterprise Practice

Framing innovation through lived micro-enterprise practice made innovation more accessible and less intimidating for students. Initially, many students associated innovation primarily with technological disruption, invention or large-scale entrepreneurial ventures. However, engaging with authentic examples drawn from a functioning micro-enterprise enabled students to reconceptualise innovation as incremental, contextual and achievable.

At the level of **product innovation**, students began to recognise that innovation does not necessarily involve creating entirely new products or services. Instead, innovation was understood through adaptation, refinement and recombination. Incremental changes to service offerings, customer experience and delivery methods demonstrated how innovation could emerge through continuous improvement rather than radical invention. This reduced student anxiety surrounding innovation and broadened perceptions of what entrepreneurial creativity might involve.

Similarly, **process innovation** helped students recognise forms of innovation that are frequently overlooked within entrepreneurship education. Operational systems, workflow redesign, client communication practices and digital integration were initially perceived as administrative or routine activities rather than innovation. Mapping these practices explicitly against the 4Ps framework made visible how value is created and delivered within resource-constrained contexts. Students subsequently demonstrated greater awareness of the strategic importance of operational innovation within small businesses.

The study also highlighted the pedagogical value of **position innovation**. Students demonstrated increasing sophistication when analysing how identical services could be repositioned for different audiences, contexts or value propositions without fundamentally altering the core offering itself. This challenged assumptions that innovation must involve changing the product or operational structure and instead highlighted the importance of communication, perception and market framing.

Together, these dimensions repositioned innovation as an ongoing and multidimensional activity embedded within everyday entrepreneurial practice rather than as an exceptional or distant achievement. This broader conceptualisation appeared particularly valuable for students who did not initially identify with high-growth or technology-driven entrepreneurial narratives.

6.2 Bridging Innovation Theory and Practice through the 4Ps Framework

The 4Ps of Innovation framework provided a shared conceptual language that effectively bridged academic theory and lived entrepreneurial experience. Students engaged more deeply with innovation concepts when they could observe how product, process, position and paradigm innovation operated simultaneously within a real micro-enterprise context.

The framework supported movement beyond surface-level understandings of innovation by encouraging students to identify interconnected forms of change within a single business example. Rather than viewing innovation as isolated acts of product development, students increasingly recognised the systemic relationships between operational processes, market positioning and underlying business assumptions. This multidimensional perspective aligned more closely with the realities of contemporary micro-enterprise practice.

The consistent application of the 4Ps framework across teaching activities, case discussions and assessment tasks also provided coherence within the curriculum. Students became more confident in applying innovation theory critically to their own entrepreneurial ideas and analyses. The framework therefore functioned not only as a descriptive model but as a cognitive scaffold that structured analytical thinking and supported deeper engagement with entrepreneurship concepts.

Importantly, the framework also enabled innovation to be discussed in more inclusive and realistic terms. By foregrounding incremental and context-specific innovation rather than exclusively disruptive or technological models, the teaching approach validated diverse entrepreneurial pathways and experiences. This appeared to strengthen students' confidence in recognising innovation opportunities within familiar and constrained contexts.

6.3 Paradigm Innovation and Reciprocal Reflection

The most transformative pedagogical insight emerged at the level of **paradigm innovation**, where both students and educator engaged in deeper questioning of underlying entrepreneurial assumptions. Students began critically examining dominant narratives surrounding business growth, success and innovation, exploring alternative entrepreneurial logics and definitions of success aligned with sustainability, lifestyle entrepreneurship, wellbeing and community impact. Paradigm innovation therefore extended beyond business operations into the formation of entrepreneurial identity and values.

At the same time, the process of teaching innovation prompted ongoing reflection within the micro-enterprise itself. Preparing teaching materials, articulating innovation concepts and facilitating classroom discussion encouraged critical interrogation of existing business assumptions and practices. Teaching became a reflexive space in which entrepreneurial decisions were reconsidered and opportunities for further innovation identified.

This reciprocal relationship between teaching and entrepreneurial practice became one of the most significant findings of the study. Pedagogical reflection informed business development, while lived entrepreneurial experience continually reshaped curriculum design and classroom dialogue. The 4Ps framework therefore functioned simultaneously as an analytical lens, a pedagogical scaffold and a professional reflexive tool.

The findings suggest that innovation pedagogy can extend beyond supporting student learning to become a mechanism for ongoing professional learning and business development for educator-practitioners themselves. In this way, innovation emerged not as a linear outcome but as a cyclical and reflective process operating across both educational and entrepreneurial domains.

7. Contribution and Usefulness of the Study

This study contributes to entrepreneurship education literature by extending understandings of how innovation pedagogy can be authentically enacted through educators' own entrepreneurial practice. While entrepreneurship education research frequently emphasises student learning experiences, less attention has been given to how educators' dual professional identities shape the teaching of innovation. This study therefore foregrounds the educator not simply as facilitator of entrepreneurial learning, but as an active site of innovation practice and reflective inquiry.

A key contribution of the study lies in demonstrating how the 4Ps of Innovation framework can operate simultaneously as an analytical lens, pedagogical scaffold and reflexive professional tool. Rather than presenting innovation as primarily technological or product-driven, the study illustrates how product, process, position and paradigm innovation can be embedded within everyday micro-enterprise activity and translated into authentic and practice-oriented entrepreneurship teaching. In doing so, the paper extends existing applications of the 4Ps framework by illustrating its pedagogical usefulness within higher education contexts and its relevance to small-scale, resource-constrained entrepreneurial environments.

The findings also contribute to wider debates concerning inclusivity within entrepreneurship education. By repositioning innovation as incremental, multidimensional and contextually situated, the study challenges dominant high-growth and disruption-oriented narratives that can unintentionally alienate students who do not identify with traditional entrepreneurial archetypes. The pedagogical approach presented here therefore supports broader and more accessible understandings of entrepreneurial capability and innovation practice.

Methodologically, the study demonstrates the value of self-study of professional practice as an approach for examining innovation pedagogy within higher education. The integration of reflective inquiry, professional artefacts and lived entrepreneurial experience enabled the development of analytically transferable insights into the relationship between teaching, professional identity and innovation. In particular, the study highlights the significance of reciprocal reflection, where teaching informs entrepreneurial development while entrepreneurial practice simultaneously reshapes pedagogy.

While context-specific, the conceptual framework and reflective processes developed through this study may offer a useful model for other entrepreneurship educators and practitioner-researchers seeking to integrate innovation theory, authentic practice and reflexive teaching within their own educational contexts.

8. Limitations and Ethical Considerations

As a self-study of professional practice, the findings are context-specific and are not intended to be statistically generalisable. Instead, the study seeks to provide analytically transferable insights that may resonate with and inform the practice of other entrepreneurship educators operating within similar contexts. The interpretations presented are shaped by the author's dual role as educator and micro-entrepreneur, which inevitably introduces elements of subjectivity into the research process. However, within self-study methodology, such positionality is not viewed solely as a limitation but as a valuable source of professional insight and reflexive understanding [6],[7].

The dual-role nature of the study also required ongoing reflexivity to mitigate the potential for uncritical self-representation or confirmation bias. Critical reflection was therefore embedded throughout the research process, particularly during the interpretation of professional experiences and teaching artefacts. Engagement with relevant literature and systematic interrogation of recurring themes supported analytical rigour and helped situate personal reflections within broader educational and entrepreneurship debates.

Ethical considerations were addressed through anonymisation of teaching contexts and a focus on professional learning rather than evaluation of students or colleagues, in line with established ethical guidance for practitioner research [2]. No student data were used directly within the study, and reflective analysis centred primarily on curriculum design, pedagogical practice and professional experience.

A further limitation relates to the scale and specificity of the micro-enterprise context examined. The innovation practices discussed may not fully reflect the realities of larger organisations or different disciplinary settings. Nevertheless, the study's focus on micro-enterprise offers an important contribution to entrepreneurship education, given the prevalence of small and resource-constrained businesses within contemporary economies.

9. Conclusion

This paper has demonstrated how the integration of lived micro-enterprise experience with the 4Ps of Innovation framework can enrich entrepreneurship education by bridging innovation theory and authentic professional practice. Through a self-study of professional practice, the research illustrated how product, process, position and paradigm innovation can be enacted within everyday entrepreneurial activity and translated into meaningful pedagogical experiences for students. The findings suggest that the 4Ps framework offers more than a model for analysing business innovation; it can also function as a pedagogical scaffold and reflexive professional tool that supports deeper engagement with entrepreneurship learning. By reframing innovation as multidimensional, incremental and contextually situated, the study challenges narrow representations of entrepreneurship that privilege technological disruption and high-growth ventures. Instead, innovation is positioned as an accessible and ongoing process embedded within real-world entrepreneurial practice.

A particularly significant insight concerns the role of paradigm innovation and reciprocal reflection. The study demonstrated how teaching innovation can simultaneously reshape entrepreneurial practice, while lived entrepreneurial experience continually informs curriculum design and pedagogical decision-making. In this way, dual professional identity emerges not simply as background experience, but as a valuable source of innovation knowledge, reflexive inquiry and authentic learning.

While context-specific, the study contributes analytically transferable insights into how entrepreneurship educators may integrate innovation theory, professional practice and reflective pedagogy to create more inclusive, grounded and practice-oriented approaches to entrepreneurship education.

Prospective Teachers' Knowledge of Multiplication

Stein A. Berggren[1], Paal Jom[2]

[2]Nord University, Norway

Abstract

According to the Norwegian curriculum ([1]), students are expected to learn the basics of multiplication in third grade. It is therefore important that prospective primary school teachers possess solid knowledge of how to teach multiplication ([2]). While there is a substantial body of research on prospective teachers' understanding of multi-digit multiplication algorithms ([3]), comparatively little attention has been given to how prospective teachers solve multiplication problems that do not require the use of standard algorithms. Inspired by the study of Fischbein et al. (1985) ([4]), which investigated how Italian students solved word problems involving multiplication and division, we conducted a study examining how 46 prospective primary school teachers, in their first semester of teacher education, solved eight arithmetic problems. Four of these problems focused on multiplication and proportionality. The prospective teachers' solutions to these four problems constitute the data material for the present study. The prospective teachers' solutions were analyzed using a thematic qualitative analysis approach ([5]). Since the tasks solved by the prospective teachers fall between what the literature describes as single-digit arithmetic and multi-digit arithmetic ([6]), we developed an analytical framework tailored to this intermediate level. This framework was inspired by Hickendorff et al.'s (2019) ([6]) classification system for multi-digit multiplication strategies, as well as by Cramer and Post's (1993) ([7]) categorization of solution strategies for proportionality tasks. The results indicate that prospective teachers predominantly rely on procedural knowledge when solving problems related to multiplication and proportionality. This suggests a need for changes in teacher education, with greater emphasis on fostering prospective teachers' conceptual understanding of these topics.

Keywords: *Prospective teachers, multiplication, proportionality, solution strategies, procedural knowledge*

1. Introduction

The four basic arithmetic operations are fundamental to further learning in mathematics. It is therefore crucial that students acquire solid knowledge and skills in these operations during primary school. It is difficult to argue that one of the four operations is more important than the others; however, multiplication is sometimes described as the core of basic arithmetic instruction, as an operation, and it is a key component of several other mathematical topics, such as division, fractions, and proportionality ([8]). In the Norwegian school system, multiplication is introduced in Grade 3 (ages 7–8) ([1]). At this grade level, four out of eleven competence aims relate to multiplication. In Grade 4 (ages 8–9), three out of ten competence aims include content relevant to multiplication, such as exploring and explaining relationships between the four arithmetic operations. In addition, three of the competence aims focus on division, which is the inverse operation of multiplication. This highlights multiplication as a central topic for students in Grades 1–4 in the Norwegian school system.

Teachers' competence is crucial in the challenging and complex process of teaching mathematics. More specifically, specialized content knowledge in mathematics is essential for teachers to teach mathematics effectively ([9]). Teachers who have developed advanced levels of specialized content knowledge are better equipped to understand students' thinking and to interpret the solutions students produce ([2]). For this reason, teacher education programs aim to educate teachers who develop and acquire deep specialized content knowledge. Furthermore, although this may seem self-evident, it is worth emphasizing that teachers who teach multiplication should themselves have a solid understanding of the operation of multiplication ([10]).

It has long been recognized that students' arithmetic is characterized by strategic variation, meaning that students use a variety of different strategies to solve arithmetic problems ([11]; [6]). This variation includes both interindividual variation, which refers to different individuals relying on different strategies to solve a given arithmetic task, and intraindividual variation, which refers to a single individual using

different strategies to solve different tasks, or even the same task at different points in time and/or in different contexts ([4]; [12]).
Several studies have examined how prospective teachers apply multi-digit multiplication algorithms ([3]) and have concluded that they experience difficulties in understanding these algorithms. However, there is limited research on how prospective teachers solve multiplication problems that do not require the use of algorithms. Therefore, in the present study, we investigate how 46 prospective teachers enrolled in the primary teacher education program (Grades 1–7) solve multiplication tasks that do not require the use of a multiplication algorithm.
The data material in this study is based on eight arithmetic tasks solved by 46 prospective teachers enrolled in the primary teacher education program (Grades 1–7). The first four tasks required the use of addition and subtraction and are not included in the present study. The remaining four tasks address multiplication and proportionality, and it is the students' solutions to these tasks that are analyzed in this study. The tasks are inspired by the study by Park and Nunes (2001) ([13]) and are presented in Table 1.

2. Theory

In this section, we highlight different situations and definitions of multiplication that are considered relevant for the present study. Greer (1992) ([14]) describes ten different situations for multiplication. Two of these are identified in this study: repeated addition with equal groups and multiplicative change of quantities (proportionality). An example of repeated addition with equal groups is: *"3 children each have 4 oranges. How many oranges do they have altogether?"* In contrast, the task *"A piece of elastic can be stretched to 3.3 times its original length. What is the length of a piece that is 4.2 meters long when fully stretched?"* exemplifies multiplicative change of quantities ([14]).
Lampert (1986) ([15]), on the other hand, describes multiplication as an operation involving two factors, $a \cdot b$, where the factor a represents the number of groups (the multiplier) and the factor b represents the number of objects in each group (the multiplicand). The product ($a \cdot b$) indicates the total number of objects across all groups. This relationship can be expressed as $a \cdot b = p$ ([16]). This definition is consistent with Fischbein et al. (1985) ([4]), who describe multiplication as $operator \cdot operand$, where the operator represents the number of groups and the operand represents the number of objects in each group.
When considering the commutative property of multiplication ($a \cdot b = b \cdot a$), the factors take on different roles (cf. [15]). According to Beckmann and Izsák (2015) ([17]), the fact that the multiplier and multiplicand assume different roles results in two different perspectives on proportional relationships: the *multiple-batches perspective*, where the multiplier varies and the multiplicand remains constant, and the *variable-parts perspective*, where the multiplicand varies and the multiplier remains constant.
Although multiplication can be defined as $multiplier \cdot multiplicand = product$ ([15]; [16]), research shows that students perform multiplication in multiple ways ([6]; [11]). Sherin and Fuson (2005) ([11]) describe the development of different solution strategies for single-digit multiplication, including counting with drawings, fingers, and rhythm; additive calculation through repeated addition and grouping; pattern-based calculation; recalled products; and multiplicative reasoning. In contrast, Hickendorff et al. (2019) ([6]) identify several solution strategies for multi-digit multiplication, such as sequential strategies, decomposition, variation strategies, column-based methods, and standard algorithms for multiplication.
Our theoretical framework is based on the two situations for multiplication identified by Greer (1992) ([14]) that are present in this study: repeated addition with equal groups and multiplicative change of quantities (proportionality). In the study by Fischbein et al. (1985) ([4]), repeated addition is presented as a primitive model of multiplication. Most of the students in the study by Park and Nunes (2001) ([13]) initially used additive strategies when learning multiplication. However, the goal is for students to adopt multiplicative solution strategies, which represent a more conceptual understanding of multiplication and are based on a correspondence scheme ([13]).
Proportionality refers to a multiplicative relationship between quantities represented in a situation and can be expressed algebraically as $y = m \cdot x$ ([7]). Cramer and Post (1993) ([7]) describe four different solution strategies for proportionality problems, two of which are included in our framework: the *unit-rate strategy* and the *factor-of-change strategy*. The unit-rate strategy involves determining the value of one unit and then scaling it up to find the required quantity. The factor-of-change strategy involves solving the problem through multiplication; for example: *"It takes 20 minutes to drive four miles. Since Mark is driving three times as far, it should take three times as long. Therefore, the answer is 20 minutes times three, or 60 minutes"* ([7]).

Mathematical knowledge can be divided into two types: *procedural* and *conceptual knowledge* ([18]). Procedural knowledge of multiplication involves understanding multiplication as repeated addition, for example interpreting $4 \cdot 5$ as taking the number 5 four times (5 + 5 + 5 + 5) ([19]). Conceptual knowledge of multiplication, by contrast, involves: (1) understanding the concepts and mathematical content associated with multiplication; (2) the ability to solve multiplication problems using a variety of strategies and representations; and (3) the ability to retrieve basic multiplication facts directly from memory ([20]). One approach to teaching multiplication that supports the development of conceptual understanding includes the use of manipulatives, symbolic representations of these manipulatives, group or pair discussions, and the use of everyday contexts ([21]). Manipulatives can help students develop an understanding of mathematical concepts and operations, and when combined with symbolic representations, they can further strengthen mathematical understanding ([22]). Working in groups or pairs and engaging in discussion allows students to articulate their mathematical thinking to peers, which can help consolidate their understanding ([23]). Using everyday context enables students to connect mathematics to their own experiences ([22]).

The study by Park and Nunes (2001) ([13]) shows that the choice of strategy distinguishes between the development of procedural and conceptual understanding of multiplication. Repeated addition was used to foster procedural understanding, whereas conceptual understanding of multiplication emphasized the relationship between the number of groups and the number of objects in each group. One finding of their study was that students who received instruction emphasizing conceptual understanding developed a deeper understanding of multiplication. This suggests that repeated addition may be useful in introducing multiplication as a calculation procedure, but not as a foundation for understanding the concept of multiplication itself.

Özel et al. (2022) ([10]) also highlights the importance of being aware of the distinction between procedural and conceptual knowledge. They found that most of the prospective teachers in their study correctly evaluated students' solutions to multiplication problems. However, the evaluations were primarily based on the prospective teachers' procedural knowledge rather than their conceptual understanding of multiplication.

Repeated addition can be viewed as a primitive model of multiplication (cf. [4]). Based on Greer's (1992) ([14]) multiplication situations, Bao (2023) ([24]) investigated students in Grades 3–6 and their solutions to four multiplication tasks. Bao found that, for tasks involving equal groups, many students used repeated addition as a solution strategy, suggesting that such tasks may not sufficiently support the development of multiplicative thinking.

Proportionality is a fundamental skill in mathematics education and serves as a bridge between basic arithmetic and more advanced mathematical concepts ([27]). It encompasses a range of mathematical ideas, including fraction equivalence, division, place value, percentages, and unit conversions ([28]). Developing a strong understanding of proportionality is therefore considered essential for students' overall mathematical learning ([27]). Despite its importance, numerous studies indicate that students often lack a sound understanding of proportionality. Avcu and Avcu (2010) ([28]) found that most sixth-grade students in their study used the cross-product algorithm to solve rate and proportion problems. However, this strategy lacks a meaningful connection to the context of the tasks, and there is no inherent logical reason for students to select this method ([7]).

In the study conducted by Torma and Kosztolányi (2025) ([30]), in which seventh-grade students solved proportion problems, more than 90% of the students answered the problems correctly on both the pre-test and post-test. Most students used the unit-rate strategy. A comparison of strategy used between the pre-test and post-test revealed no significant change in students' approach to solving proportionality problems.

Modestou and Gagatsis (2009) ([31]) examined how students in primary and secondary school solved proportional and non-proportional tasks. One of their findings was that primary school students primarily used the unit-rate strategy, whereas secondary school students predominantly used cross-multiplication. This result suggests that secondary school students relied on cross-multiplication as a procedural strategy without a corresponding conceptual understanding of proportionality.

3. Methodology

In this study, 46 prospective teachers enrolled in the primary teacher education program (Grades 1–7), during their first semester of teacher education, solved a set of tasks that included four multiplication problems. We analyzed the solutions to the multiplication tasks in order to identify the strategies used by the prospective teachers. The strategies were identified using a qualitative thematic analysis, as described by Braun and Clarke (2013) ([5]). The first step of the analysis involved reviewing the students'

responses to the four multiplication tasks and initially categorizing them according to whether the tasks had been answered or left unanswered. The responses were then further classified into correct and incorrect solutions. The vast majority of the students answered all tasks; one student did not respond to Task 7, and another student did not respond to Task 8. In the next step, the solutions were examined and categorized according to the solution strategies employed. This process resulted in the following categories: proportionality, additive, unit-rate (the "way through 1"), multiplicative, other, and incorrect answers ([11]; [6]; [4]), see Table 2.
The four tasks with a multiplicative structure, which constitute the data material of the study, are presented in Table 1.

Table 1. The four tasks included in the study.

Task	Task description	Mathematical content
5	In a forest, there are 4 birdhouses. There are 4 birds living in each birdhouse. How many birds live in the birdhouses?	Multiplication The multiplier and the multiplicand are known
6	Two gingerbread cookies cost 8 kroner. You buy 4 gingerbread cookies. How much do you have to pay?	Proportionality The mulitple-batchs perspective
7	Two caterpillars eat 5 leaves per day. How many leaves are needed to feed 12 caterpillars for one day?	Proportionality The mulitple-batchs perspective
8	There are 6 pieces in a pack of chewing gum. How many pieces are there in 3 packs of chewing gum?	Multiplication The multiplier and the multiplicand are known

4. Analysis and Results

It has long been recognized that students' arithmetic is characterized by strategic variation, meaning that students use a range of different strategies to solve arithmetic problems ([4]; [12]). However, there are no corresponding studies focusing on prospective teachers. Therefore, in this study, we investigate how prospective teachers solve multiplication tasks that do not require the use of the standard algorithm, but that demand more advanced strategies than those typically used for single-digit multiplication (cf. [11]).
The tasks solved by the students in our study fall between what the literature refers to as single-digit arithmetic and multi-digit arithmetic ([6]). Consequently, we developed our own analytical tool, inspired by the classification system proposed by Hickendorff et al. (2019) ([6]) for multi-digit multiplication and by the solution strategies for proportionality tasks described by Cramer and Post (1993) ([7]).
The analysis in this study is a descriptive analysis ([32]), in which the researcher examines individual occurrences without the need for multiple events or situations. In our case, the students' solutions to the four multiplication tasks constitute the units of analysis. We reviewed the students' solutions and searched for patterns in the data in order to generate categories ([32]). The categories identified through this process were: multiplicative, additive, proportionality, unit-rate ("the way through 1"), other, and a category for incorrect answers.

Table 2. Description of the categories used in the analysis.

Category	Content
Multiplicative strategy	In this category, the students arrived at the answer by multiplying the numbers, that is, they used multiplicative reasoning. We did not distinguish between the two cases 3 × 6 = 18 and 6 × 3 = 18 (example from Task 8), nor between the multiple-batches perspective and the variable-parts perspective as described by Beckmann et al. (2015) ([17]).
Additive strategy	In this category, the students add the multiplicand the number of times indicated by the multiplier; that is, they write 4 + 4 + 4 + 4 = 16 instead of 4 × 4 = 16 (example from Task 5).
The factor of change strategy	Here, the students solved the tasks by viewing the situation as two quantities increasing simultaneously; for example, in Task 6, that when the number of gingerbread cookies is doubled, the price is also doubled.
The unit-rate strategy	This is illustrated, for example, in Task 7, by first determining how many leaves one caterpillar eats (5 ÷ 2 = 2.5) and then multiplying this by the number of caterpillars (2.5 × 12 = 30).
Other	This category includes alternative solution methods that are not mentioned above, for example solutions based on illustrations (drawings). In this category, we also included responses that did not contain any calculations.

Incorrect answer	We chose to place responses that resulted in incorrect answers in a separate category. This category also includes incomplete responses, for example those in which a calculation was set up but not carried out.

We analyzed the prospective teachers' solutions by identifying which solution fit into the different categories, then counting the number of solutions and calculating the percentage distribution across the categories. The results of the analysis are summarized in Table 3.

Table 3. Percentage distribution across the different categories for each task.

	Multiplicative strategy	Additive strategy	The factor of change strategy	The unit-rate strategy	Other	Incorrect answer
Task 5	84,8	2,2	0	0	8,7	4,4
Task 6	0	19,6	17,4	30,4	13,0	19,6
Task 7	0	4,4	28,9	26,7	4,4	35,6
Task 8	88,9	2,2	0	0	6,7	2,2

As shown in Table 3, a large majority of the prospective teachers solved Task 5 (84,8%) and Task 8 (88,9%) using multiplicative reasoning. Only a small proportion answered these tasks incorrectly: 4,4% for Task 5 and 2,2% for Task 8. In both tasks, 2,2% used additive reasoning. Furthermore, 8,7% used other methods in Task 5, while 6,7% did so in Task 8.
The factor-of-change strategy (proportional reasoning) was used by 17,4% of the students in Task 6 and by 28,9% in Task 7. A larger proportion of incorrect solutions was observed for these tasks, with 19,6% answering Task 6 incorrectly and as many as 35,6% answering Task 7 incorrectly. None of the prospective teachers used multiplicative reasoning in either of these tasks. In Task 6, there was considerable variation in strategy choice: 19,6% used additive reasoning and 15,2% used other methods. For Task 7, 4,4% used additive reasoning and 4,4% used other methods.
In summary, the main findings indicate substantial agreement in strategy choice for Tasks 5 and 8, where 84,8% and 88,9%, respectively, used multiplicative reasoning. In contrast, there is greater variation in strategy use for Tasks 6 and 7. Task 6 is also notable in that it has the highest proportion of additive reasoning (19,6%). When considering the factor-of-change strategy and the unit-rate strategy together as approaches to solving proportionality tasks, we find that 45,7% of the responses to Task 6 and 55,6% of the responses to Task 7 were solved using one of these two strategies. These findings form the basis for the discussion in the following section.

5. Discussion and Didactic Implications

We now discuss our findings. In Task 5, multiplicative reasoning dominates, with 84,8% of the prospective teachers using this approach ([7]). This is not surprising given the numbers in the task and the fact that the multiplier and multiplicand are equal (symmetric) ([26]). In Task 8, multiplicative reasoning is also dominant, with 88,9% of the prospective teachers multiplying the numbers given in the task. However, it should be noted that in the analysis we did not distinguish between the order of the multiplier and multiplicand ([25]); we considered $3 \cdot 6 = 18$ and $6 \cdot 3 = 18$ as equivalent solutions. Had we instead emphasized the context ([23]), represented by packages of chewing gum, 95% of those who used multiplicative reasoning would have applied an order of multiplier and multiplicand that does not correspond to the context. They simply multiplied the factors in the order presented in the problem statement, without recognizing that the factors in the commutative property of multiplication ($a \cdot b = b \cdot a$) take on different roles (cf. [15]). This tendency to multiply the numbers as given in the text indicates that the prospective teachers do not understand the significance of context and therefore demonstrate procedural rather than conceptual knowledge of multiplication ([18]).
An additive solution strategy in multiplication involves solving tasks through repeated addition, reflecting procedural knowledge of multiplication. In Tasks 5 and 8, 2,2% of the prospective teachers used repeated addition, while in Tasks 6 and 7 the corresponding percentages were 19,6% and 4,4%, respectively. This suggests that these prospective teachers rely on a primitive model of multiplication ([4]).
Prospective teachers who rely on a primitive model of multiplication ([4]) are likely to teach multiplication as procedural knowledge, using repeated addition as their primary strategy ([13]). These teachers may

also apply procedural knowledge when evaluating students' solutions to multiplication tasks ([10]). Bao (2023) ([24]) emphasizes that providing students with equal-group multiplication tasks may encourage continued use of repeated addition and does not necessarily promote the development of multiplicative thinking.

In this study, the prospective teachers solved two proportionality tasks, both of which involved the multiple-batches perspective ([17]). The analysis shows that 47,8% used proportional reasoning in Task 6, while 55,6% did so in Task 7. The strategies applied within proportional reasoning were the factor-of-change strategy and the unit-rate strategy.

In Tasks 6 and 7, 30,4% and 26,7% of the prospective teachers, respectively, used the unit-rate strategy, which is the same strategy that Modestou and Gagatsis (2009) ([31]) found to be commonly used by students at the primary school level. Based on the competence aims in LK20 ([1]), it is reasonable to assume that the prospective teachers have been taught other methods; nevertheless, they continue to use the same strategy, a finding consistent with the study by Torma and Kosztolányi (2025) ([30]). This suggests that strategy choice is not grounded in an understanding of proportionality, a pattern also noted by Avcu and Avcu (2010) ([29]) regarding the use of the cross-product algorithm. In such cases, students rely on a learned method without a meaningful reference to the context of the problem (cf. [7]). In our study, this implies that the prospective teachers apply a learned method even when it is not the most efficient.

Proportionality serves as a bridge between arithmetic and more advanced mathematical concepts ([27]), such as fraction equivalence, division, place value, percentage calculations, and unit conversions ([28]). Our analysis shows that 19,6% of responses to Task 6 and 35,6% of responses to Task 7 were incorrect. The most common incorrect answer in Task 7 was that 60 leaves are needed to feed 12 caterpillars; among those who answered incorrectly, 68,8% provided this response. This indicates that the prospective teachers demonstrate limited or insufficient procedural knowledge of proportionality ([18]).

Our findings indicate that the prospective teachers primarily possess procedural knowledge of multiplication and proportionality. This suggests that teacher education must be changed to place greater emphasis on the development of conceptual knowledge in these areas. One approach is to problematize the commutative property of multiplication ($a \cdot b = b \cdot a$) by demonstrating how the factors assume different roles when situated in context (cf. [15]; [17]). In addition, instruction for prospective teachers should foreground concepts and mathematical content in multiplication, promote the use of varied strategies and representations, and support the development of a broader foundation of multiplication facts ([20]).

With regard to proportionality, instruction should likewise foreground conceptual understanding. One possible approach is to use examples that demonstrate that although the unit-rate strategy can lead to correct answers, a strong understanding of proportionality supports the selection of more efficient strategies that preserve relationships. This can be seen as analogous to solving multiplication problems through repeated addition. To foster this understanding, instruction should provide opportunities for prospective teachers to engage deeply with proportional functions and the role of the proportionality constant. In this way, teacher education can support the development of prospective teachers' conceptual knowledge of proportionality.

The Case Method as a Strategy to Enhance Teaching Effectiveness in University Classrooms

Jessica Zumarraga-Avila[1], Lizbeth Zumarraga-Avila[2]

[1]Autonomous University of Yucatan, Mexico
[2]Modelo University, Mexico

Abstract

The case method has traditionally been used in business, law and medical education. But it has also become a common and powerful teaching tool in many other academic fields. However, due to limited evidence, the effectiveness of case studies in fulfilling specific learning objectives remains a topic of discussion. This study aims to contribute to the discussion by examining the experiences of 24 faculty members from various disciplines at a private university in southeastern Mexico who collaboratively designed and implemented 12 original teaching cases tailored to their respective fields. Through semi-structured interviews, participant reflections, and analysis of the developed cases, data collected revealed how the case method fostered interdisciplinary collaboration, critical thinking, and practical application of theoretical knowledge. Findings suggested that the case method not only improved faculty members' pedagogical skills and confidence in active learning strategies but also led to unexpected outcomes, such as innovative, contextually relevant cases that bridged disciplinary silos and enhanced student engagement. Initial resistance to guideline uniformity across fields was a challenge, yet the process ultimately promoted professional growth and institutional teaching innovation. This study highlights the case method's potential as a scalable strategy for teacher professionalization in higher education and suggests implications for curriculum design and faculty training programs.

Keywords: *Case method, case-based learning, faculty professionalization, higher education, teaching effectiveness.*

1. Introduction

The case method is generally recognized as an effective teaching strategy in business, law, and medical training. However, there is limited evidence supporting its application in all fields of higher education (Rosier, 2022). Some studies suggests that case-based learning (CBL) is more effective than conventional teaching strategies because it enhances student engagement with learning processes, connects theory with practice, and fosters deeper understanding and critical thinking skills (Bonney, 2015; Delany et al., 2025; Mahdi et al., 2020; Varma et al., 2025).

Not only do students benefit from this strategy, but faculty do as well. Şen Akbulut & Hill (2022) and Ulvik et al. (2022) state that CBL encourages educators to transform from knowledge-transmitters to learning-facilitators. However, despite these advantages, the adoption of the case method beyond business, law and medicine remains limited, especially in social sciences, humanities, engineering, and education. This may be due to the predominant focus of research on student outcomes, with fewer studies exploring faculty experiences in developing and implementing cases, especially through interdisciplinary collaboration to create original, context-specific materials.

Higher education is undergoing a drastic transformation driven by the global and national trends and priorities (OECD, 2019), which have prompted universities to offer relevant education to their students. Yucatán, located in the southern of Mexico, has experienced an increasing migration of people from across the country. Consequently, private institutions have played a central role in serving these diverse student populations, whose presence provides rich material for case development. Unfortunately, as Villatoro et al. (2023) have suggested, faculty members frequently work in disciplinary silos, with limited structured opportunities for cross-disciplinary collaboration or professional development in innovative teaching methods.

The Modelo University (Unimodelo) is a private higher education institution with campuses in three cities: Mérida and Valladolid in the state of Yucatán, and Chetumal in the state of Quintana Roo. Unimodelo's educational approach is centred on human development, critical thinking, innovation, and social responsibility. The University comprises specialized schools of business, law, design, humanities, health, architecture, and engineering, offering a total of 25 undergraduate programs and 14 graduate

programs. With an enrolment of 3,200 students and 378 faculty members, Unimodelo seeks to prepare professionals to make significant contributions to society across the Yucatán Peninsula and beyond.
The present study is a big step forward for Unimodelo because it is the first time it has systematically documented the impact of encouraging faculty participation in a "Case Method" workshop not only to learn how to develop cases but to provoke interdisciplinary collaboration among members from different fields and schools. The objective was to analyse the impact of collaborative case development by faculty members from diverse disciplines on their professional growth and pedagogical transformation through three specific objectives:

1. Explore the experiences of the twenty-four faculty members who participated in the “Case Method” workshop and collaboratively designed cases.
2. Determine whether any teaching competencies were developed during the case method development process.
3. Identify the challenges faced during the process, the unexpected outcomes, and the potential for institutional adoption.

The findings indicate that the case method is a powerful vehicle for teacher professionalization, pedagogical innovation, and student engagement. They also demonstrate its potential for institutional application as a strategy to develop faculty teaching competencies and collaborative projects that transcend disciplinary boundaries.

2. Methodology

The study adopted a qualitative, interpretive approach grounded in constructivist paradigm, which facilitated an in-depth understanding of faculty experiences, with collective case-study design (Stake, 1995; Yin, 2018). The data-collection sources were: (a) Document analysis on the twelve cases using a seven-criteria-rubric: generalities, narrative, structure & organization, information & evidence, discussion engaging, composition, and excellence. (b) Semi-structured focus group interviews with participating faculty. The process unfolded in three phases: (1) Delivery of the “Case Method” workshop; (2) Collaborative case development. Faculty worked in interdisciplinary groups of two to four members; however, three faculty members whose areas of expertise were highly specialized chose to work individually. (3) Implementation of the cases.

2.1 Participants

Participation in the study was voluntary and encompassed two aspects: (a) the desire to engage in the “Case Method” workshop, and (b) the commitment to develop a case. All faculty from the seven schools at the Mérida campus were invited to participate. A total of twenty-seven people signed up to join the initiative, but twenty-four of them completed the whole process (see Table 1).

Table 1. Participants by school and field of expertise

School	Participants	Fields of expertise
Architecture	4	• Architecture (3) • Environment impact (1)
Law	4	• Ethics and Law (2) • Entrepreneurship (1) • Land use regulation (1)
Design	3	• Digital illustration and product design (2) • Neurodivergence (1)
Engineering	4	• Industrial Engineering (1) • Innovation (3)
Business	4	• Administration and Finance (2) • Business and Finance (2)
Health	5	• Sports medicine (2) • Clinical Nutrition (3)

2.2 Data Analysis

The data were analysed using Braun and Clarke's (2021) thematic analysis approach within a constructivist paradigm. Focus group interviews were audio-recorded and transcribed verbatim in Spanish before being imported into a secure document for analysis. The coding process, supported by Grok (xAI), comprised the following steps: (a) familiarisation with the transcripts through multiple readings and audio review; (b) inductive and deductive generation of initial codes based on the interview guide and emergent data; (c) collation of codes into candidate themes; (d) review and refinement of themes with peer debriefing for validation; and (e) definition and naming of final themes supported by illustrative quotes. The researchers oversaw the process, providing Grok with iterative prompts for coding suggestions, theme mapping, and pattern identification. This was followed by critical human review and adjustment.
Trustworthiness was enhanced through triangulation of the data from focus groups and document analysis of the twelve cases, checking of preliminary findings, and maintaining a detailed audit trail of the analysis process. To ensure the content validity of the seven-criteria rubric used for document analysis of the cases, the instrument was first aligned with the guidelines and template, as well as established literature on case-based pedagogy. The rubric was then piloted on two sample cases by the researchers and a peer expert in pedagogical innovation. Feedback from the pilot focused on the relevance, clarity, and comprehensiveness of the criteria.

3. Results

The results are presented in three sections. One shows the results of the three semi-structured focus groups interviews with the twenty-four faculty members. The other section shows the results of a systematic document analysis of the twelve cases.

3.1 Focus Groups Interviews

The focus groups interviews centred on seven main topics: motivation toward English, interdisciplinary collaboration, competency development, critical thinking, institutional follow-up, and artificial intelligence. The theme of collaborative networks also emerged in two of the focus groups. For better organization the results were grouped into four categories: (1) faculty workshop experience, (2) teaching competencies and interdisciplinary collaboration, (3) challenges and suggestions, and (4) implementation of the cases.

(1) Faculty workshop experience

They described the workshop experience as highly positive, rewarding, and transformative. They repeatedly emphasized how challenging it was to take a course in English language and yet how fluid, safe, and structured the course was. The English language issue was initially perceived as a limitation, but then it was seen as a challenging motivator. As one faculty member shared: *"What I remember most was the language challenge… it was difficult at first, but everything just started flowing, and it was a very rewarding, surprising experience."* (Group 1). Another noted, *"It was my first experience at the university taking a training course in English… it felt like gaining the confidence to speak."* (Group 2).

The faculty also valued the supportive atmosphere created by the instructor. They appreciated how the workshop broke down the traditional isolation between schools, allowed them to "get to know faces" and discovered their previously unrecognized expertise among their colleagues.

(2) Teaching competencies and interdisciplinary collaboration

The collaborative case development process increased teaching competencies. Faculty placed greater emphasis on scaffolding different levels of thinking (recognize, apply, analyse, propose). *"It helped me distinguish the levels of depth in thinking we want students to reach" (Group 2).* They affirmed having developed more reflective and critical assessments**,** moving away from memorization exams and toward activities that require students to argue and defend their ideas. *"I no longer give multiple-choice exams. They are now 100% reflective… it's about whether they defended their idea, not whether they think differently" (Group 2).* Another competency that the faculty said they developed was paying greater attention to real-world context (social, economic, multidisciplinary). *"I want them to develop this ability*

and not just stick to what they see in books, but to generate critical analysis based on the context in which they are living" (Group 3). Many faculty members reported implementing these new approaches in their courses during the semester following the workshop.

Similarly, interdisciplinary collaboration was another highly valued aspect. Faculty repeatedly expressed how valuable it was for them to "be forced" to work with colleagues from different fields. They said: *"It was such a diverse team… we approached it from the architectural perspective, the legal perspective, and the environmental engineering perspective… it was really cool." (Group 1).* Another mentioned: *"Although we share the same technical advisor, our areas of expertise are different; it helped me understand how others think… and we arrived at an interesting joint proposal." (Group 3).* Participants recognized that one of the greatest advantages of promoting interdisciplinary work is the possibility of developing richer and more contextualized cases, with broader, multifaceted perspectives and reduced bias. However, they also acknowledged scheduling difficulties, an initial preference for working with familiar colleagues, and occasional barriers related to disciplinary egos.

(3) Challenges and suggestions

The most prominent challenges participants identified were:

- The significant time required to design and implement case studies.
- Students' excessive reliance on artificial intelligence tools and reluctance to engage in deep analytical work.
- The lack of institutional follow-up or support after the workshop.

Participants also highlighted several positive, yet unexpected outcomes. These included increased confidence in using English in academic settings, strengthened networks between schools that led to new collaborative projects and a sense of professional renewal. Several faculty members also noted a powerful role model effect on their students. As one participant reflected: *"I could see… that I'm asking this of you, but I'm also making an effort as a teacher to do the same" (Group 2).* Faculty expressed enthusiasm to continue and expand the initiative and offered practical suggestions for scaling the project:

- A version 2.0 of the workshop that includes ongoing support during case implementation in classrooms.
- Creation of an institutional repository of teaching cases.
- Formal institutional incentives, such as academic credit, reduced teaching loads, or a points-based recognition system.
- Regular technical-pedagogical English courses tailored for faculty.
- Development of formal multidisciplinary projects with institutional follow-up and stronger links to industry, government, and the local community.

Some participants offered the following quotes in this regard: *"It would be great if we could have some kind of guidance or support… to help us bridge the gap, because we're ready to move to the next level" (Group 2)*. Another suggested, *"If there's a model project… let a group be selected… and give them the assignment that they'll have a year to work on it" (Group 3).*

(4) Implementation of the cases

Some participants mentioned that the implementation of the cases revealed certain discrepancies between what they planned and how it was applied. The findings in this regard were organised into three categories, as shown in Table 2.

Table 2. Frequency of faculty comments on the implementation of cases per category

Category	Frequency
Implementation issues	18
Barriers and facilitators	15
Impact on students	14

The majority of participants reported feeling rushed because they did not feel ready. They had to adapt their approach during the implementation, incorporating new perspectives, reflective questions, ludic dynamics and role-playing, as the students were not responding as expected. However, these modifications helped to engage them. With regard to barriers, the time required to rethink activities was cited as the most frequent difficulty, followed by managing students' reliance on AI and the lack of post-workshop support. The guidelines provided during the workshop and academic freedom, however, were ideal facilitators for making quick changes to adapt to students' needs and characteristics. Some faculty observed benefits that enriched the learning experience in students. They (the students) demonstrated higher levels of engagement and participation, moving beyond the theoretical content to actively analyse real scenarios. The faculty shared some comments from students about their experiences with the cases developed in class. These comments have been translated verbatim into English, with the original meaning, tone and intent preserved as closely as possible.

- Student A. *Personally, ma'am, I thought they were good, because basically we bring reality into the classroom, and I find that quite interesting and enriching, because we work with real-life cases, real solutions, and basically situations that could happen in real life, not just the educational activities that are typically used in classrooms.*

- Student B. *Basically, what I took away from them was how to solve real-life problems and to work with a different mindset, one that isn't as methodical as what we're taught in the classroom.*

- Student C. *I believe that these case studies help us approach the subject matter using logic that's more closely aligned with the situation at hand. Positive aspects include that they challenge us to delve deeper into our analysis and offer new perspectives. An area for improvement could be to approach them with a more structured framework. They allow me to grasp the complexity of this type of project and also to tackle seemingly overwhelming tasks step by step.*

3.2. Document Analysis of Cases

The cases were analysed using a seven-criteria rubric (generalities, narrative, structure & organization, information & evidence, discussion engaging, composition, and excellence), each criterion could be scored on a scale from 4 (proficient) to 1 (deficient) scale, yielding a maximum of 28 points; the total was converted to a 100-point scale. The rubric was designed in accordance with the guidelines employed in the Case Method workshop, and the template used to develop their own cases. This approach enabled the establishment of a standard against which cases could be evaluated.
The cases were rated from 57 to 93 out of 100 with an average rating of 77.5. Eight cases (66%) demonstrated proficiency, while three cases required substantial revision and improvement. Most cases (83%) exhibited strengths particularly in the structure & organization criterion showing a clear and logical structure with well-defined sections and coherent flow. It's worth noting that a 100% of cases were developed considering the local context issues of Yucatán such as beach land dispossession, neurodiversity in the classroom, child abuse, ethical dilemmas in outsourcing and financial decisions, among others. In addition to considering global issues in a local context, nine of the twelve cases (75%) were developed by interdisciplinary teams. These cases featured realistic narratives, strong integration of evidence and a successful effort to incorporate different analytical perspectives, with bilingual (English-Spanish) versions.
Furthermore, a review of the cases revealed common weaknesses. The most prevalent, identified in 92% of cases, was the lack of alignment among three primary components that ensure consistency across cases: the line of reasoning (inductive or deductive), the discussion questions, and the anticipated learning outcomes. The majority of discussion questions had a high degree of bias or answers readily apparent, limiting the potential for critical thinking. Furthermore, the instructions for the final assignment were frequently ambiguous or even absent. Other issues were also identified such as grammatical errors, formatting inconsistencies, and non-adherence to the institutional template.

4. Discussion

The findings of this collective case study confirm that the faculty-led initiative for the collaborative development of teaching cases had a positive and significant impact on the pedagogical training of the twenty-four participants. Both the focus group transcripts and the document analysis of the cases reveal

a highly valued experience, in which the challenge of the English language served as a motivational catalyst and interdisciplinary work enriched the perspectives of the cases.
These results align with the constructivist approach (Stake, 1995; Yin, 2018) which emphasizes how collaborative work can achieve profound changes in practice (Braun & Clarke, 2021). The triangulation of data was consistent. While faculty reported improving their teaching competencies in designing cases, structuring activities, and promoting critical thinking, case analysis evidenced well-structured development. The content addressed global issues while being grounded in a local context. Interdisciplinary collaboration strengthened this approach by enabling analysis of one case from different perspectives. In addition, the identified weaknesses serve as evidence of the efficacy of the workshop, the collaborative efforts of the faculty with colleagues from diverse fields, and the design of one case study to be analysed from multiple perspectives.
The interdisciplinary collaboration is a pivotal finding of the study. This collaboration has been shown to improve case quality and foster professional networks. Furthermore, it has been demonstrated to reduce isolation among schools and enable innovative and disruptive work methods. This finding reinforces Modelo University's vision as an institution that promotes collaborative work beyond disciplinary boundaries. It's no wonder the institutional follow-up that the faculty requested will be granted.

5. Conclusion and Recommendations

This study shows that the faculty-led initiative for the collaborative development of cases successfully achieved its three main objectives. The twenty-four participating faculty members experienced a positive yet challenging Case Method workshop, and the collaborative design of cases represented a great opportunity to break boundaries (Objective 1). The experience of designing cases and working interdisciplinarily strengthened their teaching competencies in designing activities, promoting critical thinking among students, and evaluating beyond memorization (Objective 2). Finally, they produced relevant cases that address global issues in local contexts and have great potential for institutional adoption (Objective 3).
Integrating Case Method training, English-language practice, and interdisciplinary collaboration has resulted in a robust intervention capable of fostering significant pedagogical renewal in higher education settings, particularly at Modelo University. However, the study also revealed important areas for improvement that require institutional attention to fully consolidate and scale the initiative's impact. To build on the current success, the following actions are recommended:

- Implement Version 2.0 of the workshop that includes support during the classroom implementation along with peer review sessions and formative feedback.
- Create an institutional database of standardized cases, using the official institutional template and classified by educational level, discipline, and type of reasoning.
- Establish formal institutional incentives such as academic credit, teaching load reduction (time off), or a points-based system to encourage sustained faculty participation.
- Strengthen the teaching competencies and the English component through permanent training programs that preserve the practical and confidence-building approach of the original workshop.
- Design institutional multidisciplinary projects that connect schools and, when possible, external stakeholders (industry, government, and community), with structured follow-up and dissemination of results.
- Provide training on the ethical and pedagogical use of artificial intelligence (AI) to guide faculty toward responsible AI practices.

Pre-service Teachers' Solution Strategies in Addition and Subtraction Tasks

Paal Jom[1], Eirik Bergli[2]

[1,2]Nord University, Norway

Abstract

Specialized content knowledge (SCK) concerns the mathematics teacher's deeper understanding of the specific mathematical topics to be taught ([1]). Flexibility refers to the ability to use a variety of strategies to solve mathematical problems, while adaptivity refers to the selection and use of strategies that are appropriate for a given task ([2]). In this study, we examine which solution strategies first-year pre-service teachers in the primary school teacher education program use when solving addition and subtraction tasks. We asked 22 pre-service teachers to complete a test consisting of addition and subtraction tasks toward the end of their first semester in the teacher education program. The test was analyzed using a thematic qualitative analysis strategy ([3]). The theoretical framework applied in the study was based on the solution strategies for addition and subtraction with multi-digit numbers described by Hickendorff et al. (2019) ([4]). Our results indicate that most pre-service teachers in the primary school program used algorithm-based solution strategies when solving addition and subtraction tasks, while only a small proportion used the number line as a strategy. The findings highlight the importance of strengthening representational competence and conceptual understanding in the early stages of teacher education ([5]; [2]). In particular, the number line, central in the Norwegian curriculum and foundational for understanding number relations, should be emphasized not only as a pedagogical tool for young students but also as a representational resource for future teachers' own mathematical reasoning.

Keywords: *Solution strategies, Pre-service teachers, Addition and Subtraction Tasks, Specialized content knowledge*

1. Introduction

Ball et al. (2008) ([1]) developed a model describing the knowledge required by mathematics teachers, consisting of two main domains: subject matter knowledge and pedagogical content knowledge. Within the domain of subject matter knowledge, the model distinguishes between common content knowledge and specialized content knowledge. Common content knowledge refers to the mathematical knowledge needed to solve mathematical problems and includes the fundamental mathematical skills that are taught in school ([6]). Specialized content knowledge (SCK), on the other hand, concerns the mathematics teacher's deeper understanding of the specific mathematical topics to be taught. This includes, among other aspects, the ability to provide explanations that are comprehensible and useful for students, to represent mathematical ideas and relationships in appropriate and accessible ways, and to solve mathematical problems using multiple approaches ([6]).

The development of flexibility and adaptivity has become a central goal of arithmetic instruction in primary school ([2]). Flexibility refers to the ability to use a variety of strategies to solve mathematical problems, while adaptivity concerns the selection and use of strategies that are appropriate for a given task ([2]). Lin et al. (2011) ([5]) suggest that specialized content knowledge (SCK) consists of three components: representation, justification, and explanation. Representation involves the accurate and effective selection and use of mathematical representations; justification concerns the description and justification of mathematical ideas; and explanation refers to providing mathematical expressions of common rules and procedures. In this study, we focus specifically on representations, more precisely, on the solution strategies used by pre-service teachers.

According to the Norwegian national curriculum (LK20), students are introduced to addition and subtraction in Grades 1 and 2, multiplication in Grade 3, and division in Grade 4 ([7]). One of the competence aims for Grade 2 states that students should use the number line when solving addition and subtraction tasks. In addition, students are expected to explore the commutative and associative properties of addition. At Grade 3, a competence aim emphasizes that students should use appropriate strategies for subtraction in practical situations.

These curriculum requirements imply that mathematics teachers working in Grades 1–7 need strong knowledge of a variety of solution strategies for addition and subtraction tasks. Accordingly, the aim of this study is to investigate the following research question: **Which solution strategies do pre-service teachers in the Grades 1–7 teacher education programme use when solving addition and subtraction tasks early in their teacher education?** To address this research question, pre-service teachers enrolled in the Grades 1–7 programme were asked to solve 22 addition and subtraction tasks at the end of their first semester in teacher education. The students' solutions were analyzed using the solution strategy framework described by Hickendorff et al. (2019) ([4]), and the results are discussed in relation to previous research on the solving of addition and subtraction problems.

2. Theory

The model of Mathematical Knowledge for Teaching (MKT) developed by Ball et al. (2008) ([1]) conceptualizes the knowledge teachers need into two main dimensions: subject matter knowledge and pedagogical content knowledge. Specialized content knowledge (SCK) constitutes one of the three categories within subject matter knowledge and is defined as mathematical knowledge that is specific to the work of teaching. Delaney et al. (2008) ([8]) describe specialized content knowledge as the mathematical knowledge and skills that teachers use in instructional contexts.
Morris et al. (2009) ([9]) suggest that SCK is a particularly suitable focus area for pre-service teacher education. Moreover, SCK is considered essential for effective classroom instruction. In this sense, teachers and pre-service teachers should be able to accurately represent mathematical ideas, provide explanations for common rules and procedures, and examine, interpret, and understand non-standard or unusual solution methods ([10]). Similarly, Petrou and Goulding (2011) ([11]) define SCK as the type of mathematical knowledge teachers and pre-service teachers require for effective mathematics teaching and for use in classroom practice.
Mitchell et al. (2013) ([12]) examined teachers' classroom practices and emphasized that the use of representations is essential in the teaching of integers. They also developed a typology of tasks involving the use of representations in integer instruction. The use of representations is particularly important when dealing with integer operations, as the properties of these operations are often challenging for students. Stephan and Akyüz (2012) ([13]) point out that integer operations pose specific representational challenges because, unlike natural numbers, students cannot construct meanings for integer operations solely through abstraction from concrete objects.
Addition is defined as an operation in which the sum of two numbers results in a third number that contains as many units as the two numbers combined, and it is symbolized by the plus sign (+) ([14]). The two numbers are referred to as addends, expressed as *addend* + *addend* = *sum* ($a + b = c$). Subtraction, on the other hand, is the operation or process of finding the difference between two numbers using the minus sign (–). When the sum and one addend are known, the operation used to find the unknown addend is subtraction. Subtraction is therefore the inverse operation of addition ([14]), and a subtraction task can be expressed as *minuend* – *subtrahend* = *difference* ($a - b = c$).
Over the past decades, the development of flexibility and adaptivity has become a central goal in the teaching of arithmetic in primary education ([2]). Flexibility refers to the ability to use a variety of strategies to solve mathematical problems, while adaptivity concerns the selection and use of strategies that are appropriate for a given task ([2]). In a study by Körner et al. (2026) ([15]), the authors investigated how 91 pre-service teachers early in their education and 91 pre-service teachers at the end of their education solved addition and subtraction tasks on a test. The results showed that many pre-service teachers at the beginning of their education struggled with flexible and adaptive calculations, whereas pre-service teachers nearing the end of their education demonstrated greater flexibility and adaptivity in their solution strategies.
A key characteristic of solution strategies for multi-digit numbers is whether the calculation is based on place value or not. This distinction results in two main types of strategies: *number-based strategies* and *digit-based strategies* (cf. [16]). In number-based strategies, the place value of digits is respected (for example, the number 83 is decomposed into 80 and 3). In contrast, digit-based strategies ignore place value, treating numbers as sequences of individual digits (for example, decomposing 83 into the digits 8 and 3 without considering that 8 represents eight tens, or 80). The most common digit-based strategies are the written algorithms for addition, subtraction, multiplication, and division, which operate on single digits in a proceduralized manner, typically from right to left.
Hickendorff et al. (2019) ([4]) describe both number-based and digit-based strategies for multi-digit addition and subtraction. One dimension for categorizing strategies concerns the underlying operation of the solution process: addition or subtraction. In multi-digit addition, there is only one operational

approach, direct addition, where one addend is added directly to the other. In contrast, multi-digit subtraction can be performed in three different ways: as direct subtraction, where the subtrahend is taken away from the minuend; as indirect addition, where one adds on from the subtrahend until the minuend is reached (also referred to as an addition strategy); and as indirect subtraction, where the difference is determined by calculating how much must be taken away from the minuend to reach the subtrahend.

The number-based strategies include sequential strategies, decomposition strategies, varying strategies, and the column-based strategy. In sequential strategies (also known as jump strategies), numbers are primarily viewed as positions on a (mental) number line, and operations involve forward or backward movements along this number line. In decomposition strategies (also referred to as split strategies;[17]), numbers are conceptualized according to their decimal structure, and operations involve partitioning or splitting numbers into place-value-based components. Varying strategies involve adapting numbers and/or operations in the problem, such as in compensation strategies where one operand is rounded to a more convenient number (e.g., subtracting 70 instead of 69 and then compensating by adding back the extra 1 that was subtracted).

The column-based strategy largely relies on the same numerical approach as decomposition strategies but is explicitly taught as a separate strategy in Dutch Realistic Mathematics Education (RME). It functions as an intermediate or hybrid strategy that bridges number-based strategies and digit-based algorithms. On the one hand, it operates with numbers rather than digits; on the other hand, it follows a standardized step-by-step procedure accompanied by a structured vertical notation.

Column-based strategies therefore represent a specific form of number-based strategies designed to facilitate a smoother and more conceptually meaningful transition between number-based strategies and digit-based algorithms (cf. [18]). Although these strategies share features with digit-based algorithms, such as the use of structured vertical notation, they operate on whole numbers rather than digits and proceed from left to right, which clearly distinguishes them from digit-based algorithms.

In most countries, digit-based algorithms fall under the category of direct addition or subtraction. The key difference from number-based strategies is that numbers are treated as individual digits, thereby ignoring their place value. For example, in a digit-based addition strategy, one begins by adding the units (e.g., 8 + 6 = 14), writes down the 4, carries the 10 as a 1, and then adds the tens digits (e.g., 3 + 4 + 1 = 8). Only after combining the resulting digits does the 8 come to represent eight tens. Digit-based addition and subtraction algorithms proceed from right to left, starting with the units, followed by the tens, and so on.

Table 1. Different solution strategies for multi-digit addition and subtraction tasks (Hickendorff et al., 2019)

Arithmetic operation	**Type**	**Number-based strategy**				**Digit-based strategy**
		Sequential	**Dekomposisjon**	**Variert**	**Colum-based**	
Addition Example 38 + 46	Direkt addition	38+40=78; 78+6=84	30+40=70; 8+6=14; 70+14=84	38+50=88; 88-4=84	38 46+ 70 14+ 84	1 38 46+ 84
Subtraction Example 82 - 69	Direkte subtraction	82-60=22; 22-9=13	80-60=20; 2-9=-7; 20-7=13	Eksempel, kompensasjon: 82-70=12; 12+1=13	82 69- 20 -7 13	7 10 82 69- 13
	Indirekt addition	69+3=72; 72+10=82; 3+10=13	9+3=12; 60+10=70: 3+10=13	69+1=70; 70+12=82; 1+12=13		
	Indirekt subtraction	82-10=72; 72-3=69; 10+3=13	80-10=70; 2-3=-1; 10+3=13	82-20=62; 62+7=69; 20-7=13		

In sequential strategies (also referred to as *jump strategies*), numbers are primarily conceptualized as objects on a number line. Number lines reveal the ordinal meaning of numbers, while counters reveal their cardinal meaning. Davidson (1987) ([19]) therefore emphasizes the importance of understanding both ordinal and cardinal meanings of integers in the conceptualization of number concepts. From this

perspective, both teachers and pre-service teachers need a deep conceptual understanding of why and how addition and subtraction with integers are performed.
For example, Griffin et al. (1995) ([20]) identified knowledge of number order, such as that represented on a number line, as a crucial foundation for the development of other number concepts. Their study showed that low-performing students who received explicit instruction using number lines were able to catch up with high-performing students in mathematics. Similarly, participants in the study by Bofferding et al. (2013) ([21]) were able to use movements on a number line to add or subtract positive integers from negative integers. However, they did not successfully use the number line to add or subtract negative integers, suggesting that number line instruction needs to address such situations more explicitly and effectively ([21]).
Ipek (2018) ([22]) investigated pre-service teachers' specialized content knowledge related to addition and subtraction. In this study, 42 fourth-year pre-service teachers solved 16 addition and subtraction problems and subsequently participated in interviews. When the pre-service teachers' representations, justifications, and explanations were analyzed collectively, the findings indicated that they lacked sufficient subject matter knowledge. The number line is an early numerical representation that can be strategically used by teachers to develop students' understanding of number magnitude and arithmetic operations ([23]). Number lines support accurate counting, comparisons of number magnitude, and computational processes, and one of their key advantages is that they help connect mathematical content across grade levels ([23]).
When comparing pre-service teachers' representational abilities, Ipek (2018) ([22]) found that the number line was the representation they struggled with the most, whereas counters were the representation they used most successfully. This finding aligns with earlier research, which also reported counters to be more effective than number lines. Finally, the results showed that pre-service teachers primarily focused on procedural or operational knowledge when explaining integer addition and subtraction. According to Skemp (1976) ([24]), symbolic presentations of integer operations that are not connected to meaningful contexts reflect *instrumental understanding*, which may contribute to rote learning. From this perspective, the appropriate use of number lines and counters, combined with meaningful contexts, is crucial for fostering relational or conceptual understanding of integer operations.

3. Method

This study involved 22 pre-service primary school teachers enrolled in the Grades 1–7 teacher education programme during their first semester. The participants completed a written test consisting of 22 tasks on addition and subtraction involving integers. Examples of the test tasks are presented in Table 2.
The students' written solutions were analyzed in order to identify the solution strategies they used when solving the tasks. The strategies (see Table 1) were identified through a qualitative thematic analysis, following the approach described by Braun and Clarke (2013) ([3]). In the analytical process, the students' responses were categorized according to the solution strategy framework proposed by Hickendorff et al. (2019) ([4]) (see Table 1).

Table 2. Examples of tasks from the test

Task	Task description	Answer	Mathematical content
4	-20 + 15 = ____	Svar: -5	Addend + Addend = Sum Unknown sum; two-digit numbers; one addend is negative.
5	– 4 + ____ = 10	Svar: 14	Addend + Addend = Sum Unknown addend; the other addend is negative; the sum is positive.
6	___ + 13 = -5	Svar: -18	Addend + addend = sum. Unknown addend; the other addend is positive; the sum is negative.
7	– 8 + (-7) = _____	Svar: -15	Addend + addend = sum. Unknown sum; two single-digit negative addends; sign rules.
8	___ + (-9) = - 16	Svar: -7	Addend + addend = sum. Unknown addend; the other addend is negative; the sum is negative.
9	– 5 – 4 = ____	Svar: -9	Minuend − subtrahend = difference. Unknown difference; the minuend is negative.
10	2 – (-3) = ____	Svar: 5	Minuend − subtrahend = difference.

			Unknown difference; the subtrahend is negative.
11	____ - 8 = - 5	Svar: 3	Minuend − subtrahend = difference. Unknown minuend; the minuend is positive.

4. Analysis and Results

The analysis was conducted by following the deductive–thematic approach described by Braun and Clark (2013) ([3]). Each student solution was coded using the predefined strategy categories from Hickendorff et al. (2019) ([4]). This step allowed us to describe the distribution of strategy types across the 22 tasks. After that we examined patterns in the coded material to identify broader themes in the pre-service teachers' strategy use.
We entered the categories and codes we used from Hickendorff et al. (2019) ([4]) into an analysis form, Table 3. The analysis form provided an overview of how the pre-service teachers responded to the different tasks.

Table 3. The categories in the analysis

Category	**Not answered**	**Number-based strategies**				**Digit-based algorithm**
Code		**Seq**	**Dec**	**Var**	**Col**	**Algorithme**
Numerical value	0	1	2	3	4	5

The results of the analysis are summarized in Table 4, which presents the percentage distribution across the different categories for each task.

Table 4. Response rate to the different tasks

Tasks	**1**	**2**	**3**	**4**
1	18,18 %	0	54,54 %	22,27 %
2	13,63 %	0	63,63 %	18,18 %
3	9,10 %	4,54 %	59,1 %	18,18 %
4	68,18 %	0	13,63 %	4,54 %
5	63,63 %	0	22,72 %	9,1 %
6	50 %	0	18,18 %	18,18 %
7	40,9 %	0	27,27 %	18,18 %
8	40,9 %	0	18,18 %	22,27 %
9	59,1 %	0	18,18 %	9,1 %
10	31,81 %	0	13,63 %	27,27 %
11	45,45 %	0	13,63 %	18,18 %
12	27.27 %	0	4,54 %	50 %
13	4,54 %	9,1 %	45,45 %	31,81 %
14	4,54 %	18.18 %	40,9 %	31,81 %
15	9,1 %	0	22,27 %	45,45 %
16	9.1 %	0	22,27 %	45,45 %
17	13,63 %	0	4,54 %	77,27 %
18	13.63 %	0	4,54 %	77,27 %
19	18,18 %	0	0	77,27 %
20	13,63 %	4,54 %	4,54 %	68,18 %
21	13,63 %	4,54 %	4,54 %	68,18 %
22	9,1 %	9,1 %	0	68,18 %

4.1 Distribution of Strategies Across Tasks

Table 4 summarizes the frequency of strategy categories for each of the 22 tasks. Across the dataset, a clear pattern emerged: an algorithm-based strategy was the most frequently used, particularly in the later tasks of the test. Several tasks (e.g., tasks 17–22) show algorithm use by more than two thirds of the students, with task 19 reaching 77.27%.
In contrast, number-based strategies were used far less frequently. Among these, sequential strategies (which often indicate a number line approach) were almost absent. Only a small number of students

used sequential reasoning on any tasks, and often only 1–2 students per task (e.g., 4.54% on several tasks). Importantly, for the tasks specifically suited to number line reasoning (tasks 4–11), the expected increase in sequential strategies did not occur. For instance, task 4 (−20 + 15) and task 5 (−4 + __ = 10) yielded 0% sequential strategies, despite being tasks that could naturally invite a jump strategy on the number line. A second notable pattern is the high rate of non-response on early negative-number tasks (tasks 4–11). Several of these tasks show non-response rates between 40% and 68%.
The structure of the tasks appears to influence the strategy choices. In the early tasks (especially tasks 1–3), a noticeable subset of pre-service teachers applied decomposition strategies (e.g., 54.54% in task 1), but as the test progressed, this category decreased sharply. In contrast, the last six tasks (17–22) show a strong concentration of algorithm use (68–77% across all tasks), suggesting that many students rely on procedural fluency rather than conceptual flexibility. The near absence of varied strategies (e.g., compensation) reinforces this interpretation.

5. Discussion and Didactics Implications

This study examined the solution strategies used by first-year pre-service teachers when solving addition and subtraction tasks. Using a deductive thematic analysis based on the framework of Hickendorff et al. (2019) ([4]), we found that the majority of students relied primarily on algorithmic-digit based strategy across the 22 tasks. Number-based strategies, including sequential, decomposition, and varied approaches, were used far less frequently, and strategies directly connected to number line reasoning appeared only sporadically.
The clear predominance of algorithm-digit based strategy across the majority of tasks indicates that the pre-service teachers, at the beginning of their teacher education, have an poor flexibility and adaptive solution strategies in addition and subtraction tasks. This agrees well with what Körner et al. (2026) ([15]) found in their study. While fluency with standard algorithms is an important component of a teacher's mathematical repertoire, it does not, by itself, constitute specialized content knowledge ([1]). Such knowledge includes the ability to explain procedures conceptually, use and justify alternative strategies, and make explicit connections between representations.
The analysis across tasks shows that the vast majority of students stuck consistently to one strategy type, most often the algorithm-digit based strategy, regardless of task structure. Very few students demonstrated intra-individual variation, an indicator of adaptive expertise in arithmetic. This reinforces the interpretation that many students rely on memorized procedures rather than conceptual reasoning or strategic adaptation. The almost complete absence of intra-individual flexibility across the tasks reinforces this interpretation. Most students used the same strategy type throughout the test, regardless of the structure or complexity of the problem. This is in contrast to earlier research showing that flexible strategic adaptation is characteristic of mathematically proficient learners and a hallmark of expert teaching ([2]). Limited flexibility suggests that these students may struggle to choose strategies purposefully or to demonstrate the variety of methods they will be expected to model in their future classrooms.
We found that number-based strategies were used far less frequently than an algorithm-based strategy. Despite the documented importance of the number line as a foundational representational tool, supporting understanding of magnitude, structure, continuity, and relationships among numbers, only a small number of pre-service teachers employed number line, related (sequential) strategies. This finding is notable because several of the tasks (especially items 4–11 involving negative numbers and missing addends) were well-suited to such reasoning.
Despite the central role of the number line in the Norwegian curriculum ([7]) and in conceptual understanding of number and operations ([19]), only a handful of pre-service teachers used sequential (jump) strategies. Even when tasks were structurally suited for number line reasoning (tasks 4–11), students overwhelmingly chose algorithms or left the task blank. This suggests that the students may not consider the number line a natural or accessible representation when solving arithmetic tasks involving negative numbers. This interpretation aligns with previous studies reporting that pre-service teachers often associate the number line with early counting activities rather than with general mathematical reasoning or structure. If the number line is not perceived as a meaningful tool in their own reasoning processes, it is unlikely that they will use it purposefully in classroom instruction.
The high non-response rates on several items involving negative numbers suggest additional conceptual difficulties. Previous research has identified operations with negative integers as a persistent challenge even for teachers and pre-service teachers' ([22]; [21]; [20]; [16]), and the pre-service teachers' omission patterns in this study reflect this. A lack of representational strategies, such as using a number line to visualize additive inverses or directionality on the continuum, may contribute to this

difficulty. This also connects to Ball et al.'s (2008) ([1]) notion of specialized content knowledge: teachers must not only be able to compute with negative numbers but also to explain *why* their procedures work and to choose representations that make the concepts accessible to students. Weaknesses in the students' use of the number line therefore indicate more than a representational gap; they suggest limitations in deeper structural understanding of integer arithmetic ([9]; [10]; [11]; [8]).

The findings highlight the importance of strengthening representational competence and conceptual understanding in the early stages of teacher education ([5]; [2]). In particular, the number line, central in the Norwegian curriculum and foundational for understanding number relations, should be emphasized not only as a pedagogical tool for young students but also as a representational resource for future teachers' own mathematical reasoning. Developing flexible strategy use, and a deeper understanding of the structure of operations with both positive and negative numbers, should be integral goals within the mathematics education of pre-service teachers.

Overall, this study suggests that while pre-service teachers may enter teacher education with strong procedural fluency, they require further support to develop the conceptual and representational knowledge necessary for high-quality mathematics teaching. Future research could examine how targeted instruction on number line representations and flexible strategy use influences pre-service teachers' mathematical reasoning over time.

Storytelling for Teachers' Professional Development. Narrative Reflections on In-Service Teacher Training Pathways

Daniela Di Donato[1], Laura Ceccacci[2]

[1]University of Tuscia, Viterbo, Italy
[2]E-Campus University, Ancona, Italy

Abstract

As part of the initiatives linked to the PNRR, Ministerial Decree 66/2023 has been a key milestone for schools in promoting a system of continuous professional development for Italian teachers, with the aim of strengthening their professional, pedagogical and digital skills with a view to innovative and reflective teaching. In this context, the need to recount experiences from different perspectives offers one way of capturing the complexity of adult learning and teachers' professional development. The personal and professional narrative of training, viewed through the eyes of the trainer, emerges as a methodological tool for promoting transformative learning and teachers' professional identity. The approach proposed in this paper is based on Narrative Inquiry and narrative-oriented practices, which develop an interconnected framework between narration, guidance and the development of educational practices. The process of reflection and support that uses stories and narratives to foster the construction of meaning and skills in training contexts reveals positive effects on equity and professional motivation among both teachers and trainers. The experience described here represents an attempt to share structured narratives (logbooks, memes, critical reflections) analysed according to an integrated narrative model, inspired by Narrative Inquiry as a research methodology.

Keywords: *Narrative Inquiry; Teacher professional development; Continuing professional development; Transformative learning; Innovative teaching methods*

1. Introduction

As part of the initiatives under the National Recovery and Resilience Plan (PNRR), Ministerial Decree 66/2023 marked a significant step forward in promoting the continuous professional development of school staff, with a focus on enhancing teachers' professional, pedagogical and digital skills. The decree frames professional development within a context of educational innovation and organisational transformation, emphasising collaborative and reflective models of professional learning that are consistent with lifelong learning.

From this perspective, teacher training is not merely a matter of professional updating, but constitutes a process of identity construction and the transformation of educational practices. International literature indeed highlights the link between professional development, reflection on experience and participation in professional learning communities (Schön, 1983; Wenger, 1998; Sachs, 2021). Through narration, individuals attribute meaning to experience and construct forms of knowledge that guide action (Bruner, 1988, 1991). Training thus takes on a relational and narrative dimension, in which learning emerges from the exchange of situated experiences and practices.

Recent European education policies have placed greater emphasis on training models based on reflection, collaboration and the integration of digital skills. In particular, the DigCompEdu framework highlights the need to develop forms of professional learning capable of integrating the technological, pedagogical and critical dimensions of teaching professionalism (Redecker, 2022; Ceccacci, 2022). At the same time, educational research emphasises the importance of structured spaces for shared reflection, in which teachers can collectively interpret their professional experience (Di Donato & De Santis, 2021a; Darling-Hammond et al., 2023).

This paper focuses not on the narratives of the participating teachers, but on the reflective experience of the trainers who designed and observed the training programmes. Their narratives constitute a reflective meta-narrative that allows us to view training as a relational ecosystem, in which the trainers themselves also construct professional knowledge through observation, discussion and the re-elaboration of experience.

The approach adopted is based on Narrative Inquiry, a qualitative methodology focused on the study of lived experience through narratives (Clandinin & Connelly, 1997, 2000; Ceccacci, 2020). Narrative takes

on an epistemic function, as it facilitates processes of interpretation, understanding and the attribution of meaning to experience. This perspective engages with studies on Transformative Learning, which attribute a central role to critical reflection in the revision of interpretative and professional frameworks (Mezirow, 2003), and with the literature on Communities of Practice, which interprets professional learning as a social process of participation and negotiation of meanings (Wenger, 1998; Fabbri, 2014; Di Donato & De Santis, 2021a).
The research aimed to document how training experiences prompted the trainers to reflect on their professional identity, the effectiveness of teaching approaches and the dynamics of peer interaction. The paper therefore offers a methodological and pedagogical reflection on the value of Narrative Inquiry in teacher training, highlighting how narrative reflection can serve not only as a tool for analysing experience, but also as a practice that fosters continuous professional learning.

2. Theoretical Framework

Narrative Inquiry is one of the main qualitative approaches for investigating educational and professional experience. According to Clandinin and Connelly, storytelling enables individuals to attribute meaning to their experiences over time and within social contexts, thereby facilitating the construction of professional identity. Narrative knowledge is not limited to the description of events; rather, it enables an understanding of how individuals interpret and reorganise their professional experience. Riessman (2008) also highlights the interpretative and relational nature of narration, whilst other authors (Barkhuizen, 2014) emphasise its value in teacher education contexts, where professional stories become tools for self-reflection. In the present study, narration serves a dual function: as a means of collecting qualitative data and as a space for reflection through which the trainers critically process their own professional experience. Professional reflection is a central element of continuous professional development. Schön (1983) interprets professionalism as the ability to reflect on action and within action, developing forms of situated knowledge that are useful for addressing the complexity of educational practices. The perspective of transformative learning broadens this dimension, highlighting how critical reflection facilitates the revision of interpretative and professional frameworks through the reinterpretation of experience (Mezirow, 2003). From this perspective, training takes on a transformative function insofar as it promotes critical awareness and the re-elaboration of professional meanings. In the context of this research, reflexivity concerns the trainers, who are engaged in the observation and critical re-examination of their own training practices. Professional learning is also interpreted through the lens of Communities of Practice (Wenger, 1998). The shared narrative practices among trainers have triggered collaborative processes of interpreting experience, shaping a professional space in which training knowledge is collectively constructed and redefined. Research on Professional Learning Communities confirms that collaboration and shared reflection are fundamental conditions for sustaining lasting transformations in educational practices (Di Donato & De Santis, 2021b; Stoll et al., 2023; Zhang et al., 2024).
Finally, this contribution is situated within the framework of practitioner inquiry, which views education professionals not only as recipients but also as producers of professional knowledge (Cochran-Smith & Lytle, 2009). From this perspective, the trainers' narrative reflection is interpreted as a practice of professional inquiry aimed at the critical understanding of training practice and the shared construction of professional meanings.

3. Methodology

The research takes the form of a qualitative study using the Collaborative Narrative Inquiry approach, aimed at gathering reflections arising from the trainers' experience in organising and delivering teacher training courses carried out under Ministerial Decree 66/2023. The methodological approach adopted is based on the idea that professional knowledge emerges through processes of narration, reflection and shared interpretation of experience (Clandinin & Connelly, 2000). The research design therefore adopts an interpretative and reflective perspective, consistent with qualitative approaches aimed at understanding the meanings attributed to professional experience (Creswell & Poth, 2018).
Between June 2024 and September 2025, the two trainers designed and delivered 111 training courses, all within the thematic area of digital transition, both face-to-face (45.9%) and remotely (49.5%), covering almost all Italian regions. The courses were aimed at school staff from both comprehensive schools (60.4%) and higher education institutions (39.6%).

Fig. 1. Generated using Claude (Anthropic, 2026)

The map shows the distribution of schools: comprehensive schools (primary and lower secondary schools) are highlighted in green, whilst upper secondary schools are shown in purple. The trainers delivered a total of 111 courses, of which 55 were face-to-face workshops and 51 were online courses. A total of 1,714 teachers took part.

From an epistemological perspective, Ministerial Decree 66/2023 adopts the European DigCompEdu framework as a binding scientific and methodological matrix for the standardisation of training courses, moving beyond the ad hoc use of technologies in favour of the systematic development of professional digital competences. In line with this regulatory framework, the research design adopts the multidimensional structure of DigCompEdu, organised into six strategic competence areas, in light of the taxonomic progression of proficiency levels set out in the framework (from Novice-A1 to Pioneer-C2):

Area 1: Professional Engagement; Area 2: Digital Resources; Area 3: Teaching and Learning; Area 4: Assessment; Area 5: Empowering Learners; Area 6: Facilitating Learners' Digital Competence.

Segmentation was initially used to identify the training needs of the sample of teachers involved in the research, by assessing their self-perception of digital competences and identifying the main gaps in those areas of DigCompEdu most in need of methodological support. The data collected made it possible to define training priorities and to structure the subsequent quantitative and qualitative analysis protocols.The materials were treated as qualitative data of a narrative nature, useful for capturing both the trainees' self-perception of their skills and the interpretations developed by the trainers. The use of different narrative tools facilitated a multifaceted and context-specific representation of training needs, both explicit and latent.

The document corpus was subjected to Qualitative-Thematic Content Analysis according to the model by Braun and Clarke (2006). In line with Narrative Inquiry (Clandinin & Connelly, 2000), the unit of analysis was identified as the narrative fragment or visual artefact possessing autonomous meaning. Coding followed a hybrid approach (Fereday & Muir-Cochrane, 2006): deductive, anchored to the areas of the DigCompEdu framework; inductive, aimed at capturing emotional experiences and processes of identity revision. Data saturation (Saunders et al., 2018) led to the identification of three interpretative macro-axes: the epistemological-methodological dimension, relating to application gaps and requests for methodological support; the reflective and transformative dimension, focused on processes of redefining professional identity in line with Transformative Learning (Mezirow, 2003); the relational and social dimension, oriented towards the analysis of collaborative dynamics and cultural resistance to innovation within Communities of Practice (Wenger, 1998).

The empirical materials, collected longitudinally throughout the entire training programme, constituted a heterogeneous narrative corpus divided into four main sources: reflective documentation by the trainers, comprising logbooks, critical notes and ethnographic notes on the dynamics that emerged during the

sessions; informal interprofessional exchanges, such as narrative conversations, debriefing video calls and immediate communications aimed at co-designing and monitoring the programme; narratives from course participants, collected in person and in digital environments, relating to teaching practices, methodological challenges and experiences of using the tools; artifacts and multimedia productions by the trainers, including digital works and interpretative memes (Di Donato, 2023), used to represent, in a visual and ironic manner, experiences and difficulties linked to the digital transition.To ensure greater reliability and reduce interpretative bias on the part of the researcher-trainers, a triangulation approach involving two blind analysts was applied (Lincoln & Guba, 1985). The independent coding of the corpus yielded an inter-rater agreement index (Cohen's K) of over 0.80. The empirical analysis highlights a marked polarisation of training needs: teachers demonstrate greater proficiency in areas relating to communication and the selection of digital resources (Area 1 and Area 2), whilst the main challenges emerge in Digital Assessment (Area 4) and Facilitating Student Skills (Area 6). The data reveal the difficulty in transforming the instrumental use of technologies into pedagogical practices geared towards advanced assessment and the critical co-creation of digital content (Figure 2).

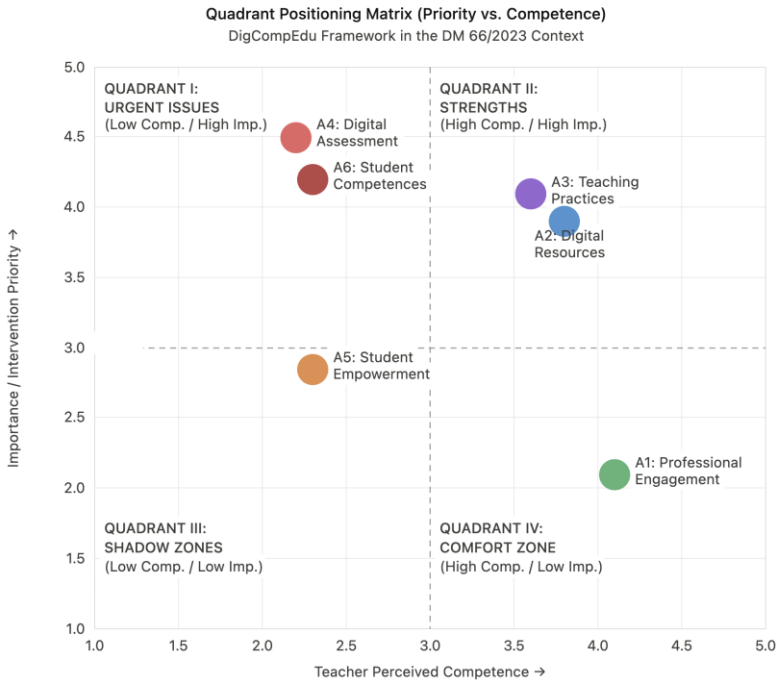

Fig. 2. Compiled by the authors

The intersection of self-perceived digital competence (X-axis) and the methodological and pedagogical importance attributed by teachers (Y-axis) provides a map of the main identity-related tensions and training needs that emerged from the analysis of the DigCompEdu framework (Figure 1). The positioning of the six macro-areas across the four quadrants highlights a marked polarisation of training needs.

Quadrant I – Urgent issues (low competence/high importance) concentrates the main professional weaknesses and the 'disorienting dilemmas' described by Mezirow (2003). Area 4 (Digital Assessment) has the lowest perceived competence level (X: 2.1) compared to the highest importance attributed (Y: 4.5), followed by Area 6 (Student Competences) (X: 2.2; Y: 4.2). Teachers' accounts and the trainers' ethnographic observations reveal a widespread difficulty in translating the technical use of technologies into advanced assessment and training practices, accompanied by requests for immediately applicable tools.

Quadrant II – Strengths (high competence/high importance) includes Area 3 (Teaching practices) (X: 3.5; Y: 4.1) and Area 2 (Digital resources) (X: 3.8; Y: 3.9). These dimensions represent teachers' operational 'comfort zone', linked to the daily use of digital tools for managing teaching. However, the proximity to Quadrant I suggests the need to transform these skills into practices geared towards assessment and the critical development of students' skills.

In Quadrant III – Grey Areas (low competence/low importance), Area 5 (Student Empowerment) (X: 2.3; Y: 2.8) emerges. The data indicate limited attention to digital inclusion and personalisation, often delegated to support teachers and rarely perceived as a shared responsibility of the entire class council.

Quadrant IV – Technical comfort zone (high competence/low importance) contains Area 1 (Professional engagement) (X: 4.2; Y: 2.1). The use of institutional tools and school digital channels now appears to be established as a standardised bureaucratic practice, perceived as a technical prerequisite rather than an area for professional development.
In the second phase of the research, the trainers' narrative accounts were interpreted as heuristic tools useful for investigating the meanings attributed to professional practice in different training contexts. The study engages with Transformative Learning, which assigns a central role to critical reflection in the revision of professional frameworks (Mezirow, 2003), and with Communities of Practice, which interpret teacher learning as a social process of participation and negotiation of meanings (Wenger, 1998).
The aim was to document how the training programmes under Ministerial Decree 66/2023 triggered processes of mutual reflection between trainees and trainers. The trainers shared experiences, methodological challenges, metaphors of learning and the outcomes of teaching experiments integrated with the DigCompEdu and DigComp 2.2 frameworks. These narratives prompted the trainers to engage in second-order reflections on professional identity, the effectiveness of the training proposals, and the dynamics of peer-to-peer dialogue. From this perspective, the trainers' narrative reflexivity is not merely a reporting of experience, but a generative practice of continuous professional learning.

4. Results: A Narrative SWOT Analysis

A SWOT analysis was used to systematise the resonances and negotiations of meaning that emerged from the trainers' narrative accounts. In line with the epistemological approach adopted, the matrix was not used as a quantitative classification tool, but as an interpretative device aimed at highlighting the situated nature of the trainers' professional experiences, the tensions surrounding identity, and the processes of transformative learning generated by interaction with the course participants.
The picture of training needs that emerged from the analysis — characterised by the critical issues in Areas 4 and 6 and the marginalisation attributed to Area 5 — triggered, through Narrative Inquiry (Clandinin & Connelly, 2000), a process of metacognitive reflection among the trainers, who were called upon to renegotiate the meaning of their professional stance in the face of the gaps and resistance that emerged in the training context. The findings of this monitoring and debriefing process have been summarised in the Narrative SWOT Matrix (Figure 3), which links internal factors — professional identity, skills and emotional aspects — with external factors, such as classroom dynamics and institutional pressures, highlighting their connection to teachers' training needs.

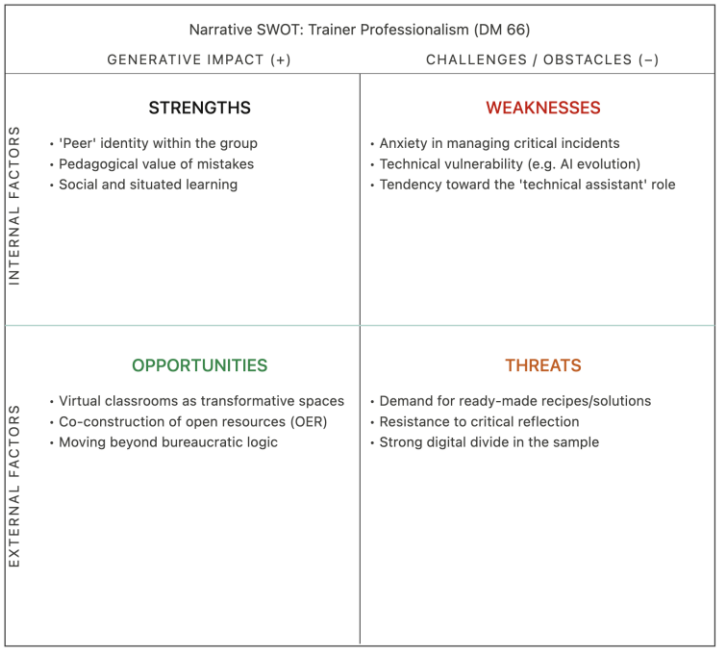

Fig. 3. Compiled by the authors

Generative convergence: strengths and opportunities - The trainers responded to the trainees' vulnerabilities by redefining their role from the perspective of the Community of Practice (Wenger, 1998). Rather than adopting a didactic stance, they emphasised the peer-to-peer dimension to acknowledge

and rework the teaching failures that emerged in the training contexts. Error was thus reinterpreted as an opportunity for social and situated learning. This professional stance was intertwined with the possibility of inhabiting virtual and physical classrooms as transformative spaces (Mezirow, 2003), in which the sharing of metaphors, diaries and artefacts helped overcome the purely bureaucratic logic linked to Ministerial Decree 66/2023, promoting the co-construction of open educational resources rooted in the concrete needs of schools.

Managing challenges: weaknesses and threats - The SWOT matrix also highlights the systemic and identity-related tensions faced by the trainers. The polarisation of the sample, divided between teachers with advanced needs (Areas 4 and 6) and teachers struggling with basic skills, highlighted the risk of a significant digital divide. This divide fuelled resistance to critical reflection and a widespread demand for immediate solutions, perceived as a response to technological performance anxiety. These dynamics have led to feelings of technical vulnerability among trainers and difficulties in managing critical incidents, exacerbated by the rapid evolution of tools such as generative Artificial Intelligence. Faced with requests for immediate operational support, there has sometimes been a tendency to slip into the role of 'technical assistant', with the risk of reducing the digital transition to mere IT training, thereby undermining pedagogical reflection on student assessment and empowerment.

5. Discussion: Narrative Reflexivity as a Practice of Continuous Professional Learning

The re-examination of documentary materials through SWOT Analysis highlights how the training activities within the DM 66/2023 pathways did not take the form of a simple transmission of content on the DigCompEdu framework, but rather a process of Transformative Learning. The sharing of instances of methodological failure and uncertainty in the use of digital tools acted as a 'disorienting dilemma' (Mezirow, 2003), fostering processes of critical reflection among both trainees and trainers. By acknowledging the vulnerabilities and difficulties that emerged in the narratives and professional exchanges, the trainers gradually redefined their own identity, shifting from a role as 'digital experts' to that of facilitators of reflective processes. The knowledge produced thus takes on a social and situated nature (Wenger, 1998), as professional learning is consolidated through shared engagement with error and with methodological and technological uncertainty.

However, critical issues remain. The demand for predominantly technical and instrumental support put forward by some teacher-trainees risks pushing the trainers towards an operational support role, reducing the space dedicated to pedagogical reflection and the co-construction of meaning.

Overall, the findings confirm that Narrative Inquiry is a generative practice for professional learning. The creation of narrative spaces dedicated to the experience of the digital transition makes it possible to address the most sensitive areas of the DigCompEdu framework — in particular digital assessment (Area 4) and the development of students' skills (Area 6) — whilst offering a replicable model for continuing professional development. From this perspective, the digital transition in schools goes beyond the technical compliance requirements linked to the PNRR and takes the form of a process of cultural and professional transformation for the entire school community.

From Individual Innovation to Institutional Strategy: A Competency-Based Model for Strategic AI Integration in Faculty Development

Claudia Quinteros

Universidad del Valle de Guatemala, Guatemala

Abstract

The integration of generative artificial intelligence (AI) in higher education requires more than isolated initiatives; it demands a structured institutional model that connects pedagogical innovation, competency-based alignment, and academic validation. Within the framework of Universidad del Valle de Guatemala's Institutional AI Adoption Strategy, the Center for Excellence in Teaching and Learning led a collegial process to identify, analyze, validate, and systematize faculty practices in AI integration. The initiative aimed to strengthen student learning and ensure coherence with the university's educational model. It also supported faculty in integrating AI into their teaching strategies. The initiative was organized into four strategic phases. The first phase, Institutional Mapping of Teaching Practices, identified AI-integrated teaching and assessment practices across disciplines through a targeted faculty survey. A total of 135 practices were collected and organized according to the university's twelve generic competencies. The second phase, Selection and Alignment with Institutional Generic Competencies, involved a rigorous qualitative review and comparative analysis to determine the degree of alignment between reported practices and formal competency definitions. This process refined the initial set of practices and resulted in 25 selected practices with strong potential for institutional adoption. During the third phase, Interfaculty Collegial Validation, faculty from diverse academic departments participated in structured consultation sessions to evaluate clarity, relevance, and reproducibility. This collaborative dialogue strengthened the academic quality and cross-disciplinary viability of the selected practices. Finally, Academic Standardization and Institutional Projection led to the publication of an institutional document compiling validated practices, pedagogical guidelines, and structured levels of AI integration to support faculty development. This experience demonstrates that institutional AI adoption can be addressed through a structured, competency-aligned, and collegial model. It positions faculty as active agents of academic innovation and offers a replicable framework for higher education institutions seeking to integrate AI through a strategic and collaborative approach.

Keywords: *Faculty Development, AI integration, Higher Education*

1. Introduction

The rapid integration of generative artificial intelligence (AI) in higher education is reshaping teaching and learning practices across disciplines. While many faculty members are experimenting with AI tools to enhance their courses, these efforts often remain fragmented and disconnected from broader institutional strategies. As a result, universities face the challenge of moving beyond isolated innovations toward structured approaches that ensure pedagogical coherence, alignment with institutional goals, and sustainable faculty development.

In this context, the integration of AI in teaching cannot be reduced to the adoption of technological tools. It requires the design of institutional models that support faculty in developing pedagogically grounded practices, aligned with competency-based education frameworks and validated through collaborative academic processes. However, there is still a limited number of documented experiences that describe how institutions can systematically organize, evaluate, and scale such practices.

This experience addresses this gap through a structured, competency-based approach to AI integration in faculty development. The model is based on a collegial process that includes the identification, analysis, validation, and systematization of teaching practices, aligned with institutional generic competencies. Developed within the framework of the University of Valle de Guatemala's AI Adoption Strategy [1], the model offers a replicable approach for higher education institutions seeking to integrate AI in a strategic, collaborative, and pedagogically meaningful way.

2. Literature Review

2.1 Artificial Intelligence in Higher Education

The integration of artificial intelligence (AI) in higher education has expanded significantly in the last decade, positioning itself as a key driver of educational transformation. AI technologies—such as machine learning, learning analytics, and intelligent tutoring systems—enable personalized learning, adaptive feedback, and data-informed decision-making, contributing to more efficient and responsive teaching and learning processes [2] [3].
Research has shown that AI applications in education can be categorized into areas such as assessment, prediction, intelligent tutoring, and learning management, reflecting a broad spectrum of pedagogical uses [2]. These developments have the potential to reshape traditional instructional practices. They enhance access to information and transform how knowledge is constructed, delivered, and evaluated [4]. However, despite its transformative potential, the integration of AI in higher education is not without challenges. Issues related to ethical considerations, data privacy, infrastructure, and the lack of AI literacy among educators continue to limit its effective implementation [2][3]. Additionally, research highlights that while AI adoption is increasing, its pedagogical integration often lacks alignment with instructional design and institutional frameworks, which may reduce its impact on meaningful learning outcomes [4].

2.2 Faculty Development in the Context of AI

Faculty members play a critical role in the successful integration of AI in higher education, as they are key agents in designing, implementing, and mediating AI-enhanced learning experiences. However, current research indicates that faculty perspectives, competencies, and professional development needs in relation to AI remain underexplored [2]. Studies show that while educators recognize the benefits of AI—such as improved instructional efficiency, personalized teaching strategies, and enhanced feedback mechanisms—they also face significant challenges, including limited AI literacy, ethical concerns, and uncertainty about their evolving roles [2][5]. This tension reflects a broader gap between technological advancement and pedagogical readiness.
Moreover, the literature emphasizes that professional development is essential to support faculty in navigating this transformation. Effective faculty development programs should not only focus on technical skills but also address pedagogical integration, ethical considerations, and human–AI collaboration [2]. In this context, AI should be understood as a tool that supports teaching rather than replaces educators, reinforcing the need for structured institutional support systems.

2.3 Competency-Based Education and AI

Competency-based education (CBE) has gained increasing relevance in higher education as an approach that prioritizes the development of measurable skills, progressive mastery, and continuous improvement, rather than traditional time-based models of instruction. This approach emphasizes the alignment between learning outcomes, assessment practices, and the gradual development of competencies that can be transferred to academic and professional contexts [6]. Within this framework, the integration of artificial intelligence (AI) creates new opportunities to strengthen both the design and the monitoring of competency development.
AI tools enable more adaptive, data-informed approaches within competency-based education. They can support personalized learning pathways, automated assessment systems, and real-time tracking of competency development, allowing continuous monitoring of student progress, identification of learning gaps, and provision of targeted feedback. In the context of faculty development, AI has shown strong potential to support competency mapping, adaptive training processes, and micro-credentialing, although its large-scale adoption still faces challenges related to infrastructure, ethical considerations, and methodological limitations [6]. At the same time, recent advances in AI competency frameworks have expanded the understanding of what it means to be “competent” in AI-mediated educational environments. Beyond technical skills, AI competency is increasingly understood as a multidimensional construct that includes critical thinking, ethical awareness, digital agency, and self-regulated learning. International organizations such as UNESCO and the European Commission emphasize the importance of embedding these competencies into curricula, enabling students not only to use AI tools but also to engage with them in informed, reflective, and socially responsible ways [7].

However, despite these advances, existing competency frameworks are often based on conceptual definitions and self-reported measures, with limited attention to empirical evidence derived from real teaching and learning practices. Recent studies highlight a gap between theoretical models of AI literacy and the actual behaviors, strategies, and usage patterns that students develop in authentic educational contexts [7]. Similarly, research on AI in competency-based education shows that much of the literature focuses on student-centered applications, while the development of faculty competencies and related professional practices remains less explored [6].

This gap highlights the need to complement traditional competency-based approaches with practice-oriented and evidence-based perspectives. These perspectives better capture how AI is integrated into teaching and learning processes. Understanding competency development not simply as a predefined set of skills, but as a dynamic and context-dependent process shaped through interaction with AI tools, can provide a stronger foundation for designing faculty development models and institutional strategies [7]. In this sense, integrating AI into competency-based education requires not only technological adoption, but also pedagogical alignment and institutional support to ensure meaningful and sustainable implementation [6].

2.4 Toward Institutional Models for AI Integration

Recent literature increasingly highlights the need to move beyond isolated initiatives toward structured institutional approaches for the integration of artificial intelligence in higher education. While many universities have begun to develop guidelines, ethical frameworks, and support resources, these efforts are often fragmented or focused on specific aspects such as policy, tool usage, or academic integrity, rather than articulated as comprehensive and validated models for faculty development and pedagogical integration [2].

In the case of the University of Valle de Guatemala, significant progress has been made in establishing an institutional foundation for the ethical and responsible use of artificial intelligence. This process has been led by the Artificial Intelligence department through the institutional AI Adoption Strategy [1]. The strategy established dedicated working groups, including the Center for Excellence in Learning and Teaching (CEAD), responsible for AI integration in teaching. This is reflected in the development of formal guidelines for students and faculty members [8] [9], and a comprehensive Code of Ethics of UVG that emphasize principles such as transparency, equity, data protection, and respect for human dignity [10]. These institutional efforts promote the use of AI as a tool to enhance learning, foster critical thinking, and support responsible decision-making in academic contexts. However, despite this strong normative foundation, a gap remains between these institutional guidelines and their translation into everyday teaching practice. While the policies clearly define what responsible AI use should look like, they do not fully specify how these principles are operationalized in the design of courses, teaching strategies, and assessment practices. This creates a disconnect between institutional intent and pedagogical implementation, highlighting the need for more structured and practice-oriented models that support faculty in integrating AI in a consistent and meaningful way [4]. More broadly, this situation reflects a recurring challenge in higher education: institutional documents often provide a strong ethical and normative foundation, yet they do not always translate into structured, systematic, and empirically validated models that guide how AI should be integrated into teaching practice and faculty development processes. In many cases, the focus remains on defining principles and recommended practices, with less emphasis on how these are operationalized through coordinated processes, collaborative validation, and alignment with competency-based educational frameworks [2].

This reveals an important gap between institutional intention and pedagogical implementation. Although universities recognize the importance of integrating AI in a responsible and meaningful way, there is still a need for models that organize this integration into clear phases, incorporate faculty participation, ensure alignment with institutional competencies, and generate validated and transferable practices. Addressing this gap requires moving from guidelines and ethical frameworks toward structured institutional models that combine strategy, pedagogy, and collaborative processes. Such models should not only define what responsible AI use looks like, but also provide a systematic pathway for identifying, validating, and scaling effective teaching practices. In this context, the present study contributes by proposing an institutional model that articulates these elements through a phased, competency-based, and collegial approach to AI integration in faculty development.

3. Methodology

This work describes the systematization of an institutional experience aimed at integrating artificial intelligence (AI) into higher education teaching. The process was carried out at the University of del Valle de Guatemala and led by the Center for Excellence in Learning and Teaching (CEAD), as part of the institution's AI adoption strategy [1]. Its purpose was to identify, analyze, and strengthen teaching practices that incorporate AI into the teaching and learning process. Rather than applying a predefined model, this experience was developed through an iterative and collaborative process involving faculty members and academic teams. This approach enabled the identification of real practices implemented across different disciplines, their analysis in terms of their contribution to student learning, and their alignment with the institution's competency-based educational framework. To structure this process, a sequence of coordinated activities was implemented and organized into four sequential phases. These phases were designed to systematize the experience, ensure alignment with institutional learning objectives, and support its use as a reference for faculty development. The four phases are described below.

3.1 Phase 1: Institutional Mapping of Teaching Practices

The first phase focused on identifying existing teaching and assessment practices that incorporate artificial intelligence (AI) across different academic disciplines of the three UVG Campuses. To support this process, a structured survey was designed and distributed to faculty members who had previously demonstrated interest or experience in the use of AI in their teaching. The survey collected both contextual and descriptive information. Faculty members shared their perspectives on the use of AI in teaching, the perceived effectiveness of AI integration for developing institutional competencies [11], and descriptions of up to three teaching practices implemented in their courses.The identification of participants was informed by prior institutional initiatives and internal collaboration within the academic team. The information collected provided an initial mapping of AI use in teaching. It also captured practice-based examples grounded in real classroom experiences. The data collection process included follow-up communication to support participation and clarify responses when needed, establishing a comprehensive basis for the subsequent analysis and refinement phases.

3.2 Phase 2: Selection and Alignment with Institutional Generic Competencies

The second phase focused on the review, selection, and alignment of the teaching practices collected during the previous phase. Screened to identify those demonstrating an appropriate and ethical use of AI in accordance with the Institutional Guidelines for AI Use [8] [9] and the UVG Code of Ethics [10]. Practices that lacked sufficient information, showed limited pedagogical relevance, or did not provide evidence of meaningful AI integration were excluded at this stage. The remaining practices were then reviewed for clarity, level of detail, and alignment with the university's generic competencies. Faculty members whose practices met these criteria were invited to expand their submissions using a standardized format. The enriched practices were subsequently evaluated for pedagogical coherence, explicit competency alignment, and potential applicability across academic contexts. Practices that did not meet these requirements or lacked sufficient information after follow-up communication were excluded from the process, while those demonstrating consistency across all criteria advanced to the collegial validation phase. As part of this process, specifically, AI tools were used to support the organization and preliminary analysis of the practices by grouping similar practices, identifying recurring themes, and suggesting possible relationships between practices and institutional competencies. These outputs were used only as analytical aids and were not considered evidence for decision-making. All classifications, interpretations, inclusion or exclusion decisions, and competency alignments were reviewed and validated by the academic team. To reduce potential bias, AI-generated suggestions were systematically contrasted with the original faculty submissions and the formal definitions of the institutional competencies before any determination was made.

3.3 Phase 3: Interfaculty Collegial Validation

The third phase focused on the collegial validation of the teaching practices through structured consultation sessions involving faculty members from different academic departments from the three UVG Campuses. The purpose of this phase was to strengthen the clarity, relevance, and potential applicability of each practice through peer dialogue and collective reflection. To support this process,

three validation sessions were organized, in which selected practices were shared in advance with participants to allow for prior review and reflection. During the sessions, each practice was presented and discussed using a guided review process. Feedback focused on two guiding questions: (1) “Is there any aspect of this practice that should be clarified to improve understanding by other faculty members?” and (2) “Do you have any suggestions that could make this practice more effective, reproducible, or transferable?” Prior to each session, participants received the practices for review. During the validation sessions, faculty members presented their practices in concise three-minute presentations, followed by peer feedback and discussion. Participants were also invited to provide written comments or suggested revisions when necessary, that would include: observations, suggestions, and recommendations based on their disciplinary perspectives and teaching experience. Following the sessions, faculty members were given one week to incorporate the recommendations received and submit a revised version of their practice to the academic team responsible for the final publication. This phase emphasized collaborative engagement as a mechanism to refine the practices, ensuring that they were not only pedagogically sound but also understandable and transferable across different areas of knowledge.

3.4 Phase 4: Academic Standardization and institutional Documentation

The fourth phase focused on the academic standardization and institutional documentation of the teaching practices following the collegial validation process. The purpose of this phase was to organize the practices in a consistent and structured format, ensuring coherence in their presentation and facilitating their use as a reference for faculty development. To achieve this, a writing and coordination team synthesized the validated practices by applying a standardized structure that included key elements such as pedagogical purpose, description of activities, use of AI tools, and alignment with institutional competencies. This process involved organizing, editing, and refining the content to ensure clarity, consistency, and fidelity to the practices discussed during the validation phase. The documentation process was conceived as the development of the first volume of an institutional series aimed at compiling and disseminating AI-integrated teaching practices, establishing a foundation for future volumes that will continue to expand and update the collection as the institutional experience evolves.

4. Process Outcomes

4.1 Phase 1: Institutional Mapping of Teaching Practices

The first phase was implemented over a one-month period, beginning in the third week of August 2025 and concluding in the third week of September 2025. During this stage, a structured survey was distributed to 100 faculty members across the university’s six academic faculties, of which 60 responded. The survey collected both contextual and practice-based information, capturing faculty profiles, their level of experience using AI in teaching, and their perceptions regarding the effectiveness of AI integration for the development of institutional competencies. In addition, respondents described up to three teaching practices incorporating AI, resulting in a total of 135 reported practices.
From a quantitative perspective, the results show that the participating faculty are highly experienced educators, with 45% reporting more than 15 years of teaching experience and an additional 32% reporting between 5 and 15 years, indicating a strong institutional base of pedagogical expertise (Fig 1).

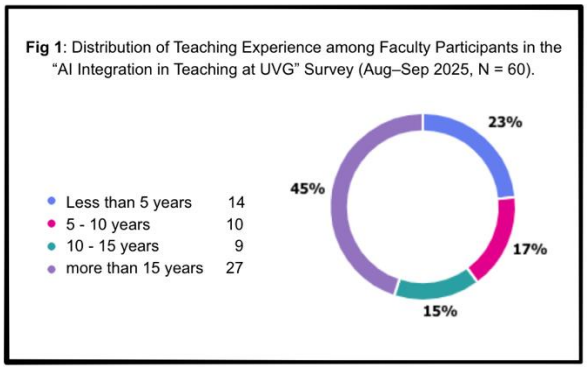

Fig 1: Distribution of Teaching Experience among Faculty Participants in the “AI Integration in Teaching at UVG” Survey (Aug–Sep 2025, N = 60).

In contrast, their experience with AI in teaching is relatively recent: nearly 70% of respondents reported having less than two years of experience integrating AI into their courses, with the majority indicating between six months and two years of use. Faculty responses also revealed current patterns of AI use in teaching. The data indicate that the integration of AI is primarily oriented toward supporting teaching and learning activities rather than being embedded as a fully structured pedagogical practice (Fig 2). Faculty reported varying levels of frequency in guiding students to use AI tools, suggesting that while its use is present in the classroom, it is not yet consistently incorporated across courses. These patterns reflect an exploratory stage of adoption. AI is primarily used as a support tool rather than as an integrated component of course design. Overall, these results indicate that the university is in an early stage of AI integration, characterized by high teaching expertise, emerging use of AI, and significant potential for institutional development.

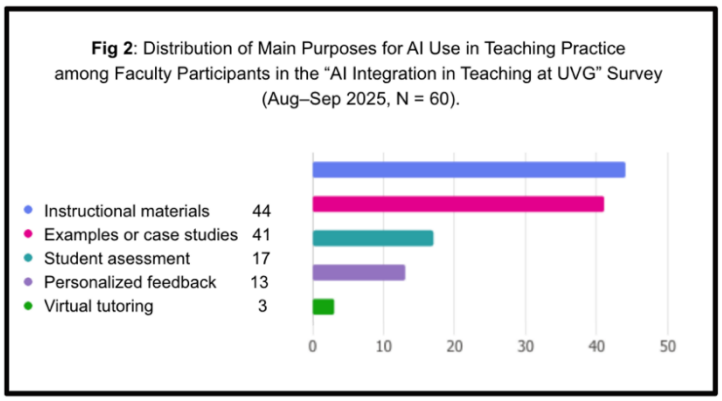

Fig 2: Distribution of Main Purposes for AI Use in Teaching Practice among Faculty Participants in the "AI Integration in Teaching at UVG" Survey (Aug–Sep 2025, N = 60).

4.2 Phase 2: Selection and Alignment with Institutional Generic Competencies

The second phase was conducted during October 2025 and focused on the refinement, selection, and further development of the teaching practices identified in the previous stage. An initial filtering process was applied to the 135 reported practices, resulting in the identification of 87 practices considered as good practices, concentrated among 40 faculty members, based on predefined criteria related to the appropriate and ethical use of AI. Following this selection, a standardized format was distributed to these 40 faculty members to expand and enrich the description of their practices, ensuring greater clarity, pedagogical detail, and alignment with institutional competencies. Each selected practice required the completion of this standardized form, which provided a more structured and comparable description of the teaching experience. As a result of this process, 25 practices were submitted in the required format. A subsequent review led to the approval of 18 practices, while five were excluded for not meeting the established criteria, and two were deferred to a second volume of the document due to time constraints faced by faculty members. This phase strengthened the quality, consistency, and alignment of the practices, preparing them for the collegial validation process.

4.3 Phase 3: Interfaculty Collegial Validation

The third phase was carried out during the first two weeks of November 2025 and focused on the interfaculty collegial validation of the selected teaching practices. During the first week, three structured validation sessions were conducted, in which a total of 18 practices approved in the previous phase were presented and discussed. In each session, six practices were evaluated by groups of 6 to 8 faculty members who had previously contributed good practices, fostering a peer-based review grounded in teaching experience. The sessions included the presentation of each practice followed by structured feedback focused on clarity, pedagogical coherence, and potential applicability in other academic contexts. As a result of this process, 17 practices were approved for continuation, while one practice was excluded from the process. During the second week, faculty members provided amendments and refinements to the practices based on the feedback received during the validation sessions, ensuring that each practice incorporated the necessary adjustments before moving to the final documentation phase.

4.4 Phase 4: Academic Standardization and Institutional Documentation

The fourth phase was carried out from mid-November to mid-December 2025 and focused on the academic standardization and institutional documentation of the validated teaching practices. During this stage, the team from the Center for Excellence in Learning and Teaching (CEAD) was responsible for organizing, editing, and refining the content to ensure clarity, consistency, and fidelity to the practices discussed during the validation phase. This process resulted in the development of the electronic publication "*Buenas prácticas de integración de la Inteligencia Artificial generativa en la docencia. Volume 1*" [12], a 128-page document designed to provide faculty with practical examples, guidance, and recommendations on how to effectively integrate AI into their teaching. The publication encourages faculty members to adapt these practices to their own academic initiatives. It emphasizes student learning and the development of competencies aligned with the university's educational model (Fig 3).
The document was distributed to the university's faculty during the second week of December 2025. In the first trimester of 2026, the practices included in the publication were further disseminated through institutional faculty development spaces organized by CEAD. These included "CafeCITo con", a forum aimed at sharing teaching practices and fostering reflection and collaboration among faculty across departments, where 4 practices have been presented, and the "UVG Faculty AI Club", a space designed to explore and experiment with AI tools in higher education, where four practices have been presented. These dissemination efforts contributed to extending the impact of the initiative beyond documentation, promoting ongoing dialogue and engagement around the integration of AI in teaching.

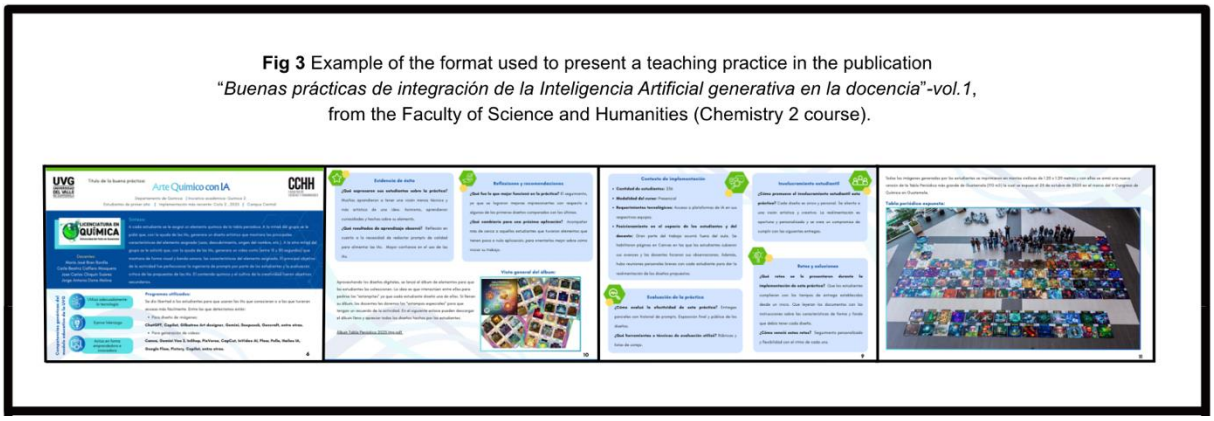

Fig 3 Example of the format used to present a teaching practice in the publication "*Buenas prácticas de integración de la Inteligencia Artificial generativa en la docencia*"-*vol.1*, from the Faculty of Science and Humanities (Chemistry 2 course).

5. Conclusions

The integration of artificial intelligence (AI) in higher education requires more than isolated faculty initiatives; it demands structured institutional processes that guide, support, and align teaching practices with educational goals. The experience documented in this study shows that a systematic and phased approach enables institutions to move from dispersed individual practices toward a coherent and organized framework for AI integration in teaching.
A key finding of this experience is the central role of faculty as agents of innovation. The identification, refinement, and validation of teaching practices showed that meaningful AI integration emerges from real classroom experiences. Collaborative processes help strengthen and refine these practices. The collegial validation phase, in particular, proved to be critical in improving the clarity, relevance, and transferability of the practices across disciplines.
The process also highlights the importance of aligning AI integration with a competency-based educational framework. By connecting teaching practices with institutional competencies, the initiative ensured that the use of AI contributes directly to student learning and the development of the graduate profile, rather than remaining at the level of technological adoption.
Finally, this experience confirms that documenting and systematizing teaching practices is a valuable strategy for institutional learning. The development of a structured institutional document not only supports faculty development but also creates a shared reference that promotes consistency, reflection, and continuous improvement in the integration of AI in teaching.

6. Implications for Faculty Development and Institutional Practice

The experience documented in this study suggests that higher education institutions seeking to integrate AI into teaching should move beyond policy frameworks and focus on structured, practice-based processes. A phased approach provides a clear pathway for organizing and scaling innovation. The process begins with identifying existing practices and continues through refinement, collegial validation, and institutional documentation. This approach can be adapted to different institutional contexts, allowing universities to build on their own faculty experiences rather than relying solely on external models.

For faculty development, the findings highlight the importance of creating spaces for collaboration and peer exchange. Structured validation processes, such as interfaculty consultation sessions, not only improve the quality of teaching practices but also promote shared understanding and collective learning among educators. These spaces foster reflection, encourage the exchange of ideas across disciplines, and support the development of a community of practice around AI integration.

The study also underscores the need to align AI integration with competency-based educational frameworks. Institutions should ensure that the use of AI tools is explicitly connected to the development of student competencies and learning outcomes. This alignment helps avoid superficial or purely instrumental uses of AI and instead positions it as a means to enhance critical thinking, problem-solving, and autonomous learning.

Finally, the results highlight the value of institutional documentation for sustaining and disseminating innovation. Structured resources that compile validated teaching practices provide shared references for faculty, support ongoing professional development, and encourage adaptation across academic contexts. In this sense, the process also contributes to strengthening the Scholarship of Teaching and Learning (SoTL) as a means to systematically document, share, and reflect on teaching practices within a community of educators committed to learning from and with one another. Therefore, documenting and sharing good practices becomes a key mechanism for continuous improvement and long-term institutional transformation.

While this experience provides a structured approach for identifying, validating, and documenting AI-integrated teaching practices, its primary contribution lies in the systematization of an institutional process and the development of faculty development resources. The initiative was not designed to measure the direct impact of these practices on student learning outcomes, faculty competencies, or long-term teaching quality. Future work may build on this foundation by examining the educational impact of the documented practices and their contribution to sustained pedagogical innovation.

Abstract

The rapid digitalisation of education systems has intensified the need for educators to acquire competencies in digital pedagogy and technology-enhanced learning (TEL). While global frameworks emphasise digital competence acquisition, less attention has been paid to how educators experience TEL training and the processes that enable or constrain meaningful skills development. This paper explores educators' perceptions of TEL training initiatives in three South African TVET colleges participating in the Pro-Telde Project, situating their experiences within broader debates on institutional readiness, pedagogical transformation, and sustainability of digital reforms. Drawing on an interpretive qualitative approach within a mixed-methods design, the study highlights anticipated gains in technical skills, pedagogical confidence, and contextual resource design, alongside constraints such as infrastructure limitations and uneven baseline digital literacy. Findings indicate that the training contributed to a shift from functional technology use towards learner-centred digital pedagogies, enhanced educators' confidence in creating and applying digital learning resources and promoted the transfer of skills through experiential and collaborative learning approaches. The study further found that the translation of newly acquired competencies into practice was strongly influenced by institutional conditions, including infrastructure availability, leadership support, and policy alignment. In addition, trained educators played an important role in extending digital capabilities to colleagues and students, thereby contributing to broader institutional capacity-building. The paper argues that effective capacity-building requires experiential learning, institutional alignment, and sustained post-training support, offering practical insights for higher education and TVET contexts.

Keywords: *Technology-Enhanced Learning (TEL), Digital Pedagogy, TVET Colleges, Skills Development, Institutional Readiness, Pro-Telde Project*

1. Introduction

The accelerating pace of global digital transformation has reshaped education systems, compelling institutions to integrate technology-enhanced learning (TEL) as a central pillar of teaching and learning. TEL is increasingly recognised as a mechanism to democratise access, foster learner engagement, and align curricula with the demands of knowledge economies [1]. Within technical and vocational education and training (TVET), the imperative is particularly acute: vocational institutions are expected to prepare graduates not only with technical expertise but also with digital fluency and transferable competencies that enable adaptability in volatile labour markets [2,3]. The growing importance of TEL lies in its capacity to transform learning environments into interactive, flexible, and student-centred spaces. Frameworks such as DigCompEdu [4] and pedagogical models like e-tivities [5] emphasise the role of digital tools in fostering active participation, collaboration, and contextualised knowledge construction. TEL can enhance student engagement, problem-solving, and workplace readiness when embedded within coherent pedagogical strategies [6,7]. Yet, despite these global advances, the translation of TEL into practice remains uneven, particularly in resource-constrained environments where infrastructural limitations and institutional fragmentation hinder sustainable adoption [8,9].

While TEL initiatives often emphasise technical skill acquisition, research highlights that meaningful integration requires pedagogical confidence, curriculum innovation, and the ability to design contextually relevant learning experiences [10.11]. However, educators frequently struggle to achieve this due to time pressures, uneven digital literacy, and limited institutional [12]. These challenges are particularly acute in South Africa's TVET colleges, which occupy a strategic role in addressing youth unemployment

and advancing social inclusion. Although policy frameworks envision TVET as a driver of local economic development governance and funding weaknesses have undermined institutional coherence and capacity [13] Consequently, studies reveal persistent curriculum-industry misalignment, limited digital learning infrastructure, and inadequate lecturer training, all of which prevent the sector from fulfilling its mandate [12,14].

The Pro-Telde Project was a funded initiative designed to strengthen educator capacity in digital pedagogy and TEL within South African TVET colleges. It has seven partners that are three from Europe (Pixel, Univerity of Sapienza Universita and University of Peloponnese) and four from South Africa (Univeristy of Jhannesburg, Vhembe TVET college, Majuba TVET college and Central Johannesburg TVET college). The project provided structured training programmes aimed at equipping South African lecturers with both technical skills and pedagogical confidence to integrate digital tools into their teaching practice. By foregrounding experiential learning, peer collaboration, and contextual resource design, Pro-Telde sought to address systemic challenges of institutional readiness and uneven digital literacy, positioning TEL as a sustainable pathway for curriculum innovation and improved teaching effectiveness in vocational education.

The purpose of this study is to examine how educators experience skills development within this initiative. Specifically, it asks: How do educators experience skills development in a funded technology-enhanced learning initiative within three South African TVET colleges? The following section reviews the literature relevant to this inquiry.

2. Review of Related Literature

2.1 Theoretical Framework

This study draws on Constructivism, Technological Pedagogical Content Knowledge (TRACK) and Technology-Enhanced Learning Perspectives to examine educator skills development across multiple dimensions; cognitive, pedagogical, and contextual, by drawing on Constructivism, Technological Pedagogical Content Knowledge (TPACK), and Technology-Enhanced Learning (TEL) perspectives. Originating from Shulman's concept of pedagogical content knowledge, TPACK extends the framework to include technology integration [10]. It emphasises the dynamic interplay between technology, pedagogy, and content knowledge, highlighting the need for educators to balance these domains in practice. Constructivist theory emphasises active, experiential learning, where learners construct knowledge through interaction with their environment [5]. In TEL contexts, constructivism highlights the importance of hands-on application, peer collaboration, and reflective practice.TEL perspectives emphasise the role of digital tools in enabling interactive, learner-centred environments [4,1]. They highlight the potential of TEL to democratise access, foster engagement, and align curricula with labour market demands. Together, TPACK, constructivism, and TEL perspectives provide a multidimensional lens for understanding educator skills development in the Pro-Telde Project. Collectively, these frameworks support the study's focus on educator experiences, institutional readiness, and the sustainability of TEL reforms in South African TVET colleges.

2.2 Technology-Enhanced Learning in TVET

TEL has been widely promoted as a transformative force in vocational education, enabling interactive, flexible, and learner-centred approaches. Studies highlight its potential to enhance engagement and achievement through gamification, smart classrooms, and digital tools [6,7]. However, adoption in TVET contexts remains uneven, with infrastructural constraints and limited institutional investment undermining sustainability [8].

2.3 Digital Pedagogy and Educator Competencies

Frameworks such as DigCompEdu [4] and TPACK [7] emphasise the integration of technological, pedagogical, and content knowledge. Yet research shows educators often struggle to move beyond technical proficiency to pedagogical innovation [11]. TEL training must therefore prioritise experiential learning and contextual resource design to build confidence and adaptability.

2.4 Skills Development and Professional Learning in TEL

Professional development initiatives have demonstrated that peer learning, reflective practice, and hands-on application are critical enablers of TEL competence [5]. In South Africa, however, lecturer training remains inadequate, with limited institutional support for sustained skills development [9]. The Pro-Telde Project's inclusion of lecturers alongside students reflects a multiplier logic which is the lecturers who acquire TEL competencies can extend programme benefits to colleagues and students who did not participate directly [15].

2.5 Institutional Readiness and Support Mechanisms

Institutional readiness is a decisive factor in TEL implementation. Leadership support, infrastructure provision, and policy alignment are essential enablers [3]. Yet South African TVET colleges face systemic fragmentation, with governance and funding models weakening institutional coherence [13]. The Pro-Telde Project highlighted these challenges across Majuba, Vhembe, and Central Johannesburg Colleges, where infrastructural limitations and uneven digital literacy shaped the effectiveness of training.

2.6 Challenges Affecting TEL Implementation

Constraints include infrastructure limitations, uneven baseline digital literacy, and time pressures [12]. These barriers hinder translation of training into practice, particularly in contexts where educators face heavy workloads and limited access to digital resources.

2.7 Knowledge Gap

Existing studies privilege quantitative measures of competence acquisition, neglecting qualitative insights into educators lived experiences. This study addresses that gap by foregrounding educators' perceptions of TEL training processes in the Pro-Telde Project, examining how institutional conditions enable or constrain skills development

3. Research Methodology

3.1 Research Paradigm and Approach

This study is situated within an interpretive qualitative paradigm, which prioritises understanding participants lived experiences and the meanings they attribute to their engagement with technology-enhanced learning (TEL). The interpretive stance is particularly appropriate for examining educators' perceptions of skills development, as it foregrounds subjective accounts of competence acquisition, institutional support, and pedagogical transformation rather than seeking generalisable causal claims [16]. To achieve this, the study adopts a qualitative approach embedded within a broader mixed-methods evaluation design. While quantitative measures of digital competence acquisition are common in TEL research [6,7], this study emphasises qualitative insights to capture the nuanced processes through which educators experience TEL training. Semi-structured interviews serve as the primary data source, enabling participants to articulate their perceptions of knowledge, skills, and competencies gained, as well as the enabling and constraining factors that shaped their development.

3.2 Research Design, Setting, and Procedures

A case study design was employed, focusing on three South African TVET colleges which are Majuba TVET College, Vhembe TVET College, and Central Johannesburg TVET College that participated in the Pro-Telde Project. These institutions represent diverse socio-economic and geographic contexts, ranging from rural to urban environments, thereby providing a rich basis for examining how institutional conditions shape educators' experiences of TEL training [12,13]. 12 participants were purposively selected to include educators directly engaged with the Pro-Telde initiative, ensuring relevance to the study objectives. Semi-structured interviews, lasting 30 minutes, were conducted online via teams, guided by open-ended questions on knowledge acquisition, pedagogical confidence, peer collaboration, and institutional support. Data were analysed thematically following [16] six-phase approach, combining inductive coding with deductive lenses informed by TPACK, constructivism, and TEL perspectives.

Trustworthiness was ensured through triangulation of perspectives, rich contextual description, and peer debriefing, while ethical clearance was obtained from the University of Johannesburg (Johannesburg Business School). Informed consent, confidentiality, and voluntary participation were strictly observed, with findings reported in a manner that avoided attributing specific constraints to individual participants or colleges.

4. Results

Five explanatory themes emerged from analysis of educator experiences across the Pro-Telde training cohort. Each theme follows the analytical sequence established by the programme documentation: intended objective, training content deployed to achieve it, participant baseline conditions, evidence of change, practical application, and implication. Table 1 provides a synoptic overview.

Table 1. Summary of Themes: Programme Objectives, Evidence of Change, and Implications

Theme	**Theme Title**	Programme Objective	Key Evidence of Change	Implication
4.1	From Functional to Pedagogical: The Reorientation of Digital Tool Use	Expand platform use from content delivery to interactive, learner-centred pedagogy (both courses)	Padlet deployed for live collaborative introductions; Google Forms converted to formal assessment; YouTube repositories created for on-demand student access; Flippity and Miro used to redesign content encounters	The programme succeeded by changing the pedagogical logic of tool use, not merely the tool inventory. Competence assessments measuring tool knowledge miss this shift entirely
4.2	From Individual Skill Acquisition to Institutional Capability Formation	Build multimedia content creation capacity through animation, motion design, and production tools (Nov course)	Animaker adopted for instructional animation; institution funded studio equipment across two budget cycles; studio became blueprint for colleagues; freemium access severed training capability from post-training practice	The studio ceased to represent an individual achievement and became institutional infrastructure through which capability could be continuously reproduced. Freemium access disrupts this cycle institutionally, not individually
4.3	Experiential Design and the Transfer Problem: What Made Learning Stick	Teach through TEL methods while teaching about them; embed active, task-based learning (both courses)	Physical-to-digital game bridging cited independently by multiple participants; deadline and peer presentation structures produced embodied confidence; prior Mahara exposure retrospectively organised through Miro instruction	The mechanism of transfer is pedagogical architecture: active before passive, embodied before digital, doing before describing. These are replicable design principles
4.4	Institutional Conditions and Three Modes of Capability Translation	Enable sustained TEL implementation beyond training completion (both courses)	Enabling environment: multi-year equipment budgets, sector-wide plan, trained educator as blueprint. Constraining environment: load-shedding, connectivity gaps, data costs redirected but did not extinguish practice. Policy-neutral environment: no governing framework, digital teaching individually driven and formally unrecognised	A third institutional condition beyond support and obstruction: policy neutrality. Capable educators in neutral environments cannot convert individual practice into institutional transformation
4.5	Capability Circulation Beyond Direct Programme Participants	Extend programme benefits through trained educators to colleagues and students (both courses)	Post-training peer gatherings extended skills to non-participants; cross-institutional networks persisted; online placement assessments replaced traditional student auditions; resistance to same-level peer training identified and addressed through leadership competence the programme had developed	Training effects did not remain with trained individuals. The relevant unit of evaluation is the institutional capability network, not the direct participant. Multiplier capacity includes change-management competence, not only content knowledge

4.1 From Functional to Pedagogical: The Reorientation of Digital Tool Use

The first programme objective, addressed across both training blocks, was to expand educators' capacity to use digital platforms not for content delivery alone but for interactive, learner-centred pedagogy. The October 2024 course introduced visual data representation, PowerPoint, Canva, and Prezi for presentation design, alongside synchronous collaboration tools including Google Meet, Microsoft Teams, and Zoom. The November 2024 course deepened this by introducing multimedia resources, animation, and blended and online teaching methodologies. The two courses were designed to shift the function educators assigned to technology: from administrative infrastructure to a site of active student engagement. At the point of entry, participants across institutions described a pattern of digital use that was functional but pedagogically thin. The most common pre-training technology was the Learning Management System, used as a document repository rather than an interactive environment. Participants who had engaged with Google Classroom during COVID-19 described having done so reactively, without understanding the platform's full capacity. Others rated their prior digital engagement at two out of ten, describing pre-training use as limited to how to distribute lessons and materials. One participant, despite prior exposure to Google Forms, had not understood it as a formal assessment instrument until the programme made that application explicit. The pattern across the cohort was not absence of tools but absence of pedagogical purpose such as educators possessed platforms, they did not yet know how to use.
Following training exposure to Canva, Miro, Mentimeter, Flippity, Animaker, Padlet, Kahoot, and Wayground, educators described a fundamental reorientation in what they understood technology to be for. The most consequential shift was from transmission-oriented tool use to interaction-centred design. One participant redesigned first-day introductions by creating a Padlet profile, distributing the link through Google Classroom, having students complete their own introductions on the platform, and using the resulting visible collaboration as a live demonstration of digital interaction:

'*I'm using digital tools for introduction. And everybody could see that*.'

The activity did not add a tool; it reconstructed what a first class is for. Another participant moved Google Forms from casual use to formal assessment deployment. A third converted lesson content into Flippity sequences and Miro mind maps, replacing information presentation with designed interactive encounters. Participants who had used Teams or Zoom only during COVID-19 began recording lessons, uploading content to YouTube, and providing students with direct links:

'Whatever I recorded it, I uploaded in YouTube and I give the students a link. They're able to use that link, whatever they are, their own time, and they're able to repeat it.'

This is not a change of platform; it is a redesign of the temporal logic of teaching. The recording extends the lesson beyond the classroom and places control of repetition with the learner. The programme succeeded in this objective not by transferring new tools but by changing the pedagogical logic within which existing and new tools were deployed.

4.2 From Individual Skill Acquisition to Institutional Capability Formation

The November 2024 course aimed to build educators' capacity for multimedia content creation, with animation and motion design as its centrepiece. Animaker was the primary platform, introduced as an open production tool for creating animated instructional content. The course also addressed the quality of teaching materials, positioning production not merely as technical output but as pedagogically considered design. The intended outcome was an educator who could generate original instructional resources rather than deploy existing ones. Participants entered this dimension of the programme with uneven preparation. Those with prior digital exposure had conceptual frameworks that accelerated engagement with content creation. One participant described already knowing about timelines and content production but having lacked the structured conditions for application:

'I always wanted to know how to do animations because I sometimes I go to YouTube and Google how to. And search how to do it, but I never really got to do it because of discipline.'

The training did not introduce animation as a concept to this participant; it provided the facilitated conditions under which self-directed interest became applied capability. Participants entering with

limited prior digital experience encountered animation as genuinely novel, describing it as among the first things of its kind they had encountered. The same training content produced different entry mechanisms depending on what participants brought to it. Hands-on production emerged as the decisive mechanism of capability formation. Participants consistently identified application rather than instruction as what sharpened skill:

'When you listen, you sit there and listen, you are not participating. When you do, basically doing is being interactive with the content. So, when you interact with the content by doing something, an activity, that's when your skills are sharpened.'

The training cycled between explanation and application within the same session, and active production was the norm rather than the exception. Participants described remaining at computers through lunch to continue working, a pattern confirmed by the facilitators themselves, who observed that the South African cohort had not left their machines when the session was formally paused. The most consequential expression of this theme was not the content creation skills themselves, but what happened to them institutionally. Following training completion, one institution approved multi-year equipment budgets for studio infrastructure: microphones, interfaces, studio monitors, and a camera procured across two annual budget cycles. The participant who had established the studio described colleagues using it as a model:

'Everyone is looking at me now like, okay, let's see the blueprint. We're going to build from there.'

The studio ceased to represent an individual achievement and became institutional infrastructure through which capability could be continuously reproduced. This distinction carries theoretical weight: a studio is not a set of skills but an enabling environment for continuous production, not a threshold reached but a space maintained. Individual competence had generated institutional investment, and that investment had created the conditions under which further competence could be developed without additional external training. A constraint emerged that worked in the opposite direction. Several platforms introduced in the November course operated on freemium models, restricting functionality without institutional licensing. One participant observed:

'You are training, but you're not really training, because you need full access to get all the features of the tool.'

Where institutions did not extend budgets to licensing, the gap between what training had shown to be possible and what post-training resources permitted converted fluent capability into partial access. This is not an individual problem; it is an institutional policy gap that individual motivation cannot bridge.

4.3 Experiential Design and the Transfer Problem: What Made Learning Stick

The programme's pedagogical approach was not only to introduce tools but to teach through them. Both course blocks incorporated active, task-based learning, and the November block specifically foregrounded blended and online teaching methodology as content, meaning that participants were simultaneously learning to teach online and being taught through online methods. The intended effect was for educators to experience the learning approaches they were expected to implement, making the pedagogy of the training itself a demonstration of what it was advocating. Participants consistently identified the facilitators' design strategy as what distinguished Pro-Telde from prior professional development experiences. Earlier training, described as narrowly focused on single tools, had been largely reception-based: a programme delivered to an audience.
Pro-Telde was experienced as structurally different because learning was generated through activity. The facilitators' technique of beginning with traditional physical games before moving to their digital equivalents was cited independently by multiple participants as the most effective single approach. The bridge made the logic of digital interaction visible in embodied terms before asking participants to operate it through a screen:

'They interacted with us first, and then they said, okay, this is how you do this in a computer.'

This was not a motivational technique; it provided a conceptual structure for understanding what interaction means, which participants could subsequently apply when designing their own classes. One

participant described how the training allowed her to link prior knowledge she had accumulated without fully understanding. She had encountered a collaborative digital tool in a postgraduate diploma programme but had been told only that it was a mind map. The Pro-Telde training introduced Miro by name, with a full account of its pedagogical applications, and in doing so gave meaning to an experience she had already had. The training gave meaning to experiences participants had previously encountered but not fully understood. The physical and temporal structure of training also functioned as a confidence-building mechanism. Being given deadlines, preparing presentations for peer audiences, and writing reports on behalf of one's college created an accountability structure that replicated professional responsibility:

'a sense of accountability was also enforcing us that you need to be accountable to report.'

Confidence, in participant accounts, was not a feeling produced by reassurance, but a state produced by having delivered. One participant moved from describing himself as 'a low average' before training to doing whatever he did 'with confidentially and with motivated', locating that shift in the accumulated experience of completing, presenting, and submitting rather than in instruction. The mechanism of transfer was pedagogical architecture that is active before passive, embodied before digital, doing before describing.

4.4 Institutional Conditions and Three Modes of Capability Translation

The programme's objectives were addressed at the level of individual educator competence. The institutional conditions into which trained educators retained were not part of the programme design. Yet those conditions proved to be the primary determinant of whether competence became practice. Participants across institutions described moving between two structurally different environments which are the training environment that is characterised by reliable infrastructure, collaborative peers, facilitated support, and access to full platform functionality, and the institutional environment, which varied significantly in its capacity to sustain what training had produced. Three structurally distinct modes of institutional response emerged from the data. In institutionally enabling environments, capabilities became embedded within broader organisational systems. One institution responded to training completion by approving multi-year equipment budgets, developing a sector-wide TEL implementation plan, and positioning the trained educator as a model for colleagues. The institution was described as 'already ready for implementing' and as approving 'everything that we say we need'. Individual capability was drawn into institutional development which is what one person had learned became the blueprint for what the institution was building. Existing infrastructure further amplified this effect that computer laboratories meant digital tools were available for every lesson without additional provision, removing the access problem before it arose.

In institutionally constraining environments, capabilities remained dependent on adaptation and individual effort. Participants in rural settings described infrastructure conditions that redirected but did not extinguish TEL practice. Unreliable internet connectivity, load-shedding that suspended digital activity for days, inadequate laboratory provision relative to student numbers, and the cost of mobile data for students who lacked institutional connectivity all shaped what was possible:

'Because I'm from the rural areas, network coverage or internet connectivity, that is the biggest problem.'

Educators adapted by shifting to offline content, uploading recorded lessons to google classroom for asynchronous access, and redesigning assignments to account for uneven connectivity. Practice continued, but it was carried entirely by individual resourcefulness rather than institutional provision. In policy-neutral environments, capabilities remained individually held and structurally unsupported. One participant described an institution in which there was:

'No policy that speaks to online teaching'.

Digital practice was individually driven and formally unrecognised:

'Some of us were doing it because we know how to do it.'

There was no accountability for digital teaching, no resource allocation attached to it, and no shared institutional direction. Capability existed and was genuinely exercised which one participant taught through a month-long hospitalisation and produced more than twenty student distinctions during that period. But those results were the outcome of personal commitment rather than institutional design, and they could not be extended to colleagues, accounted for in institutional reporting, or built upon over time. Policy neutrality is structurally distinct from obstruction; it does not resist TEL practice, but it ensures that practice remains permanently individual.

4.5 Capability Circulation Beyond Direct Programme Participants

Training effects did not remain with the educators who had been directly trained. Across all four participants, capabilities circulated into institutional networks through multiple channels which are peer support gatherings, cross-institutional collaboration, redesigned institutional procedures, and the informal transmission of skills to colleagues who had not attended the programme. This pattern was not incidental; it was described as a normative expectation, partly enforced and partly driven by the confidence formation that training had produced. Post-training gatherings at the college level were used to review whether skills were being applied, help colleagues who had encountered difficulties with specific tools, and share knowledge with lecturers who had not attended. This knowledge-sharing was understood as self-reinforcing: 'The more you spread the information, you learn more.' The act of transmission required a different and deeper engagement with content than receiving it, and that deeper engagement consolidated the transmitter's own understanding. Capability circulation was therefore not merely charitable knowledge transfer; it was a productive mechanism for the educators doing the circulating.

Cross-institutional peer networks formed during training persisted after it. One participant described sustained collaboration with a colleague from Central Johannesburg College, extending to joint podcast production and ongoing creative exchange across institutional boundaries. Another described deliberately sitting with participants from other institutions during training sessions and finding that cross-institutional groups were sites of practical support in which colleagues with stronger digital skills demonstrated techniques to those still developing them. The training's rotation of venues across all three colleges and its inclusion of international training in Italy and Greece both contributed to this that they enforced institutional mixing and produced a shared professional identity that outlasted the formal programme.

The social dynamics of circulation were more demanding than simple sharing. One participant described the specific difficulty of training colleagues at the same institutional level:

'When you want to train your colleagues who are at the same level with you, it comes with resistance.'

Peer authority is negotiable in ways that hierarchical authority is not, and willingness to learn from a colleague can be conditioned by assumptions about relative standing. The programme had prepared participants for this, developing not just digital capability but the leadership and patience required to work with resistant colleagues:

'This project taught us to take the initiative, to be the leaders or to be the pioneers to make sure that those who don't want change, they don't resist to change easily.'

Capability circulation at the peer level depends on this social and institutional competence, not only on content knowledge. Circulation also took institutional procedural forms. One participant used online assessment tools, acquired through the programme, to replace the traditional audition process for incoming students, moving prospective students to online placement assessments that the system marked automatically. This was not an application of a tool to an existing process; it was a redesign of an institutional procedure using capability that training had produced. The programme had not specified this application; it emerged from the participant's engagement with their institutional context and the agency the training had produced. The impact boundary of the programme was therefore not defined by who attended it.

5. Discussion

Findings indicate that TEL interventions function less as direct skills transfer mechanisms and more as capability catalysts, whose effects depend on how institutional environments absorb, reproduce, and

circulate what participants acquire. Training exposure is necessary but insufficient; sustainable pedagogical change arises from the interaction between learning design quality, institutional conditions, and capability circulation networks. The most consequential achievement of Pro-Telde was not expanded tool knowledge but a shift in pedagogical logic: participants reoriented what they understood technology to be for. This gap between possessing a platform and knowing what to do with it corresponds precisely to the TPACK distinction between technological knowledge and technological-pedagogical knowledge [10,17]. Thus, evaluating training by which tools participants can name asks the wrong question; the right question is whether they can articulate how a tool changes the student–content relationship. While the literature frames TPACK integration as an individual cognitive achievement [10,11], the Majuba studio complicates this. Individual competence generated institutional investment, which produced infrastructure enabling continuous capability reproduction without further external intervention. The studio became institutional infrastructure, not just individual achievement. Conversely, the freemium access problem disrupts this cycle at the policy level, imposing a constraint that only institutional action can resolve.

The pedagogical mechanisms that made learning durable rather than fragile are replicable. Facilitators' bridging strategy—moving from physical game to digital equivalent, operationalises [18] experiential learning cycle within sessions rather than privileging reception. A less documented mechanism also emerged: training worked not by introducing novelty but by providing an interpretive framework that made existing experience intelligible, retrospectively organising prior knowledge participants had accumulated without fully understanding.

Existing institutional readiness frameworks distinguish supportive from unsupportive environments, treating readiness as binary [3,8]. The findings require a third category: policy-neutral environments, which neither obstruct nor actively enable. The result is permanently individual capability, competence that cannot be extended to colleagues, embedded in processes, or built upon over time. This differs structurally from obstruction (no visible resistance) and from support (no mechanism for converting individual practice into shared capacity). Policy neutrality is underspecified in TEL literature; its identification here enables more granular analysis than binary readiness frameworks permit.

Conventional evaluation defines programme impact at the direct participant level [8,9], but this unit of analysis systematically understates effects. Training produced nodes in institutional capability networks, with effects circulating far beyond the original cohort; redesigned student intake procedures, studio infrastructure, cross-institutional collaborations, and peer gatherings extending skills to non-participants. Capability circulation is the mechanism through which time-bounded training acquires potential for enduring impact. However, circulation depends on social and political competence to manage peer resistance, not only on technical content. Programmes neglecting this dimension produce educators who can do things but cannot extend what they can do to others. This study supports a relational model in which capability formation, institutional conditions, and circulation are simultaneous and mutually determining, not sequential. An educator with strong capability in a policy-neutral institution remains a practitioner; the same educator in an institutionally committed environment becomes infrastructure. The outcome of a training investment is determined as much by what institutions do after training ends as by what the training itself achieves.

Modelling, Not Telling: Embedding 21st Century Skills in Teacher Education through an Educational Escape Room

Patrick Murphy

Nord University, Norway

Abstract

Integrating 21st-century competences into higher education requires more than policy rhetoric or theoretical endorsement; it demands concrete pedagogical practices that model creativity, collaboration, problem-solving, and adaptive thinking for future teachers. Although teacher-education programmes emphasise the importance of innovative, student-centred approaches in schools, they may remain anchored in traditional, discipline-bound and lecture-based formats. This paper presents a cross-curricular learning initiative designed to disrupt such habitual structures by introducing second-year teacher-training students to an immersive educational escape room as the starting point for a full-day interdisciplinary learning experience. The escape room serves as an active, task-based learning environment in which students engage with authentic problem-solving scenarios under time pressure. This design requires them to mobilise a broad range of 21st-century skills, shifting classroom dynamics from passive knowledge reception to creative, collaborative, and communicative meaning-making. The experience demonstrates in practice what teacher-education programmes frequently advocate in theory: that future teachers must learn through the pedagogies they are expected to enact. The pedagogical framework draws inspiration from Howard Gardner's theory of Multiple Intelligences. Challenges are intentionally designed to activate linguistic, logical-mathematical, spatial, interpersonal, intrapersonal, bodily-kinaesthetic, and other forms of intelligence, enabling students to contribute in varied and meaningful ways. This diversity of entry point competencies is often overlooked in conventional academic tasks, though the escape room generates new collaborative constellations in which leadership and participation shifts. Through this design, the escape room becomes a learning environment where multiple forms of ability are recognised, valued, and mobilised both Gardner's insights and contemporary 21st-century competence frameworks. Findings indicate that immersive, game-based learning designs can serve as powerful catalysts for reimagining teaching and learning in teacher-education programmes. By embodying rather than merely discussing 21st-century competences, the escape room bridges the gap between theory and practice and provides a concrete model of innovative pedagogy for future teachers.

Keywords: *21st-century skills; teacher education; cross-curricular learning; educational escape room;*

1. Introduction

Integrating 21st-century competences into higher education involves more than policy rhetoric or theoretical endorsement; it requires pedagogical practices that actively model creativity, collaboration, problem solving, and adaptive thinking for future teachers. Within teacher education, however, a tension often emerges between what is emphasised in the curriculum and what is enacted and modelled in the higher education lecture halls and classrooms; in other words, the difference between knowledge and competence. While programmes may well promote the importance of innovative, student-centred approaches in schools, the formats through which these ideas are taught may remain rooted in traditional, discipline-bound and lecture-based practices. This tension raises a key question: how can teacher education move from teaching *about* 21st-century skills to actively *modelling* them for students? While many programmes rightly incorporate opportunities for students to engage with such competences, these activities are often isolated within specific subjects rather than forming part of a coherent pedagogical approach. However, if future teachers are expected to implement these approaches in their own classrooms, the process must begin within teacher education itself. Learning how to teach in more collaborative, creative, and adaptive ways requires that such approaches are not only discussed, but experienced.

The study described in this paper draws on experiential and sociocultural perspectives on learning, where knowledge is understood as emerging through concrete experience and interaction [1] [2]. In addition, game-based and multimodal approaches inform the design, particularly in relation to immersion, engagement, and the mobilisation of diverse competencies [3] [4]. These perspectives provide a framework for analysing how the escape room functions as a learning environment in teacher education. These perspectives are reflected in the design of the escape room itself. From an experiential

perspective, the activity can be understood as a structured movement through challenge, reflection, and resolution [1], while the collaborative nature of the tasks reflects a sociocultural understanding of knowledge construction through interaction [2].
In response to this challenge, the present study explores how a more holistic and interdisciplinary approach might be carried out as modelling rather than presenting. The context for this was the organisation of a cross-curricular theme day for second-year teacher training students at Nord University, centred on artificial intelligence as part of a broader 21st-century competence framework. As an entry point to this topic, the focus was deliberately shifted towards what might be termed “natural intelligence” - the collaborative, creative, and problem-solving capacities students themselves bring to the learning situation. This was operationalised through the design and implementation of an interdisciplinary educational escape room, in which students engaged in time-restricted, collaborative problem-solving tasks requiring communication, adaptability, and collective meaning-making.
Drawing on observations from the activity and student feedback, the paper examines how this design functioned as a learning environment for the enactment of 21st-century competences. Rather than positioning the escape room solely as an engaging or motivating activity, the analysis suggests that it can be understood as a form of embodied pedagogy, through which students experience the kinds of learning environments they are expected to create in their future classrooms. In doing so, the study contributes to ongoing discussions about how teacher education might more effectively bridge the gap between pedagogical theory and practice.

2. Pedagogical Design and Methodological Approach

The escape room was designed by colleagues Raymond Lillevik and Patrick Murphy and took place in the campus black box theatre, which was reconfigured to create an immersive learning environment. The activity centred on four distinct boxes, each secured with a padlock, which students were required to open by identifying clues distributed throughout the room. Each box represented a specific topic and contained tasks that later formed the basis for the subsequent workshop on artificial intelligence.
To unlock the boxes, students interpreted both overt and hidden clues in order to construct three-digit codes. The topics - ranging from John 3:16 (of Biblical reputation) to dead writers, reggae, and fantasy literature - were deliberately varied, creating a diverse and interdisciplinary set of challenges. The design required students to draw on different forms of knowledge and ways of thinking, while negotiating meaning collaboratively within their groups. A 60-minute time limit structured the activity, introducing a sense of urgency that shaped both the pace and the collaborative dynamics of the task. In this sense, the escape room functioned not only as a sequence of tasks, but as a situated and collaborative learning environment.
The study adopts a small-scale qualitative, practice-based approach to examining this teaching method. The study involved 26 second-year teacher education students enrolled in programmes for years 1–7 and 5–10, randomly organised into six groups. Data were generated through three primary sources: first, observational notes taken during the activity captured students’ engagement, interaction patterns, and problem-solving processes, with particular attention paid to moments of collaboration, frustration, and achievement. Second, student feedback was anonymously collected following the session, in the form of a questionnaire focusing on students’ experiences of the activity and its perceived relevance for their future teaching practice. And third, feedback through dialogue immediately following the escape room session and completing questionnaires.
The role of the researcher as both designer and facilitator position the study within a practitioner inquiry tradition. While this enables close insight into the learning process, it also requires awareness of potential bias. The analysis is therefore interpretive in nature, aiming to identify recurring patterns across observations and student responses rather than to produce generalisable findings. The data were analysed thematically, guided by the study’s focus on engagement, collaboration, and the enactment of 21st-century competences, and interpreted through the theoretical perspectives outlined in the paper. Ethical considerations were addressed by ensuring voluntary participation and anonymisation of student contributions.

3. Analysis and Discussion

The analysis that follows draws on observations and student feedback from the escape room activity. Students’ engagement began even before entering the room, increasing both attention and readiness to engage. As one student reflected, “I was curious from the start - it didn’t feel like a normal lesson at all.” This highlights how the framing of the activity itself contributed to heightened motivation and

engagement. Being informed in advance that the session would start with an escape room generated curiosity and anticipation, which carried into the learning situation. This expectation was further intensified by the physical staging of the experience, as students were led blindfolded into a black box theatre reconfigured as an unfamiliar and immersive environment. The transition from a familiar classroom to a multisensory and unpredictable space signalled that this would not be a conventional learning activity, increasing both attention and readiness to engage. These dynamics align with game-based learning perspectives, where immersion and novelty play a central role in sustaining engagement [3], as well as with the concept of flow coined by Csikszentmihalyi, where challenge and immersion generate deep involvement [5].

Fig. 1. Entering the escape room

The tasks themselves were deliberately challenging, and both individuals and groups experienced periods of frustration when encountering difficulties. However, these moments of struggle were closely linked to strong emotional responses upon success. When groups unlocked boxes and progressed in the activity, this was more often than not marked by spontaneous and audible celebrations. Such collective expressions of achievement contrast with traditional classroom settings, where success is typically individualised and less visibly embodied. From an experiential learning perspective, these moments of tension and resolution constitute powerful concrete experiences that can later be reflected upon and conceptualised [1]. The intensity of the experience suggests that emotionally charged learning situations play an important role in supporting deeper engagement and retention.

The imposed time constraint introduced a clear sense of urgency, which in turn necessitated collaboration and reinforced collective responsibility and shared focus. One student noted that “we had to rely on each other – none of us could solve it alone.” This illustrates how the task structure made collaboration a necessary condition for progress rather than an optional strategy. Students quickly recognised that tasks could not be solved individually and that effective communication was essential. This resulted in high levels of participation across groups, with students contributing in different ways depending on the demands of the task. Competitiveness between groups further intensified engagement, functioning as a motivational driver without undermining collaboration. Instead, it reinforced collective responsibility and shared focus. These dynamics reflect a sociocultural understanding of learning, in which knowledge is constructed through interaction and joint problem-solving [2]. The shifting roles within groups, where leadership changed in response to different challenges, can also be understood as participation within a community of practice, in which learning emerges through shared activity and evolving roles.[6]

Fig. 2. Immersed in collaborative, problem-based, and time-bound challenges.

A particularly striking aspect of the activity was the visibility of diverse competencies among students. Different participants demonstrated different strengths depending on the nature of the task, with some excelling in logical reasoning, others in spatial or practical problem-solving, and others in communication and coordination. The escape room promoted forms of competence that are not always recognised in traditional academic settings. As one student remarked, “people who usually don’t speak much were suddenly the ones solving things”. This illustrates how the activity redistributed participation and made diverse competencies visible. This resonates with Howard Gardner’s theory of multiple intelligences [7] and aligns with multimodal perspectives that view meaning-making as extending beyond purely linguistic forms [4]. At the same time, the activity challenged more static understandings of differentiation. Rather than positioning students along a fixed axis of ability, competence within the escape room was situational and task dependent. The teacher’s role as game master, providing targeted hints and guidance in response to immediate needs, illustrates a dynamic and responsive form of adapted learning. In this context, distinctions between “stronger” and “weaker” students became less pronounced, as successful problem-solving depended on the collective mobilisation of varied competencies.

The shared experience of challenge, frustration, and eventual success also had a clear impact on group dynamics. Completing the escape room within the allotted time contributed to a strong sense of collective achievement, which carried over into the subsequent workshop on artificial intelligence. Groups were more cohesive, communicative, and willing to collaborate, suggesting that the escape room functioned not only as a standalone activity but as a social and pedagogical foundation for further learning. From a transformative learning perspective, such experiences may influence not only immediate engagement but also students’ orientation towards subsequent learning activities and pedagogical approaches [8].

Fig. 3. Overcoming frustration was a real challenge

Taken together, these findings suggest that the escape room functioned not merely as an engaging activity, but as a form of embodied pedagogy, in which students experienced key principles of student-centred learning in practice. By immersing students in collaborative, problem-based, and time-bound challenges, the activity created a learning environment in which 21st-century competences were not discussed in abstract terms, but actively enacted. The findings highlight how such experiences make visible the complexities of collaboration, differentiation, and meaning making, while also challenging traditional assumptions about classroom roles and practices. In this sense, the escape room can be understood not simply as a teaching activity, but as a pedagogical model that demonstrates what student-centred learning looks like in practice.
For teacher education, this points to a clear implication: if future teachers are expected to design learning environments that foster creativity, collaboration, and adaptability, they must themselves meaningfully encounter such environments as learners. Bridging the gap between theory and practice therefore requires not only new content, but new forms of teaching through which these competences can be experienced, reflected upon, and taken into their future classrooms. This suggests that modelling pedagogy in teacher education is not simply an enhancement, but a necessary condition for developing pedagogical competence in contemporary classrooms.

Transformative Teacher Learning in Secondary Education: The Role of Erasmus+ in Shaping Future Practice

Abigail Barbara[1], George Cremona[2]

[1,2]University of Malta, Malta

Abstract

This paper explores how Erasmus+ mobility programmes contribute to teacher learning and future educational practice in secondary education. Drawing on mixed-method principles, the study investigates how international mobility experiences support professional development, pedagogical innovation, and intercultural understanding among teachers from Malta and Spain. The paper is based on findings collected through questionnaires and semi-structured interviews involving teachers who participated in Erasmus+ mobilities. Findings demonstrate that participation in Erasmus+ activities encouraged teachers to reflect critically on their classroom practice, strengthen collaboration with international colleagues, and experiment with more inclusive and student-centred teaching approaches. Participants also reported increased motivation, emotional awareness, communication skills, and confidence in responding to diverse classroom needs. However, workload pressures, limited resources, language barriers, and varying levels of institutional support influenced the sustainability of Erasmus+ outcomes within schools. The paper concludes that teacher learning extends beyond technical skill acquisition and includes changes in professional identity, reflective practice, emotional awareness, and intercultural competence. Internationally connected professional development opportunities therefore remain highly relevant in preparing educators for the challenges of contemporary education.

Keywords: *Teacher training and learning, international training, pedagogical innovation, Erasmus+*

1. Introduction

The Erasmus+ programme has become one of the most influential educational initiatives within the European Union, supporting collaboration, mobility, and professional learning across educational sectors. The growing complexity of contemporary classrooms has increased the importance of continuous teacher professional development.

Contemporary perspectives on teacher learning emphasise reflective practice, collaboration, emotional awareness, and intercultural understanding rather than simply the acquisition of technical teaching skills [1]. According to Darling-Hammond et al. [2], meaningful teacher development occurs when educators participate actively in collaborative and practice-based learning experiences connected directly to classroom realities.

International mobility experiences also contribute to the development of intercultural competence. Deardorff [3] defines intercultural competence as the ability to communicate effectively across cultural contexts through openness, adaptability, and respect.

This paper focuses on the experiences of secondary school teachers from Malta and Spain who participated in Erasmus+ mobility programmes.

2. Literature Review

Teacher professional development has become a major focus within educational policy and research due to changing classroom realities and increasing expectations placed upon educators. Effective professional learning supports teachers in strengthening pedagogical skills, improving classroom management, and responding more effectively to students' academic and emotional needs. Continuous learning is therefore viewed as essential for educators who wish to remain adaptable and responsive within contemporary educational environments.

Darling-Hammond et al. [2] explain that professional development is most effective when it is collaborative, reflective, sustained over time, and connected directly to classroom practice. Teachers benefit most from opportunities that encourage active participation and practical engagement rather than passive forms of training. Erasmus+ mobility programmes attempt to create these conditions by exposing teachers to different educational settings and encouraging international collaboration.

The Erasmus+ programme supports educational mobility across Europe through training courses, workshops, teaching assignments, and job-shadowing opportunities. Research indicates that participation in Erasmus+ programmes contributes positively to teacher confidence, motivation, and willingness to adopt innovative teaching strategies [3]. Teachers frequently report renewed enthusiasm for teaching and stronger openness toward collaborative and student-centred methodologies after participating in international mobility experiences.

Reflective practice is another important element associated with Erasmus+ participation. Schön [5] argues that professionals improve their effectiveness through reflection on their experiences and actions [4]. Erasmus+ experiences encourage teachers to compare educational systems, question assumptions, and critically evaluate their classroom approaches. Such reflection often leads to pedagogical experimentation, professional growth, and greater awareness of students' learning needs.

Intercultural competence also represents a major outcome associated with international mobility. Deardorff [3] defines intercultural competence as the ability to communicate effectively across cultural contexts through openness, adaptability, and respect. Through interaction with colleagues from different countries, teachers develop stronger communication skills, empathy, and cultural awareness. These competencies are increasingly important within multicultural classrooms across Europe.

Existing studies further suggest that Erasmus+ participation contributes to emotional and interpersonal development. Teachers frequently report becoming more open-minded, reflective, and aware of the emotional dimensions of teaching following international mobility experiences. Exposure to different educational contexts encourages educators to become more sensitive to inclusion, wellbeing, and diversity within their own classrooms.

Another important aspect linked to Erasmus+ participation is professional collaboration. Mobility experiences provide opportunities for teachers to exchange ideas, resources, and teaching strategies with international colleagues. Such collaboration often continues after mobility programmes end through online communication and educational partnerships. These professional relationships support ongoing learning and encourage teachers to remain engaged in professional development activities [6].

Despite these benefits, several challenges continue to affect Erasmus+ participation. Existing research highlights workload pressures, administrative demands, language barriers, and insufficient institutional support as factors that may reduce the long-term sustainability of mobility outcomes [7]. Teachers may struggle to implement innovative practices when schools lack resources or when professional responsibilities limit opportunities for experimentation.

The comparative dimension of Erasmus+ participation is particularly significant when exploring educational contexts such as Malta and Spain. Educational systems differ in organisational structure, policy implementation, school culture, and levels of institutional support. These contextual factors may influence how teachers perceive mobility experiences and apply newly acquired knowledge within their classrooms.

Overall, the literature demonstrates that Erasmus+ programmes can contribute positively to professional development, reflective practice, intercultural competence, and pedagogical innovation. However, the long-term impact of mobility experiences depends significantly on institutional conditions and support structures within schools.

Building on the theoretical perspectives discussed in the literature, the study is guided by the following research questions:

The study is structurally guided by the following two central research questions:

1. **Research Question 1 (RQ1):** *How do secondary school teachers from Malta and Spain perceive the effectiveness of Erasmus+ as a contributor to their professional development?*
2. **Research Question 2 (RQ2):** *What factors facilitate or hinder the contribution of Erasmus+ mobilities to teacher learning experiences?*

3. Methodology

This study adopted a mixed-methods approach to investigate how Erasmus+ mobility programmes contribute to teacher learning experiences among secondary school educators in Malta and Spain. Mixed-methods research combines quantitative and qualitative approaches to provide a broader and more comprehensive understanding of educational experiences.

Note on Data Source: The empirical data, frameworks, and findings presented in this paper were originally compiled, analysed, and presented as part of a broader master's thesis project exploring international teacher mobilities at the University of Malta (Barbara, 2026) [4].

Quantitative data was collected through online questionnaires distributed to teachers who had participated in Erasmus+ mobilities. The questionnaire included Likert-scale items and open-ended

questions related to professional development, pedagogical innovation, intercultural competence, emotional awareness, and institutional support. The online format allowed participants from both Malta and Spain to respond flexibly and anonymously.
Qualitative data was gathered through semi-structured interviews conducted with selected participants from both countries. The interviews explored teachers' reflections on mobility participation, classroom practice, collaboration, emotional development, and professional growth. Participants were encouraged to discuss both the positive and challenging aspects of their Erasmus+ experiences.
The comparative framework adopted in the study allowed similarities and differences between Maltese and Spanish teachers' experiences to be identified. Thematic analysis was used to analyse qualitative data, while descriptive statistics supported the interpretation of questionnaire responses. Combining both forms of data enabled the study to examine broader trends while also exploring individual experiences in greater depth. Ethical procedures were maintained throughout the research process. Participation was voluntary, confidentiality was protected, and informed consent was obtained from all participants before data collection began.

4. Findings and Discussion

The findings revealed that Erasmus+ mobility programmes contributed positively to teachers' professional and personal development. Participants from both Malta and Spain described mobility experiences as valuable opportunities for reflection, collaboration, intercultural learning, and pedagogical innovation.

4.1 Professional Growth and Pedagogical Innovation (Addressing RQ1)

One of the strongest themes emerging from the data related to professional growth. Teachers explained that Erasmus+ experiences exposed them to alternative teaching methodologies and encouraged them to reconsider their classroom practices. In line with Darling-Hammond et al.'s definition of meaningful development, participants reported introducing more collaborative, student-centred, and inclusive approaches after returning from mobility experiences, linking training directly to classroom realities.
Exposure to different educational systems also increased teachers' confidence in experimenting with innovative teaching strategies. Many participants described Erasmus+ experiences as professionally motivating, noting that mobility activities renewed their enthusiasm for teaching and encouraged greater engagement in continuous professional development. Several participants referred to Erasmus+ participation as transformative because it allowed them to step outside routine educational environments and observe alternative approaches to learning, classroom management, and assessment.
Teachers also highlighted how mobility experiences encouraged greater creativity within the classroom. Exposure to digital learning tools, collaborative projects, and innovative methodologies inspired educators to adapt their teaching strategies according to students' interests and learning needs. Some participants explained that they became more willing to experiment with active learning approaches after participating in international training activities. This active experimentation reflects the core tenets of reflective practice outlined by Schön, where professional growth is catalysed by critically evaluating actions and trying new strategies.

4.2 Intercultural Learning and Emotional Awareness (Addressing RQ1)

Intercultural learning emerged as another major outcome associated with Erasmus+ participation. Teachers reported increased awareness of cultural diversity and stronger communication skills following interaction with colleagues from different countries. This growth aligns directly with Deardorff's framework of intercultural competence, which values the development of openness, adaptability, and respect across cultural contexts. Participants explained that intercultural experiences improved empathy, openness, and sensitivity toward students from diverse backgrounds.
Teachers also described becoming more adaptable and reflective within multicultural classroom settings. Exposure to different educational cultures encouraged participants to reconsider assumptions about teaching and learning while becoming more aware of alternative educational perspectives.
Another recurring theme involved emotional awareness and wellbeing. Several participants explained that Erasmus+ experiences encouraged greater reflection on the emotional dimensions of teaching. Teachers reported stronger awareness of student wellbeing, classroom relationships, and the importance of creating supportive learning environments. Some participants described becoming more patient and emotionally responsive following mobility experiences. Furthermore, interacting with

international colleagues and successfully participating in collaborative activities strengthened their sense of professional identity and belonging within a wider European educational community.

4.3 Professional Collaboration and Networking (Addressing RQ1 & RQ2)

Professional collaboration and networking represented additional important outcomes that act as both a product of growth (RQ1) and a facilitating factor for long-term sustainability (RQ2). Teachers valued opportunities to exchange ideas, resources, and teaching strategies with international colleagues. Many participants continued communication with educators they met during mobility activities through online collaboration and educational partnerships.

These professional relationships contributed to ongoing learning beyond the duration of the mobility itself. Teachers explained that collaboration with international colleagues encouraged them to remain engaged in reflective practice and continuous professional development.

However, the comparative dimension of the study also revealed that the success of this collaboration was heavily conditional on context. Teachers working within supportive school environments were far more likely to share mobility experiences with colleagues and implement innovative practices collaboratively, identifying school culture as a primary facilitating factor.

4.4 Challenges and Barriers: Factors Hindering Outcomes (Addressing RQ2)

Despite the positive outcomes associated with Erasmus+ participation, participants identified several structural barriers limiting the long-term impact and sustainability of mobility experiences. Workload pressures and administrative demands represented some of the most common challenges. Teachers often struggled to balance mobility participation and the implementation of new ideas with existing professional responsibilities.

Institutional support significantly influenced how teachers experienced Erasmus+ outcomes. Participants who received encouragement from school leadership were generally more successful in applying innovative practices after mobility participation. In contrast, teachers who experienced limited support reported greater difficulty integrating new methodologies into their schools. This directly confirms the literature warning that missing institutional support structures diminish the long-term viability of international training.

Resource limitations also hindered the execution of mobility outcomes in some schools. Participants explained that insufficient technological infrastructure and limited financial support restricted opportunities to sustain projects inspired by Erasmus+ participation.

Language barriers were also identified as challenges by some teachers, particularly during collaborative activities conducted in English or other foreign languages. Although many participants viewed these experiences as opportunities for improvement, some initially experienced difficulties participating confidently in discussions and collaborative tasks.

Ultimately, while Erasmus+ mobility programmes contribute positively to teacher development, reflective practice, intercultural competence, emotional awareness, and pedagogical innovation, the sustainability of these benefits depends significantly on fixing these institutional barriers within schools.

5. A Proactive Look at the Future

This paper examined how Erasmus+ mobility programmes contribute to the professional learning experiences of secondary school teachers in Malta and Spain. The findings demonstrate that international mobility supports professional growth, reflective practice, intercultural competence, emotional awareness, and pedagogical innovation. Teachers participating in Erasmus+ programmes reported increased motivation, stronger collaboration with international colleagues, and greater openness toward innovative and inclusive teaching approaches. Mobility experiences also contributed to communication skills, confidence, and reflective professional practice.

At the same time, the study highlighted several barriers affecting the sustainability of Erasmus+ outcomes, including workload pressures, limited institutional support, resource constraints, and language difficulties. These findings suggest that the effectiveness of mobility programmes depends not only on participation itself but also on the broader educational environment within schools.

As a conclusion, this study underscores that shaping the future of educational practice requires moving away from stagnant training models. Internationally connected professional development opportunities offer a transformative roadmap for the future, equipping educators with the dynamic intercultural and emotional competencies needed to navigate the unpredictable landscape of tomorrow's classrooms. To

realize a more informed future, stronger institutional support, deliberate structural resources, and continued international collaboration must be prioritized to solidify the long-term impact of Erasmus+ mobility experiences within secondary schools.
